GENERAL NOTES:

DESIGN SPECIFICATIONS: A.A.S.H.O. 1965

DESIGN LOADING: HS20-44 and Alternate Military Loading with 15 lbs./sq. ft. future wearing surface. Earth Press. lbs./sq. ft. Equivalent Fluid Pressure 30 lbs./cu. ft.
Fatigue Loading: A.W.S. D2.0-66 Formulae 15b & 16b

CONSTRUCTION SPECIFICATIONS: Missouri Standard Specifications for State Roads, Materials, Bridges, Culverts, and Incidental Structures-1961.

DESIGN UNIT STRESSES:

Class B1 Concrete (Superstructure)	fc =	1,600 psi.
Class B Concrete (Substructure)	fc =	1,200 psi.
Reinforcing Steel	fs =	20,000 psi.
Structural Steel		
(A.S.T.M. A36-66)	fs =	20,000 psi.
(A.S.T.M. A441-66) 3" and under	fs =	27,000 psi.
(Modified A441) 4" and under	fs =	27,000 psi.
Steel Pile (A.S.T.M. A36-66)	fb =	9,000 psi.

CONCRETE:
Concrete for superstructure shall be Class B1.
Concrete for substructure shall be Class B.

REINFORCING STEEL:
All splices in reinforcing steel shall be 24 bar diameters minimum.
Bar sizes are designated on the plans by numbers. The first digit after the letter in three digit marks and the first two digits after the letter in four digit marks indicate the size of the bar.
Dimensions shown on the plans from the reinforcing steel to the outside edge of concrete are clear dimensions unless otherwise indicated.
All bending dimensions are "out to out" of bars.

SEALING OF DECKS: Superstructure deck to be surface sealed.

UTILITIES: All utilities, unless shown otherwise, shall be removed or relocated by others. The Contractor will notify the owner of the utilities of his work schedule sufficiently in advance to allow time for disposition of utilities.

WELDING: Details of welded joints shown are for manual arc welding except as noted.

By approval of the Engineer the contractor may omit any shop splice, if desired, by extending the heavier flange plate and providing approved modification of details of field flange splices and elsewhere as required. Payweight in any case will be based on material shown on design plans.

The following shop welds will be subject to radiographic inspection.
All butt welded flange plates.
[illegible] of each girder [illegible] splice beginning at a point of maximum tension.

The following shop welds will be subject to inspection by magnetic particle procedure.
At least 10% of each size and type of fillet welds, web to flanges and bearing stiffeners, and bearing devices.
The tests shall be located at random in the members so as to be typical for each size and type of weld.
This test procedure may also be used for examination of weld passes and miscellaneous welds not specifically set out, at the discretion of the Engineer.

STRUCTURAL STEEL:
All structural steel shall be ASTM A36-66 unless noted otherwise.
Bolts shall be ASTM A325, ¾" with ⅞" holes unless otherwise shown.

PAINTING: Structural Steel shall be cleaned and painted one coat of Red Lead in the shop. Field painting shall consist of one [illegible] coat of red lead on unpainted and damaged areas, one coat of brown and the final coat Aluminum all in accordance with Std. Spec. 33.4.10.

Note:
BARS IN ALL UNITS WILL BE BILLED AND TAGGED SEPARATELY.
The designation preceeding the bar mark in the Bending Diagrams, indicates the unit in which the bar will be placed. (B2E=Bent 2 East)

Note:
Hooks and bends shall be in accordance with The A.C.I. Manual of Standard Practice for Detailing Reinforced Concrete Structures (ACI-315-65). Two diameter bends shall not be used unless specified in bending diagrams.

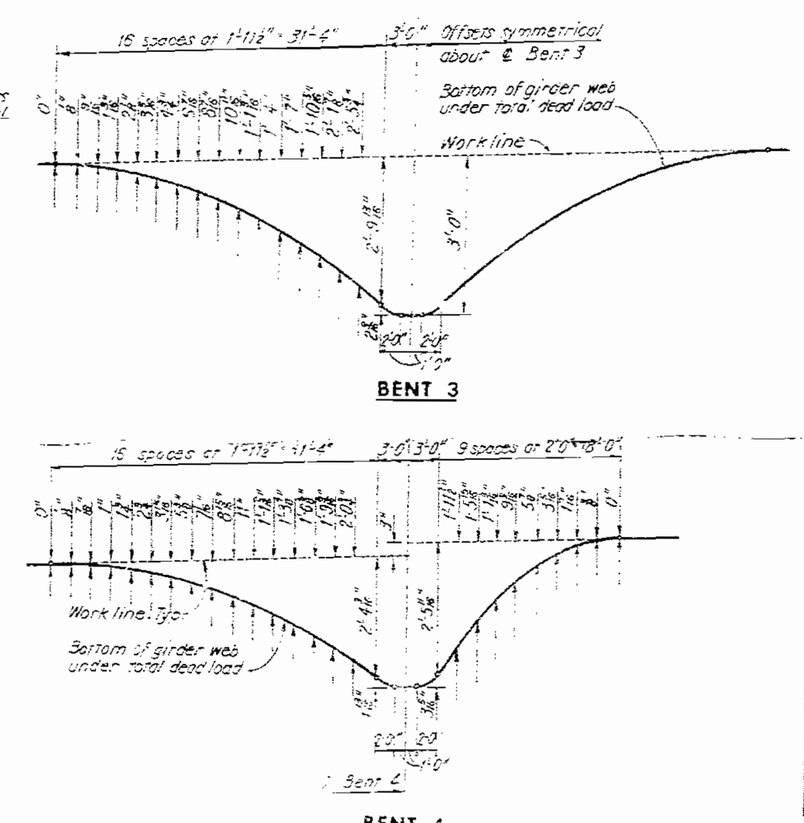
* ---Modified A441 Steel

TYPICAL BENT 3 AND BENT 4 GIRDER WEB HAUNCH

GIRDER ELEVATION
BEND LINE 3 TO BEND LINE 6



Note:
Offsets shown are vertical.

PARABOLIC OFFSETS

Note:
Dimensions shown are along grade at top of girder web under full dead load conditions. Vertical intersections are to lines parallel to bearing lines at Bents.

All material shall be A36 Steel except for plates marked with asterisk or where shown otherwise.

Girder K shown detailed on Girder Elevation. This sheet shall be worked with Framing Plan Sheet 27 for intermediate stiffener spacing between intermediate diaphragms.

Lateral connections not shown. For details see Sheet 29.

No shear connectors required over ℄ Bent and Field Splices

For girder web haunch details see Unit 1 Typical Girder Web Details, Sheets 30 and 31.

For intermediate stiffener to exterior girder flange weld limits see Sheet 33.

One shop welded girder web splice will be permitted in any girder which requires a web plate length greater than 50'-0". See Sheet 28 for details of shop welded web splice.

For Camber, Blocking and Deflection Diagram see Sheet 34.

Plate girders shall be fabricated to conform with Camber Diagram shown on Sheet 34.

GIRDERS A THRU F

NOTE: This drawing is not to scale. Follow dimensions.

Note: Dimensions shown are along grade at top of girder web under full dead load conditions. Vertical intersections are to lines parallel to bearing lines at Bents.

All material shall be A36 Steel except for plates marked with asterisk.

Girders F and L detailed in Girder Elevation. This sheet shall be worked with Framing Plan Sheet 28 for intermediate stiffener spacing between intermediate diaphragms.

For girder web haunch details see Unit 1 Typical Girder Web Details, Sheets 30 and 31. For girder details near hanger, see Sheet 40. No shear connectors required at Bent and Field Splices.

For intermediate stiffener to ex. ior girder flange weld limits see Sheet 33.

One shop welded girder web splice will be permitted in any girder which requires a web plate length greater than 30'-0". See Sheet 38 for details of shop welded web splice.

For Camber, Blocking and Deflection Diagram see Sheet 35.

Plan: girders shall be fabricated to conform with Camber Diagram shown on Sheet 35.

GIRDER ELEVATION

Note: Intermediate stiffeners outside limits shown above shall be welded to top flange.

LIMITS OF INTERMEDIATE STIFFENER TO EXTERIOR GIRDER FLANGE WELD

LEGEND

* ..... Modified A441 Steel

** ..... A441 Steel

RT ..... Shop Web Splice radiographic testing. See Welding Notes, Sheet 38.

Note:
Dimensions shown are along grade at top of girder web under full dead load conditions. Vertical intersections are to lines parallel to bearing lines of Bents.
All material shall be A36 Steel except for plates marked with asterisk.
Girder E shown detailed in Girder Elevation. This sheet shall be worked with Framing Plan Sheet 29 for intermediate stiffener spacing between intermediate diaphragms.

No shear connectors required at ℄ Bent and Field Splices.
One shop welded girder web splice will be permitted in any girder which requires a web plate length greater than 50'-0". See Sheet 38 for details of shop welded web splice.
For Camber, Blocking and Deflection Diagram see Sheet 35.
Plate girders shall be fabricated to conform with Camber Diagram shown on Sheet 35.

CAMBER AND BLOCKING DIAGRAM

Note:
Deflections and cambering offsets are given at one tenth points between field splices.
Negative deflections are above the reference line.
Negative cambering offsets are below the reference line.
Elevations shown are at top of web with Total Dead Load applied.
Blocking dimensions are for no applied Dead Load.
Letter preceding dimensions denotes the girder for which they are to be used.
Top of girder web shall be fabricated to conform to offsets given, and bottom of girder web shall be parallel to top of web except as shown on Girder Elevations.
The reference line shown in Camber and Blocking Diagram is between top of web at field splice points.
Deflection and Camber dimensions are in inches.

CAMBER AND BLOCKING DIAGRAM

Note:
Deflections and cambering offsets are given at one tenth points between field splices.
Negative deflections are above the reference line.
Negative cambering offsets are below the reference line.
Elevations shown are at top of web with Total Dead Load applied.
Blocking dimensions are for no applied Dead Load.
Letter preceding dimensions denotes the girder for which they are to be used.
Top of girder web shall be fabricated to conform to offsets given, and bottom of girder web shall be parallel to top of web except as shown on Girder Elevations.
The reference line shown in Camber and Blocking Diagram is between top of web at field splice points.
Deflection and Camber dimensions are in inches.

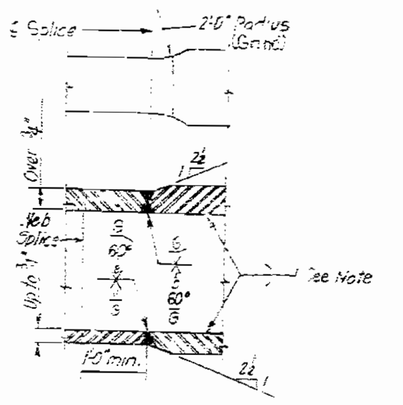
FIELD SPLICE DETAILS



FLANGE TO WEB WELD	
Flange Thickness	Min. Size Fillet Weld *
To 3/4" inclusive	1/4
over 3/4" to 1 1/4"	5/16
over 1 1/4" to 2 1/4"	3/8
over 2 1/4" to 6"	1/2

* Except that weld size need not exceed the thickness of the thinnest part being joined.

WELDING NOTES:
Fillet weld size for flange to web welds when submerged arc process is used shall be 1/4" for material to 3/4" thick, and in accordance with AWS recommended weld sizes for material over 3/4" thick.

Radiographic and or magnetic particle inspection of shop welds will be required. See General Notes.

RT, where shown on Girder Elevations, indicates location of shop web splice Radiographic testing.

SHOP WELDING DETAILS

Note: Splice Material shall be A.S.T.M. A36-66. Use 7/8" High Strength bolts and nuts with one hardened washer under the part to be turned in tightening. Holes to be reamed to 7/8". Reentry cuts will not be allowed on field splice plates.
See Girder Elevations, sheets 30 thru 33 for locations of field splices.
All dimensions are measured along ℄ girder.

