proposed pipe. Trenches shall be excavated to the width and depth as necessary to lay the sewer pipe to the grade line as indicated on the Contract Drawings. Deviation from the indicated alignment will not be permitted except under special circumstances, subject to approval of the Engineer. Excavated materials are to be deposited beside trenches and excavations, beyond the reach of slides, transported to the spoil banks, or used for backfilling.

- B. The length of trench excavation opened at one time shall be limited depending on the nature of the soil or other safety considerations. Trenches shall be excavated to a width that will provide adequate working space and pipe clearances for proper pipe installation, jointing, and embedment. However, the limiting trench widths must comply with the bedding class requirements set forth in APWA Section 2602.3.C. Over-excavation shall be replaced with granular bedding material, or CLSM.
- 1 **Unclassified Excavation:** Unclassified excavation is defined as the removal of all material encountered regardless of its nature. All material excavated will be considered as Unclassified Excavation.
 - 2 **De-watering:** The Contractor shall remove any water that may accumulate, or be found in the trenches and other excavations made under the Contract. The Contractor shall form all dams, flumes or other works necessary to keep them clear of water while the sewers and their foundations, and other foundation works, are being constructed. All water shall be removed from such excavation in a manner to avoid damage to property.
 - 3 **Cribbing and Sheeting:** The Contractor shall furnish, install, and maintain such sheeting, bracing, and other components, as may be required to support any excavation and to prevent any movement which could in any way injure or delay the work or endanger adjacent pavement, building, or other structures. Care shall be taken to prevent voids outside of the sheeting, but if voids are formed they shall be immediately filled and consolidated.
 - 4 **Unstable Foundation:** Where materials encountered in the bottom of the trench are deemed as unsuitable by the Engineer to afford a sufficiently stable pipe foundation, the materials shall be removed to the depth and limits as ordered by the Engineer. Areas undergraded shall be backfilled with approved granular material.
 - 5 **Protection of Property:** The Contractor shall satisfactorily shore, support, and protect any and all structures and all pipes, sewers, drains, conduits, and other facilities, and shall be responsible for any damage resulting thereto. The Contractor shall not be entitled to any damages or extra pay on account of any postponement, interference, or delay caused by any such structures and facilities being on the line of work, whether or not they are shown on the Contract Drawings;

specifically, but not limited to, damage due to delay in utility relocation.

3.06 ALIGNMENT AND GRADE

- A. All pipe shall be laid straight between changes in alignment and at a uniform grade between changes in grade. All lines shall be laid so that each section between structures will lamp.
- B. Maximum deviation from indicated alignment of any pipe after installation and backfilling shall not be greater than 0.1 foot. All pipe shall have a continuous slope free from depressions that will not drain. The Contractor shall establish such grade control devices as are necessary to maintain the above tolerances.

3.07 LAYING AND JOINTING PIPE

- A. Handling and Protection: All pipe shall be protected during installation against shock and free fall, and be installed without cracking, chipping, breaking, bending, or damage to coating materials. Damaged pipe materials shall be replaced with new materials except as may be permitted by the Engineer.
- B. Grade Control: Maximum deviation from indicated alignment of any pipe after installation and backfilling shall not be greater than 0.1 foot. All pipe shall have a continuous slope free from depressions that will not drain. The Contractor shall establish such grade control devices as are necessary to maintain the above tolerances.
- C. Laying: The laying of pipe in finished trenches shall commence at the lowest point, and pipe shall be installed with the bell end forward or upgrade. All pipe shall be laid with ends abutting and true to line and grade. Pipe shall be carefully centered to form a sewer with a uniform invert.
- D. Bedding: The class of bedding required shall be as indicated on the Contract Drawings or standard details except that as a minimum the bedding shall be granular bedding material placed to the requirements of APWA Section 2602.3.C titled "Backfill of Trenches." Bedding shall be rodded, spaded, and consolidated as necessary to provide firm uniform support for the pipe, and not subject pipe to settlement or displacement.
- E. Jointing: Preparatory to making filled, bonded, and watertight sealed pipe joints, all surfaces of the portions of the pipe to be jointed shall be clean and dry. Lubricants, primers, adhesives, and other substances that are used shall be compatible with the jointing material recommended or specified.
 - 1. Other than for trimming sewer pipe to be flush with the inside walls of storm sewer structures, no pipes may be trimmed unless ordered by

the Engineer. Pipes having defects that do not cause their rejection shall be so laid as to place these defects where they will be of least consequence.

2. Trenches shall be kept water-free and as dry as possible during bedding, laying, and jointing, and for as long a period as required to protect the pipe joints and concrete in structures.
3. As soon as possible after the joint is made, sufficient bedding material shall be placed alongside each side of the pipe to offset conditions that might tend to move the pipe off line and grade.
4. Concrete Pipe Flexible Gaskets: Flat gaskets may be cemented to the pipe tongue or spigot. O-ring gaskets shall be recessed in a groove on the tongue or spigot and confined by the bell or groove after the joint is completed. Roll-on gaskets shall be placed around the tongue or spigot and rolled into position as the joint is assembled. Flat gaskets and O-ring gaskets shall be lubricated as recommended by the manufacturer.
 - i. Flat gasket: Flat flexible gaskets shall conform to ASTM C 443. If there is no recess provided for the gasket, the surface of the tongue shall be cleaned and rubber adhesive applied. Using quick-drying adhesive, gaskets may be applied ahead of the laying operation or in the plant.
 - ii. O-ring gasket: O-ring or roll-on flexible gaskets shall conform to ASTM C 361, Section 4.10. The entire surface of the bell that comes in contact with the rubber gasket shall be well lubricated with a soap lubricant. The entire gasket shall be greased with soap. Only the soap lubricant supplied by the pipe manufacturer shall be used. Adhesive type cements shall not be used.
5. Structure Connections: Pipes connected to structures shall be cut parallel with the inside face of the structures. Projection of the pipe beyond the inside face shall not exceed 1 inch (measured at the springline for structures having curved walls.)

3.08 PIPE EMBEDMENT AND TRENCH BACKFILL

A. Pipe Embedment

1. As soon as possible after the joint is made, sufficient bedding material shall be placed alongside each side of the pipe to offset conditions that might tend to move the pipe off line and grade.
2. The class of bedding required shall be as indicated on the Contract Drawings or standard details.

3. Bedding shall be rodded, spaded, and consolidated as necessary to provide firm uniform support for the pipe, and not subject pipe to settlement or displacement.

B. Pipe Backfill

1. Pipe backfill shall be as indicated on the Contract Drawings or standard details.
2. The CLSM shall be constructed to the configuration and the lines and grades shown on the Contract Drawings, or as directed by the Engineer.
3. No CLSM shall be placed on frozen ground. When the ambient temperature either falls or is forecasted to fall below 35 degrees F within 24 hours of its proposed placement time, a set accelerator shall be used.

END OF SECTION 33 41 13

SECTION 33 41 14**HDPE STORM SEWER PIPE****PART 1 - GENERAL****1.01 SCOPE OF WORK**

- A. This section covers all work, materials, and testing for installation of HDPE storm sewer pipe by the open-cut method as shown on the Drawings and in conformity with these specifications. All pipelines shall be constructed to proper line and grade as shown on the Drawings and shall result in an unobstructed, smooth and uniform conduit.

1.02 DESCRIPTION

- A. Storm sewer construction shall consist of furnishing all labor, materials and equipment for the complete installation of HDPE storm sewer pipe and appurtenances in accordance with Contract Drawings and these specifications and as specified in American Public Works Association Standard Specifications and Design Criteria Section 2600 titled "Storm Sewers" as revised, adopted, and provided by the director of Kansas City, Missouri Public Works current at the time of bidding and American Public Works Association Standard Specifications.

1.03 SPECIFICATION MODIFICATIONS

- A. It is understood that throughout this section these Specifications may be modified by appropriate items in the Specific Project Requirements section of these specifications or on the Contract Drawings.

1.04 REVISIONS OF STANDARDS

- A. In addition to complying with all pertinent codes and regulations, comply with the referenced or applicable portions of the American Public Works Association Standard Specifications and Design Criteria as revised, adopted, and provided by the Director of Kansas City, Missouri Public Works current at the time of bidding.
- B. When reference is made to a Standard Specification, i.e., ASTM, ANSI, AWWA, the Specification referred to shall be understood to mean the latest revision of said specifications as amended at the time of the Notice to Bidders, except as noted on the Drawings or in the Specific Project Requirements section of these specifications.

PART 2 - PRODUCTS**2.01 MATERIALS**

- A. General - This section governs materials that may be required to complete pipeline construction, exclusive of structures, as shown on the drawings and/or as provided for in the Modifications to Detailed Specifications.
- B. Requirements - Furnish pipe materials, joint types, sizes, and strength classes indicated and specified. Higher strengths may be furnished at the Contractor's option at no additional cost to the Owner.
- C. Manufacturer - The manufacturer shall be experienced in the design, manufacture and commercial supplying of the specific material.
- D. Inspection and Testing – Installation shall be witnessed by Owner, Engineer, or approved independent testing laboratory. The contractor shall provide certified test reports indicating that materials conform to these specifications.

2.02 PIPE, FITTINGS, JOINTS, COATINGS

- A. High Density Polyethylene Pipe: High density polyethylene (HDPE) pipe and fittings shall conform to ASTM F2306 with annual corrugations and an integral bell and spigot. The manufacturer of the pipe must participate in the AASHTO/National Transportation Product Evaluation Program (NTPEP). The maximum cover depth shall be 30 feet.
 - 1. Materials: Virgin material for pipe and fitting production shall be HDPE conforming with the minimum requirements of cell classification 435400C for 12" to 60" diameters as defined in ASTM D3350, except carbon black content shall not exceed 4%
 - 2. Joints: Joint tightness shall conform to ASTM D3212. Elastomeric seal (gasket) shall have a basic polymer of synthetic rubber conforming to ASTM F477. Natural rubber gaskets will not be used. Bells shall span over three corrugations.
 - 3. General Description. Furnish maximum pipe length normally produced by the manufacturer except for fittings, closures and specials.

2.03 GRANULAR BEDDING MATERIAL

- A. Granular bedding material shall be crushed clean limestone aggregate meeting one of the following gradations:

Bedding Material Gradation Limits, % Passing

Sieve Size	3/4"	1/2"	3/8"
1"	100		
3/4"	90-100	100	
1/2"		80-100	
3/8"	20-55	40-70	100
No. 4	0-10	0-15	30-40
No. 8	0-5	0-5	0-4

In areas where the pipe trench is below the potential high point of the water table, only three-eighths (3/8") inch bedding may be used.

2.04 FLOWABLE BACKFILL: CONTROLLED LOW STRENGTH MATERIAL (CLSM):

A. The CLSM materials proposed for use in construction shall conform to the following requirements:

- a. Cement shall conform to ASTM C 150, Type I or Type II.
- b. Fly Ash shall conform to ASTM C 618, Class C
- c. Fine Aggregate shall conform to ASTM C 33.
- d. Mixing water shall conform to ASTM C 94.
- e. Admixtures shall only be used when specified by the Engineer.

B. Mixture Design

- a. The CLSM Flowable Backfill shall be transit mix, or from a mobile mixer. The elapsed time from when the water is added for batching until the CLSM is placed shall not exceed two hours.
- b. The slurry mixture shall be mixed between 70 to 100 revolutions of the ready-mixed truck. To minimize segregation, all flowable fill material shall be re-mixed at the project site at mixing speed in the ready-mix truck for approximately two (2) minutes immediately prior to discharge of the slurry mixture.
- c. The CLSM shall be composed of the proportions as hereinafter provided, or an acceptable mix as approved by the Engineer.

Design Mix	Type A	Type B	Type C
Type 1 Cement	150 lbs.	50 lbs.	0 lbs.
Water	460 (55 gal.)	500 (60 gal.)	542 (65 gal.)
Sand	3085 lbs.	2817 lbs.	2649 lbs.
Class C Fly Ash	0 lb.	250 lbs.	350 lbs.

PART 3 - EXECUTION**3.01 HANDLING AND PROTECTION**

- A. Pipe and accessories shall be handled in a manner that will ensure their installation in the work in a sound, undamaged condition. Equipment, tools and methods used in unloading, reloading, hauling and laying pipe and fittings shall be such that the pipe is not damaged. Pipe having premolded joints shall be handled in such a manner that no weight, including the weight of the pipe itself, will bear on or be supported by the spigot end or bell end at any time. Pipe and pipe fittings which have been damaged in any way will not be accepted and shall be removed from the project site.
- B. All pipe shall be protected during installation against shock and free fall, and be installed without cracking, chipping, breaking, bending, or damage to coating materials. Damaged pipe materials shall be replaced with new materials except as may be permitted by the Engineer.

3.02 LAYING PIPE

- A. Pipe shall be protected from lateral displacement by means of pipe embedment material installed as provided in Section 32 11 00. Under no circumstances shall pipe be laid in water and no pipe shall be laid under unsuitable weather or trench conditions.
- B. When jointed in the trench, the pipe shall form a true and smooth line. Pipe shall not be trimmed except for closures, and pipe not making a good fit shall be removed.
- C. Pipe which is part of a storm sewer line shall be aligned and constructed to grades as shown on the Drawings.
- D. The laying of pipe in finished trenches shall commence at the lowest point, and pipe shall be installed with the bell end forward or upgrade. All pipe shall be laid with ends abutting and true to line and grade. Pipe shall be carefully centered to form a sewer with a uniform invert.
- E. HDPE Pipe: HDPE pipe shall be assembled and installed in accordance with the manufacturer's instructions. For pipe sizes 48 inches and larger, during pipe installation, including placement and consolidation of the rock bedding and backfill to a point 4 feet above the top of the pipe, full time inspection shall be provided by a qualified inspector working under the supervision of a professional engineer.
- F. During construction of the project in areas subjected to heavy construction equipment traffic, pipe sizes 12" – 42" shall have a minimum cover of 3 feet, and pipe sizes 48"-120" shall have a minimum cover of 4 feet. Full time inspection for this fill shall be provided by a

qualified inspector working under the supervision of a professional engineer who is registered in the State of Missouri.

- G. Structure Connections: Pipes connected to structures shall be cut parallel with the inside face of the structures. Projection of the pipe beyond the inside face shall not exceed 1 inch (measured at the springline for structures having curved walls.)

3.03 ALIGNMENT AND GRADE

- A. All pipe shall be laid straight between changes in alignment and at a uniform grade between changes in grade. All lines shall be laid so that each section between structures will lamp.
- B. Maximum deviation from indicated alignment of any pipe after installation and backfilling shall not be greater than 0.1 foot. All pipe shall have a continuous slope free from depressions that will not drain. The Contractor shall establish such grade control devices as are necessary to maintain the above tolerances.

3.04 JOINTING

- A. Preparatory to making filled, bonded, and watertight sealed pipe joints, all surfaces of the portions of the pipe to be jointed shall be clean and dry. Lubricants, primers, adhesives, and other substances that are used shall be compatible with the jointing material recommended or specified.
- B. Other than for trimming sewer pipe to be flush with the inside walls of storm sewer structures, no pipes may be trimmed unless ordered by the Engineer. Pipes having defects that do not cause their rejection shall be so laid as to place these defects where they will be of least consequence.
- C. Trenches shall be kept water-free and as dry as possible during bedding, laying, and jointing, and for as long a period as required to protect the pipe joints and concrete in structures.
- D. As soon as possible after the joint is made, sufficient bedding material shall be placed alongside each side of the pipe to offset conditions that might tend to move the pipe off line and grade.
- E. Push-on gasketed joints. All instructions and recommendations of the pipe manufacturer, relative to gasket installation and other jointing operations, shall be observed and followed by the Contractor.

3.05 CUTTING PIPE

- A. Cutting of pipe shall be done in a neat manner, without damage to the pipe. Pipe cuts shall be smooth, straight and at right angles to the pipe axis. All cutting of pipe shall be done with mechanical pipe cutters of an approved type except that in locations where the use of mechanical cutters would be impracticable, existing pipe may be cut with diamond point chisels, saws, or other tools which will cut the pipe without a damaging impact or shock.

3.06 CLEANING

- A. The interior of all pipe shall be cleaned of all foreign matter before being installed and shall be kept clean until the work has been accepted. All lumps, blisters and excess coating shall be removed from exterior spigot and interior bell surfaces. Such surfaces shall be wired brushed and wiped clean, dry, and free from oil and grease before placing the spigot in the bell. All joint contact surfaces shall be kept clean until the jointing is completed.
- B. Every precaution shall be taken to prevent foreign material from entering the pipe while it is being installed. No debris, tools, clothing, or other materials shall be placed in the pipe.
- C. Whenever pipe laying is stopped at the end of the work day, the open end of the line shall be sealed with a watertight plug. Whenever a tie-in to the existing collection system is made, a plug shall be installed in the new line to prevent water and/or debris from entering the existing collection system.

3.07 PIPE EMBEDMENT AND TRENCH BACKFILL

- A. The class of bedding required shall be as indicated on the Contract Drawings or standard details.
- B. Bedding shall be rodded, spaded, and consolidated as necessary to provide firm uniform support for the pipe, and not subject pipe to settlement or displacement.
- C. The CLSM shall be constructed to the configuration and the lines and grades shown on the Contract Drawings, or as directed by the Engineer.
- D. No CLSM shall be placed on frozen ground. When the ambient temperature either falls or is forecasted to fall below 35 degrees F within 24 hours of its proposed placement time, a set accelerator shall be used.

END OF SECTION 33 41 14

SECTION 33 44 19**UTILITY STORM WATER TREATMENT
INFILTRATION TRENCH**

PART 1 - GENERAL

1.01 DEFINITION

- A. An infiltration trench may not receive run-off until the entire contributing drainage area to the infiltration trench has received final stabilization.

PART 2 - PRODUCTS (Not Used)

PART 3 - EXECUTION

3.01 SCOPE

- A. Heavy equipment and traffic shall be restricted from traveling over the proposed location of the infiltration trench to minimize compaction of the soil.
- B. Excavate the infiltration trench to the design dimensions. Excavated materials shall be placed away from the trench sides to enhance trench wall stability. Large tree roots must be trimmed flush with the trench sides in order to prevent fabric puncturing or tearing of the filter fabric during subsequent installation procedures. The side walls of the trench shall be roughened where sheared and sealed by heavy equipment.
- C. A Class "C" geotextile or better (see Section 24.0, Material Specifications, 1994 Standards and Specifications for Soil Erosion and Sediment Control, MDE, 1994) shall interface between the trench side walls and between the stone reservoir and gravel filter layers. A partial list of non-woven filter fabrics that meet the Class "C" criteria follows. Any alternative filter fabric must be approved by the plan approval authority.
 - 1. Amoco 4552 Carthage FX-80S
 - 2. GEOLON N70 Mirafi 180-N
 - 3. WEBTEC N07
- D. The width of the geotextile must include sufficient material to conform to trench perimeter irregularities and for a 6-inch minimum top overlap. The filter fabric shall be tucked under the sand layer on the bottom of the infiltration trench for a distance of 6 to 12 inches. Stones or other anchoring objects should be placed on the fabric at the edge of the trench to keep the trench open during windy periods. When overlaps are required between rolls, the uphill roll should lap a minimum of 2 feet over the downhill roll in order to provide a shingled effect.