EXPANSION DEVICE NOTES:
Finger plates shall be cut with a gas torch from one plate 25½" x 14¼". The surface of cut shall be perpendicular to the surface of plate. The cut shall not exceed ⅜" in width. The centerline of cut shall not deviate more than ⅜" from the position of centerline of cut shown in Finger Plate Layout. No part of expansion device may be spliced.
The expansion device shall be ASTM A36.

LEGEND

①	Pouring Sequence Number
(N.B.)	Northbound Lane
(S.B.)	Southbound Lane

The Contractor shall use an approved oscillating screed type, self-propelled mechanical finishing machine and shall pour and satisfactorily finish the slab pours at a rate of not less than 60 cubic yards per hour unless he elects to use an approved retarder at his own expense to retard the set of the concrete to 2.5 hours in which case he may reduce his pouring and finishing rate to not less than 35 cubic yards per hour. The Contractor shall observe the basic pouring sequence unless he can demonstrate to the engineer that he can pour and satisfactorily finish one of the longer alternate pours. Finishing machine loads will not be permitted on concrete less than 48 hours old.

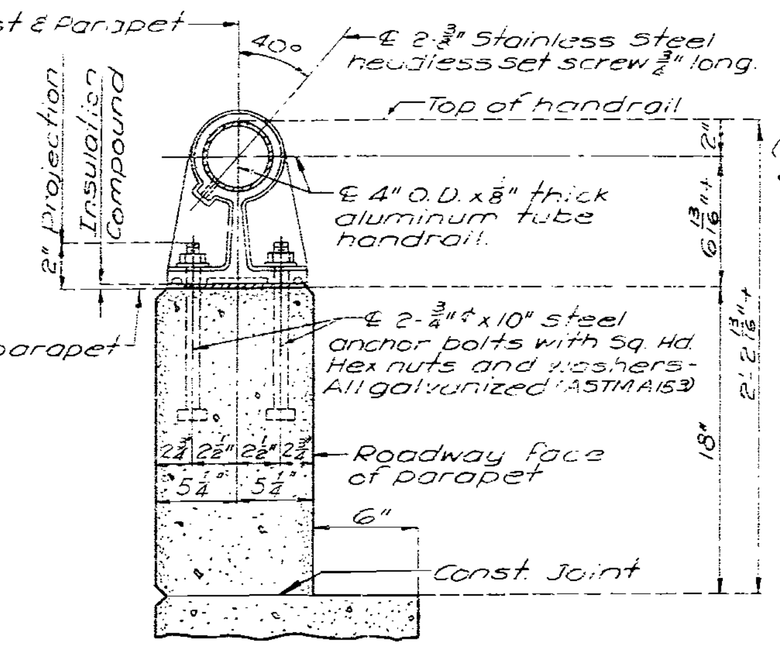
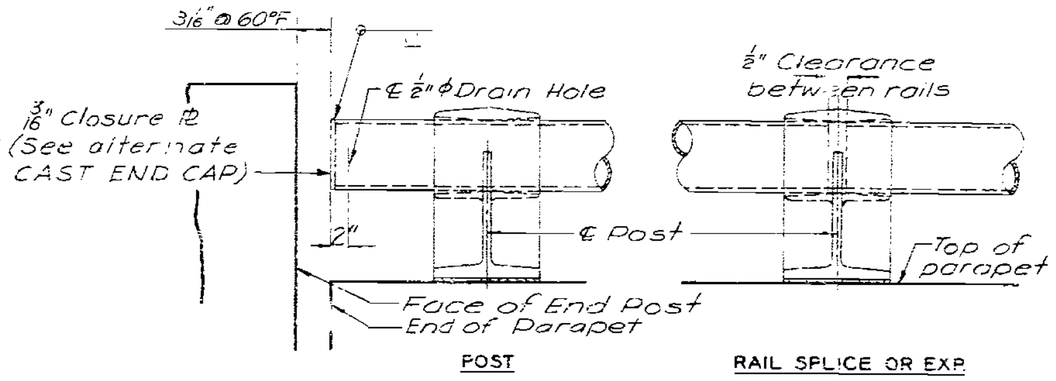
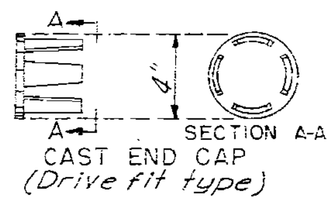
POST DETAILS



SECTION THRU HANDRAIL



TYPICAL HANDRAIL DETAILS



CAST END CAP
(Drive fit type)

SINGLE TUBE ALUMINUM RAILING

GENERAL NOTES:

All handrail posts shall be set normal to grade.

Aluminum tube handrail shall be bent to conform to vertical and horizontal alignment of parapet.

Aluminum washer shims between top of parapet and post base may be used for adjusting handrail alignment. Maximum thickness of shims to be ⅛". Where more tilting of post is required for proper alignment, concrete bearing areas shall be ground down.

All parts of handrail, except anchor bolts, nuts, washers, and set screws are to be of aluminum material.

The contract unit price per linear foot of "Bridge Rail" shall include furnishing and erecting the handrail complete with anchor bolts, shims and insulating compound.

All fillets ¼" except as noted.

All drafts 3° except as noted.

Pipe Rail to be fabricated in a minimum of two panel lengths.

Omit set screw on side adjacent to filled joint in parapet and curb at all expansion posts.

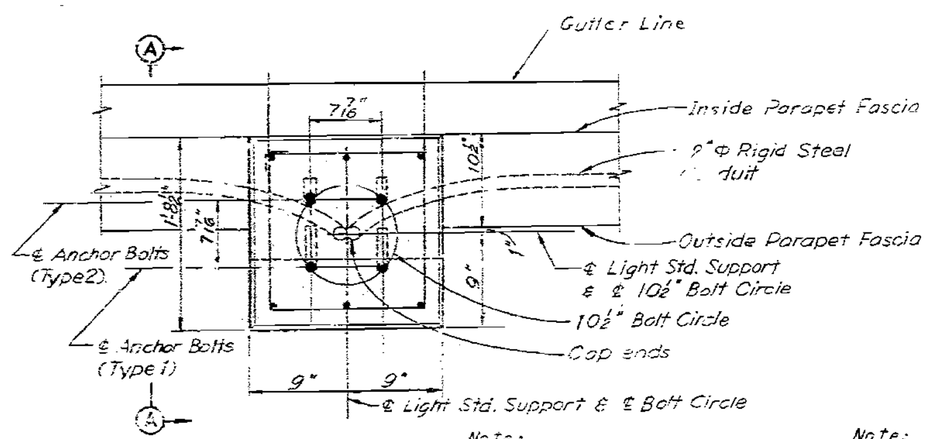
Top of curbs and parapets to be built parallel to grade with curb and parapet joints (except at end posts) normal to grade.

All exposed edges of end posts shall have ½" bevel. All exposed edges of curbs & parapets shall have ¾" radius or ¾" bevel unless otherwise noted.

If the contractor desires, he may use drive fit cast aluminum end caps in lieu of welded aluminum closure plates.

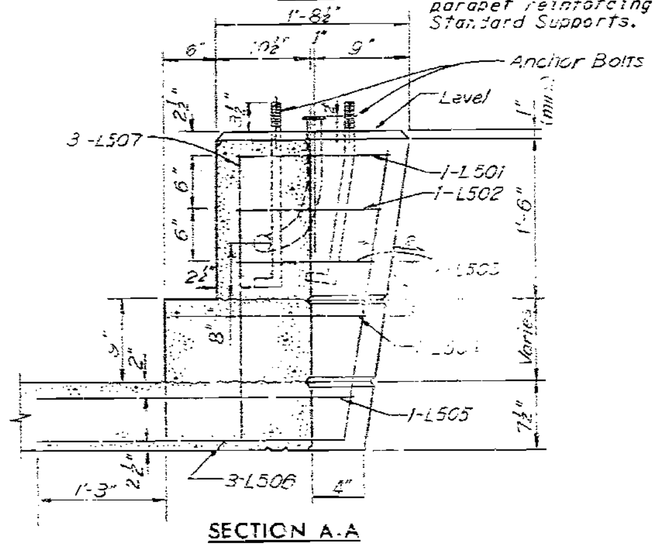
Concrete end posts to be vertical.

Integrally cast test coupons and a coat of clear lacquer specified in Std. Specs 836.2.4 and 1.3.3.5 respectively will not be required for these rail posts.



PLAN

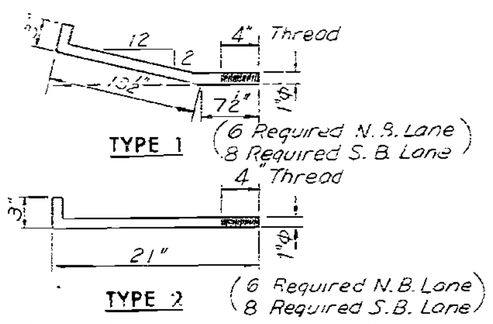
Note: Continue normal curb and parapet reinforcing thru Light Standard Supports.



SECTION A-A

LIGHT STANDARD SUPPORT DETAILS

(3 Light Standards Required N.B. Lane
4 Light Standards Required S.B. Lane)

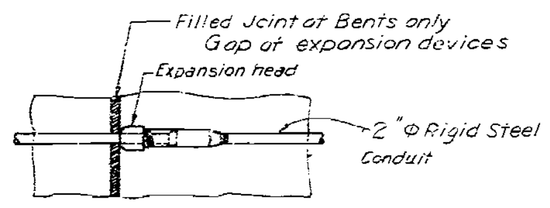


TYPE 1

TYPE 2

Note: Bolts shall be in accordance with Section 70.8 of Standard Specifications.
Payment for furnishing and installing bolts shall be included in price bid for other items.

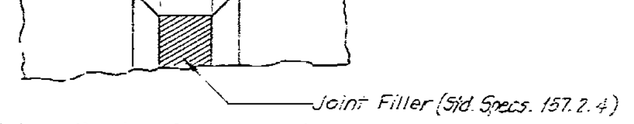
ANCHOR BOLTS



EXPANSION FITTING DETAIL

Note: Cost of furnishing and placing conduit, expansion fittings, junction boxes, and anchor bolts for light standard shall be included in contract unit price of Conduit System On Structures.
Light Standards, wiring and fixtures to be furnished and installed by others.
All conduit to be rigid galvanized steel with 3" minimum cover in concrete. All ends of conduit shall be capped.
Shift reinforcing steel in field where necessary to clear conduit and junction boxes.
Top of light standard supports to be made horizontal, anchor bolts to be placed vertically.
For details of light standards and wiring, see Electrical Plans.
Galvanized expansion fittings shall provide a minimum of movement in either direction of 4" at open joints and 1" at filled joints. Fittings shall be equal to O.Z. Elec. Mfg. Co. Expansion Fittings AX or DX.
Place 1" ϕ copper tube drains at low points in conduit and junction boxes. Drain tubes shall protrude 1" from bottom of slab.
All pull or junction boxes shall be Plowe mounted box equal to O.Z. Elec. Mfg. Co. Type "VP-4-NU".

Note: This drawing is not to scale. Follow dimensions



Note: Use bevel as shown for exposed faces of all filled joints.