- E. If a 6 inch sand filter layer is placed on the bottom of the infiltration trench, the sand for the infiltration trench shall be washed and meet AASHTO-M-43, Size No. 9 or No. 10.
- F. Any alternative sand gradation must be approved by the plan approval authority.
- G. The stone aggregate should be placed in a maximum loose lift thickness of 12 inches. The gravel (rounded "bank run" gravel is preferred) for the infiltration trench shall be washed and meet one of the following AASHTO-M-43, Size No. 2 or No. 3.
- H. Following the stone aggregate placement, the filter fabric shall be folded over the stone aggregate to form a 6-inch minimum longitudinal lap. The desired fill soil or stone aggregate shall be placed over the lap at sufficient intervals to maintain the lap during subsequent backfilling.
- I. Care shall be exercised to prevent natural or fill soils from intermixing with the stone aggregate. All contaminated stone aggregate shall be removed and replaced with uncontaminated stone aggregate.
- J. Voids may occur between the fabric and the excavation sides shall be avoided. Removing boulders or other obstacles from the trench walls is one source of such voids. Therefore, natural soils should be placed in these voids at the most convenient time during construction to ensure fabric conformity to the excavation sides.
- K. Vertically excavated walls may be difficult to maintain in areas where soil moisture is high or where soft cohesive or cohesionless soils are dominant. These conditions may require laying back of the side slopes to maintain stability.
- L. PVC distribution pipes shall be Schedule 40 and meet ASTM-D-1785. All fittings shall meet ASTM-D-2729. Perforations shall be 3/8 inch in diameter. A perforated pipe shall be provided only within the infiltration trench and shall terminate 1 foot short of the infiltration trench wall. The end of the PVC pipe shall be capped. Note: PVC pipe with a wall thickness classification of SDR-35 meeting ASTM-D-3034 is an acceptable substitute for the Schedule 40 pipe.
- M. The observation well is to consist of 6-inch diameter perforated PVC Schedule 40 pipe (M 278 OR F758, Type PS 28) with a cap set 6 inches above ground level and is to be located near the longitudinal center of the infiltration trench. The pipe shall have a plastic collar with ribs to prevent rotation when removing the cap. The screw top lid shall be a cleanout with a locking mechanism or special bolt to discourage vandalism. The depth to the invert shall be marked on the lid. The pipe shall be placed vertically within the gravel portion of the infiltration trench and a cap provided at the bottom of the pipe. The bottom of the cap shall rest on the infiltration trench bottom.
- N. Corrugated metal distribution pipes shall conform to AASHTO-M-36, and shall be aluminized in accordance with AASHTO-M-274. Aluminized pipe in contact with concrete shall be coated with an inert compound capable of preventing the deleterious effect of the aluminum on the concrete. Perforated distribution pipes

- shall conform to AASHTO-M-36, Class 2 and shall be provided only within the infiltration trench and shall terminate 1 foot short of the infiltration trench wall. An aluminized metal plate shall be welded to the end of the pipe.
- O. If a distribution structure with a wet well is used, a 4-inch drain pipe shall be provided at opposite ends of the infiltration trench distribution structure. Two (2) cubic feet of porous backfill meeting AASHTO-M-43, Size No. 57 shall be provided at each drain.
 - P. If a distribution structure is used, the manhole cover shall be bolted to the frame.

END OF SECTION 33 44 19

SECTION 33 44 19.16**CATCH BASIN INSERT UTILITY STORM WATER FILTER
CONTECH TRITON DROP-IN MODEL OR APPROVED EQUAL****PART 1 - GENERAL****1.01 DESCRIPTION****A. Work included:**

The Contractor, and/or a manufacturer selected by the Contractor and approved by the Engineer, shall furnish all labor, materials, equipment and incidentals required and install all catch basin inserts in accordance with the drawings and these specifications.

B. The Triton Drop Inlet system is designed for use in stormdrains that experience oil and grease pollution accompanied by sediment, trash and debris. Trash, debris and sediment accumulate in the outer housing with oil and grease and fine particulates being trapped in the media cartridge. The system is a low cost best management practice (BMP) that helps meet National Pollutant Discharge Elimination System (NPDES) requirements with effective treatment, efficient installation and moderate maintenance.

1.02 QUALITY CONTROL INSPECTION

A. The quality of materials, the process of manufacture, and the finished sections shall be subject to inspection by the Engineer. Such inspection may be made at the place of manufacture, or on the work site after delivery, or at both places, and the sections shall be subject to rejection at any time if material conditions fail to meet any of the specification requirements, even though sample sections may have been accepted as satisfactory at the place of manufacture. Sections rejected after delivery to the site shall be marked for identification and shall be removed from the site at once. All sections that have been damaged beyond repair during delivery will be rejected and, if already installed, shall be repaired to the Engineer's acceptance level, if permitted, or removed and replaced, entirely at the Contractor's expense.

PART 2 - PRODUCTS**2.01 MATERIALS AND DESIGN****A. Insert Trough/Housing**

1. Inserts are available to fit most industry standard catch basins. Custom sizes are available to fit most applications.
2. Standard insert troughs or housings shall be constructed of non-reactive high density polyethylene (HDPE) plastic with U.V. inhibitors. Larger units requiring greater structural support shall be constructed

using fiberglass with Isophthalic polyester resin, which provides corrosion resistance needed for wet applications.

B. Exterior Cartridge Cage

1. The exterior cage of the cartridges shall be made of stainless steel Type 304, having 0.063 gauge welded 1" square openings.

C. Media-Pak Cartridges

1. Disposable media-pak cartridges shall be constructed of durable geotextile polyethylene fabric.
2. Media-pak cartridges shall be easily removed from housing for maintenance.

D. Media and Media-Pak Combinations

1. A number of combinations can be set in place to obtain the most appropriate treatment level for the site.

Option A – Standard: Includes media-pak (a durable geotextile polypropylene fabric) charged with XSORB® media for capture of hydrocarbons, oils and grease and sediment.

Option B – Standard setup with cartridge pre-screen: Includes exterior cartridge housing fitted with a woven polypropylene geo-textile that is designed to capture smaller sediment (e.g., 850 microns).

Option C – Dual stage media-pak charged with XSORB® media: Includes two media-pak staggered within a cartridge cage designed to target heavy hydrocarbon runoff areas.

Option D – Dual stage media-pak with activated carbon: A standard media-pak is fitted on the outer interior of the cartridge housing with a second media-pak (charged with activated carbon) fitted behind the standard media-pak. The second media-pak is designed as a polishing media to remove pollutants found in runoff.

2. The media shall be non-biodegradable and non-hazardous per the Environmental Protection Agency (EPA) and Occupational Safety and Health Administration (OSHA).

3. Media shall be a treated perlite having hydrophobic properties.

E. Diverter Panels

1. If required, diverter panels or flow block material shall be ultra violet resistant high density polyethylene.

2.02 PERFORMANCE

Each standard Triton Drop Inlet model shall adhere to the following performance specifications.

Drop Inlet Model No.	Flange Outside Dimension (OD)	Trash and Debris Capacity (ft ³)	Treatment Capacity ₁ (gpm)	Bypass Capacity* (gpm)
TR12RD	13"	0.193	70	830
TR1212	13"X13"	0.193	70	830
TR 16RD	18"	0.673	142	1,660
TR1616	18"X18"	0.673	142	1,660
TR18RD	20"	0.936	151	1,660
TR1818	20"X20"	0.936	151	3,103
TR1824	19"X25"	0.936	157	3,103
TR2024	21"X25"	0.936	157	3,103
TR24RD	26"	1.070	299	4,261
TR24SR	26"X26"	1.070	299	4,261
TR2436	26"X40"	1.570	345	6,206
TR2448	26"X52"	2.140	572	8,522
TR3030	33"X33"	1.570	345	6,206
TR3636	40"X40"	8,430	690	12,412
TR36RD	40"	8,430	690	12,412
TR4848	52"X52"	15.500	1,196	17,044

* Bypass Capacity is estimated as circular weir flow and is a function of the available head (inside top of structure to the overflow crest of the cartridge) and crest length. Typically, the bypass capacity should be less restrictive than the inlet grate of the catch basin.

1 – Treatment capacity based on standard media-pak configuration (Option A).

2.03 MANUFACTURER

The manufacturer of said system shall have been regularly engaged in the engineering design and production of systems for the physical treatment of stormwater runoff for 10 years minimum. Each catch basin insert shall be supplied by CONTECH Stormwater Solutions Inc., 9025 Centre Pointe Drive, Suite 400, West Chester, OH 45069, phone 1-866-551-8325 or approved equal.

PART 3 - EXECUTION

3.1 INSTALLATION

A. Each stormwater treatment system shall be constructed according to the dimensions shown on the Drawings and as specified herein. Install at elevations and locations shown on the Drawings or as otherwise directed by the Engineer.

B. If required in most cases, the housing flange can be cut in the field using a skillsaw or other saw blade to fit the grate frame.

END OF SECTION 33 44 19 16 - 3

SECTION 33 46 00**SUBDRAINAGE****PART I - GENERAL****1.1 SUMMARY****A. Description**

This Section covers the furnishing and installation of perforated track subdrain pipe, fittings, cleanouts, non-perforated pipe laterals, ditch catch basins, geotextile fabric and drain rock as shown on the Contract Drawings and specified herein.

B. Related Sections

1. 31 23 33 – Trenching, Backfilling and Compacting for Utilities
2. 31 05 19.13 – Geotextiles for Earthwork
3. 03 30 00 - Cast-In-Place Concrete

1.3 SUBMITTALS

- A. Submittals shall be made in accordance with the requirements of the Project Quality Plan, except as modified herein.
- B. Manufacturer's data sheet for pipe and fitting material, details of precast Ditch Catch Basins, details of metal components for frame and grates.
- C. Certificate of compliance with the gradation requirements for the drain rock included in this Section.

PART II - PRODUCTS**2.1 MATERIALS**

- A. Drain Rock and Filter Fabric
 - 1. Drain rock shall be specially graded or crushed material that meets the following requirements:

<u>Sieve Size</u>	<u>Percentages Passing by Weight</u>
2 Inch	100
1-1/2 Inch	30 - 65
3/4 Inch	0 - 5
No. 100	0 - 2
 - 2. Sieve analysis will be determined according to ASTM C 136. Sand equivalent will be tested according to ASTM D 2419 and shall not be less than 25.
 - 3. Filter fabric shall conform to standards in Section 31 05 19.13.
- B. Perforated Underdrain Pipe (HDPE) and Fittings
 - 1. Corrugated polyethylene pipe tubing and fittings shall conform to ASTM F 667, M294, and AASHTO M 252. Perforated pipe shall be circumferentially perforated.
 - 2. PVC pipe and fittings shall conform to the requirements of ASTM D2729.
 - 3. Only one type pipe material to be used throughout the project.
 - 4. Strength of pipe shall support E-80 loads under 24 inches minimum cover (top of pipe to bottom of rail).
- C. Pipe (non-peforated laterals)
 - 1. Lateral pipes shall be HDPE or galvanized corrugated metal pipe.
 - 2. Strength of lateral pipe shall support E-80 loads under 24 inches minimum cover (top of pipe to bottom of rail).
 - 3. Corrugated metal pipe shall be galvanized and shall meet AREMA Manual for Railway Engineering Table 1-4-29. Corrugations shall be 2 2/3 inches by 1/2 inches and 0.064 inch thickness (16 gage).

4. HDPE laterals shall conform to Section 2.1.B except laterals do not have perforations.
- D. Cleanout frame and grate shall conform to ASTM A48.

PART III - EXECUTION

3.1 FIELD OPERATION

- A. Trenching shall conform to Section 31 23 33.
- B. Preparation of Trench Bottom
1. The trench bottom shall be excavated to a grade one-half the outer diameter of the underdrain pipe below bottom of pipe.
 2. Filter fabric shall be placed in the bottom of the trench as specified in Section 31 05 19.13 and shown on the Contract Drawings.
 3. The trench bottom shall then be refilled to the bottom of pipe grade with approved drain rock to ensure complete and continuous support for the barrel of the pipe.
 4. Bell holes shall be excavated.
- C. Placement
1. Pipes shall be laid in the upstream direction per the Contract Drawings, with the bell point upgrade. Perforated pipes shall be placed with slots or perforations down.
 2. Interior surfaces of pipes shall be kept clean during placement. Pipe ends shall be blocked to prevent drain rock from entering the pipes.
 3. Filter fabric shall completely enclose the drain rock and be lapped as shown on the Contract Drawings.
 4. After pipe is laid and joined, prior to backfilling, the installation will be inspected. Any pipe found to be out of alignment, unduly settled or damaged shall be taken up and relayed or replaced.
- D. Ditch Catch Basins shall be provided on the track underdrain system as indicated on the Contract Drawings.
- E. Drain rock for bedding shall be placed uniformly and equally along each side of the pipe in layers not exceeding six inches after compaction. Each layer shall be spaded to eliminate voids.
- F. Compact top of trench with one pass of a vibratory roller to eliminate voids.
- G. Filter fabric shall be lapped in accordance with Section 31 05 19.13 and shall be securely joined to the junction structure.
- H. Field Inspection

1. Pipes and accessories shall be inspected for defects before lowering into the trenches.
2. Defective, damaged or unsatisfactory pipes and accessories shall be replaced.

PART IV - MEASUREMENT

4.1 Measurement

- A. The quantities of accepted work will be measured in the following units. All measurements will be plan measure except for authorized changes.
 1. Underdrain, 4" Perforated LF (Linear Foot)
 2. Underdrain Tie In To Drainage EA (Each)

PART V - PAYMENT

5.1 Payment

Payment will be made at the respective unit or lump-sum price listed in the proposal and shall be full compensation for all labor, materials, and equipment necessary to complete the respective unit in place. There will be no separate measurement or payment for any item of work not specifically identified and listed in the proposal, and all such work shall be considered a subsidiary item with all costs pertaining thereto included in the prices for other items listed in the proposal. At the Engineer's option, partial payment may be made for any lump sum item listed in the proposal, providing that the Contractor is diligently and satisfactorily pursuing full completion of such partially complete item in accordance with the approved job progress schedule.

END OF SECTION

SECTION 33 46 16.19**UNDERDRAINS**

PART 1 - GENERAL

1.01 SCOPE OF WORK

- A. Underdrain construction shall consist of furnishing of all labor, equipment and materials necessary for the complete installation of underdrains, including pipe, geotextiles and granular filter material in accordance with these specifications, standard drawings, the contract special provisions, and as shown on the Plans or established by the Engineer.

1.02 RELATED WORK

- A. Submittals are included in Section 01 33 00.
- B. Site preparation is included in Section 31 22 00 Site Preparation and Grading.
- C. Subgrade Preparation is included in Section 31 23 13 Subgrade Preparation.
- D. Crushed Aggregate Base Course is included in APWA Section 02203 Incidental Construction.
- E. Portland cement concrete paving is included in Section 32 13 13.

1.03 REFERENCE STANDARDS

- A. In addition to complying with all pertinent codes and regulations, comply with the referenced or applicable portions of the American Public Works Association Design Criteria and Standard Specifications as revised, adopted, and provided by the Director of Kansas City, Missouri Public Works current at the time of bidding.
- B. American Society for Testing and Materials (ASTM)
 - 1. ASTM C33 - Standard Specification for Concrete Aggregates
 - 2. ASTM C88 – Test Method for Soundness of Aggregates by Use of Sodium Sulfate or Magnesium Sulfate
 - 3. ASTM C131 – Test Method for Resistance to Degradation of Small-Size Coarse Aggregate by Abrasion and Impact in the Los Angeles Machine
 - 4. ASTM C136 – Test Method for Sieve Analysis of Fine and Coarse Aggregates

5. ASTM C142 – Test Method for Clay Lumps and Friable Particles in Aggregates
 6. ASTM D75 – Practice for Sampling Aggregates
 7. ASTM D422 – Test Method for Particle Size Analysis of Soils
 8. ASTM D 695 – Test Method for Compressive Properties of Rigid Plastics
 9. ASTM D698 – Test Method for Laboratory Compaction Characteristics of Soil Using Standard Effort
 10. ASTM D 1621 – Test Method for Compressive Properties of Rigid Cellular Plastics
 11. ASTM D 3034 – Specification for Type PSM Poly(Vinyl Chloride) (PVC) Sewer Pipe and Fittings
 12. ASTM D4318 – Test Method for Liquid Limit, Plastic Limit, and Plasticity Index of Soils
 13. ASTM F 758 – Standard Specification for Smooth-Wall Poly(Vinyl Chloride) (PVC) Plastic Underdrain Systems for Highway, Airport, and Similar Drainage
- C. American Association of State Highway and Transportation Officials (AASHTO)
1. AASHTO M 252 – Corrugated Polyethylene Drainage Tubing
- D. Where reference is made to one of the above standards, the revision in effect at the time of bid opening shall apply.

PART 2 - PRODUCTS

2.01 MATERIALS

A. Aggregate

1. Aggregates shall consist of clean, sound, durable particles of crushed stone or crushed gravel and shall be free from coatings of clay, silt, vegetable matter, and other objectionable materials and shall contain no clay balls.
2. Fine aggregate (passing the No. 4 (4.75 mm) sieve) shall consist of fines from the operation of crushing the coarse aggregate. If necessary, additional fine aggregate may be added to produce the correct gradation. All fine aggregate shall be produced by crushing stone or gravel that meets the requirements for wear and soundness specified for the coarse aggregate.

3. The crushed aggregate portion which is retained on the No. 4 (4.75 mm) sieve shall contain not more than 15%, by weight, of flat and elongated pieces as defined in ASTM D 4791 (ratio = 5:1) and shall have at least 90% by weight of particles with at least two fractured faces and 100% with at least one fractured face. The area of each face shall be equal to at least 75% of the smallest midsectional area of the piece. When two fractured faces are contiguous, the angle between the planes of fractures shall be at least 30 degrees to count as two fractured faces.
4. The percentage of wear shall not be greater than 35% when tested in accordance with ASTM C 131.
5. The magnesium sulfate soundness loss shall not exceed 15%, after 5 cycles, when tested in accordance with ASTM C 88.
6. The fraction passing the No. 40 (0.42 mm) sieve shall have a liquid limit no greater than 25 and a plasticity index of not more than 8 when tested in accordance with ASTM D 4318. The fine aggregate shall have a minimum sand equivalent value of 35 when tested in accordance with ASTM D 2419.
7. Gradation Requirements: The gradation of the final mixture shall fall within the design range indicated in Table 2, when tested in accordance with ASTM C 117 and C 136. Pipe Underdrain Aggregate shall conform to the following gradations:

Sieve Size	Percent Passing by Weight
1½ in (37.5 mm)	-
1 in (25.4 mm)	-
¾ in (19 mm)	100
3/8 in (9.5 mm)	85-100
No. 4 (4.75 mm)	-
No. 8 (2.36 mm)	40-60
No. 16 (1.18 mm)	-
No.30 (0.6 mm)	5-30
No. 50 (0.3 mm)	-
No. 100 (150 um)	0-2

A. Underdrain Pipe

1. Polyvinyl Chloride pipe shall meet the requirements of ASTM F758/D3034.
2. Corrugated Polyethylene Tubing shall be the heavy duty type and shall meet the requirements of AASHTO M 252 for 4" through 10" pipe

and AASHTO M294 or ASTM F2306 for 12" through 60 inch. In addition, the tubing shall have a minimum pipe stiffness of 30 psi (210 kPa) at 10% deflection.