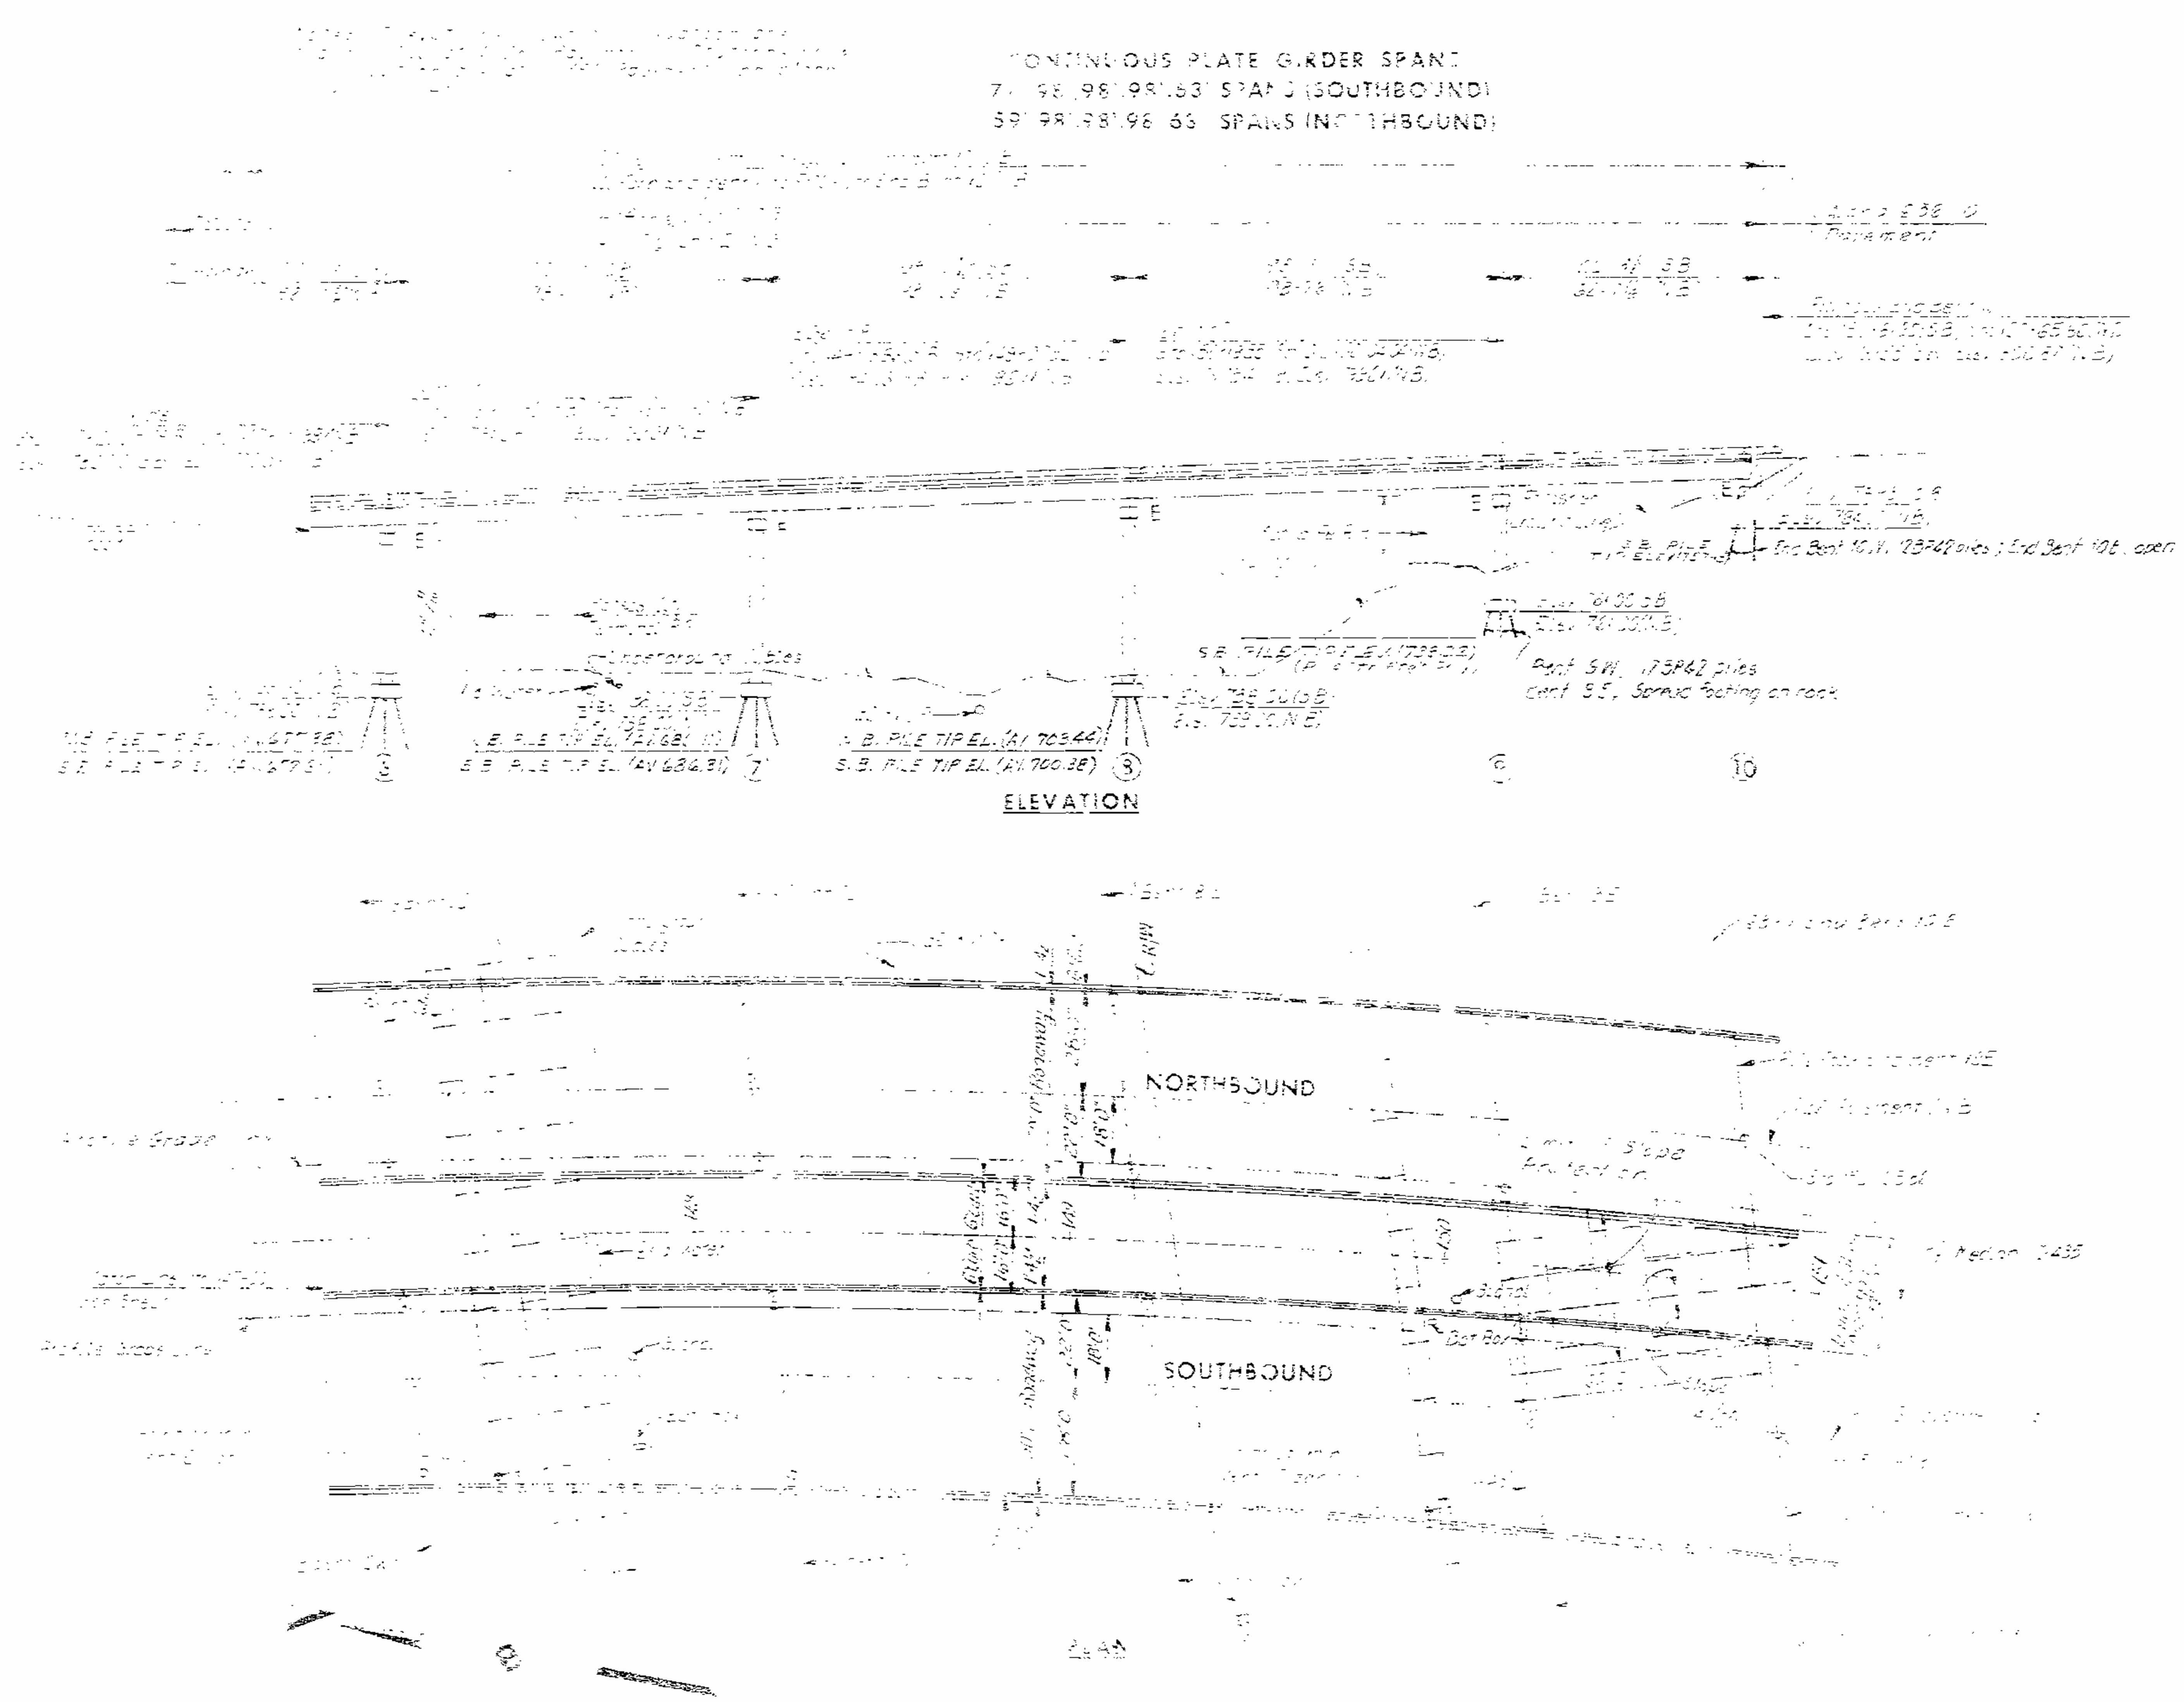
FINAL PLANS



GENERAL NOTES:

DESIGN SPECIFICATIONS: A.A.S.H.O. 1965

DESIGN LOADING: HS20-44 and Alternate Military Loading with 35#/sq. ft. future wearing surface. Earth 120#/cu. ft. Equivalent Fluid Pressure 30#/cu. ft. Fatigue Loading: [illegible]

CONSTRUCTION SPECIFICATIONS: Missouri [illegible] Specifications for State Road [illegible], Bridges, Culverts and Incidental [illegible] 1961.