3. Virgin material for pipe and fitting production shall be high density polyethylene conforming with the minimum requirements of cell classification 424420C for 4- through 10-inch diameters, or 435400C for 12- through 60-inch diameters, as defined and described in the latest version of ASTM D3350, except that carbon black content shall not exceed 4%. The 12- through 60-inch virgin pipe material shall comply with the notched constant ligament-stress (NCLS) test as specified in Sections 9.5 and 5.1 of AASHTO M294 and ASTM F2306, respectively.
4. All underdrain pipes shall have a nominal minimum inside diameter of six inches (150mm) unless shown otherwise on Plans.
5. Perforations shall be approximately circular and cleanly cut; shall have nominal diameters not less than 3/16-inch (5mm) nor more than 3/8-inch (10 mm); and shall be arranged in at least two rows parallel to the axis of the pipe.
6. Fittings shall be of the same composition and have the same physical properties as the pipe and shall not restrict flow.

B. Geotextile Filter Fabric

1. Geotextile for use with pipe and edge underdrains shall be a nonwoven geotextile filter fabric. The synthetic fiber shall consist of polypropylene, nylon, or polyester filaments. The percent open area shall be not less than 4 percent nor more than 10 percent. The cloth shall provide an Equivalent Opening Size (EOS) no finer than the U.S. Standard Sieve No. 100. In addition, filter fabric shall meet the following physical requirements:
 - a. Tensile Strength: Minimum grab tensile strength, both warpwise and fillingwise, shall be 200 pounds when tested in accordance with ASTM D 5034, using a 4-inch by 6-inch specimen and a jaw speed of 12 inches per minute.
 - b. Elongation: Grab elongation shall be not less than 15 percent nor more than 60 percent, both warpwise and fillingwise, when tested in accordance with ASTM D 5034.
 - c. Tear Strength: Minimum trapezoid tear strength shall be 100 pounds, both warpwise and fillingwise. Method of test for woven fabrics shall be in accordance with ASTM D 4533.
 - d. Bursting Strength: Minimum bursting strength shall be 400 psi when tested in accordance with ASTM D 3887.

- e. Seam Strength: Woven fabric shall have a minimum seam-breaking strength of 180 pounds when tested in accordance with ASTM D 1683, using a jaw speed of 12 inches per minute.
- f. Width: Filter fabric shall be furnished in widths of not less than 6 feet.

PART 3 - EXECUTION

3.01 CONSTRUCTION

A. General

1. The exact location and layout of underdrains and/or edge drains as shown on the Plans shall be subject to revision by the Engineer as determined during construction.

B. Excavation

1. Trenches for all lateral and longitudinal underdrains shall be excavated to the dimensions, depths and elevations or as ordered by the Engineer. In case of a conflict, where the actual elevation of the strata or stratum to be intercepted is found to vary from Plan elevation, the stratigraphy shall govern in the installation of underdrains.
2. Trench bottoms for perforated pipe underdrain and edge drain shall be in firm material (no mucky or soupy condition existing) and constructed to permit the placing of three inches (75 mm) of aggregate underneath the pipe. If unstable material is encountered in the bottom of the trench, the trench shall be over excavated to firm material.
3. Minimum width of trench shall be as shown on the Plans.

C. Laying Pipe

1. All underdrain pipe shall be laid carefully to line and grade.
2. All pipe shall be laid on a minimum grade of one percent unless otherwise shown on the plans.
3. All dead ends of pipe underdrains shall be completely closed with a cap of the same material as the pipe.
4. All junctions and turns shall be made with wyes, tees, and bends as supplied by the manufacturer of the pipe.
5. Perforation shall be laid down unless otherwise indicated on the Plans.

D. Backfilling

1. Backfilling the trenches of lateral and longitudinal underdrains shall not be started until approved by the Engineer or the Inspector.
2. The trenches shall be backfilled to the elevations shown on the Plans.
3. The backfill material shall be placed in such a manner as to prevent formation of large cavities in the backfill and walls of the trench.
4. The backfill material shall be placed in such a manner as to prevent formation of large cavities in the backfill and walls of the trench.

END OF SECTION 33 46 16.19

SECTION 33 49 13**STORM STRUCTURES****PART 1 - GENERAL****1.01 SCOPE OF WORK**

- A. This section governs the performance of all work necessary for construction of cast-in-place and precast concrete structures for inlets, manholes, junction boxes, and incidental structures. Masonry structures shall not be allowed under these Specifications.

1.02 DESCRIPTION

- A. Storm sewer construction shall consist of furnishing all labor, materials and equipment for the complete installation of storm sewer structures and incidentals in accordance with Contract Drawings and these specifications and as specified in American Public Works Association Standard Specifications and Design Criteria Section 2600 as revised, adopted, and provided by the Director of Kansas City, Missouri Public Works current at the time of bidding and American Public Works Association Standard Specifications.

1.03 REVISIONS OF STANDARDS

- A. In addition to complying with all pertinent codes and regulations, comply with the referenced or applicable portions of the American Public Works Association Standard Specifications and Design Criteria as revised, adopted, and provided by the director of Kansas City, Missouri Public Works current at the time of bidding.
- B. When reference is made to a Standard Specification, i.e., ASTM, ANSI, AWWA, the Specification referred to shall be understood to mean the latest revision of said specifications as amended at the time of the Notice to Bidders, except as noted on the Drawings or in the Specific Project Requirements section of these specifications.

PART 2 - PRODUCTS**2.01 MATERIALS**

- A. Concrete Mixes: Concrete shall be MCIB Mix Number A564-3/4-4 or A543-1-4 at the Contractor's option; except concrete used for soil stabilization, pipe cradles, filling, leveling courses, and other similar purposes may be either MCIB Mix Number A440-3/4-4 or A473-1/2-4. Using a mechanical mixer, concrete may be prepared on-site to construct inverts only for pre-cast structures having developed bases. Concrete

may be either MCIB Mix Number 495-3/4-4 or 527-1/2-4 at the Contractor's option. A maximum of 7 gallons of water per sack of cement is in the design for both of these mixes.

B. Concrete Materials:

1. Concrete materials shall conform to MCIB Section 1 Concrete Materials, except that total shale, coal, and lignite content shall not exceed 0.5 percent by weight, and clay content shall be zero
2. Concrete shall conform to all requirements of MCIB and the compressive strength of each mixture shall be as designated therein.

C. Reinforcing Steel: Reinforcing bars shall conform to ASTM C 615, Grade 60. Welded steel wire fabric shall conform to ASTM A 185.

D. Precast Concrete Structures:

1. Manholes: Precast manholes shall conform to ASTM C 478. Manholes are classified by their inside diameter dimension, and shall conform to the dimensions indicated on the Contract Drawings.
2. End Sections: End sections for concrete pipe shall be flared end sections of the pipe manufacturer's standard design, and shall meet all applicable requirements of ASTM C 76 for Class II or higher classes of pipe.
3. Rectangular Structures: Rectangular structures shall conform to the dimensions indicated on the Contract Drawings and be designed for the following loads:
 - a. H-20 live load for all structures in/or under pavement, shoulders, driveways, and other traffic areas.
 - b. 2,000-lb wheel live load for curb opening inlets and junction boxes in non-traffic areas.
 - c. 50-pcf equivalent fluid pressure for soil pressure on vertical walls.
 - d. 120 pcf for unit weight of soil cover on top slabs.

E. Joints: Joints between concrete structures shall be filled with plastic joint compound or preformed plastic compound as stated herein.

1. Barrel Sections: Minimum cross sectional area of preformed compound between concrete barrel sections shall be 1 inch square or 1.25 inches diameter. Minimum cross-sectional area of the preformed compound between the concrete adjustment ring and the cone barrel section shall be two beads of either 1 inch square or 1.25 inches in diameter.

2. Manhole Adjustment Rings: Rings shall be constructed of concrete, HDPE, or recycled rubber.
 - a. If HDPE adjustment rings are used, they shall be injection molded-recycled HDPE - as manufactured by LADTECH, Inc. or approved equal. They shall be bolted to the manhole cone section and otherwise installed as per manufacture's recommendations.
 - b. If recycled rubber adjustment rings are used, they shall consist of no less than 80%, by weight, recycled rubber and no less than 10% by volume shredded fiber as manufactured by GNR Technologies or approved equal. They shall be installed as per manufacture's recommendations.
 - c. The top and bottom of all adjustment rings shall be sealed using a mastic filler meeting the requirements of Section 2510.3.E.6 of APWA or an epoxy paste. The epoxy paste shall be a two component, moisture insensitive, containing no solvents, and capable of bonding with all materials it is to be used on, like Epoxytec Micor C.P.P or approved equal. Minimum cross-sectional area of preformed compound between concrete adjustment rings shall be two beads of either 1 inch square or 1.25 inches in diameter.
 3. Manhole Ring and Covers: Minimum cross-sectional area of preformed compound between the adjustment ring and the manhole casting shall be two beads of either 1 inch square or 1.25 inches in diameter.
 4. Internal Manhole Chimney Frame Seal: Internal frame seal shall consist of a flexible rubber sleeve, interlocking adjustment extension(s), and stainless steel compression bands. The flexible rubber sleeve and extension shall be extruded or molded from a high grade rubber compound conforming to the applicable requirements of ASTM C 923 with a minimum tensile strength of 1500 psi and minimum elongation at break of 350%. At a minimum, the compression bands shall be 16-gauge stainless steel conforming to ASTM A 240, Type 304, with a minimum width of one inch. Screws, nuts, and bolts shall be stainless steel conforming to ASTM F 593 and 594, Type 304. The compression bands shall have the capacity to tighten with enough pressure to make a watertight seal around the rubber chimney sleeve.
- F. Air Entrainment: All concrete, unless otherwise stated in Section 2.1 A, APWA Section 2510.2.F.C., or MCIB Section 3 shall be air entrained. Minimum strength requirements shall be as specified in Section 2.1 B.2 above.
- G. Manhole Castings:
1. Rings and Covers: Castings shall be gray iron conforming to ASTM A 48, Class 35B. Castings of rings and covers shall be of the shape,

dimension, minimum weight, and type as indicated on Standard Drawing "MH-RC4C," and be free from manufacturing defects. All curb inlet castings shall have cam locks. Storm Sewer manhole ring and covers shall be "MH-RC Type 3". If requested by special order, castings shall be cleaned and painted with one coat of tar prior to delivery. Bearing surfaces between all rings and covers for installation in all areas shall be machined to provide even seating and interchangeability of like pieces.

- a. All manhole rings and covers placed in paved areas or as directed by the Water Services Department Engineer shall be adjustable to meet any slope and grade of the roadway, from 0 to 17%, and shall be able to be raised or lowered in ¼ inch increments, up to 2¾ inches. Ring height must be adjustable after installation without disturbing the surrounding pavement. The ring and lid shall be rated for H20 traffic. Cam lock covers shall not be placed in roadway pavement unless shown on the plans or directed by the engineer. All covers shall have provisions for opening, such as concealed pick holes.
2. Steps: All steps shall comply with APWA Section 2510.3.H.2. and the most recent Supplement to APWA Section 2500. Cast iron steps shall not be used.
- H. Steel End Sections: Steel end sections shall be fabricated from galvanized or aluminized base metal as specified in APWA Section 2602, and shall be flared end sections of the metal pipe manufacturer's standard design. End sections shall be furnished with a steel toe plate. Bituminous coating is not required.
 - I. Toe Walls: Flared end sections for concrete and steel pipe shall be set on a concrete toe wall centered on the end of the section. Toe walls shall be 8 inches thick by 24 inches deep by the width of the bottom of the cut trench.
 - J. Resin Adhesive: Injectable adhesive shall be used for installation of all reinforcing dowels into adjacent precast concrete. Adhesive shall be HILTI HIT HY or HIT-ICE or approved equal. Drill holes and install adhesive/dowels per manufacturer. Work is subsidiary to C.I.P. headwall concrete.

PART 3 - EXECUTION

3.01 Concrete Structures

- A. Concrete construction shall conform to the MCIB Standard Specifications.
 1. Precast Structures: The Contractor may, at his option, construct precast concrete inlets, and junction boxes, in lieu of the cast-in-place structures indicated on the Contract Drawings; except that all concrete base slabs for pre-cast inlets, manholes, and junction boxes may be cast-in-place. Solid concrete brick or block shall be used to

block inlets and similar structures to grade during placement of base slab concrete.

2. Finishing: Exposed edges of all slabs, walls, and other concrete structures shall be beveled $\frac{3}{4}$ " or edged with a 1 $\frac{1}{4}$ " radial tool.
 - a. Formed Surfaces: Immediately following removal of forms, fins and irregular projections shall be removed. Form tie connections, holes, honeycomb spots, and other defects shall be chipped to ensure the voided area is exposed, and shall be chipped back to solid material. These areas shall be thoroughly cleaned, saturated with water, and pointed with a grout approved by the Engineer. The repaired surfaces shall be cured in accordance with MCIB Specifications.
 - b. Exposed Slabs: Finish for exposed slabs shall be wood float texture in accordance with MCIB Specification.
 3. Form Removal: Forms shall remain in place until the concrete has attained sufficient strength to support loads imposed by backfilling, construction, and traffic. Within 24 hours of form removal, small holes and pockmarks of exposed walls shall be filled with Portland cement grout and rubbed smooth. Concrete voids and honeycombs shall be chipped open with a light hammer to expose weak areas for inspection. At the direction of the Engineer, expansive repair grout shall be used for partial reconstruction of otherwise sound structures.
 - a. Walls: Forms shall remain in place until the concrete reaches a minimum strength of 2000 p.s.i.
 - b. Slabs: Forms shall remain in place until the concrete reaches a minimum strength of 3000 p.s.i.
 4. Manhole Riser Adjustments: Manhole rings and covers shall be adjusted to match the slope and height, or grade, of pavements. In no case shall the surface pitch of the manhole ring and cover mismatch the pavement slope by more than $\frac{1}{4}$ inch. The difference in height between the top of manhole cover and the top of precast cone shall not exceed 24 inches.
 - a. In lieu of replacing concrete adjustment rings that are properly seated and structurally sound but have a small fracture, an external rubber chimney may be fitted to secure a watertight seal between the casting (manhole ring and cover) and the concrete cone barrel section.
- B. Invert Channels: Form concrete invert channels in manholes, inlets, and junction boxes to make changes in direction of flow with smooth curves of as large a radius as permitted by the inside dimension of the structure. Grade changes and transitions shall be smooth and uniform, and all parts of the invert channel and adjacent floor shall slope to drain. Channel bottom shall be finished smooth without roughness or irregularity. Invert channels for

precast concrete structures may be cast integrally with the structure base slabs at the Contractor's option.

- C. Excavation: All excavation shall be done in conformance with Section 31 22 00, 3.03 A. 1. entitled "Grading."
1. Excavation for structures shall be carried a sufficient distance, but not less than 18 inches outside the limits of the structure, to permit efficient erection and removal of forms and laying of masonry units, and shall be sloped, stepped, or braced as required for stability. Unsuitable soils encountered at the bearing elevation of the structure shall be removed and replaced with either fill concrete or compacted granular material at the Contractor's option. Over excavation shall be corrected in like manner. The Contractor shall maintain the excavation free of standing water until backfilling is complete.
- D. Backfill of Structures: All excavations of structures, such as cast-in-place and precast concrete structures for inlets, manholes, junction boxes shall be backfilled with suitable material placed and compacted in conformance with these specifications and as shown on the drawings.
1. Street Right-of-Way Areas: The trenched backfill areas around all storm sewer inlets, junction boxes, and manholes shall be backfilled with removable flowable-fill (CLSM) to a level flush with the bottom of pavement subgrade for paved areas or twelve-inches below finish grade for non-paved areas. In non-paved areas, the top twelve inches shall be consolidated soil; the top six inches shall be topsoil.
 - a. The external opening surfaces of weep holes shall be covered with hardware cloth and surrounded with a minimum of three cubic feet of consolidated granular bedding material.
 2. Areas other than Street Right-of-Way: The trenched backfill areas around all City-maintained storm sewer inlets, junction boxes, and manholes located within the pavements of private streets, driveways, and parking lots shall be backfilled as specified for the paved areas in Section 3.1 D.1 (above). City-maintained storm sewer structures that are located in non-paved areas shall be backfilled with removable CLSM, untreated compacted aggregate, consolidated granular bedding material, or compacted soil to a level twelve inches below finish grade. In non-paved areas, the top twelve inches shall be consolidated soil; the top six inches shall be topsoil.
 3. Backfilling: Backfilling shall conform to the requirements of this Section, the drawings, and as follows:
 - a. All trenches and excavations shall be backfilled with suitable material placed and compacted in conformance with this Section and Section 31 22 00.

- b. Controlled low strength material (CLSM), or flowable fill as it is commonly known, shall be used for all trenches under street or alley pavements and for structures adjacent to pavements up to the level of the pavement subgrade. The pavement subgrade is a six to twelve-inch thick layer that consists of uniformly compacted material at 95% of standard max. density.
- c. No backfill shall be placed over or around any structure until the concrete or mortar therein has attained a minimum strength of 2000 p.s.i. and can sufficiently support the loads imposed by the backfill without damage.
- d. The Contractor shall use utmost care to avoid any wedging action between the side of the excavation and the structure that would cause any movement or floating of the structure. Any damage caused by premature backfill or by the use of equipment on or near a structure will be the responsibility of the Contractor.
- e. Backfill shall be placed and compacted on all sides of the structure simultaneously, and operations shall be so conducted that the backfill is always at approximately the same elevation on all sides of the structure.
- f. No excavated rock larger than 4 inches maximum dimension shall be placed within 1 foot of the exterior surface of any structure.

END OF SECTION 33 49 13

SECTION 34 11 00**RAIL****PART I - GENERAL****1.1 SUMMARY****A. Scope**

1. This specification covers carbon steel rails that are intended for use as tee rails and grooved rails for streetcars.

1.2 REFERENCES**A. American Railway Engineering and Maintenance-of-Way Association (AREMA):**

1. AREMA – “Manual for Railway Engineering” (AREMA Manual)

PART II - PRODUCTS**2.1 TEE RAIL**

- A. 115 RE section either standard or premium rail in accordance with the requirements of AREMA “Specifications for Steel Rails” and as specified.

2.2 GROOVED RAIL MANUFACTURE

- A. The steel shall be melted using electric-furnace process.
- B. The steel in liquid form shall be vacuum degassed.
- C. The steel shall be produced using a continuous casting process. The minimum reduction ratio from cast bloom to final product will be 8:1.
- D. The Product shall be hot rolled.
- E. All aspects of the Manufacturer’s quality system shall be in effect.