DESIGN UNIT STRESSES:
Class B1 Concrete (Superstructure) [illegible]
Class B Concrete (Substructure) [illegible]
Reinforcing Steel [illegible]
Structural Steel
(A.S.T.M. A36-60) [illegible]
(A.S.T.M. A441-66) [illegible] and under [illegible]
[illegible] and under [illegible]
Steel Piles (A.S.T.M. A36-63) [illegible]

CONCRETE:
Concrete for superstructure was Class B1.
Concrete for substructure was Class B.

REINFORCING STEEL:
All splices in reinforcing steel 24 bar diameters minimum.
Bar sizes are designated on the plans by numbers. The first digit after the letter in three digit marks and the first two digits after the letter in four digit marks indicate the size of the bar.
Dimensions shown on the plans from the reinforcing steel to the outside edge of concrete are clear dimensions unless otherwise indicated.
All bending dimensions are "out to out" of bars.

SEALING OF DECKS: Superstructure deck [illegible] surface sealed.

UTILITIES: All utilities, unless shown otherwise, were removed or relocated by others. The contractor shall notify the owner of the utilities of his work schedule sufficiently in advance to allow time for disposition of utilities.

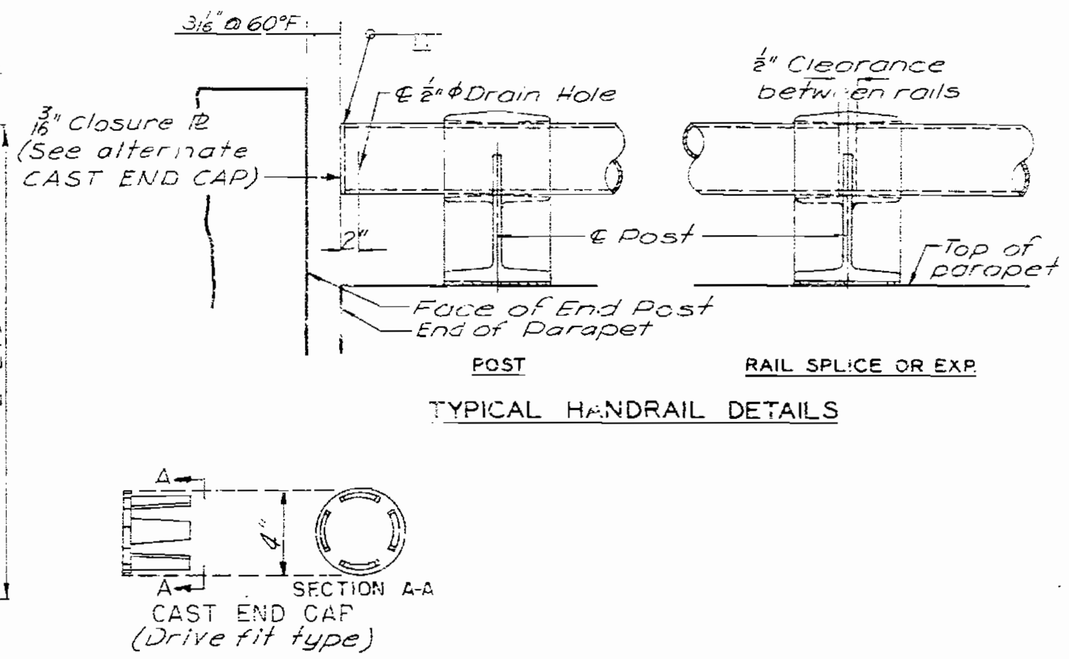
POST DETAILS

SECTION THRU HANDRAIL



TYPICAL HANDRAIL DETAILS

SINGLE TUBE ALUMINUM RAILING

GENERAL NOTES:

All handrail posts shall be set normal to grade.

Aluminum tube handrail shall be bent to conform to vertical and horizontal alignment of parapet.

Aluminum washer shims between top of parapet and post base may be used for adjusting handrail alignment. Maximum thickness of shims to be ⅛". Where more tilting of post is required for proper alignment, concrete bearing areas shall be ground down.

All parts of handrail, except anchor bolts, nuts, washers, and set screws are to be of aluminum material.

The contract unit price per linear foot of "Bridge Rail" shall include furnishing and erecting the handrail complete with anchor bolts, shims and Insulating compound.

All fillets ½" except as noted.

All drafts 3° except as noted.

Pipe Rail to be fabricated in a minimum of two panel lengths.

Omit set screw on side adjacent to filled joint in parapet or curb at all expansion posts.

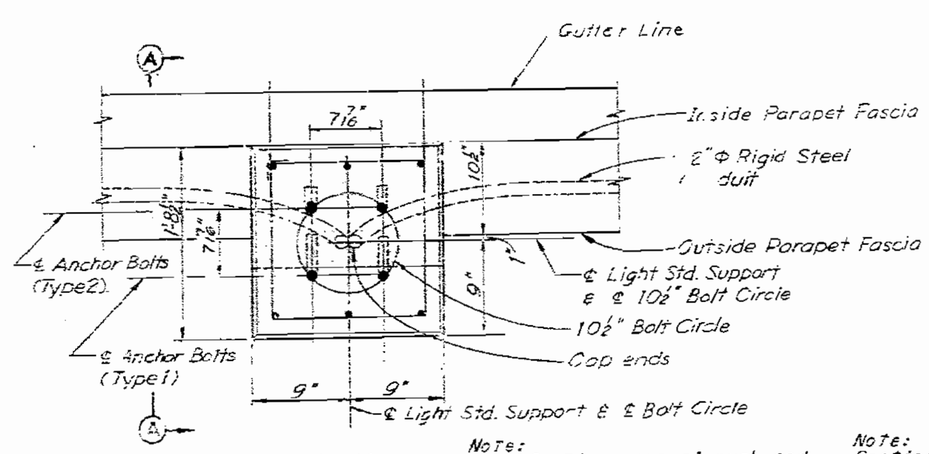
Top of curbs and parapets to be built parallel to grade with curb and parapet joints (except at end posts) normal to grade.

All exposed edges of end posts shall have ½" bevel. All exposed edges of curbs & parapets shall have ¾" radius or ¾" bevel unless otherwise noted.

If the contractor desires, he may use drive fit cast aluminum end caps in lieu of welded aluminum closure plates.

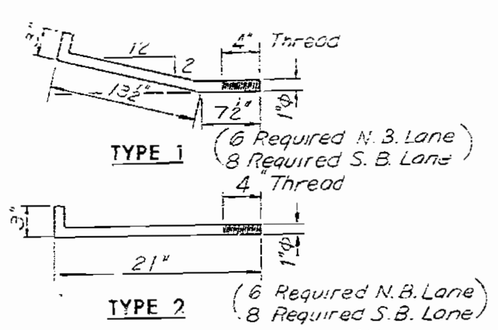
Concrete end posts to be vertical.

Integrally cast test coupons and a coat of clear lacquer specified in Std. Specs. 56.2.4 and 56.3.5 respectively will not be required for these rail posts.



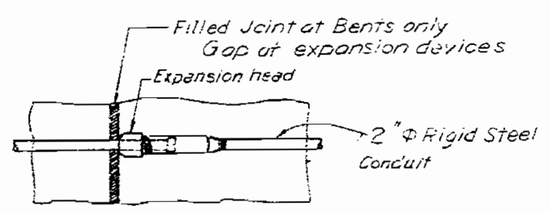
LIGHT STANDARD SUPPORT DETAILS

(2 Light Standards Required N.B. Lane
2 Light Standards Required S.B. Lane)



Note: Bolts shall be in accordance with Section 70.8 of Standard Specifications. Payment for furnishing and installing bolts shall be included in price bid for other items.

ANCHOR BOLTS



EXPANSION FITTING DETAIL

Note: Cost of furnishing and placing conduit, expansion fittings, junction boxes, and anchor bolts for light standard shall be included in contract unit price of Conduit System On Structures.

Light standards, wiring and fixtures to be furnished and installed by others.

All conduit to be rigid galvanized steel with 3" minimum cover in concrete. All ends of conduit shall be capped.

Shift reinforcing steel in field where necessary to clear conduit and junction boxes.

Top of light standard supports to be made horizontal, anchor bolts to be placed vertically.

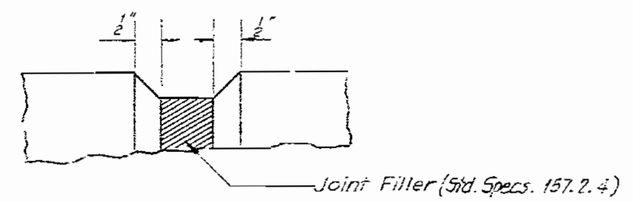
For details of light standards and wiring, see Electrical Plans.

Galvanized Expansion Fittings shall provide a minimum of movement in either direction of 4" at open joints and 1" at filled joints. Fittings shall be equal to O.Z. Elec. Mfg. Co. Expansion Fittings As Ordered.

Place ¾" ϕ copper tube drains at low points in conduit and junction boxes. Drain tubes shall protrude 1" from bottom of slab.

All parapet junction boxes shall be Pluvia mounted on equal & as Elec. Mfg. Co. Type "VP-8".

Note: This drawing is not to scale. Follow dimensions.



Note: Use bevel as shown for exposed faces of all filled joints.

Estimated Quantities for Slab on Steel

Item		Stage I	Stage II	Stage III	Total
Reinforcing Steel (Epoxy Coated)	kilogram	69 175	84 750	81 005	234 930
Concrete	cu. meter	327.6	378.7	424.9	1131.2

The table of estimated quantities for Slab on Steel represents the quantities used by the state in preparing the cost estimate for concrete slabs. Variations may be encountered in these estimated quantities but these variations cannot be used for an adjustment in the contract unit price per square meter of Slab on Steel.

Slab on steel shall be constructed using cast-in-place conventional forming.

* Safety barrier curb shall be cast-in-place option or slip-form option.

Construction Clearances

Railroad	Vertical (mm)	Lateral (mm)
GST Steel Company	7010	3048
UP	6553	4572
KCS	6553	3048
BNSF	6553	3048
KCT	7010	3048

General Notes:

Design Specifications:
ASHTO-1996 Load Factor Design
Seismic Performance Category A

Design Loading:
MS18 Modified
No Future Wearing Surface
Fatique Stress - Case I

Design Unit Stresses:

Class B1 Concrete (Substructure)	f'c = 28 MPa
Class B1 Concrete (Safety Barrier Curb)	f'c = 28 MPa
Class B2 Concrete (Superstructure, except Safety Barrier Curb)	f'c = 28 MPa
Reinforcing Steel (Grade 420)	fy = 420 MPa
Structural Carbon Steel (ASTM A709 Grade 250)	fy = 250 MPa

Fabricated Steel Connections
Field connections shall be made with 19.0 mm diameter high strength bolts and 20.6 mm diameter holes, except as noted.

Joint Filler
All joint filler shall meet the requirements of Section 1057.2.4 of the Missouri Standard Specifications (Metric), except as noted.

Reinforcing Steel
Minimum clearance to reinforcing steel shall be 40 mm, unless otherwise shown.

Protective Coating (New Steel Only)
System G by the contractor.

Prime Coat: The cost of the prime coat shall be included in the contract unit price of the Fabricated Structural Steel. Tint of the prime coat for System G shall be similar to the color of the field coat to be used.

Field Coat: The color of the finish coat shall be Gray (Federal Standard #26373). The cost of the intermediate and finish coats shall be included in the contract unit price per Megagram of Field Coat (System G) Gray.

Miscellaneous
See table for minimum vertical clearance from top of rails and minimum lateral clearance from the centerline of track to nearest temporary construction falsework to be maintained during construction.

Traffic over structure to be maintained during construction.

High strength bolts, nuts and washers will be sampled for quality assurance as specified in Section 106 of the Missouri Standard Specifications (Metric) and Field Section (FS-712) from Materials Manual.

Outline of old work is indicated by dashed lines. Heavy lines indicate new work.

Contractor shall verify all dimensions in field before ordering new steel.

Bars bonded in old concrete not removed shall be cleanly stripped and embedded into new concrete where possible. If length is available, old bars shall extend into new concrete at least 40 diameters for smooth bars and 30 diameters for deformed bars, unless otherwise noted.

Contractor shall take all necessary precautions to prevent debris and other material from dropping onto the railroad tracks. See Special Provisions.

Dimensions
All dimensions are shown in millimeters (mm) unless otherwise specified.

Drawings are not to scale. Follow dimensions.

Elevations
All elevations are specified in meters except as noted.

Hinge Modifications
Removal of existing structural steel in hinge areas as shown shall be included in the cost of Fabricated Structural Carbon Steel (Misc.) - Metric.

1: Steel Flex. SSPA by the D.S. Brown Company
2: Type "P" by Watson, Bowman, Acme

State	Proj. No.	Sheet NO.
MO		

NOTE:

The expansion device shall be fabricated and installed in accordance with the recommendations of the manufacturer, and as set forth in the Special Provisions.

The contractor must verify all dimensions prior to fabrication.

All welds shall conform to Section 712 of the Standard Specifications (Metric).

All steel shall be ASTM A709M Grade 250, except steel extrusions shall be ASTM A709M Grade 345W or Grade 250.

Neoprene Strip Seal shall meet ASTM D-2628.

Anchors for the extrusions or armor shall be approved welded studs (C1010 through C1020).

Payment for steel extrusions, curb plate , neoprene strip seal & B2 Concrete, reinforcing steel & curb replacement shall be made under the contract unit price for Modification of Existing Expansion Device.

Structural Steel for the expansion device and curb plate shall be coated with a minimum of two coats of inorganic zinc primer (125 micrometers minimum thickness) or galvanized in accordance with ASTM A123. Anchors need not be protected from overspray.

Payment for furnishing, coating or galvanizing and placing Strip Seal Expansion Device shall be included in the contract unit price for Modification of Existing Expansion Device.

Note: The expansion gap dimension shall be increased 3 mm for each 5° C fall in temperature and decreased 3 mm for each 5° C rise in temperature at installation.

(3) Extrusions shall be welded top and back.

Concrete shall be forced under and around strip seal extrusions and studs. Proper consolidation of the concrete shall be achieved by localized internal vibration.

Contractor shall support the steel extrusions during placement of adjacent concrete, to assure accurate alignment of extrusions.

The Expansion Device shall conform to grade of roadway.

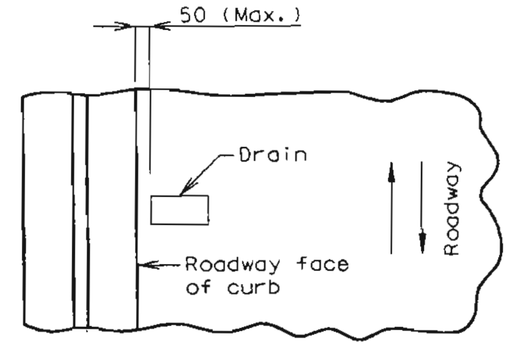
PLAN OF DRAIN



PART PLAN OF SLAB AT DRAIN

Notes:

Slab drains may be fabricated of either 6 mm welded sheets of ASTM A709M Grade 250 steel or from 6.4 mm structural steel tubing ASTM A500 or A501.

Outside dimensions of drains are 203 mm x 102 mm.

Locate drains in the slab by dimensions shown in Part Section Near Drain.

Shift reinforcing steel in field where necessary to clear drains.

The drains and bracket assembly shall be galvanized in accordance with ASTM A123.

All bolts, hardened washers, lock washers and nuts shall be galvanized in accordance with ASTM A153.

Shop drawings will not be required for slab drains and the bracket assembly.

See Sheet No. 17 for location of slab drains.

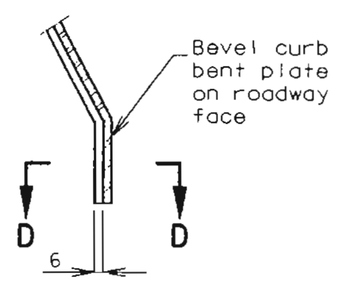
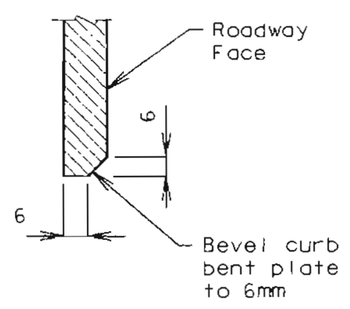
SECTION A-A



PART ELEVATION AT END OF BEVELED CURB BENT PLATE



SECTION D-D

Notes:

The expansion device shall be fabricated to the grade and cross slope of the roadway.

Material for the expansion device shall be ASTM A709M Grade 250 structural steel. Anchors for the expansion device shall be approved stud-welded anchors (C1010 thru C1020).

Structural steel for the expansion device and curb plate shall be coated with a minimum of two coats of inorganic zinc primer (125 micrometers minimum thickness) or galvanized in accordance with ASTM A123. Anchors need not be protected from overspray.

Plan dimensions are based on installation at 16 degree Celsius. The expansion gap and other dimensions shall be increased 5mm for each 5 degree Celsius fall and decreased 5mm for each 5 degree Celsius rise in temperature at installation.

Furnishing, coating or galvanizing and installing the expansion device and barrier curb plates shall be included in the contract unit price for Expansion Device (Flat Plate).

Concrete shall be forced under and around flat plate, studs and angles. Proper consolidation of the concrete shall be achieved by localized internal vibration.

Dimensions shown are horizontal.

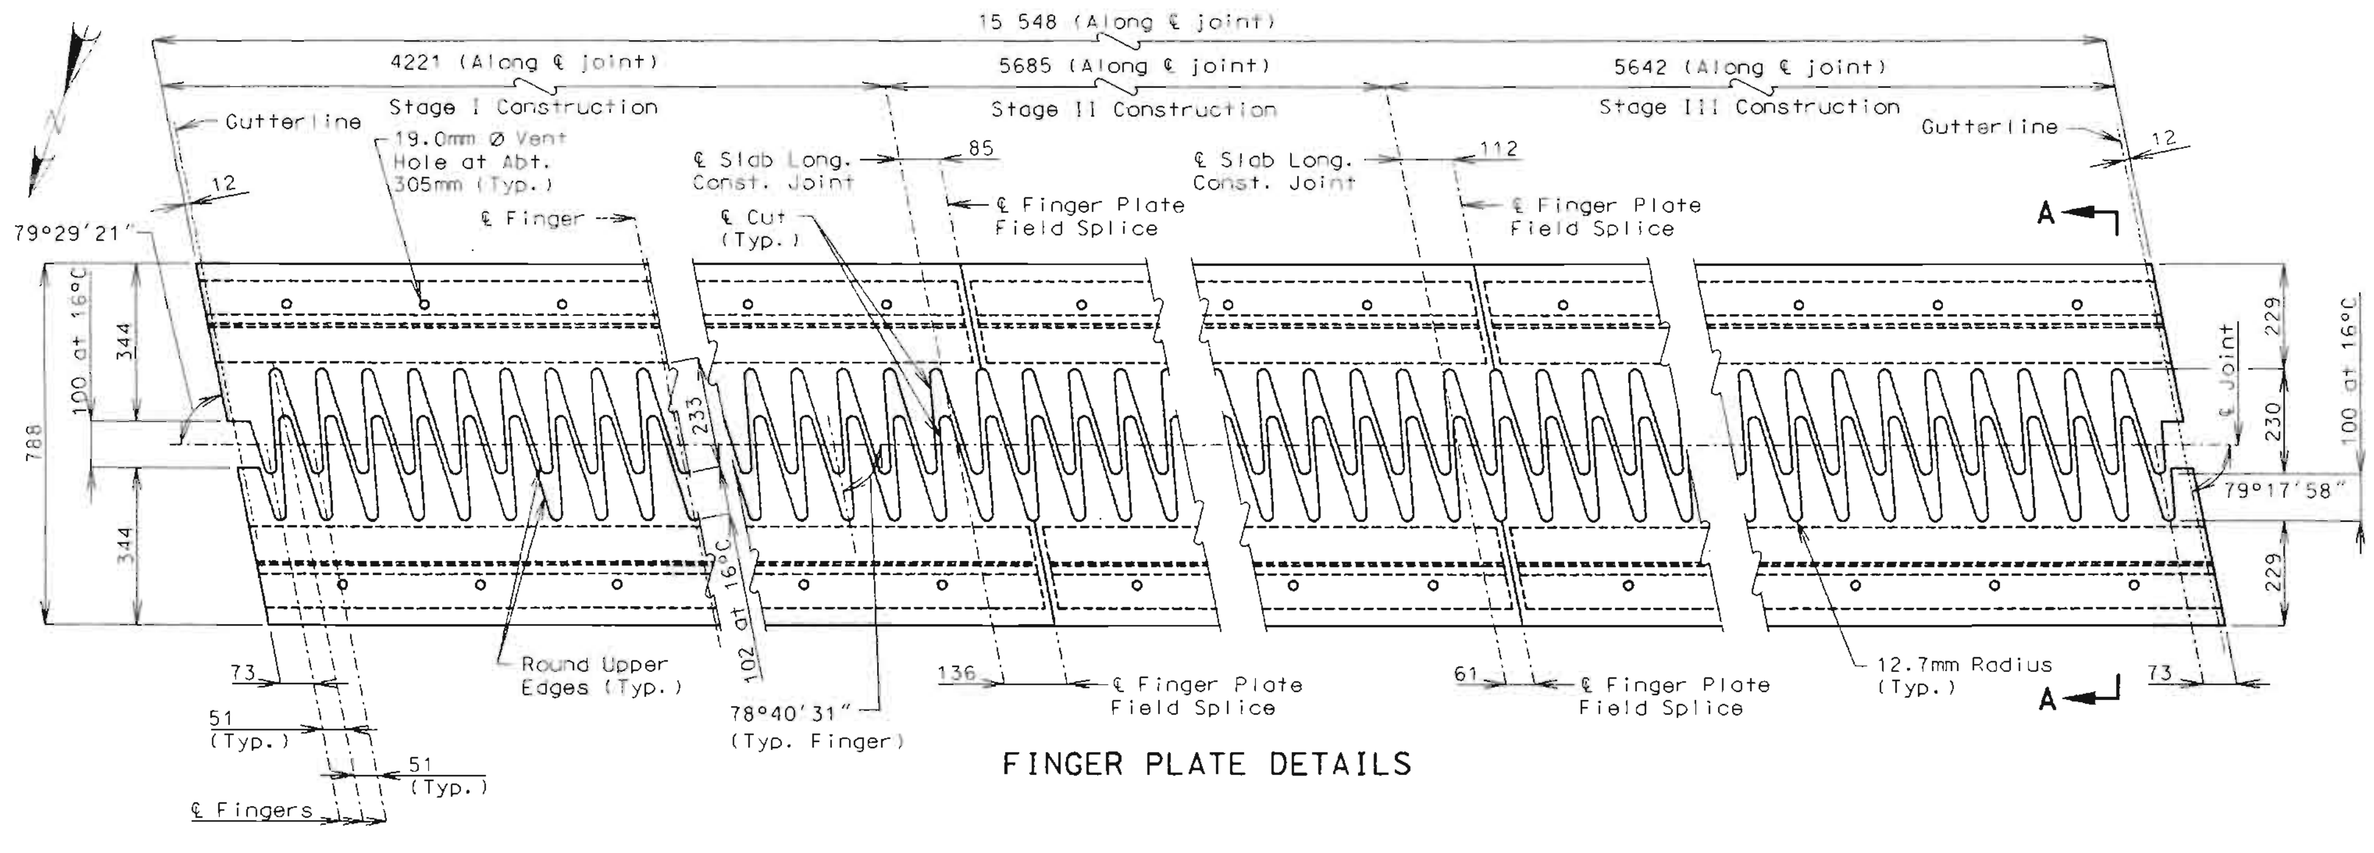
PART PLAN OF EXPANSION DEVICE AT HINGE NEAR BENT NO. 5



FINGER PLATE DETAILS

Notes:

Finger skew is different than skew of plate ends. Skew of plate ends are not equal. See finger plate details this sheet.