2.3 GROOVED RAIL CHEMICAL COMPOSITION

- A. The chemical composition will depend on grade, either standard strength or premium strength. Final chemical testing will be from the tundish during casting and will represent the front and back of the heat. The average of the tests will be reported. Finished material representing the heat may be product tested. The product analysis shall be considered as meeting the specification if they are within the limits specified on the right side of the tables below.

1. Standard Strength

<u>Element</u>	<u>Chemical Analysis (wt %)</u>	<u>Product Analysis Tolerance (wt %)</u>	
		<u>Under Min.</u>	<u>Over Max.</u>
Carbon	0.50 - 0.65	0.02	0.02
Manganese	1.00 - 1.25	0.05	0.05
Phosphorus Max.	0.025		0.008
Sulfur Max.	0.025		0.008
Silicon	0.15 – 0.58	0.02	0.02
Chromium Max.	0.15		0.03
Molybdenum Max.	0.050		
Aluminum Max.	0.010		
Copper Max.	0.40		
Hydrogen Max.	3.0 ppm		

2. Premium Strength

<u>Element</u>	<u>Chemical Analysis (wt %)</u>	<u>Product Analysis Tolerance (wt %)</u>	
		<u>Under Min.</u>	<u>Over Max.</u>
Carbon	0.62 - 0.80	0.02	0.02
Manganese	0.70 - 1.20	0.05	0.05
Phosphorus Max.	0.025		0.008
Sulfur Max.	0.025		0.008
Silicon	0.15 – 0.58	0.02	0.02
Chromium Max.	0.15		0.03
Molybdenum Max.	0.050		
Aluminum Max.	0.010		
Copper Max.	0.40		
Hydrogen Max.	2.5 ppm		

B. Hydrogen

1. Hydrogen shall be subject to the limits listed above. If the hydrogen exceeds those limits, the blooms from the heat shall be slow cooled and the rails will be tested.

PART III – EXECUTION**3.1 MECHANICAL PROPERTIES AND ELECTRICAL RESISTANCE**

- A. Brinell Hardness will be measured on the running surface of the rail after the decarburized layer has been removed. The frequency of testing shall be once per heat and will be constructed in accordance with ASTM E10. For standard strength, the minimum hardness will be 220 BHN. For premium strength, the minimum hardness will be 260 BHN.
- B. Tensile tests will be taken from the running surface corner of the rail. The frequency shall be once per heat and will be conducted in accordance with ASTM A370. Results will be determined by grade. For standard strength, the minimum tensile strength will be 113 ksi with a 12% elongation. For premium strength, the minimum tensile strength will be 128 ksi with a 10% elongation.
- C. If any tests fail to meet the requirements of 2.3.A or 2.3.B, then two further tests shall be performed on samples from two other rails from the same heat. If those two tests are successful, the rails from the heat are acceptable.

- D. Direct current resistance shall be measured on one rail per heat and shall not be more than 10.5 micro-ohms ($\times 10^{-6}$ ohms) per foot. Alternatively, the electrical resistance can be determined by calculating the electrical resistivity ratio in comparison to pure copper. The calculated resistivity ratio to Cu will be 15.0 maximum.

3.2 DIMENSIONAL TOLERANCES

- A. The drawings of the rail along with the nominal dimensions is listed in Appendix A. Dimensional tolerances to nominal are as follows:

Height of Rail (running or groove side)	-0.020"/ +0.040"
Width of Groove	-0.040"/ +0.040"
Depth of Groove	-0.040"/ +0.040"
Width of Running Rail Head	-0.040"/ +0.040"
Overall Top Width	-0.080"/ +0.060"
Base Width	-0.125"/ +0.125"
Base Concavity	-0.000"/ +0.040"
Twist	0.063" max

3.3 IDENTIFICATION

- A. The rail will be cold stamped on the grooved head (not running surface) once on each end of the rail. The cold stamp will include manufacturer code, grade (standard or premium) and heat number (AM S x#### or AM P x####). The letter in the heat number specifies year produced.

3.4 SURFACE IMPERFECTIONS

- A. All rails shall undergo visual surface inspection to cull injurious imperfections.
- B. Surface imperfections may be conditioned as long as the rail microstructure is not affected by the operation. This may be accomplished by using appropriate methods (lamellar flap tool, grinding belt, etc.)
- C. Protrusions
1. Protrusions on the running surface or underside of the base shall be dressed smooth.
 2. Protrusions on any other surface are allowed up to 0.060". Protrusions higher than 0.060" may be conditioned down to 0.060".
- D. Depressions
1. Depressions in the base and rail body:
 - a. Hot scratches, scratches, and grooves that are principally longitudinal to the rail axis shall not exceed a depth of 0.040". Imperfections principally transverse to the rail axis shall not exceed 0.030". Transverse imperfections greater than 0.020" but not less than 0.040" may be conditioned down to 0.030".
 - b. Seams are allowed up to a depth of 0.040" and a surface area of 0.160" (transverse) by 1.180" (longitudinal).

- c. Overlaps are allowed of up to 0.020" deep and can extend the full length of the rail.
- d. Cold marks are allowed up to 0.020".
- 2. Depressions in the running surface:
 - a. Imperfections in the running surface shall not exceed 0.020" in depth.
 - b. Principally longitudinal defects shall be a maximum of 0.160" wide, and principally transverse defects shall not have an area exceeding 0.400" x 0.080".

3.5 STRAIGHTNESS

- A. The rail will be straightened in a roller straightening process.
- B. End Straightness:
 - 1. The straightness of the ends of the rails shall be checked with a 3' straightedge. Within this length, deviations from straightness in the vertical or horizontal directions shall not exceed 0.030". The deviation in the vertical direction is only allowed if the end has a continual upsweep.
- C. Line Straightness:
 - 1. Line straightness from end to end shall be checked with the naked eye. If there is a sharp kink, it shall be further examined and corrected. For general sweep, if an imaginary line was drawn from one end to the other of a 40' rail, the maximum tolerable gap will be 1".

3.6 COLD SAWING

- A. The cut shall be square in both the vertical and horizontal directions with a maximum deviation of 0.30".
- B. Any excessive saw burr will be removed. No beveling of the end will be allowed.

3.7 CERTIFICATION

- A. A certified mill test report will be issued with the results of the chemical and mechanical testing to confirm the product meets this specification.

PART 4 - MEASUREMENT

- 4.1 **Measurement** – No Separate measurement will be made for Work described in this Section.

PART 5 - PAYMENT

- 5.1 **Payment** – Payment for items in this Section will be incidental to the Contract unit cost of the Embedded Track bid items.

END OF SECTION

SECTION 34 11 16**TRACKWORK - FIELD RAIL WELDING****PART I - GENERAL****1.1 SUMMARY****A. Description**

1. The work specified in this section shall include providing materials, equipment, laboratory and quality control testing of rail welds, and labor necessary to weld together the abutting ends of rail, and qualification of welding and welders. Rail welds shall be one of the two types indicated below:
 - a. Pressure (Electric Flash-Butt) Welds: Tee rail and TRAM rail for ballasted mainline track, embedded/paved tracks, direct fixation (DF) tracks, and yard body tracks outside the limits of special trackwork shall be welded into continuous strings using the electric flash-butt pressure welding process.
 - b. Thermite Welds: Thermite welds shall be used to weld the strings together. String length shall be as long as possible but not be less than 150 feet without Engineers approval. Thermite welds shall be used in rail for use in embedded (paved) and ballasted track and within the limits of grade crossings. Shop pre-curved rail shall be thermite welded in place in the track.
2. Pressure welding shall be performed using mobile electric flash-butt welding machine designed for rail welding.
3. The Contractor shall make his own assessment as to the number of rails to be welded under this Contract, and the number of welds to be made by any one welding process, based on the information contained in these Specifications and the Contract Drawings.

1.2 REFERENCES

4. ASTM E709-08 - Standard Guide for Magnetic Particle Testing

1.3 SUBMITTALS

- A. Certification: Submit manufacturer's certification for foreman and crew.
- B. Pressure (Electric Flash-Butt) Welds: Submit the following:
 1. A written description of the welding procedure, including facilities, personnel and list of similar completed projects.
 2. A list of equipment and calibration methods, method of rail end alignment, method of rail straightening.
 3. Welding Machines Performance: Submit pressure welding machine performance standards as provided by the manufacturer. During welding production, a recorder shall be attached to each welding machine to record platen movement and current impulses on the form "Record of Field Welds". A record of machine performance for each weld shall be submitted to the Contracting Officer. If the record indicates performance which is not in conformance with the approved standards, the weld will be considered defective and shall be rejected.
 4. Shop Drawings: Submit Shop Drawings for the pressure welding machine and Shop Drawings of the proposed method and equipment for handling and laying CWR. This submittal shall include reference data relating to where the proposed equipment and laying method were previously successfully used.
 5. Details of the equipment and procedure proposed for straightening welds if required. The submittal shall include reference data relating to where the proposed straightening equipment and method were previously successfully used.
 6. The manufacturer's recommended procedure for welding high strength rail if different from requirements for standard rail.
 7. Pressure Weld Samples: Prior to beginning of production welding, two test welds shall be made using the welding machine and the procedures proposed in the Manufacturer's instructions for each type of rail used. The two welds shall be standard rail to standard rail. The welds shall be tested by the testing service. Certified test reports shall be submitted to the City. The test welds may be part of a continuously welded rail string at the contractor's discretion.
 8. Proposed location for flash-butt welding plant including methods of transporting materials and equipment to the site, types and locations of environmental controls and duration of welding operations.
- C. Thermite Welds: Submit the following:

1. Prepare a detailed description covering the step-by-step procedures to be employed in making the welds. Include a complete description of each of the following applicable items as well as any other characteristics essential to the welding procedures.
 - a. The manufacturer's trade name for the welding process.
 - b. The method used for cutting and cleaning of the rail ends. Flame cutting of rail ends will not be allowed.
 - c. The minimum and maximum spacing between rail ends.
 - d. The method used for maintaining the rails in alignment during welding.
 - e. The method used for preheating, including time and temperature.
 - f. The tapping procedure, including the minimum time required to cool the weld under the mold insulation.
 - g. The method used, including a description of special tools and equipment, for removing the upset metal and finishing the weld to the final contour.
 - h. The manufacturers recommended procedure for welding high strength rail if different from requirements for standard rail.
 - i. Method for controlling smoke and fumes from field welding within indicated requirements.
 - j. The manufacturer's recommended procedure for welding block or girder rail if different from requirements for standard rail.
 - k. Quality control procedures.
 2. Documentation: Prepare, maintain, and make available to the Contracting Officer a complete welding record indicating kit manufacturer, welding foreman, rail temperature, weather conditions, and station location.
- D. Calibrations: Submit description of calibration equipment and calibration methods.
- E. Testing Programs for Field Quality Control: Submit testing programs prepared by the radiographic, ultrasonic, and magnetic particle weld testing services for approval by the Contracting Officer. Each program shall include a description of the proposed procedures, materials, equipment, safety requirements, and report.

1.4 QUALITY ASSURANCE

- A. Welding Supervision:
1. Perform welding under the direct supervision of an experienced rail welding supervisor or foreman.
 2. Qualify each field welding foreman and crew through a representative of the field rail welding process manufacturer.

PART II - PRODUCTS**2.1 RAIL WELDING**

- A. Perform field rail welds utilizing one of the following brands of rail welding or an approved equal. All field welds shall only be preheated type.
 - 1. Field Flash Butt Welding: Process by Holland or approved equal.
 - 2. Calorite: Standard preheat, as manufactured by Calorite Inc., Addison, Illinois.
 - 3. Boutet: As distributed by DuWel Steel Products Company, Chicago, Illinois.
 - 4. Orgo-Thermit: As distributed by Orgo-Thermit Company, Lakehurst, New Jersey.
 - 5. Railwel Canada 175 boul J.F. Kennedy, St. Jerome, Quebec, Canada J7Y4B5
- B. Unless otherwise shown or specified, conform to the rail welding kit manufacturer's recommended standards when welding high strength rail.

2.2 RAIL

- A. Rail for welding shall be as specified in Section 34 11 29, "General Track Construction".

PART III - EXECUTION**3.1 RAIL END PREPARATION**

- A. Clean the rails to be free of grease, oil, dirt, loose scale, and moisture to a minimum of six inches back from the rail ends, including the rail end surfaces, by use of a wire brush.
- B. Align the faces of the rail ends.
- C. Clean for 2 inches on each side of the weld, to remove scale and rust, using a power actuated grinder with abrasive wheel.
- D. Rail ends shall show no steel defects, dents, or porosity before welding.
- E. If rail is required to be cut to length for any reason, cut it square and clean by means of rail saws or abrasive cutting wheels in accordance with AREMA, "Specifications for Steel Rails".

3.2 RAIL

- A. Straighten rail not meeting the requirements of AREMA, "Specifications for Fabrication of Continuous Welded Rail", shall be within the specified tolerance.
- B. If any rail cannot be straightened, cut it back a sufficient distance to achieve the required alignment.
- C. Perform all straightening or cutting prior to welding.

3.3 RAIL GAP

- A. Align and properly gap the ends of the rails to be welded to produce a weld which conforms to the alignment tolerances specified.

- B. Hold the rail gap and alignment during field welding without change during the complete welding cycle.
 - 1. Align rail on the head of the rail:
 - a. Vertical alignment: To provide for a flat running surface. Any difference of height of the rails shall be in the base.
 - b. Horizontal alignment: In such a manner that any difference in the width of heads of rails occurs on the field side.
 - 2. Horizontal offsets: Not to exceed 0.040 inch in the head and 0.125 inch in the base.
 - 3. Surface misalignment tolerance:
 - a. Combined vertical offset and crown camber: Not to exceed 0.040 inch per foot.
 - b. Combined vertical offset and dip camber: Not to exceed 0.010 inch per foot.
 - 4. Gauge misalignment tolerance: Combined horizontal offset and horizontal kink camber not to exceed 0.040 inch per foot.

3.4 BOLT HOLES

- A. One handling hole may be made in each end of a CWR string. Cut off rail ends containing such holes prior to welding.

3.5 FIELD WELD POSTHEATING

- A. Leave the molds in place after tapping for the time required to permit complete solidification of the molten metal and proper slow cooling to prevent cracking and provide a complete weld with proper hardness and ductility.

3.6 PRESSURE (ELECTRIC FLASH-BUTT) WELDING

- A. Pressure welding shall be in accordance with the AREMA Specification for, "Fabrication of Continuous Welded Rail" except as modified hereinafter.
- B. Mismatched or jagged rail ends shall be either sawed or cut with an abrasive rail cutter. Mating rail ends by flashing shall not be accepted.
- C. Rails shall have the scale removed down to bright metal in areas where the welding current-carrying electrodes contact the rail. Grind down raised rail brands in electrode areas. The weld and adjacent rail for a distance clearing the electrodes shall be rejected if in the areas of electrode contact there is not more than 95 percent of the mill scale removed. Electrode contact areas shall be examined for evidence of electrode burn. Where metal is displaced or where the oxidized areas exhibit checks or small cracks the weld shall be rejected and the rail cut back clear of the electrode burn.
- D. Welds shall be forged to point of refusal to further plastic deformation and shall have a minimum upset of 1/2 inch, with 5/8 inch as standard.

- E. If flashing on electric pressure (flash butt) welds is interrupted, because of malfunction or external reason, with less than 1/2 inch of flashing distance remaining before upsetting, rails shall be re-clamped in the machine and flashing initiated again.
- F. Whenever possible, grinding shall be accomplished immediately following welding at an elevated temperature. When grinding must be done at ambient temperature, avoid grinding burns and metallurgical damage.
- G. Alignment of rail in the welding machine shall be at the head of the rail.
 - 1. Vertical alignment shall provide for a flat running surface. Any difference of height of the rail shall be in the base.
 - 2. Horizontal alignment shall be accomplished in such a manner that any difference in the width of heads of rails shall be divided equally on both sides of the head. Where the difference, when divided, exceeds 0.040 inches, 0.020 inches of the difference shall be placed on the gauge side and the remaining differences in the width of heads shall be on the field side.
 - 3. In any case horizontal offsets shall not exceed 0.040 inch at the head and/or 0.125 inch at the base.
- H. Surface and Gauge Misalignment Tolerances: Shall meet the alignment tolerances given in the AREMA Manual, Chapter 4, Part 2, "Tolerances for Inspection of Welded Rail New and Mainline Relay Rail".
- I. If, at any time, 7 or more of a series of 12 consecutive welds made on one machine exceed 75 percent of the stated surface misalignment tolerances that machine shall be shut down and adjusted before work continues.
- J. Re-welds shall be cut out beyond the heat affected zone of the previous weld.

3.7 WELD FINISHING AND TOLERANCES

- A. Bring rails and joints in the finished track to a true surface and alignment by means of an approved grinding machine.
- B. Finish the completed weld for 112 TRAM rail by grinding to conform with the following requirements (see attached 112 TRAM rail drawings for clarification):
 - 1. Finishing deviation shall not be more than plus 0.010 inch to minus 0.0 inch of the parent section of the rail head surface. Grinding of the parent rail metal is acceptable as long as the minimum rail cross section is maintained. Top of the head of the running rail will be checked with a 3 foot straight edge to verify that there are no low spots or valleys in the head of the finished weld/rail around the weld. If low spot/valley cannot be blended, weld will be rejected and cut out along with the heat affected zone of the rail.
 - 2. Finish the sides of the 112 TRAM rail head to plus or minus 0.010 inch of the parent section. Grinding of the parent rail metal is acceptable as long as the minimum rail cross section is maintained.
 - 3. Finish the bottom of rail base, sides of the rail base, and outside faces of the rail flange and rail head to a finishing deviation of not more than plus 0.010 inch of

the parent section and minus no more than the minimum 112 TRAM rail cross section (For example rail base minimum dimension is 5.875 inches, grinding on side of rail base cannot cause the rail base dimension of the weld or the rail around the weld to be less than 5.875 inches)..

4. Finish the web zone to within 1/8 inch of the parent contour but not deeper than the minimum 112 TRAM rail cross section (see attached drawing for clarification of Web Zone for 112 TRAM rail). Finishing shall eliminate all cracks.
5. Alignment tolerances to be as specified in AREMA specification Sec. 4.2.2 Specification for Fabrication of Continuous Welded Rail.
6. Notches created by minor offset conditions, twisted or misshaped rails shall be eliminated by minimum grinding to blend the variations.
7. Fins on the weld due to grinding or shear drag shall be removed prior to final inspection.
8. Grind marks can be blended into the parent metal as long as 112 TRAM rail minimum cross sections are maintained.
9. Grind all sharp edges from welds to prevent damage to rail boot.
10. Finishing of 115 RE welds will follow Kansas City Downtown Streetcar Standard Specification requirements 34 11 16 3.8 B.

3.8 WELD QUALITY

- A. Inspect each "test and pressure weld" using the dry powder magnetic particle method in accordance with ASTM E709.
- B. Inspect each weld using a three foot straightedge along the centerline of the rail and 0.625 inch below top of rail on the gauge side of the rail head. Center the straightedge over the weld. The gap between the straightedge and the rail shall comply with the requirements of AREMA, Chapter 4.
- C. Ensure that each completed weld has full penetration and complete fusion and is entirely free of cracks or fissures.
- D. Porosity and slag-type defects will be acceptable provided that testing indicates that the largest defect does not exceed more than 3/16 inch in its largest dimension; the total area of the defect does not exceed 0.010 square inches, and the sum of the greatest dimension of defects in a line does not exceed 1/2 inch.
- E. Weld Hardness: As specified for the sample welds herein.

3.9 WELD NUMBERING

- A. Mark a sequential weld number on the rail immediately adjacent to the weld using a quality paint marker at the time the weld is made.
- B. Number welds sequentially in the order in which they are made.
- C. When defective welds are replaced assign a new sequential number to the new weld by adding a letter to the defective weld number.

3.10 FIELD QUALITY CONTROL

A. General:

1. Ultrasonically test all welds at the time of welding. Ultrasonic testing of the rail is not required.
2. Use equipment which has a distance amplitude correction feature.
3. Calibrate the equipment daily using an 11W calibration block, also made of rail steel.
4. Inspection Personnel: Qualify all inspection personnel in accordance with AWS D1.1/D1.1M.
5. Cut out and re-weld all welds giving fault indication in ultrasonic inspection using a minimum 19 foot piece of rail or cut out heat affected zone and pull together and re-weld.

B. Ultrasonic Weld Testing:

1. Mainline and yard field welds shall be ultrasonically tested (UT) over the entire cross section of head, web, and base. The UT equipment shall meet the requirements of AWS D1.1/D1.1M, Paragraph 6.17. The procedure shall meet the requirements of ASTM E164. Prior to performing production UT of welds, UT technicians shall demonstrate to the satisfaction of the Contracting Officer that they can discern and identify indication produced by slag, porosity, lack of fusion, and cracks. a. Use ultrasonic test equipment capable of detecting a 3/64 inch discontinuity, 6-1/2 inches below the top of rail. At a minimum, scan the weld from the top and both sides of the rail head and the base. Scan the weld from both sides on the face for longitudinal and transverse discontinuities using the applicable scanning pattern or patterns.
2. Testing Procedures: In accordance with the approved submittal.
3. Acceptance criteria shall be as follows:
 - a. Welds showing a response at any level that is identified as a crack or lack of fusion will not be acceptable.
 - b. Welds showing a response that is less than 50 percent of the primary reference level will be acceptable.
 - c. Welds showing a response greater than 50 percent but that do not exceed the primary reference level are acceptable, providing that all of the following apply:
 - 1) The defects are evaluated as slag or porosity.
 - 2) The largest defect does not exceed 0.180 inch in its largest dimension.
 - 3) The total area of the defects do not exceed 0.09 square inch.

- 4) The sum of the greatest dimension of defects in a line does not exceed 3/8 inch.
- d. Welds showing a response that exceeds the primary reference level will not be acceptable.

C. Magnetic Particle Testing:

1. Main line and yard field "test and pressure welds" shall be magnetic particle tested (MT). The procedures used shall meet the requirements of ASTM E709. Welds surfaces shall be tested except the underside of the rail base. The magnetizing equipment shall be an electro-magnetic yoke meeting the following requirements: a. DC lift capacity of 40 pounds, and/or b. AC lift capacity of 10 pounds at the maximum pole spacing.
2. Testing Procedures: In accordance with the approved submittal.
3. Acceptance Criteria: The weld quality shall meet the requirements of Paragraph 3.8.

3.11 DEFICIENT WELDS

A. Replacement of Defective Welds:

1. When the Contracting Officer determines a weld is unacceptable, cut out the weld and replace it with a 19 foot (minimum) rail plug.
 - a. Make saw cuts at least 6 inches from the centerline of the faulty weld.
 - b. Renumber replacement welds as indicated.
 - c. Ultrasonically test replacement welds made in rail as specified herein.
2. If one or both of the rails may be moved, cut out the weld, pull rails together to the indicated rail gap and reweld.
3. If neither rail may be moved, cut the weld out of the rail and replace with a section of new rail and with two new welds. Use a 19 foot minimum length of the new rail.

3.12 PROTECTION OF RAIL INSULATORS

- A. Rail insulators (pads, clips, insulators, and bushings) shall be covered/protected by a non-flammable material to prevent hot grinding fines from fusing into the rail insulating components.

3.13 WELD SLAG

- A. Welding fines and slag shall be removed from around the rails, insulating components, and the entire track area.

3.14 THERMITE WELD STAGGER

- A. Field welds in opposite rails shall be staggered a minimum of 5' for connecting CWR strings and a minimum of 2' at all other locations.

- B. Field welds shall not be located within 10' of a bolted rail joint.
- C. Field welds shall not be positioned within 3" of a support tie.

PART IV - MEASUREMENT AND PAYMENT

4.1 GENERAL

- A. The work specified in this section will not be measured separately for payment, but all costs in connection therewith will be considered incidental to track construction measured elsewhere.

SECTION 34 11 23
SPECIAL TRACKWORK

PART I - GENERAL

1.1 SUMMARY

- A. Description
1. This Specification defines the requirements for the design, detailing, manufacturing, fabricating, furnishing and delivery of the special trackwork.
 2. Special trackwork for this project shall consist of turnouts and all related equipment including switches and other track materials. All special trackwork shall have high-strength, head-hardened AREMA 115 RE rail in embedded track or on concrete slabs. Special trackwork shall include the following:
 - a. No. 4 turnouts with 115 lb. rail (115 lb. RBM frogs) on a concrete slab.
 - b. 25 M turnouts with 115 lb. rail (115 lb. RBM frogs) in embedded track.
 3. For Special Trackwork ties, see Contract Documents.
 4. The scope of work shall include all rail and associated components to include adapter plates for mounting switch machine rods. Supports and brackets for the switch machines shall be supplied by the switch machine manufacturer.

1.4 TESTING

- A. Except where specifically stated otherwise, all testing specified shall be undertaken by the Manufacturer. If the Manufacturer has previous or existing test results or certifications that are applicable, it may supply those subject to Engineer approval.

1.5 SUBMITTALS

- A. Submit or retain the following:
1. The Manufacturer shall submit separate shop drawings for each special trackwork turnout for review.
 2. Submit interface drawings addressing the attachment of the switch and detector rods to the special trackwork, prepared by the Manufacturer and approved by the Engineer.
 3. Retain full installation details and step-by-step procedures for installing the special trackwork in the field. The procedures also shall address the interface requirements for the installation of the switch machine.

1.6 TOLERANCES

- A. All fabrication tolerances shall conform with the track gauge of 4'- 8 ½", +/- 1/8", and a horizontal and vertical cross level tolerance of 1/16 inch.
- B. All component and fit tolerances shall meet the applicable requirements of AREMA Portfolio Drawings 1010 and 1011, and Specification 100.

1.7 COMPATIBILITY WITH SWITCH MACHINES

- A. Special trackwork and components shall be compatible with interface and operation of the designated switch machine manufacturer's model. Compatibility shall be confirmed by design and testing as specified herein.

1.8 SPECIAL TRACKWORK GEOMETRY

The following dimensions are fixed for each turnout as indicated on the Contract Drawings and may not be altered by the Manufacturer:

- A. Turnout Lead
- B. Length of switch alignment
- C. Radius of switch points
- D. Frog number
- E. Throw at point of switch
- F. Spread at heel of switch

PART II - PRODUCTS**2.1 RAIL**

- A. Rail for special trackwork, including stock rail and closure rail, shall be high strength and head hardened.
- B. Stock rails shall vary in length according to Special Trackwork Drawings (K3009 and K3010).
- C. Rails shall be cut square and clean by means of rail saws, shears or abrasive cutting wheels in accordance with the applicable current AREMA standards. All jointed rail shall be developed from one continuous rail section.
- D. Unless otherwise noted for thermite field welding, all rail ends shall be drilled for standard 6-hole joint bars in accordance with the current AREMA Manual for Railway Engineering, Rail Drillings, Bar Punchings, and Track Bolts. Holes drilled in the rails shall be peened or ground to remove all sharp edges, in reference to AREMA Table 4-3-1 and Figures 4-3-9 and 4-3-9.
- E. Curved rails (for curves with radius < 400 feet) shall be pre-curved in the shop by either gag press or roller bending methods. The rails shall be curved to true radius throughout the designated curve length and shall not exhibit visible kinks or tangents. Applicable insulated joints shall also be pre-curved.

2.2 SWITCH POINTS

- A. Switch points shall be as per the Special Trackwork Contract Drawings. Switch points shall have reinforcing bars attached by square-head bolts and hex nuts. Reinforcing bars shall be 1/2 inch thick and double-reinforced, as per AREMA Portfolio Plan 221.
- B. Alignment of switch points shall be as per AREMA drawings with extended length for the installation of floating heel blocks. Switch point length currently is set as per the Contract Drawings. Manufacturer may substitute alternatives subject to the Engineers approval.
- C. Switch points shall have an undercut design in accordance with AREMA Plan Basic Number 221, Detail 5100. Switch point stops shall bear against the supporting stock rails when points are in the thrown positions.
- D. All switches shall be installed for interlocked power operation.

2.3 HEEL BLOCKS

- A. AREMA 11' straight and 13' curved switch points shall have heel-joint assemblies as per AREMA Plan 221. AREMA switch points of 16'-6", 19'-6", and 26'-0" shall have floating heel block assemblies. Contractor shall consider alternate designs according Contract Drawing K3405 or approved Shop Drawing substitute.
- B. The floating heel block on the straight side of the turnout (curved switch point) shall consist of cast steel, Class B.
- C. At locations where a restraining rail in the crotch area between the stock rail and the closure rail extends to the heel block, the heel block shall incorporate a flangeway flare design to maintain the curve guarding for the longest possible distance. Material for such heel blocks shall be cast manganese steel.

2.4 RAIL BRACES AND SLIDE PLATES

- A. Ballasted turnouts on concrete ties shall accommodate a boltless brace design per Contract Drawings K3022.

2.5 GAUGE PLATES – NOT USED

2.6 TURNOUT FROGS

- A. Turnout frogs shall be fabricated to the designated turnout number geometrics and shall be solid manganese steel frogs in accordance with AREMA Plans 622-03, 623-03 or 624-03; or spring frogs in accordance with AREMA Plan 401-03 or as applicable, and as designated on the Contract Drawings.
- B. Austenitic manganese steel castings shall be of a heavy wall thickness design in accordance with the requirements of AREMA Plan Basic Number 100, Section M2.2, and ASTM A128, Grade A. Castings shall be explosive depth hardened in accordance with AREMA, *Specifications for Special Trackwork*, Article M2.7, with a minimum Brinell hardness of 350. Hardening shall project uniformly to 250 BHN at a depth of 11/8 inches.
- C. The Manufacturer shall produce shop drawings to specify the procedures to be used for the depth hardening process, the portions of each frog which are to be depth hardened, and the Brinell hardness pattern which the Manufacturer anticipates to achieve with such procedures.

2.7 FROG GUARD RAIL

- A. Frog guardrail shall consist of a tee rail design with single piece construction and level guardrail height. The ends of the guardrail shall be beveled and milled. The flangeway shall be the minimum width required for the proposed AAR 1B wheel profile. Foot guards shall be provided. For details, refer to Contract Drawings.

2.8 TIE PLATES – NOT USED**2.9 TURNOUT PLATES**

- A. Turnout plates shall be designed to accommodate the required turnout geometry and for use with an elastic rail clip system with welded on shoulders. The plates shall be insulated as required to conform with system electrical isolation requirements.

2.10 SWITCH RODS

- A. Switch rods shall be vertical insulated switch rods.
- B. Prior to assembly of insulated joints, the mating surface and ends of switch rods, steel channel, and splice plates shall be coated with an approved insulation enamel. The assembled joints shall be dielectrically tested to verify that insulated joints can withstand a potential of 1,500 volts dc for one minute without evidence of flashover, pinholes, or fracture.
- C. Switch Rod Insulation shall be as per AREMA C&S Requirement for insulation.

2.11 TRACK CROSSINGS – NOT USED**2.12 LUBRICATION**

- A. Lubricant for moving parts in turnouts shall meet the following requirements:
- | | | |
|----|--|---------|
| 1. | Calcium soap | 9% |
| 2. | Graphite | 11.5% |
| 3. | Penetration, ASTM D 217 at 70 ⁰ F worked | 340 |
| 4. | Dropping Point, ASTM D 566 at 77 ⁰ F | 101/214 |
| 5. | Oil viscosity, ASTM D 445, cSt at 104 ⁰ F | 81.8 |
- B. Other types of lubricants may be used providing that the lubricant has been used successfully by other rail agencies, and subject to the Engineers written statement of no objection.

2.13 RAIL JOINTS

- A. Rail joints for special trackwork shall be thermite welded or by means of joint bars. Where a joint occurs in a guarded rail section of the turnout, a separator block shall be provided for the full length of joint bar in between the two rails.
- B. Joint bars and separator blocks shall meet the requirements specified in Section 02459.

- C. Insulated joints shall meet the requirements specified in Section 02459. Insulated joints located in single rails shall be of an epoxy glue design. Insulated joints located in guarded rail sections shall be a poly-encapsulated design.
- D. All bolted joints shall be a minimum length of 36" and have six bolts.

2.14 SWITCH TIES – NOT USED

PART III - EXECUTION

3.1 DETAILED DESIGN

- A. The Manufacturer shall develop all required details in accordance with these specifications and good practice. Detailed shop drawings shall be provided by the Contractor for all components including but not limited to frogs, switches, closure rails, restraining rails, rail fastener plates, and fastener layouts. The Contractor shall address the following considerations in the design of special trackwork:
 - 1. Rail Lengths - Design layouts with rails that are to be left longer than the theoretical length shown on the Contract drawings and with blank (non-drilled) ends so that such rails can be cut and drilled in the field to compensate for accumulated construction tolerance deviations in assembly of the layouts.
 - 2. Dimensions - All dimensions shall be confirmed in the field with respect to locations where the new special trackwork must tie into existing tracks. The location of existing joints and the amount of wear on existing rails shall be determined so that the location of joints can be detailed on the shop drawings.

3.2 SHOP ASSEMBLY FOR DOUBLE CROSSOVERS & RR CROSSING – NOT USED

3.3 HANDLING AND DELIVERY

- A. All rails and special trackwork shall be handled carefully and delivered in open top containers to avoid damage by kinking, bending, nicking, or other potential damage to the rail. Rails and special trackwork components shall not be dropped or struck sharply. Handling and delivery shall be in accordance with accepted industry practice.
- B. Stock rails, closure rails, tongue rails, and frogs shall be delivered assembled with associated fasteners attached.
- C. All bundles, boxes and kegs shall be clearly marked with the following information:
 - 1. Identification of items contained
 - 2. Supplier's name
 - 3. Delivery date
 - 4. Number of pieces
 - 5. Gross weight

3.4 ACCEPTANCE

- A. Acceptance is subject to inspection upon delivery.

PART IV - MEASUREMENT

- 4.1 Item Basis** – Measurement of the turnouts will be per each turnout supplied and installed.

PART V - PAYMENT

- 5.1 General** – The accepted measured quantity of each pay item will be paid for at the Contract unit price per unit of measurement. The Contract unit price will be payment in full for furnishing all labor, materials, tools, equipment and incidentals, and doing all Work necessary to complete the Work specified.

END OF SECTION

SECTION 34 11 29**GENERAL TRACK CONSTRUCTION****PART I - GENERAL****1.1 SUMMARY**

A. Description:

1. This section specifies general track construction which consists of the mainline and yard trackwork indicated on the plans including installing direct fixation track, ballasted track, embedded/paved track, special trackwork, and track appurtenances.

1.3 DEFINITIONS

- A. Approach Slab: A reinforced concrete slab located at the interface of ballasted track with direct fixation track or paved track to provide a transition between ballasted track construction and the types of track with significantly higher track modulus.
- B. Ballast: An integral part of the track structure, generally composed of crushed stone in which ties are embedded. Track ballast includes ballast compacted beneath the ties, in the cribs between the ties, and in the ballast shoulders at the ends of the ties.
- C. Bumping Post: A device placed at the end of stub-end tracks to prevent a moving rail vehicle from inadvertently rolling off the end of the track.
- D. Closure Rails: The rails between the parts of any special trackwork layout, such as the rails between the switch and the frog in a turnout; also the rails connecting the frogs of a crossing or of adjacent crossings, but not forming parts thereof.
- E. Continuous Welded Rail (CWR): A number of rails welded together into a single length.
- F. Crossing, Road: The intersection of one or more tracks and a street, road, or highway, at grade.
- G. Crossing, Railroad: The intersection of two tracks, at grade, consisting of four frogs, also known as a "diamond".
- H. Crosslevel: The difference in elevation of the tops of heads of opposite rails measured at right angles to the track alignment.
- I. Crossover, Single: Two turnouts with the track between the frogs arranged to form a continuous passage between two nearby and generally parallel tracks.
- J. Crossover, Double: Two crossovers which intersect between the connected tracks.
- K. Crossover, Universal: Two single crossovers, one being right hand and the other left hand, joining two nearby parallel tracks. The two single crossovers are located in close proximity to one another and typically are operated by the same signal interlocking.
- L. Frog: A device used at the intersection of two running rails to provide support for wheel treads and passageways for their flanges, thus permitting wheels traversing either rail to cross the other left hand, joining two nearby parallel tracks. The two single crossovers are located in close proximity to one another and typically are operated by the same signal interlocking.

- M. Frog Number: The number used to designate the size of a frog, and being equal to one-half the cotangent of one-half the frog angle.
- N. Grade Line: The line on the profile representing the top of the roadbed ready to receive the sub-ballast at the intersection of the roadbed with a vertical plane through the track center line.
- O. Guard Rail: A rail or other device laid parallel with the running rails of a track to prevent wheels from being derailed; or to hold wheels in correct alignment to prevent their flanges from striking the points of frogs. A rail or other device laid parallel with the running rails of a track to keep derailed wheels adjacent to running rails.
- P. Inside Rail: On curved track, the rail closest to the curve center, the rail with the shorter radius. Sometimes referred to as the "low rail".
- Q. Joint Bar: A steel member, embodying beam-strength and stiffness in its structural shape and material; commonly used in pairs for the purpose of joining rail ends together, and holding them accurately, evenly, and firmly in position with reference to surface and gauge-side alignment.
- R. Outside Rail: On curved track, the rail farthest from the curve center; the rail with the longer radius. Sometimes referred to as the "high rail".
- S. Pocket Track: A track located between the two mainline tracks on which an out-of-service train may lay over or reverse direction.
- T. Profile Grade Line (PGL): The datum line which defines the vertical alignment of the track, applied at the top of the low rail.
- U. Rail Fastening - Ballasted Track: A resilient device used to secure the running rail to the concrete tie at the proper track gauge to provide proper vertical, lateral, and longitudinal restraint of the rail.
- V. Rail Fastener - Direct Fixation Track: A resilient device used in track to secure the running rails to concrete in tunnels, cut and cover structures, aerial structures, and slab track at the proper gauge to provide proper vertical, lateral, and longitudinal restraint of the rail. Also known as direct fixation fasteners or DF fasteners.
- W. Rail Joints: A fastening designed to unite the abutting ends of contiguous rails.
- X. Rail Joint, Insulated: A rail joint designed to arrest the flow of electric current from rail to rail by means of insulation so placed as to separate the rail ends and other metal parts connecting them. Commonly called insulated joints or "IJ's".
- Y. Restraining Rail: A guard rail installed parallel to, concentric with, and on the gauge side of the inside running rail of curved track with a flangeway of approximately 2-1/8 inches. It extends into the tangent track on each end of the curve, bears against the back side of the wheels, and steers the inside wheels of each truck around the curve, thereby reducing the degree of contact of the leading outside wheel flange with the outside rail. It also reduces gauge wear on the outside running rail.
- Z. Roadbed: The foundation (prepared subgrade) on which the track structure consisting typically of sub-ballast and ballast is placed.