Finger plate shall be cut with a machine guided gas torch from one plate. The plate from which fingers are cut may be spliced before fingers are cut. The surface of cut shall be perpendicular to the surface of plate. The cut shall not exceed 3mm in width. The centerline of cut shall not deviate more than 2mm from the position of centerline of cut shown. After fingers are cut, the plate shall then be cut into sections as shown for the staged construction.

Plan dimensions are based on installation at 16 degree Celsius. The expansion gap and other dimensions shall be increased 7mm for each 5 degree Celsius fall and decreased 7mm for each 5 degree Celsius rise in temperature at installation.

Material for the expansion device shall be ASTM A709M Grade 250 structural steel.

Structural steel for the expansion device and curb plate shall be coated with a minimum of two coats of inorganic zinc primer (125 micrometers minimum thickness) or galvanized in accordance with ASTM A123. Anchors need not be protected from overspray.

Payment for furnishing, coating or galvanizing, and installing structural steel for the expansion device will be made at the contract unit price for Expansion Device (Finger Plate) per meter.

Concrete shall be forced under and around finger plate supporting hardware, angles and bars. Proper consolidation shall be achieved by localized internal vibration.

Use 19.0mm diameter high strength bolts.

Adjust spacing of stiffener plates, flat bars and slotted holes as required to maintain 75mm clear to finger plate field splice.

For Section A-A, barrier curb plates and miscellaneous details, see Sheet No. 22.

Space R1. R2. R3 and R4 bars as shown in Part Section Near Safety Barrier Curb.

Use a minimum lap of 925mm for #16 horizontal safety barrier curb bars.

Longitudinal dimensions are taken from original construction plans and are along top of outside edge of slab parallel to grade.

See Sheet No. 25 for Section A-A and miscellaneous safety barrier curb details and notes.

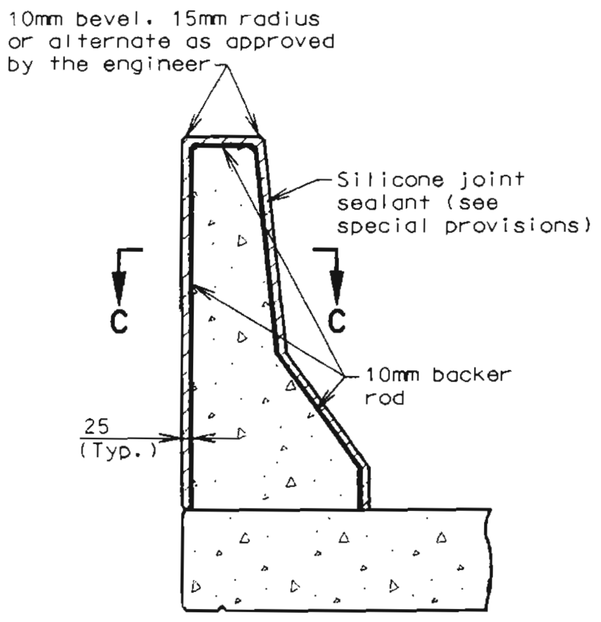
SECTION B-B

* Each side of joint location, except
bridge side only at end bents



SECTION THRU JOINT

Notes:

Top of safety barrier curb shall be built parallel to grade with safety barrier curb joints (except at end bents) normal to grade.

All exposed edges of safety barrier curb shall have either a 15mm radius or a 10mm bevel, unless otherwise noted.

Concrete in the safety barrier curb shall be class B1.

When the safety barrier curb is bid per meter, the contract unit price shall include the cost of all concrete and reinforcement, complete-in-place.

Measurement of the safety barrier curb is to the nearest half meter for each structure, measured along the outside top of slab from end of wing to end of wing.

Joint sealant and backer rods shall be used on all slip-form safety barrier curbs instead of joint filler.

Use a minimum lap of 925mm for the #16 horizontal safety barrier curb bars.

The cross-sectional area of the barrier curb above the slab = 212 225 sq. mm.

A movement gauge shall be provided on one side of the bridge at all safety barrier curb expansion joints.

All steel for movement gauge shall be galvanized.

Cost of movement gauge complete in place shall be included in contract unit price for Safety Barrier Curb.

Field cut horizontal leg on R4 bars to allow clearance at end bents and finger joints.

Notes:

* Cut and field bend existing bars as required to maintain 40mm clearance.

The contractor shall use one of the resin anchor systems listed in the job special provisions. These anchor systems shall be installed according to the manufacturer's specifications, except as modified by the job special provisions.

#16-R25 shall be used with the resin anchor system and shall have a minimum ultimate pullout strength of 68.9 kN in the existing concrete with f'c=21 MPa, see special provisions.

Cost of furnishing and installing #16-R25 and anchor system shall be included in the price bid for Safety Barrier Curb.

For additional barrier curb notes, see Sheet No. 25.

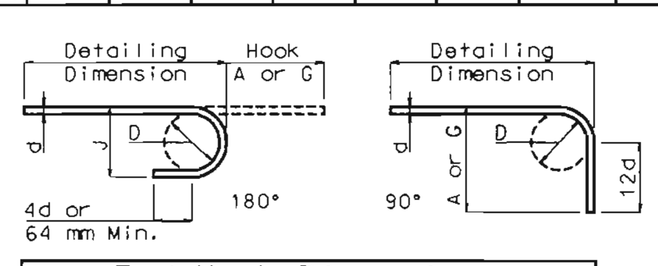
Stirrup Hook Dimensions

Bar Size	D (mm)	All Grades 90° Hook Hook A OR G	135° Hook Hook A OR G	135° Hook Approx. H
#13	50	115	115	80
#16	65	155	140	95
#19	115	305	205	115

Note: Unless otherwise noted diameter "D" is the same for all bends and hooks on a bar.



End Hook Dimensions

Bar Size	All Grades D (mm)	180° Hook A OR G	180° Hook J	90° Hook A OR G
#10	60	125	80	150
#13	80	150	105	200
#16	95	175	130	250
#19	115	200	155	300
#22	135	250	180	375
#25	155	275	205	425
#29	240	375	300	475
#32	275	425	335	550
#36	305	475	375	600
#43	465	675	550	775

Notes:

All standard hooks and bends other than 180 deg. are to be bent with same procedure as for 90 deg. standard hooks. Hooks and bends shall be in accordance with the procedures as shown on this sheet.
E = Epoxy coated reinforcement
S = Stirrup
X = Bar is included in substructure quantities
V = Bar dimensions vary in equal increments between dimensions shown on this line and the following line.
No. ea. = Number of bars of each length.
Nominal lengths are based on out to out dimensions shown in bending diagrams and are listed for fabricator's use. (Nearest 5mm)
Actual lengths are measured along centerline bar to the nearest 5mm.
Pay items are based on actual lengths.
Four angle or channel spacers are required for each column spiral. Spacers are to be placed on inside of spirals. Length and mass of column spirals do not include splices or spacers.
Reinforcing steel (Grade 420) fy = 420 MPa

#32	275	425	335	550
#36	305	475	375	600
#43	465	675	550	775

Notes:

All standard hooks and bends other than 180 deg. are to be bent with same procedure as for 90 deg. standard hooks. Hooks and bends shall be in accordance with the procedures as shown on this sheet.
E = Epoxy coated reinforcement
S = Stirrup
X = Bar is included in substructure quantities
V = Bar dimensions vary in equal increments between dimensions shown on this line and the following line.
No. ea. = Number of bars of each length.
Nominal lengths are based on out to out dimensions shown in bending diagrams and are listed for fabricator's use. (Nearest 5mm)
Actual lengths are measured along centerline bar to the nearest 5mm.
Pay items are based on actual lengths.
Four angle or channel spacers are required for each column spiral. Spacers are to be placed on inside of spirals. Length and mass of column spirals do not include splices or spacers.
Reinforcing steel (Grade 420) fy = 420 MPa

	Slab Drain	each	9
	Field Coat (System G) Gray - Metric	megagram	7.0

*** Safety Barrier Curb shall be Cast-In-Place option or Slip Form option, as shown.

General Notes:

Design Specifications:
AASHTO - 1996
Load Factor Design (Safety Barrier Curb).
Allowable Stress Design (Hanger Plate).

Design Loading:
MS18 Modified.

Design Unit Stresses:
Class B1 Concrete (Safety Barrier Curb) f'c = 28 MPa.
Reinforcing Steel (Grade 420) fy = 420 MPa.
Structural Steel (ASTM A709M Grade 250) fs = 150 MPa.

Reinforcing Steel:
Minimum clearance to reinforcing steel shall be 40 mm, unless otherwise shown.

Bars bonded in old concrete not removed shall be cleanly stripped and embedded into new concrete where possible. If length is available, old bars shall extend into new concrete at least 40 diameters for smooth bars and 30 diameters for deformed bars, unless otherwise noted.

Joint Filler:
All joint filler shall meet the requirements of Section 1057.2.4 of the Missouri Standard Specifications (Metric), except as noted.

Coating: (New Steel Only)

Protective Coating: System G by the contractor.

Prime Coat: The cost of the prime coat shall be included in the contract unit price of the Fabricated Structural Steel. Tint of the prime coat for System G shall be similar to the color of the field coat to be used.

Field Coat: The color of the finish coat shall be Gray (Federal Standard #26373). The cost of the intermediate and finish coats shall be included in the contract unit price per Megagram of Field Coat (System G) Gray.

Old Work:
Outline of old work is indicated by dashed lines. Heavy lines indicate new work.

Maintain Traffic:
See roadway plans for traffic control during construction.

Verify Dimensions:
Contractor shall verify all dimensions in field before ordering materials.

Roadway Surfacing:
Roadway Surfacing adjacent to bridge ends to match bridge overlay.

Maintain Grade:
In order to maintain grade and a minimum thickness of overlay as shown on plans, it may be necessary to use additional quanities of overlay at various locations throughout the structure. No payment will be allowed for additional labor, materials or equipment for variations in thickness of overlay.

Miscellaneous:
All dimensions are shown in millimeters (mm) unless otherwise specified.
All elevations are specified in meters (m) except as noted.
Drawings are not to scale. Follow dimensions.
High strength bolts, nuts and washers will be sampled for quality assurance as specified in Section 106 of the Missouri Standard Specifications (Metric) and Field Section (FS-712) from Materials Manual.
A minimum vertical clearance of 6.553 m for Union Pacific, KCS and BNSF Railroads and 7.010 m for GST and KCT Railroads from top of rails and a minimum lateral clearance of 3.048 m for KCS, BNSF, GST and KCT Railroads and 4.572 m for Union Pacific Railroads from the centerline of track to nearest temporary construction falsework shall be maintained during construction.

SIDE VIEW

GENERAL NOTES:

Anchor bolts shall be 50.8 mm diameter ASTM A325M steel bolts.

Actual manufacturer's certified mill test reports (chemical and mechanical)shall be provided.

All structural steel for the anchor bolts shall be coated with a minimum of two coats of inorganic zinc primer (125 micrometers minimum thickness) or galvanized in accordance with ASTM A153.

Neoprene Elastomeric Pads shall be 70 durometer.

The sole plate and bearing plate shall be furnished with the bearing and field welded to the stringers or girders.

Structural steel for the sole plate shall be ASTM A709M Grade 250 and shall be coated with a minimum of two coats of inorganic zinc primer (125 micrometers minimum thickness).

The accepted quantity of the elastomeric bearing assemblies, complete-in-place, will be paid for at the contract unit price for Type "N" PTFE Bearings, each.

Payment for the sole plate, bearing plate and anchor bolts shall be included in the cost of the bearing assembly. See Special Provisions.

Outline of old work is indicated by light dashed lines. Heavy lines indicate new work.

Note: 25mm bearing plate to be tapped to receive 50.8mm Ø H.S. Bolt

The location of the 50.8mm High Strength Bolts in relation to the slotted holes in the sole plate shall correspond with the temperature at the time of erection. At 16° C the slotted holes should center on the 50.8mm High Strength. Adjustments of 8mm for each 5° C temperature rise or fall shall be made.

NOTE:

The expansion device shall be fabricated and installed in accordance with the recommendations of the manufacturer, and as set forth in the Special Provisions.

The contractor must verify all dimensions prior to fabrication.

All welds shall conform to Section 712 of the Standard Specifications (Metric).

All steel shall be ASTM A709M Grade 250, except steel extrusions shall be ASTM A709M Grade 345W or Grade 250.

Neoprene Strip Seal shall meet ASTM D-2628.

Anchors for the extrusions or armor shall be approved welded studs (C1010 through C1020).

Payment for steel extrusions, curb plate and neoprene strip seal shall be made under the contract unit price for Strip Seal Expansion Device.

Structural Steel for the expansion device and curb plate shall be coated with a minimum of two coats of inorganic zinc primer (125 micrometers minimum thickness) or galvanized in accordance with ASTM A123. Anchors need not be protected from overspray.

Payment for furnishing, coating or galvanizing and placing Strip Seal Expansion Device shall be included in the contract unit price for Strip Seal Expansion Device.

Gap for new strip seal expansion device can not be less than the existing.

Payment of removal of existing expansion device and preparation for installation of new expansion device shall be included in the contract unit price for Modification of Existing Expansion Joints. (See Special Provisions)

(1) Min. = 40 mm
Max. = 78 mm

Note: Dimension (2) shall be increased 5 mm for each 5° C fall in temperature and decreased 5 mm for each 5° C rise in temperature at installation.

(3) Extrusion shall be welded top and back.

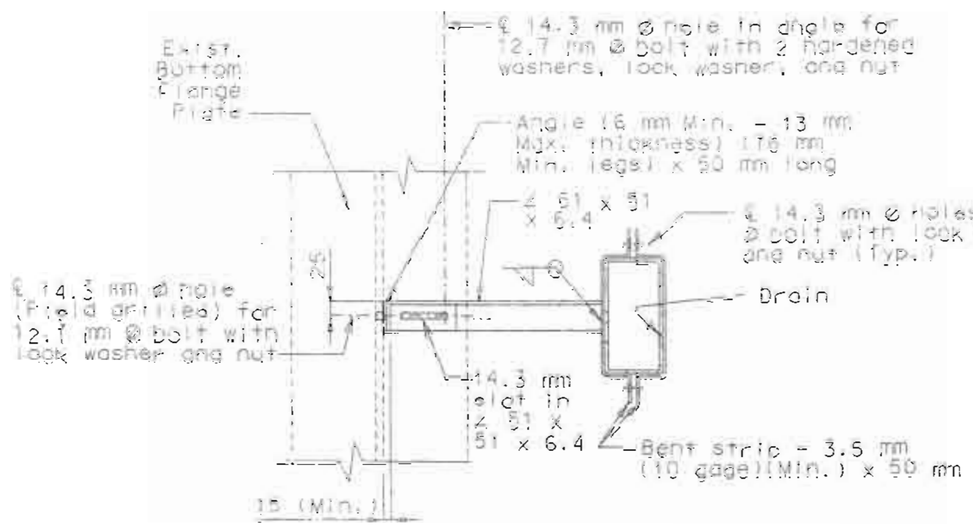
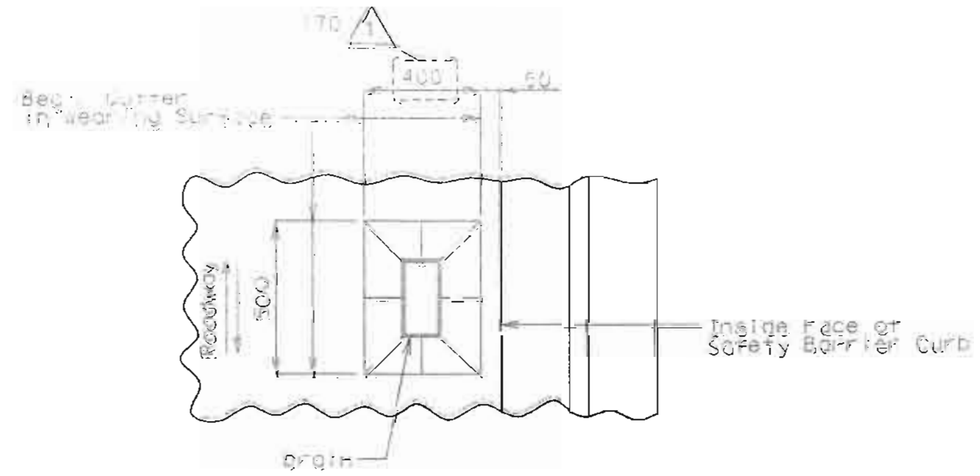
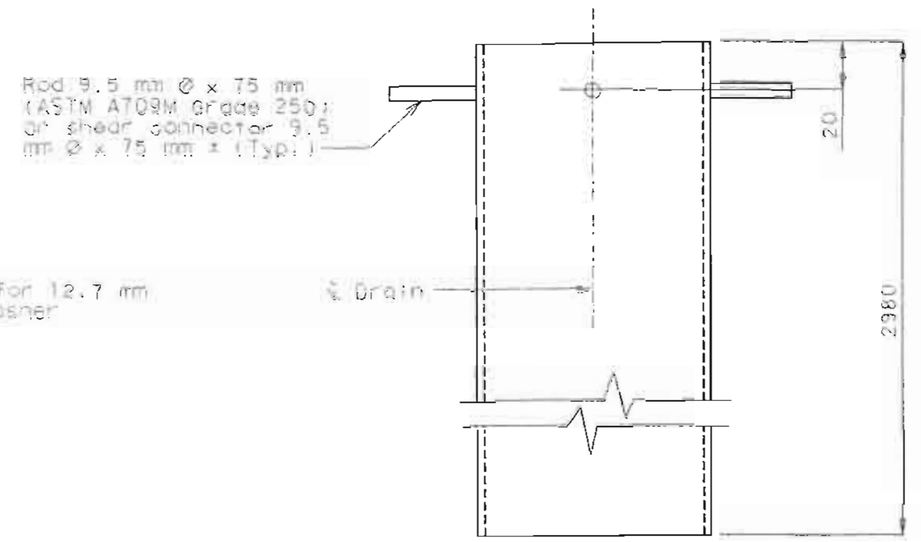
PART SECTION NEAR DRAIN



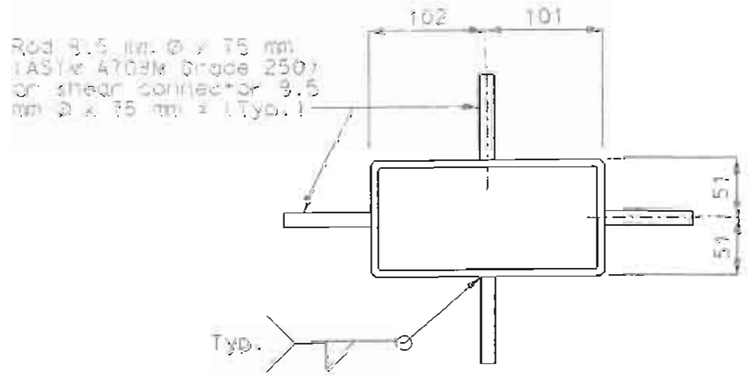
PART SECTION SHOWING BRACKET ASSEMBLY



PART PLAN OF SLAB AT DRAIN



ELEVATION OF DRAIN



PLAN OF DRAIN

GENERAL NOTES:

Slab drains may be fabricated of either 6 mm welded sheets of ASTM A709M Grade 250 steel or from 6.4 mm structural steel tubing ASTM A500 or A501.

Outside dimensions of drains are 203 mm x 102 mm.

Locate drains in the slab by dimensions shown in Part Section Near Drain.

The drains and bracket assembly shall be galvanized in accordance with ASTM A123.

All bolts, hardened washers, lock washers and nuts shall be galvanized in accordance with ASTM A153.

Shop drawings will not be required for slab drains and the bracket assembly.

Shift slab drain locations the minimum extent necessary to allow for field drilling hole in web of girder for bracket assembly attachment.

Slab drain spacings are based on layout of original plans. The contractor shall field check the location and clearance of drains so they do not interfere with any existing objects or structures below the bridge.

Payment for slab removal for drain installation and backfilling with epoxy mortar is included in the unit price for Slab Drains, per each.

PART SECTION A-A
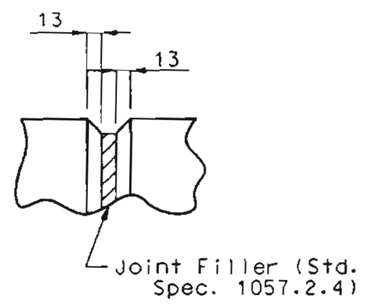
(OPTIONAL RESIN ANCHORING SYSTEM)



FILLED JOINT DETAIL

NOTE:

The contractor shall use one of the resin anchor systems listed in the job special provisions. These resin anchor systems shall be installed according to the manufacturer's special provisions. except as modified by the job special provisions.

Cost of furnishing and installing the anchor systems complete in place shall be included in the price bid for Safety Barrier Curb per meter.

The 15.9 mm diameter resin anchor systems shall have a minimum ultimate pullout strength of 68.9 kN in concrete with f'c = 28 MPa. see special provisions.

An epoxy coated #16 Grade 420 reinforcing bar 690 mm long shall be substituted for the 15.9 Ø threaded rod stud.

Top of safety barrier curb shall be built parallel to grade with safety barrier curb joints (except at end bents) normal to grade.

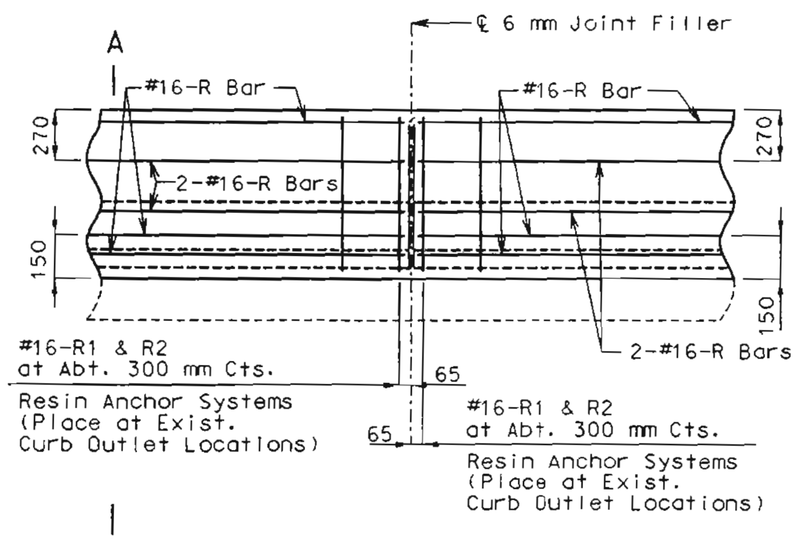
All exposed edges of safety barrier curb shall have either a 15 mm radius or a 10 mm bevel, unless otherwise noted.

When the safety barrier curb is bid per meter, the contract unit price shall include the cost of all concrete, reinforcement and resin anchor systems complete-in-place.