- AA. Special Trackwork: A generic term referring to turnouts, single and double crossovers, track crossings, and other such items.
- BB. Standard Rail: A synonymous term to 115 RE rail.
- CC. Stock Rail: A running rail against which a switch rail bears in a turnout.
- DD. Stub-up: A conduit temporarily terminated in the roadbed for later use by signal, communication, or traction power installers.
- EE. Sub-Ballast: A material which provides a semi-impervious layer between the finished subgrade of the roadbed and the ballast, to provide better drainage, prevent upheaval by frost, and better distribute the load over the roadbed.
- FF. Subgrade: The finished surface of the roadbed below the level of sub-ballast or track slab.
- GG. Superelevation: The vertical distance of the outer rail of a curve above the inner rail. It is provided to overcome or partially overcome the effects of curvature and speed.
- HH. Switch, Point of: The tip of the tapered end of a switch rail; the end of a switch rail farthest from the frog or heel block.
- II. Switch Point, Undercut: A switch point planed to mate with a stock rail having a planed undercut, in order to provide an effective point width of zero.
- JJ. Switch Rail (Switch Point): A planed, tapered, movable rail which mates with a stock rail to enable movement of a train from one track to another.
- KK. Switch, Split: The common type of track switch consisting essentially of two planed, movable switch rails.
- LL. Top of Rail (T/R): The top surface of the head of the running rail.
- MM. Track, Ballasted: Track constructed of rails, crossties, and ballast. It is the predominant form of track constructed at-grade, but it is also used on short bridges.
- NN. Track, Direct Fixation: Track constructed of rail and rail fasteners attached by means of anchor bolts to concrete, located in tunnels, cut and cover structures, aerial structures, and slab track.
- OO. Track, Embedded (Paved): Track constructed on a track slab and, except for the flangeways, embedded in asphalt, concrete, paving blocks, rubber epoxy, or other such material to the elevation of the top of rail.
- PP. Track, Gauge: The distance between the inside faces of running rails at right angles measured at a point 5/8 inch below the top of rail. Standard gauge: 4 feet 8-1/2 inches.
- QQ. Track, Mainline: A track designated by route name and direction, and which is for the purpose of carrying revenue passengers.
- RR. Track, Secondary and Yard: Track constructed for the purpose of switching, storing, or maintaining rail vehicles or connecting such tracks to mainline tracks.
- SS. Trackway: The foundation on which the track is constructed. It usually consists of an earthen roadbed, but it may also be one of the following: a concrete roadbed for support of

direct fixation track or paved track; a ballasted bridge deck (designed to receive ballast); or an aerial structure.

- TT. Turnout: An arrangement of a switch and a frog with stock rails and closure rails, enabling rail vehicles to be diverted from one track to another.
- UU. Turnout Number: The number corresponding to the number of the frog used in the turnout.
- VV. Zero Thermal Stress: The state of uniform stress in CWR, while the rail is unrestrained and free to move longitudinally.
- WW. For additional definitions, refer to AREMA Manual and Portfolio of Trackwork Plans.

1.4 SUBMITTALS

- A. Shop Drawings, include the following:
1. General plan for distributing CWR, including:
 - a. Storage location upon delivery and prior to installation.
 - b. General layout of CWR site.
 2. Complete details of the proposed methods, including equipment, of laying and fastening CWR. Include method and equipment proposed for achieving zero thermal stress.
 3. Description of temperature adjustment and final anchoring procedures for CWR, including charts, tables, and field instructions on heating, cooling and stretching.
 4. Charts shall be provided that indicate gaps for varying lengths of rail and varying rail temperatures.
- B. Procedures: Provide complete details of the end-hardening procedures, including identification of personnel to perform the procedure, the equipment, and the test results required no less than 30 days prior to initiating any end-hardening.
- C. Installation Procedures: Prepare and submit a description of the procedures and methods to be employed in the construction of embedded track. At a minimum, include the following:
1. The methods of placing rail, supporting structures, and concrete to produce finished track meeting the alignment requirements within the specified tolerances.
 2. The procedure for handling, installing, and field welding continuous welded rail..
 3. In accordance with the requirements of APWA 2703, "Special Aggregate Concrete – Bridge Deck, Sidewalk, Barriers and Curbs, Diaphragms, and Approach Slab", including:
 - a. Procedures for forming, mixing, placing, and curing of concrete.
 - b. Proposed concrete and joint materials; include packing, storing, handling, proportioning, additives, mixing, and placing details.

4. The method of ensuring that the rail and supporting structure are not dislocated during placement of concrete.
 5. The procedures for erecting the support beams and securing the rail.
 6. Procedures for installation of track drain components.
 7. Procedures for installing the rail boot, including splices, and boot clips.
 8. Quality control procedures to ensure proper installation.
- D. Track equipment to be used on Roadbed: Submit weights and dimensions of track equipment proposed for use on roadbed prior to employ it on roadbed.
- E. Rail Mounted or Hi-Rail Construction Equipment: Submit a complete list of track equipment for use during trackwork construction, within 30 days after receipt of the Notice to Proceed. Include rail-mounted geometry inspection vehicle.
1. Equipment to be utilized shall not exceed design clearance envelope and loading criteria for the Streetcar System.
 2. Submit a complete description of all proposed modified equipment, including calculations verifying that loading criteria for the light rail system will not be exceeded.
 3. Certify that the equipment modifications will clear all structures and other facilities at the areas where the equipment will be used.
 4. Certify rail wheels are in good condition, without excessive wear. Damage to frogs, crossing panels, etc. shall be repaired or replaced as determined by the City.
- F. Product Data: Submit manufacturer's data for Contractor-furnished material including non-woven filter fabric and adhesive for bonding tags to concrete. Submit installation information and sufficient description to verify that materials comply with the specifications. Include specification data and manufacturer's installation instructions for non-woven filter fabric. Submit product data for support beams and associated hardware, rail boot, and slab joint materials.
- G. Mix Design: Submit concrete mix design as specified in APWA 2703, "Special Aggregate Concrete – Bridge Deck, Sidewalk, Barriers and Curbs, Diaphragms, and Approach Slab"
- H. Certification: Certification of concrete mix design, reinforcement, and bonding agents.
- I. Samples: Submit sample for non-woven filter fabric.
- J. Test Reports: Submit summaries of test results each week for field weld tests, Brinnell Hardness Tests, insulated joint continuity tests, track geometry vehicle measurements, and any other periodic testing required by Contract. If there was no activity during the week, submit each summary noting no activity.
- K. Rail Laying Record: Submit records in accordance with Article 3.14 D. herein.
- L. Submit manufacturers' rail specifications to the Authority for approval.

1.5 QUALITY ASSURANCE

- A. Comply with:
 - 1. Codes and regulations of the jurisdictional authority.
 - 2. APTA Guidelines.
 - 3. AREMA Manual.

1.6 PRODUCT DELIVERY, STORAGE, AND HANDLING

- A. City-Furnished Material:
 - 1. None.
- B. Contractor-Furnished Material: Supply track construction material indicated in the Contract Documents.

1.7 MONUMENTATION AND SURVEYING

- A. Monuments will be provided by the City to establish the centerlines of tracks as specified in Section 01 71 23, "Field Engineering".
- B. The Contractor shall set monuments at all points as shown on the Contract Drawings.
- C. The Contractor shall be responsible for the preservation of all Geographic Reference Stations, State of Missouri and City of Kansas City Missouri maintained benchmarks, section corners, property monuments of any kind and other reference marks set by the City or any other governmental authority as shown on the plans or informed of in writing in accordance with Section 01 71 23, "Field Engineering".
- D. Do not use controls for surveys other than the monumentation described above unless otherwise approved by the Contracting Officer.
- E. Perform surveying required herein in accordance with Section 01 71 23, "Field Engineering". Assume full responsibility for all dimensions and elevations taken and the setting of lines and grades relating thereto.

PART II - PRODUCTS

2.1 CITY FURNISHED MATERIALS

- A. None.

2.2 CONTRACTOR FURNISHED MATERIALS

- A. Concrete Materials:
 - 1. Provide concrete reinforcement as specified in Section 03 20 00, "Concrete Reinforcing".
 - 2. Track slab concrete shall be as specified in Section 502 of the Missouri Standard Specifications for Highway Construction, "Portland Cement Concrete Pavement" or approved equal.

- B. Rail Support Structure:
 - 1. Provide steel support beams.
 - 2. Include leveling screws, rail clips, and other accessories as recommended by the support beam manufacturer.
 - 3. Where necessary, provide 4" X 4" x 3/16" bearing plates fabricated of ASTM A36 steel or equivalent.
- C. Rail Boot
 - 1. Provide extruded rubber rail boot as recommended by manufacturer. The rail boot shall be fabricated to fit 115RE or 112 TRAM rail.
 - 2. Provide splices for the rail boot as required, fabricated to be compatible with the rail boot. Include all required splice materials as recommended by the boot manufacturer to fully isolate the rails electrically.
- D. Track Drains
 - 1. Provide track drains fabricated of materials approved by the Authority. Include appropriate end panels, outlets, and grates. Furnish devices as necessary to secure the grates to the troughs.
 - 2. Where embedded track is in shared right-of-way, track drain grate and frames must be traffic rated (HS20-44 loading). Steel angle support and bolting of grating to angles shall be strong enough and designed to transfer HS20-44 loading into the concrete slab.
 - 3. Rail must be isolated from track grate, frame, and any other metal items.

2.3 METAL TAGS

- A. For ballasted track, provide aluminum or brass identification tags stamped in 1/4 inch increments from zero superelevation to maximum superelevation to mark the superelevation on curved track. These tags shall be 1-1/4 inches wide by 2 inches long by 0.050 inch thick, and stamped with numerals 1/2 inch high.
- B. Adhesive for Bonding Tags to Concrete: As proposed by the Contractor and approved by the City.

2.4 RAIL

- A. Tee-rail: 115 RE section either standard or premium rail in accordance with the requirements of AREMA "Specifications for Steel Rails" and as specified.
- B. Block rail: 112 TRAM – Low profile (72mm) higher strength rail (grade S900/R260).

2.5 TIES

- A. Ballasted trackwork construction shall consist of concrete crossties, unless otherwise shown on plans or in the special provisions.

- B. Concrete crossties: 8 feet 3 inches in length unless specified elsewhere conforming to AREMA "Specifications for Concrete Ties". Concrete ties shall be prestressed monoblock concrete. Type to be used shall be shown on the Contract Drawings.
- C. Concrete switch ties of varying lengths conforming to AREMA "Specifications for Concrete". Concrete ties shall be prestressed monoblock concrete. Type used shall be as shown on Contract Drawings.
- D. Concrete ties for at-grade road crossings shall be 10 feet in length conforming to AREMA "Specifications for Concrete".

PART III - EXECUTION

3.1 GAUGE

- A. Measure the track gauge between points 5/8 inch below the top. For tee rail, measure perpendicular to and from inside face to inside face of the running rails. For 112 TRAM rail, measure from outside face of groove to and from outside face of groove.
- B. Tangent and curved track gauge:
 - 1. 4 feet 8-1/2 inches for tee rail.
 - 2. 4 feet 8-1/2 inches for 112 TRAM rail in tangent and curves greater than 150' radius.
 - 3. As specified by plans for curves 150' or less radius track.
- C. Special trackwork track gauge (tee rail): 4 feet 8-1/2 inches. Special trackwork manufacturer shall conduct a wheel/rail study to verify gauge and include with trackwork submittal for engineer's review.
- D. Allowable gauge variation:
 - 1. Ballasted mainline track: plus or minus 1/8 inch.
 - 2. Direct fixation mainline track: plus or minus 1/8 inch.
 - 3. Paved mainline track: plus or minus 1/8 inch.
- E. Gauge Transition: The plans shall outline the method for transitioning between gauges of different widths.

3.2 ALIGNMENT

- A. Alignment consists of a series of straight lengths of track referred to as tangents, connected by simple, compound or reverse curves, with or without spirals.
- B. The track shall be constructed to the alignment and profile indicated on the plans, within the tolerances specified in Table 34 11 29-1.
- C. Use outer rails of curves as the line rail. Either rail may be used as the line rail in tangent; however, use that same rail for the full length of that tangential segment of track.
- D. The ends of the chord to be at points on the gauge side of the line rail 5/8 inch below the top of the rail head.

- E. In addition to the requirements specified:
 - 1. Place the track in good alignment before the finishing lift is made.
 - 2. Follow immediately behind the finishing lift with a mechanical means of lining the track and line to accurate alignment. Typically line and surface in the same operation, but the finishing lift may include adjustments to “accurate alignment”.

3.3 SURVEYING REQUIREMENTS

- A. Refer to Section 01 71 23, ‘Field Engineering’.
- B. Verify layout information shown in relation to the existing City-provided monuments and existing structures before proceeding with layout of the actual work. As the work proceeds, check every major element of work for line. Bring discrepancies in location of structures to the attention of the City before starting trackwork. Maintain an accurate surveyor's field book of such checks; make available for the City's reference. Record deviations which are accepted by the City on the Record Drawings.
- C. Verify the actual grade line and the profile of the top of the sub-ballast. Variations from the design grade line and profile shall meet tolerances specified in Section 01 71 23, ‘Field Engineering’.
- D. Furnish and place markers for the control points and reference points of the track centerlines, as indicated. Stake centerlines at station platforms, grade crossings, and bridge structures for inspection by the City.
- E. Upon completion of the project, the Contractor shall provide the City with all original surveying field notes, layouts, and computations in standard bound survey books. The Contractor shall also provide the City all electronic files, code libraries, CAD drawings and any other files or documents, whether electronic or paper, that are part of the survey work. Point code files shall be submitted in raw data file format and plain text ASCII, comma or space delimited format having one record of point number, northing, easting, elevation and point code (in that order per line). All electronic files must be submitted in an uncompressed file format on a USB flash drive or CD-ROM disk. Individual electronic files shall not span multiple disks. All disks shall be labeled with the City project number, project location, date (month and year) of the survey and disk number if more than one as required under Section 01 71 23, ‘Field Engineering’.
- F. Maintain control points and reference points for the duration of the project.

3.4 SUPERELEVATION, SPIRALS, AND CURVATURE

- A. Superelevation:
 - 1. Superelevate mainline track curves as indicated.
 - 2. Maintain superelevation uniformly over the length of curve or as otherwise shown.
 - 3. Superelevate the outer rail above the inner rail; install the inner rail at the required profile indicated.
- B. Spirals: Establish the superelevation at the point of tangency at zero and increase the superelevation uniformly through the length of the spiral to full elevation of the outer rail at the spiral-to-curve point. Install the spiral at the ends of simple curves and segments of compound curves as indicated.

- C. Curvature: Curve information shall be as shown. Shop fabricated rail shall be marked by the manufacturer for installation.

3.5 TRACK SURFACE

- A. Track surface is the relationship of opposite rails to each other in profile and crosslevel:
 - 1. Track profile is the running surface along the top of the grade rail.
 - 2. The ideal surface is a uniform profile consisting of straight gradients connected by vertical curves, with zero crosslevel on tangents, and predetermined crosslevel on curves.
 - 3. Do not raise the profile of track being surfaced above established grades.
 - 4. When surfacing or raising track, select one rail, usually the lower rail on curves and the line rail on tangents, as the grade rail. Bring the other rail to surface by adjusting the crosslevel as needed.

3.6 SUBGRADE PREPARATION

- A. Place and compact the required depth of subgrade material as specified in Section 32 11 00, "Base Courses". Reference shall also be made to the project Geotechnical Report and details in the plans.

3.7 CONCRETE PLACEMENT

- A. Place concrete in accordance with the requirements of Section 03 20 00, "Concrete Reinforcing", and Section 502 of the Missouri Standard Specifications for Highway Construction, "Portland Cement Concrete Pavement".
- B. During placement of reinforcing steel and concrete use care to avoid disturbance of the support structure, rail, boot, track drains, and associated hardware. Contractor is to take measures to prevent uplift during the concrete pour.

3.8 TRACK DRAINS

- A. Install track drain components in accordance with the plans and/or supplier's recommendations.
- B. Brace track drains with temporary supports to maintain correct position during concrete placement.
- C. Cover track drains during concrete placement to prevent concrete from entering the trough.

3.9 SUPPORT STRUCTURE

- A. Install the rail support structure as recommended by the support beam supplier. Place a bearing plate below each adjusting screw. In areas of sloped subgrade, create a flat area in the subgrade slightly larger than the bearing plate.
- B. Space beams according to the details in the plans.
- C. Adjust the support beams to the required elevation prior to placing rail.

3.10 RAIL INSTALLATION

- A. Place rail strings on the support beams and install the rail boot on the rail. Apply the rail clips loosely using procedures recommended by the supplier.
- B. Where rail will require field welding, place rail boots no closer than ten feet to the proposed weld. Field weld CWR as specified in Section 34 11 16, "Trackwork - Field Rail Welding".
- C. Prior to placing concrete, join rail strings and adjust the jacking screws and tighten rail clips to bring rails to correct grade and alignment. Complete installation of the rail boot and verify the correct installation of all boot splices.

3.11 RAIL

- A. Follow plans or track charts in determining exact location and lengths of premium and standard rail.

3.12 CUTTING AND DRILLING RAIL

- A. Use only the following tools for cutting rail:
 - 1. Rail saw.
 - 2. Abrasive cutting wheels.
- B. Drill holes:
 - 1. When necessary, drill new holes; do not punch, slot, or burn with a torch.
 - 2. Drill holes 1-1/8 inch in diameter; locate as indicated.
 - 3. Drill with the joint bars removed or before their application. Mark the location of the center of the hole, or drill through an approved template. Do not drill bolt holes using the joint bars as a template.
 - 4. When bolt holes are drilled with a power track drill, maintain a uniform feeding pressure. Reduce pressure as the bit point breaks through the opposite side of the web. Do not force the drill.
 - 5. Remove all rough edges from drilled rail holes.
 - 6. Do not leave bolt holes in the ends of rail to be welded.
 - 7. Reaming or enlarging incorrectly drilled holes to allow joint bar bolts to be installed will not be permitted. Rejected holes shall be sawcut from the rail.
 - 8. Torch cuts or blown holes will not be acceptable.
 - 9. Rail strings have handling holes. These holes shall be cropped before welding.

3.13 RAIL JOINTS

- A. Either weld or bond rail joints as indicated.
- B. Field weld rails in accordance with Section 34 11 16, "Trackwork - Field Rail Welding".

- C. Install bonded joints where indicated in accordance with the requirements of this section and Section 34 11 93, "Other Track Materials".
- D. Install joints in track that is in final horizontal and vertical alignment with ballast tamping completed.

3.14 LAYING CONTINUOUS WELDED RAIL

- A. Unload and lay CWR in a place and in a manner that prevents damage to the ties, rails, and structures.
- B. Lay opposite CWR strings in a manner which results in a 5 foot minimum stagger of welds.
- C. Make every effort to minimize or eliminate field cuts and field welds in CWR. Designate location in finished track by route name, stations of ends of rail string, and right or left rail as determined by facing in the direction of increasing stationing. Place all rail numbers on the same side of the CWR string.
- D. Record the following information at the time of laying the rails on the crossties or DF plinth and again at the time of anchoring CWR. Furnish copies of this documentation to the City.
 - 1. Location by station, track designation, and rail.
 - 2. Date and time.
 - 3. Rail weight and section, mill brand, year rolled, and the heat number of the end rails in each CWR string.
 - 4. Length of CWR string in feet.
 - 5. The following temperatures, at the beginning of the activity and again at the end of the activity:
 - a. Ambient temperature.
 - b. Rail temperature.
 - 6. Approximate weather conditions.
 - 7. Adjustment applied (type and rail end movement).
- E. Between the time of laying the rail (placement on the ties) and anchoring the rail, the Contractor shall monitor rail temperatures and adjust each Dutchman as required to avoid rail buckling or rail end batter.

3.15 RAIL TEMPERATURE

- A. Determine rail temperature by means of an AREMA standard rail thermometer as specified in the AREMA Manual.
 - 1. Place rail thermometers on the shaded side of the rail base next to the web and leave in place until no change in its reading is detected, but not less than five minutes.
 - 2. Take rail temperature at the time of adjusting the gap between rail ends.

3.16 DESTRESSING RAIL

- A. Rail zero stress (neutral) temperature at final closure and fastening shall be $75^{\circ}\text{F} \pm 10^{\circ}\text{F}$ ($24^{\circ}\text{C} \pm 5^{\circ}\text{C}$).
- B. The rail shall have a uniform longitudinal stress along the entire fastened length (except at free ends).
- C. The Contractor shall submit a detailed procedure for achieving uniform longitudinal rail stress for the zero stress temperature specified herein.
- D. Final closure shall be by field weld with the rail fully fastened (except immediately adjacent to the field weld as necessary to perform the weld) near or at final elevation and alignment. If post closure rail realignment is required, the Contractor shall provide sufficient longitudinal restraint either side of the location of realignment to assure the rail stress state is not changed by the realignment Work.

3.17 TEMPORARY FASTENING

- A. Temporarily fasten track for use of on-track equipment.
- B. Prior to equipment being placed on newly laid rail, secure the rail in a manner that will prevent damage to the CWR, rail fasteners, and other track materials.
- C. Move equipment over newly laid rail in such a manner as to prevent damage to trackwork materials.
- D. Temporarily fasten newly laid rail on ballasted track at not less than:
 - 1. Every third tie on tangents and on curves having a radius greater than 1,900 feet.
 - 2. Every other tie on curves having a radius of 1,900 feet or less.
- E. Do not field weld or bond between contiguous CWR strings and between CWR strings and special trackwork units before the rail has been brought to final vertical and horizontal alignment, before the rail has been adjusted to the indicated zero thermal stress range, and before the rail has been fully fastened.

3.18 PERMANENT RAIL FASTENING

- A. Adjust the CWR string lengths for the specified zero thermal stress temperature:
 - 1. Adjust rail on DF bridges before adjusting ballasted track approaches. Anchor 300 track feet on each side at the temperature specified for DF track. When adjusting the approaches, unclip the 300 ballasted track feet up to the structure and adjust the ballasted track string to the appropriate temperature for ballasted track.
 - 2. When closing on a fully anchored string, remove 300 feet of existing rail clips, readjust the existing string for temperature and refasten before executing the field weld.
 - 3. Fasten the CWR strings in a manner which ensures that there is no unfastened portion of rail greater than 100 feet in length between fastened portions of the same string.

4. When joining newly constructed track to existing track in operation, adjust the adjacent 300 track feet of the existing track for zero thermal stress temperature in conjunction with the de-stressing of the new track.
 5. Obtain approval of the City prior to de-stressing existing track in operation. De-stressing work of operating track shall not be scheduled during streetcar operating hours.
- B. Vibrate the rail to relieve internal rail stresses and fully fasten the string. Record movement at quarter points and submit to the City daily.
1. Use vibrators, approved by the City, to relieve internal rail stresses.
 2. Do not strike CWR with objects which might damage the rail surface.
- C. Temperature of a rail, when being fastened opposite a previously fastened rail, shall be within 5 degrees F of the previously fastened rail's temperature at the time of its fastening.
- D. Once the rail has been adjusted to achieve zero thermal stress at the specified temperature, maintain the correct rail gap until the rail is fully fastened.

3.19 ZERO THERMAL STRESS

- A. Zero thermal stress at the specified temperature in CWR may be achieved by heating, cooling, or pulling the rails, or a combination thereof. When zero thermal stress at the specified temperature is obtained, begin fastening immediately.
- B. Maintain the stress within the rail to achieve the specified zero thermal stress range during installation of joints.

3.20 FIELD WELDING

- A. Perform field welds in accordance with the requirements of Section 34 11 16, "Trackwork - Field Rail Welding".

3.21 RAIL END-HARDENING

- A. End-harden standard rail ends in the field at all bonded joints. Remove joint bars from rail ends during the end-hardening process.

3.22 END-HARDENING TESTS

- A. Personnel to perform end-hardening shall prepare two sample rails in accordance with the AREMA Manual.
1. Test the two samples through an independent laboratory approved by the City and submit the test results to the City.
 2. Acceptance of the end-hardening procedure and personnel will depend on the samples passing the tests specified below.
- B. Two samples of end-hardened rail shall be tested for Brinell hardness in accordance with ASTM E10 in a grid pattern of 1/4-inch increments for a distance of 6 inches from the end of the rail.
- C. Record the Brinell hardness numbers and locations.

- D. After the hardness test has been performed, section one sample longitudinally for 1 foot along the centerline of rail. The other sample shall be sectioned transversely 1/2 inch from the end of the rail. Etch both cross sections to facilitate the observation of the hardness pattern.
- E. Attain a Brinell hardness number not less than 341 nor more than 401 when measured at a point on the centerline of rail 1/2" from the rail end. The decrease in hardness shall occur uniformly over a distance not less than two inches. The hardness pattern shall be uniform across the top surface of the rail head. Examine the etched cross sections of the rail to ensure that a uniformly distributed hardness pattern is evident. End hardening shall be performed only by personnel and with procedures which have been accepted in accordance with the above procedure.

3.23 RAIL BEVEL

- A. Bevel rail ends at bonded joints in accordance with AREMA Standard Plan Basic Number 1005.

3.24 RAIL GRINDING

- A. Upon completion of the track by the Contractor to the specified tolerances and after acceptance, rail grinding will be done by the City.

3.25 FINAL ALIGNMENT AND TRACK INSPECTION

- A. Survey the track in accordance with Section 01 71 23, "Field Engineering", to determine if the horizontal and vertical alignment, gauge, crosslevel, and superelevation are within the tolerances specified for each type of track construction.
- B. Correct track deviations which exceed tolerances.

3.26 ELECTRICAL TESTS

- A. Electrical Test.
 - 1. The insulated joint assembly shall be dry. Apply 500 volts d.c. across the joint from rail to rail and from each rail to one bar, each arrangement for a duration of 5 seconds. Use a megohmmeter that reads directly in megaohms to measure resistance.
 - 2. The acceptance criterion for this test shall be a minimum resistance of 10 megaohms.
- B. The Contractor shall submit test procedures and equipment identification for the Engineer's review at least 30 Days prior to beginning Work. The electrical test shall be performed by a certified electrician employed by the Contractor and approved by the Engineer.
- C. Results of the electrical test shall be submitted to the Engineer for approval.
- D. Any single bonded insulated joint that fails the electrical test in track shall be removed, replaced and retested at Contractor's expense. Replacement procedure shall be approved by the Engineer.

3.27 PRECURVED RAIL

- A. Install fabricated precurved rail as shown and in accordance with the approved manufacturer's fabrication drawings.
- B. Mark precurved radius and installation location.

3.28 RESTRAINING RAIL

- A. Install fabricated restraining rail as shown and in accordance with the approved manufacturer's fabrication drawings.

PART IV - MEASUREMENT AND PAYMENT

4.1 MEASUREMENT AND PAYMENT

- A. Plan quantities are final quantities; no field measurement will be made.

TABLE 34 11 93-1

TRACK CONSTRUCTION TOLERANCES

Class and Type of Track	Gauge Variation	Cross Level and Superelevation Variation	Vertical Track Alignment		Horizontal Track Alignment	
			Total Deviation	Middle Ordinate In 62' Chord	Total Deviation	Middle Ordinate In 62' Chord
Direct Fixation and Paved Track	+1/8" - 1/16"	± 1/8"	± 1/4"	± 1/8"	± 1/8"	± 1/8"
Mainline Ballasted Track	± 1/8"	± 1/8"	± 1/2"	± 1/8"	± 1/2"	± 1/8"
Yard Ballasted Track	+3/16" - 1/8"	± 3/16"	± 3/8"	± 1/4"	± 3/8"	± 1/4"
Shop Track	± 1/8"	± 1/8"	± 1/4"	± 1/8"	± 1/4"	± 1/8"

Notes:

- (1) Total deviation is measured between the theoretical and actual alignment centerline at any point in the track.
- (2) Total horizontal and vertical deviation in road crossings ± 1/4".
- (3) In the Station Platform areas: Total Horizontal deviation shall be 0" towards Platform and 1/8" away from platform; Total Vertical deviation shall be 0" above Platform and 1/8" below platform.

END OF SECTION

SECTION 34 11 93**OTHER TRACK MATERIALS****PART I - GENERAL****1.1 SUMMARY**

A. Description

This Section defines the requirements for the manufacture, testing, and supply of insulated joint bars, compromise joints, shims, miscellaneous hardware for fastening of running rail and special trackwork. All hardware shall be new and sized to match the fastener component for which they will be used.

1.3 SUBMITTALS

A. Submit or retain the following:

1. Insulated Bonded Joints and Compromise Joints
 - a. Submit detailed description of the adhesive to be used to bond the joint bars to the rail, and the method by which the quality of the adhesive formulation and preparation is regulated, maintained and monitored.
 - b. Retain drawings showing details of bolts, lock nuts and all other components of the assembly, including fully detailed step-by-step installation instructions.
 - c. Submit inspection and test plan
 - d. Retain packaging procedures
 - e. Retain most recent historical rolling load test records demonstrating adherence to these Specifications.
 - f. List of references and contact personnel of transit authorities that have qualified and accepted similar concrete guard rail ties for Contracts with similar technical specifications.
 - g. Statement of the manufacturer's capabilities to carry out the work in accordance with the technical and quality assurance/control requirements.
 - h. Delivery procedures
 - i. Testing facilities certifications
 - j. Insulated rail joint electrical test procedures and equipment
 - k. Insulated rail joint electrical test results
2. Shims
 - a. Inspection and test plan and procedures
 - b. Retain packaging procedures
 - c. Delivery procedures
3. Miscellaneous Hardware
 - a. Retain shop drawings detailing the hardware to be furnished for the Work
 - b. Submit prequalification test results for review or prequalification test plans to include:
Test procedures
 - i. Schedule of qualification tests to be performed
 - ii. Name of independent test laboratory proposed to perform tests
 - c. Retain production run test plans to include:
 - i. Test procedures
 - ii. Test reporting procedures

- d. Retain hardware manufacture quality assurance reports to include:
 - i. Production run test reports
 - ii. Packaging procedures

1.4 QUALITY ASSURANCE/QUALITY CONTROL

A. General

The Contractor shall include its inspection and testing plan for the work. The inspection and testing plan shall identify who, what, when and where in the process of design, production, assembly, shipment and acceptance that all inspections will be performed.

- B. The Contractor shall conduct review of fabrication drawings, showing the details and procedures for the manufacture, cutting of the plates, machining of the inclined surfaces, drilling, punching or cutting of holes, and the finishing to specified tolerances prior to commencement of fabricated work.

PART II - PRODUCTS

2.1 MATERIALS

A. Insulated Bonded Joints

Insulated Bonded Joints shall be in accordance with Section 2.8 and Section 2.11 of the AREMA Manual for Railway Engineering, Chapter 4 and as directed below. The Contractor shall furnish single bonded insulated rail joints, in kit form, of the epoxy bonded type as manufactured by L.B. Foster Allegheny Rail Products, Co., Portec Rail Products Inc., Railway Bonded insulated joints, or approved equal.

Joint bars for insulated bonded joints shall provide for full face contact, conforming to the shape of the designated TRAM or RE rail section, and shall be fabricated from quenched carbon steel as specified in the AREMA specifications, except as defined herein. The joint bars shall be smooth and straight for installation along tangent track, or pre-curved to match the rail radius at the connection point of special trackwork and in curves with a radius less than 400 feet.

The fishing height of the joint bars shall be within a tolerance of + 0 inches to $1/32$ inch of the dimensions defined in the AREMA specifications. The contact surface of the joint bars adjacent to the rail shall be smooth and straight within a tolerance of $\pm 1/32$ inch using a 36 inch straight edge. The inside face of the joint bars shall be smooth, with no stamping or branding permitted.

Insulated bonded joints shall be complete with 3/16" thick high pressure laminated end posts, steel core bushings, and heat-treated oval neck track bolts, nuts, and washers. Nuts shall be designed with a locking feature to prevent loosening meeting Contract requirements.

Provide holes in the rail and joint bars as required. The size and location of deburred holes shall conform to the AREMA Manual for Railway Engineering, Volume 1, Chapter 4 Rail, Section 1.3 Rail Drillings, Bar Punchings and Bolts.

The structural adhesive used as the bonding agent shall produce a minimum lap shear strength of 3,500 psi at 75 degrees F as per test prescribed in ASTM D1002. Adhesive and electrical insulation materials supplied with the joint bars shall have a shelf life of not less

than one year when stored in a location protected from the weather. A corrosion inhibitor shall also be included in the adhesive formulation.

The insulating materials shall consist of a high pressure and laminated design; impervious to oil, grease, and water; and having electrical resistance characteristics equal to or greater than fiber insulation meeting the requirements of the AREMA Signal Manual of Recommended Practice, Sections 8.5.2 Recommended Developmental Criteria for Fabricated Insulating Parts for Track Insulation and 8.5.3 Recommended Developmental Criteria for Track Insulating Material; and the Electrical Resistance Test specified herein.

B. Compromise Joints

New compromise joint bars shall conform to the requirements of the "Specifications For Quenched Carbon-Steel Joint Bars and Forged Compromise Joint Bars" found in Chapter 4, Part 2 of the AREMA Manual for Railway Engineering.

Compromise joint bars shall be of the size, shape, and punching pattern required to fit the rail sizes and sections being joined. Only factory designed and forged or cast compromise joint bars shall be used.

TRAM rail compromise transition pieces shall be machined to smoothly transition from an RE section to TRAM section. Contractor to submit shop drawings for review.

C. Shims

Regular and tapered steel shims used to adjust the elevation of the direct fixation fasteners shall be manufactured to the shape, size and configuration to accommodate the direct fixation fastener system. The tapered shims shall be used to adjust rail cant transition from 1:20 to zero at the special trackwork areas and to maintain the required rail cant at grade crossings.

Steel shims specified to the thickness of 20 gauge and 11 gauge shall be manufactured from galvanized steel, coating designation G90, meeting the requirements of ASTM A653M, lock forming quality or approved equivalent.

Steel shims specified to the thicknesses of $\frac{1}{8}$ inch, $\frac{3}{8}$ inch, $\frac{1}{2}$ inch and all tapered shims shall be manufactured from hot-rolled plate steel meeting the requirements of CSA G40.21, Grade 260 or equal. The measured thickness shall be inclusive of galvanizing. Steel shims shall be hot-dip galvanized in accordance with the latest edition of CSA G164, or equal. Galvanizing of shims shall consist of a minimum coating of 2 ounces/ft² on each side after manufacture.

Steel shims shall be sheared or cut by a method to obtain the required configuration, and which is acceptable to the buyer. Edges sheared, punched or cut during manufacture shall be ground to remove all sharp edges. Shims are to be hot dipped galvanized after all machining is complete. Slotted or circular holes shall be drilled, punched or cut at right angles to the shim surfaces.

Steel shims shall be smoothly finished and free from injurious warp and other surface imperfections due to projecting fins of metal caused by shearing, drilling or punching operations.

D. Miscellaneous Hardware

All miscellaneous hardware shall meet the physical dimensions, strength and properties and test requirements as defined herein.

The hex head bolts shall be used for embedding into concrete with or without epoxy grout and shall consist of the minimum dimensions required for the particular use. The hex head bolt shall be capable of withstanding the ultimate torque requirement necessary to destroy the diameter bolt as specified in ASTM A325. The ultimate tensile strength of the hex head bolt itself shall equal or exceed the tensile strength of 56,380 pounds as specified in ASTM A325.

Circular holes for joint bolts shall be drilled to conform to the drawings. A variation of nothing under and $\frac{1}{16}$ inch over in the size of the bolt holes will be permitted. A variation of $\frac{1}{32}$ inch in the location of the holes will be permitted. Chamfer the entrance and exit sides of the holes.

Miscellaneous heat-treated carbon-steel track bolts and carbon-steel nuts shall be in accordance with Section 2.9 of the 2006 AREMA Manual for Railway Engineering. Miscellaneous spring washers shall be in accordance with Section 2.10 of the 2006 AREMA Manual for Railway Engineering.

PART III – EXECUTION

3.1 QUALIFICATION TESTING

A. Insulated Bonded Joint Bars

Six (6) samples of the designated RE rail section will be prepared for qualification testing. Four (4) of the pieces shall be 24 inches long and two (2) of the pieces shall be 36 inches. All qualification testing will be performed at the expense of the Contractor.

1. End Hardening Tests

All six (6) samples shall be end hardened in accordance with the Contractor's submitted procedure. Two (2) sample ends shall be selected and tested as specified below:

- a. Brinell hardness readings will be taken at the centerline of the rail head longitudinally at $\frac{1}{4}$ inch intervals for a distance of one inch from the hardened end. The rail sample shall then be sawed longitudinally along the centerline and the Brinell hardness readings shall be taken at $\frac{1}{4}$ inch intervals, $\frac{3}{16}$ inch below head of rail, for a distance of 2 inches from the hardened end. The de-carburized surface on the rail head shall be removed before taking Brinell hardness readings.
- b. Acceptance shall be based on a Brinell hardness measured at a spot on the center line of the head between 341 and 401 at all locations within $\frac{1}{2}$ inch of the rail end. The heat-affected zone defined as the region in which the hardness is above that of the parent metal shall cover the full width of the rail head and extend longitudinally a minimum of 1.5 inches from the end of the rail. The effective hardness zone $\frac{1}{2}$ inch from the end of the rail shall be at least $\frac{1}{4}$ inch deep.
- c. If either of the samples fails to meet the acceptance criteria, the procedure shall be modified and the tests repeated until acceptance hardness values have been achieved.