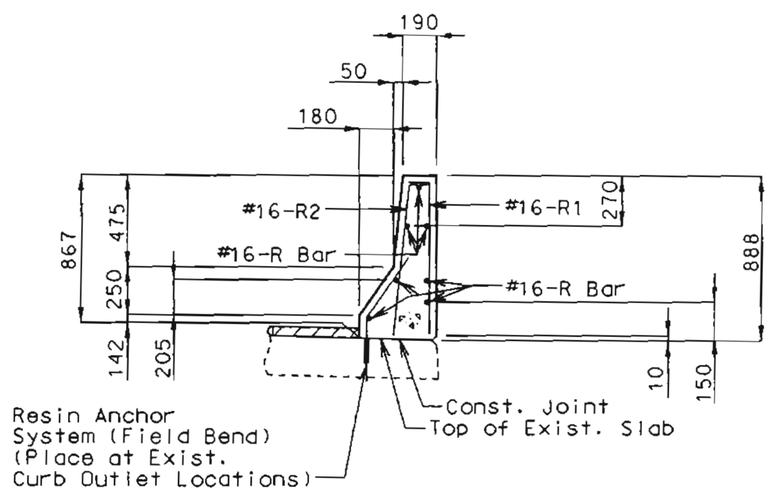
Concrete in the safety barrier curb shall be Class B1 with f'c=28MPa.

Measurement of safety barrier curb is to the nearest half meter for each structure, measured along the outside top of slab from end of wing to end of wing.

For details of expansion device movement gauge, see sheet No. 3.



TYPICAL PART ELEVATION OF RIGHT SAFETY BARRIER CURB



PART SECTION A-A

Note:

Use a minimum lap of 925 mm for #16 horizontal safety barrier curb bars.

The cross-sectional area above the slab = 248 625 sq. mm.

SECTION A-A

Note: Geotextile to be placed between select backfill & random material includes wings

REINFORCED SOIL MASS

Notes:

Drain pipe to be 150 mm diameter corrugated metallic-coated steel pipe underdrain.

Slope to lowest grade of ground line.

Perforated pipe shall be placed along granular backfill limits to the exit at the bottom of end bent and plain pipe shall be to ground line.

STATE	PROJ. NO.	SHEET NO.
MO.		

Notes:

GEOSYNTHETIC MATERIAL:

All Geotextile Material is to conform to AASHTO M288.

Tallowable(wide width tensile strength) 5840 N/m

With the approval of the Engineer, the Contractor is allowed to substitute a geogrid for the geotextile fabric, provided the contractor wraps the face constructed against the backwall with a geotextile.

The geosynthetic reinforcement is to be placed in continuous longintudinal strips normal to the abutment. Minimum overlap of strips shall be 300 mm.

SELECT GRANULAR BACKFILL:

The maximum lift thickness shall be 225 mm

To insure proper functioning of the structure, the selected backfill materials used in the structure volume shall conform to the following gradation limits and be obtained from natural sources:

Sieve Size	Percent Passing
4 inches	100
No. 40	0-60
No. 200	0-5

The backfill material shall be homogenous throughout.

The backfill material shall conform to all of the following additional requirements:

a. The Plasticity Index (P. I.), as determined by AASHTO T-90, shall not exceed 6.

b. The angle of internal friction shall not be less than 34 degrees as determined by one of the following:

(1) The direct shear test - AASHTO T-236, utilizing a sample of the material compacted to 95 percent of maximum density as determined by AASHTO T-99 Methods C or D (with oversize correction, as outlined in Note 7) at optimum moisture content;

(2) The triaxial compression test - T 234; or

(3) Other means meeting the approval of the engineer. Tests will ordinarily be waived for crushed stone products where 80 percent of the particles exceed 3/4 inch in size.

c. The dry unit weight of the backfill material shall not be less than 105 pounds per cubic foot as determined by AASHTO T-19, unit weight by rodding or jigging.

d. The material shall substantially be free of shale or other soft, poor durability particles and shall have a magnesium sulfate soundness loss of less than 30 percent after (4) cycles as determined by AASHTO T-104.

e. Selected granular backfill materials shall also meet the following electrochemical requirements:

Methods	Requirements	Test
ohm centimeters	Resistivity > 5000	California DOT 643
DOT 643	pH 4.5-9.5	California
polyester geogrids	pH 5.0-8.0 for	California DOT 643
California DOT 643	Organic Content < 1%	

Soils with resistances of less than 5000 ohm-cm but greater than 2000 ohm-cm may be accepted if they meet the following additional criteria:

per million	Chlorides ≤ 100 parts	California DOT 422
per million	Sulfates ≤ 200 parts	California DOT 417

Excepting pH and organic content requirements, the electrochemical requirements are waived for wall systems with a totally non-metallic reinforcement and connecting system to the wall units.

Backfill not conforming to this specification shall not be used without written consent of the engineer.

The contractor shall furnish to the engineer a Certificate of Compliance certifying the selected granular backfill material complies with this section of the specifications. A copy of all test results performed by the contractor or his/her supplier necessary to assure contract compliance shall also be furnished to the engineer.

Acceptance will be based on the Certificate of Compliance, accompanying test reports, and any applicable tests performed by the engineer.

The frequency of sampling of selected granular backfill, necessary to assure gradation control throughout construction, shall be as directed by the engineer.

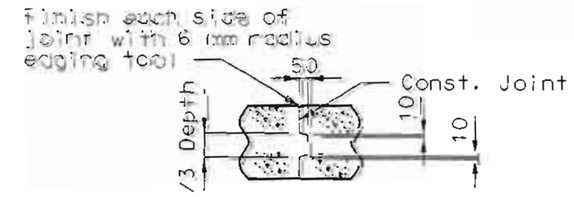
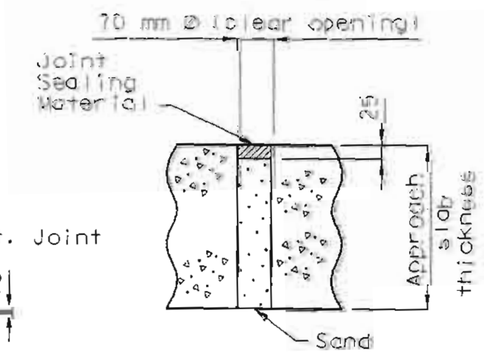
SECTION C-C

SECTION E-E
(BETWEEN CURBS)

BRIDGE APPROACH SLAB



CONST. JOINT DETAIL
(IF REQUIRED)



TYPICAL UNDERSEAL ACCESS HOLE DETAIL

GENERAL NOTES:

All concrete for the bridge approach slab and sleeper slab shall be in accordance with Section 503 (f'c = 28 MPa) of the Missouri Standard Specifications (Metric).

All joint filler shall meet the requirements of Section 1057.2.5. of Missouri Standard Specifications (Metric), except as noted.

The reinforcing steel in the bridge approach slab and the sleeper slab shall be epoxy coated Grade 420 with Fy = 420 MPa.

Minimum clearance to reinforcing steel shall be 40 mm, unless otherwise shown.

The reinforcing steel in the bridge approach slab and the sleeper slab shall be continuous. The transverse reinforcing steel may be made continuous by lap splicing the #13 & #19 bars 700 mm and 1055 mm respectively.

Mechanical bar splices will be permitted and shall develop at least 125 percent of the specified yield strength of the reinforcing bars being spliced. The contractor shall furnish the Engineer the manufacturer's certification that this requirement is met and is required to follow the manufacturer's recommendation for installation.

Mechanical bar splices shall be epoxy coated in accordance with Section 710 of the Missouri Standard Specifications(Metric).

When a lap splice is required for the use of a mechanical bar splice, the minimum lap length shall be 1055 mm for transverse approach slab bar splices.

Hooks and bends shall be in accordance with the CRSI Manual of Standard Practice for Detailing Reinforced Concrete Structures. Stirrup and Tie Dimensions.

The contractor shall pour and satisfactorily finish the bridge slab before pouring the bridge approach slabs.

Longitudinal construction joints in approach slab and sleeper slab shall be aligned with longitudinal construction joints in bridge slab.

Payment for furnishing all materials, labor and excavation necessary to construct the approach slab, including the timber header, sleeper slab, underdrain, Type 5 aggregate base and all other appurtenances and incidental work as shown on this sheet, complete in place, shall be considered as completely covered under the contract unit price for Bridge Approach Slab (Bridge), per square meter.

For Concrete Approach Pavement details, see roadway plans.

See Missouri Standard Plans Drawing M609.00 for details of Type A Barrier Curb.

At the contractor's option, Grade 300 reinforcement may be substituted for the Grade 420 #16 dowel bars connecting the bridge approach slab to the bridge abutment. No additional payment will be made for this substitution.

When Grade 300 reinforcement is substituted for the Grade 420 #16 dowel bars connecting the bridge approach slab to the bridge abutment, the reinforcement may be bent up to 90 degrees with a 50 mm minimum radius near the abutment to allow compaction of the backfill material near the abutment. Damage to epoxy coating shall be repaired according to Section 710.3.3 of the Missouri Standard Specifications(Metric).

Drain pipe may be either 150 mm diameter corrugated metallic-coated steel pipe underdrain, 100 mm diameter corrugated polyvinyl chloride (PVC) drain pipe, or 100 mm diameter corrugated polyethylene (PE) drain pipe.

BENDING DIAGRAMS

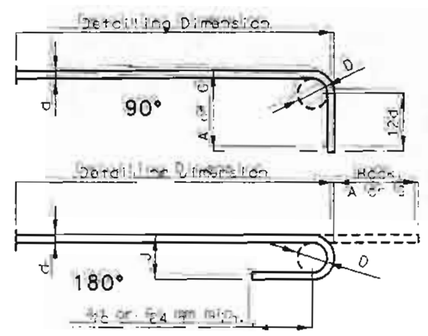
Detailed July 1995
Checked July 1995

STIRRUP HOOK DIMENSIONS (mm)

Grades 300 & 420 MPa

Bar Size	D	90° Hook A or G	90° Hook H	135° Hook A or G	135° Hook Approx. H
#13	50	115	115	80	
#16	65	155	140	95	
#19	115	305	205	115	

Note: Unless otherwise noted, diameter of the hook for all bends and hooks at a bar.



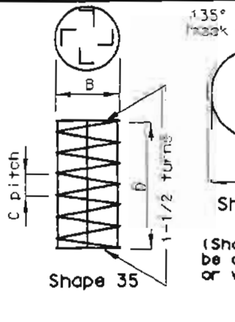
END HOOK DIMENSIONS (mm)

Bar Size	D	All Grades 180° Hooks A or G	180° Hooks J	90° Hook A or G
#10	60	125	80	150
#13	80	150	105	200
#16	95	175	130	250
#19	115	200	155	300
#22	135	250	180	375
#25	155	275	205	425
#29	240	375	300	475
#32	275	425	335	550
#36	305	475	375	600
#43	465	675	550	775

Note:
All standard hooks and bends other than 180 degree to be bent with the same procedure as for 90 degree standard hooks.
Hooks and bends shall be in accordance with the procedures as shown on this sheet.
E = epoxy coated reinforcement
S = stirrup
X = bar is included in substructure quantities
V = bar dimensions vary in equal increments between dimensions shown on this time and the following time.
No. Ea. = number of bars of each length
Nominal lengths are based on out to out dimensions shown in bending diagrams and are listed for fabricator's use (nearest 5 mm).
Actual lengths are measured along centerline bar to the nearest 5 mm.
Payweights are based on actual lengths.
Four angle or channel spacers are required for each column spiral. Spacers are to be placed on inside of spirals. Length and mass of column spirals do not include splices or spacers.
Reinforcing steel (Grade 420) = FY 420 MPa

7/12/99 Added Sheet

Sheet No. 17A of 17



(Shape 35 shall be a smooth bar or wire.)