2. Longitudinal Compression Test

Two bonded joints shall be completely assembled, by others, from the four sample pieces of RE rail each 2 feet long. Each joint assembly shall then be sawn in half

where the rails are butted together. The sawing shall be performed in a manner which will prevent overheating and damage to the epoxy bond, and the cut will be perpendicular to the centerline of the top of the rail with a tolerance of +/- one degree. The sawn ends of the bars at one end of the test piece, and the end of rail at the other, shall have fair bearing in the test machine to ensure that the loading and reaction are through the centroid of the rail, and parallel to its axis. Loads shall be applied longitudinally in increments of 25,000 pounds. Each load increment shall be maintained constant until the longitudinal deflection of the rail ceases before increasing the load to the next increment. The load will be increased in these designated increments until a total load of 600,000 pounds is attained, or failure occurs. At each increment of loading, the load and differential movement of the rail and joint bars, measured to 0.001 inch, shall be recorded.

The bonded joint shall be accepted based on the Longitudinal Compression Test when it is demonstrated that the joints have not slipped at any time during application of the incremental loads, up to 600,000 pounds, nor the magnitude of differential movement is $\frac{1}{16}$ inch in any direction. At the completion of the test, after the load on the rail has been released, the relative position of the rail and joint bar shall be within 0.020 inch of its original position.

If either sample fails to meet the above-defined requirements, the installation procedure shall be modified and the tests repeated.

3. Electrical Resistance Test:

a. Test Procedure:

- i. Fully assemble an insulated rail joint consisting of two lengths of 115 RE rail; one 24 inches long and the other 42 inches long. The rail shall be supported on non-conducting material.
- ii. 500 volts (DC) shall be applied to the rail across the insulated joint for a duration of 3 minutes, while the current flow through the joint is measured and recorded to the nearest 0.1 microampere.

b. Acceptance Criteria:

- i. The minimum resistance shall be 10 megohms for 500 volts (DC).

4. Rolling Load Test:

After completion of the Electrical Resistance Test, the same bonded joint shall be subjected to the Rolling Load Test per Section 2.11.7.4 of the 2006 AREMA Manual for Railway Engineering.

If the sample fails to meet the above defined acceptance test requirements, the installation procedure shall be modified and the tests repeated.

5. Additional Follow-up Testing:

a. Test Procedure:

- i. The bonded insulated joint shall be subjected to follow-up testing after it has passed the electrical resistance test, electrical impedance test and the rolling load test.

- ii. Repeat the electrical resistance and impedance tests as specified above.
 - iii. Subject the joint assembly to the Longitudinal Compression Test after completion of the electrical resistance and impedance tests.
 - b. Acceptance Criteria:
 - i. The follow-up testing results shall follow the acceptance criteria previously established for each respective test.
- B. Shims
 - 1. Prototype Testing

Prototypes of each designated type of steel shim shall be manufactured, tested and supplied to the UTA for review and written statement of no objection prior to the start of production.

The prototype testing shall include checks of all dimensions, coating thickness, and surface finish for each type of shim specified.
 - 2. Production Testing

The Contractor shall submit mill certificates defining the chemical and mechanical properties of the material supplied for the manufacture of the steel shims.

Dimensional measurements shall be performed by the Contractor to ensure conformance with the specifications. At least 2% of all the shims manufactured for the project and not less than 2 shim types manufactured per production day. Test results shall be submitted to the UTA for review.

The coating thickness of shims galvanized by the Contractor or its agent shall be verified by the Contractor using magnetic gauges or by a procedure acceptable to UTA. Tests on the coating thicknesses shall be performed on at least 1% of all the shims produced for the project and on not less than 1 shim type per production day. Certified test results shall be submitted to the UTA for approval.
- C. Miscellaneous Hardware
 - 1. Hardware Production Test Requirements

The Contractor shall submit mill certificates on the chemical and mechanical properties of the material supplied for the manufacture of the hardware.

The hex head bolts and lag screws shall be subjected to and meet the pre-qualification test acceptance criteria as specified in ASTM A325.

The hex head bolts and lag screws shall be subjected to and meet the production run test acceptance criteria as specified in ASTM A325.
 - 2. Coating

All hex head bolts shall be coated in accordance with ASTM B633, Type II (Olive Drab) Fe/Zn.

All other designated hardware shall be galvanized in accordance with the applicable ASTM specifications.

3.2 PACKAGING, LABELING, AND STORAGE

A. Insulated Bonded Joint Bars

1. Packaging

All materials used for packaging and crating for delivery shall be new, robust and of equal quality to the best commercial packaging and delivery crating practices accepted in the industry.

The choice of packaging shall be based on the most severe operational and climatic conditions expected during transit and storage. Key factors to be considered shall include the following:

- a. Possibility of rough handling during transit and storage from manufacturer to final destination.
- b. Shock, vibrational and static impacts, and environmental exposure during loading, unloading and transit operations.
- c. Geographic and climatic conditions at the final destination.
- d. Handling facilities and practices used at points of loading and discharging of cargo.

2. Labeling

Each package unit shall be marked to identify contents, quantity, and gross weight.

B. Compromise Joint Bars

Compromise joint bars shall be wired together in pairs and separated from the other bars.

C. Shims

Shims shall be packaged by the category of thickness, handled and stored in a manner that will prevent damage to the materials. The Contractor's commercial practice for preservation and packaging shall provide adequate protection against deterioration and physical damage during storage and handling.

Shipment marking information shall be provided on the interior and exterior of delivery containers. The information shall include nomenclature, manufacturer's name and part catalog number, contract or order number, and destination.

D. Miscellaneous Hardware

The hardware shall be manufactured, transported and stored so that no physical damage occurs to the threads. The hardware shall be packaged in equal quantities and in accordance with commercial practice for preservation and packaging.

Shipment marking information shall be provided on the exterior of delivery containers. The information shall include nomenclature, manufacturer's name and part catalog number,

contract or order number, and destination. Each pallet shall not exceed 2000 pounds in weight and each pallet shall clearly show the quantities on each pallet.

3.3 INSTALLATION OF BONDED INSULATED RAIL JOINTS

- A. Each crew and its foreman shall be pre-qualified before installing each type of glued joint. In order to become pre-qualified, a crew must fabricate two joints in track to simulate actual joint installation and then cut the joints out of the track. The joint will then be tested in accordance with the Longitudinal Compression Test. Failure of a test sample disqualifies the foreman and, at the discretion of the Engineer, the entire crew.
- B. All non-high strength 112 TRAM and 115 RE rail shall be hardened and all rail ends shall be beveled in accordance with AREMA Standard Plan No. 1005-40-Beveling of the Rail Ends for Special Trackwork. Remove all foreign materials, loose rust, and scale to near white metal on the end 21 inches of the web, bottom of head and top of base of each rail in accordance with SSPC SP-10.
- C. Field fabricated single bonded insulated joints shall be installed at locations shown on the Contract drawings and in conformance with the manufacturer's recommended procedures. Two insulated joints, on opposite rails, shall be installed at each callout on the respective Plan, unless otherwise indicated.
- D. The center of the joint shall be approximately centered between rail supports and the contractor shall alternate the direction of the bolt insertion.
- E. The Engineer shall be notified 24 hours in advance of installation of all insulated joints.
- F. Installation procedures shall be submitted for the Engineer's review at least 30 days prior to beginning Work and shall include at least the following items:
 - 1. Care and storage of materials
 - 2. Date of glue manufacture
 - 3. Glue shelf life
 - 4. Rail end preparation
 - 5. Weather and temperature restrictions
 - 6. Mixing and application of glue
 - 7. Installation of insulated joint bar and pin bolts
 - 8. Curing restrictions
 - 9. Detection of glue bond failures
- G. Insulated Rail Joint Electrical Test
 - 1. All insulated joints shall be tested after installation into track.
 - 2. Electrical Test
 - a. The insulated joint assembly shall be dry. Apply 500 volts DC across the joint from rail to rail and from each rail to one bar, each arrangement for a duration of 5 seconds. Use a megohmmeter that reads directly in megohms to measure resistance.
 - b. The acceptance criterion for this test shall be a minimum resistance of 10 megohms.

3. The Contractor shall submit test procedures and equipment identification for the Engineer's review at least 30 Days prior to beginning Work. The electrical test shall be performed by a certified electrician employed by the Contractor and approved by the Engineer.
 4. Results of the electrical test shall be submitted to the Engineer for approval.
 5. Any single bonded insulated joint that fails the electrical test in track shall be removed, replaced and retested at Contractor's expense. Replacement procedure shall be approved by the Engineer.
- H. Insulating paint shall be applied to the circumference of the rail head and post after assembly and curing of bonded insulated joint adhesive. The insulating paint shall be applied as a stripe centered on the end post 1", \pm 1/4" wide.
- I. Rail cuts and end drilling shall conform to the requirements in Section 34 11 29, "General Track Construction".

PART IV - MEASUREMENT

- 4.1 Item Basis** – Measurement of the transition rails and insulated joints will be per each item supplied and installed. No separate measurement will be made for the other track materials required for the track construction.

PART V - PAYMENT

- 5.1 General** – The accepted measured quantity of the transition rails and insulated joints will be paid for at the Contract unit price per unit of measurement. The Contract unit price will be payment in full for furnishing all labor, materials, tools, equipment and incidentals, and doing all Work necessary to complete the Work specified. Cost for the other track materials than those listed above will be incidental to the Contract unit cost of the Embedded Track bid items.

END OF SECTION

SECTION 34 21 05**COMMON WORK RESULTS FOR TRACTION ELECTRIFICATION SYSTEM (TES)****PART 1 - GENERAL****1.1 SUMMARY**

- A. This Section includes the following:
 - 1. Summary of Work for TES.
 - 2. General electrical requirements for materials, assembly, and installation.
 - 3. Labeling and listing of electrical equipment and products, and field evaluation for products not listed.
 - 4. Delivering, picking, and setting prepackaged TES substations on site.
 - 5. Coordinating with Kansas City Power & Light (KCP&L) for TES substations.
 - 6. Temporary power for TES substation HVAC.
- B. Requirements of this Section apply to all 34 21 xx and 34 22 xx sections.

1.2 RELATED SECTIONS

- A. SECTION 01 33 00 – Submittal Procedures
- B. SECTION 34 21 06 – TES Common Work Results for Metals
- C. SECTION 34 21 17 – TES Substation Design and Assembly
- D. SECTION 34 21 31 – TES Substation Automation System (SAS)
- E. SECTION 34 22 05 – TES Common Work Results for Conductors and Cable

1.3 DEFINITIONS

- A. Authority Having Jurisdiction (AHJ): As defined in NFPA 70, Article 100, Definitions.
- B. Engineer: Owner's representative.

1.4 REFERENCED STANDARDS

- A. Institute of Electrical and Electronics Engineers (IEEE)
 - 1. IEEE C2, National Electrical Safety Code
- B. International Conference of Building Officials
 - 1. International Building Code (IBC)
- C. National Electrical Contractors Association (NECA)
 - 1. NECA 1, Standard Practice of Good Workmanship in Electrical Construction

- D. National Electrical Manufacturers Association (NEMA)
 - 1. NEMA 250, Enclosures for Electrical Equipment (1000 Volts Maximum)
- E. National Fire Protection Association (NFPA)
 - 1. NFPA 70, National Electrical Code (NEC)
 - 2. NFPA 130, Fixed Guideway Transit and Passenger Rail Systems

1.5 SUBMITTALS

- A. Procedures: SECTION 01 33 00 – Submittal Procedures.
- B. TES Specific Requirements:
 - 1. Schedule submittals such that the project schedule is not delayed.
 - a. Submit product data and samples not less than 30 days before scheduled procurement. Submit shop drawings not less than 30 days before work involving such drawings is to be performed.
 - b. Contractor shall bear the risk when products, equipment, or materials are procured before approval of submittals or work is started before approval of shop drawings.
 - 2. On each submittal, indicate the relevant Specification Section by section number, paragraph number, and subparagraph number.
 - 3. For submittals requiring resubmittal, resubmit with title identical to the original submittal and clearly indicate the revision number.
 - 4. Stamp and sign submittals as reviewed and approved by the Contractor before submission, including subcontractor submittals.
- C. Product Data: Submit manufacturer's product data for products specified in this Section if not submitted under another Section:
 - 1. Sealing strip.
 - 2. Padlocks.
- D. Schedule of padlocks with keying.
- E. Submit for information only:
 - 1. Substation setting plan, including diagram showing position of truck and crane and description of steps involved.
 - 2. Substation anchoring design sealed by a structural engineer registered in the State of Missouri.
- F. Seismic Calculations: Submit sealed seismic design and bracing calculations that include equipment and raceways in each Section of these Specifications.

1.6 COORDINATION

- A. Coordinate delivery of prefabricated substation with Engineer.
 - 1. Before picking substation off truck, obtain approval to partially or completely restrict a city street, sidewalk, or alley with Kansas City.
- B. Electric Utility, Kansas City Power & Light (KCP&L):
 - 1. Contact KCP&L to obtain KCP&L-furnished metering equipment:
 - a. Meter socket.
 - b. CTs and PTs.
 - 2. Coordinate with KCP&L for connection of permanent power to substations. Provide access to allow KCP&L to install service conductors in Contractor-provided conduit. KCP&L will terminate conductors.
 - 3. Owner will pay utility bill for permanent power at each substation from the time of connection of permanent power.

1.7 QUALITY ASSURANCE

- A. Comply with the requirements of the Project Quality Plan.
- B. Regulatory Requirements: Comply with current federal, state, and local requirements.
- C. Compliance with Standards:
 - 1. Where equipment or materials are specified to conform to the standards of organizations such as ANSI, ASTM, IEEE, and NEMA, submit evidence of conformance for review and record purposes.
 - 2. The label or listing will be acceptable as sufficient evidence that the materials and equipment do conform to the specified standards.
 - 3. Wherever a code or standard is specified, it shall be understood that amendments to the specified standard by the state, county, city, or other authority having jurisdiction shall apply to the Work.
 - 4. Submit evidence of compliance to seismic safety requirements of the International Building Code and NFPA 70.
 - 5. Perform Work in compliance with the following industry standards and regulations:
 - a. NFPA 70, National Electrical Code .
 - b. NFPA 130, Standard for Fixed Guideway Transit and Passenger Rail Systems.
 - c. NECA 1, Standard for Good Workmanship in Electrical Construction.
 - d. IEEE C2, National Electrical Safety Code.
- D. Qualifications:
 - 1. Workers shall be experienced in the type of work they are performing.

2. TES Substation: Modifications or testing performed in substations after delivery to the site shall be supervised by a TES Substation Supervisor representing the substation manufacturer. The supervisor must be located at the site, not at a remote location.
 3. Welding: Performed only by welders qualified as stated in Section 34 21 06, TES Common Work Results for Metals.
 4. Ensure workers performing field work meet the qualification and licensing requirements of the State.
- E. General Performance Requirements:
1. Provide electrification equipment proven in similar railroad, rail transit, or heavy industrial service and make use of this experience to prepare a suitable and proven design for this application.
 2. Systems Integration: Integrate TES elements such that specified requirements are achieved without conflict or error within or between specified elements.
 3. Provide replacement spare parts that are functionally and physically interchangeable for each product class.

1.8 DELIVERY, STORAGE, AND HANDLING

- A. Obtain written permission from the Engineer before shipping substation.

PART 2 - PRODUCTS

2.1 TRACTION ELECTRIFICATION SYSTEM (TES) SUMMARY OF WORK

- A. Assemblies, Material, Equipment, Products, Installation, and Related Submittals:
1. Four prefabricated TES mainline substations and one built-in-place TES Vehicle Maintenance Facility (VMF) substation.
 2. Grounding for TES substations at each substation site.
 3. Grounding for surge arresters at each substation site.
 4. Blue lights on TES substations and OCS poles.
 5. Dc positive feeder cables from each substation to the OCS.
 6. Dc negative cables from each substation to the rail.
 7. Cross bonding cables.
 8. Fiber optic cables between TES substations for transfer trip.
 9. Pad-mounted dc disconnect switches at each substation.
 10. VMF dc disconnect switches.
 11. VMF contactor panel and interlocking.
 12. VMF Auxiliary Power Supply (APS), with ac disconnect switch, control panel, and APS cable with attachment plug.

13. TES spare parts and special tools.
- B. Coordination with Kansas City Power & Light (KCP&L).
- C. Special Submittals:
 1. TES Studies.
 2. TES Operation & Maintenance Manual.
 3. As-built drawings.
 4. TES Training Manual.
- D. Testing of TES substations, cable, and other installed equipment and systems.
- E. Training of Owner's personnel.

2.2 SEISMIC DESIGN

- A. Equipment provided under this Contract shall meet seismic requirements specified in the International Building Code (IBC).
- B. Submit calculations and design for suitable anchorage and bracing performed and sealed by a structural engineer registered in the State of Missouri.

2.3 MATERIALS AND PRODUCTS

- A. General Requirements:
 1. Material shall be new and in first class condition, of design, sizes, and ratings as indicated, and suitable for the use intended.
 2. Products shall be the manufacturer's latest standard design and discontinued materials or products shall not be used.
 3. Materials and equipment shall be standard products of manufacturers regularly engaged in the production of such material and equipment.
 4. Methods of fabrication, assembly, and installation shall comply with specified standards.
 5. Where two or more units of the same class of material or equipment are required, provide products of a single manufacturer.
 6. Similar component parts of different larger assemblies are not required to be the products of the same manufacturer.
 7. Each type of material and equipment shall be of the same manufacture and quality throughout the Work.
- B. Environmental Requirements:
 1. Material and equipment shall be designed to ensure satisfactory operation and life in the environmental conditions that exist where the material or equipment is installed.

2. Material and equipment shall be suitable for its intended environment.
 - a. Wet locations: NEMA 250 Type 4X corrosion resistant stainless steel enclosures.
 - b. Indoor damp locations: NEMA 250 Type 12 enclosures fabricated from painted-galvanized or stainless steel.
 - c. Wet or damp locations: Corrosion resistant fittings or supports, hot-dip galvanized or as otherwise specified.
 - d. Exposed dry locations: Corrosion resistant painted finishes may be used for equipment and enclosures as approved by Engineer.
- C. Finish Requirements:
 1. Ferrous Metal: Above Grade: Hot-dip galvanized, galvanized, or powder coated. Refer to Galvanizing or Shop Applied Coatings in Section 34 21 06, TES Common Work Results for Metals.
 2. Galvanizing: Wherever "galvanized" or "hot-dip galvanized" is called out in these Specifications, the material shall be coated in accordance with galvanizing requirements in Section 34 21 06, TES Common Work Results for Metals.
- D. Fasteners, Hardware:
 1. Fasteners: Stainless steel. Double-sided tape shall not be used for attachment of channel or wire supports.
 2. Hardware:
 - a. Corrosion resistant.
 - b. Suitable for the use and environment intended by the manufacturer.
 - c. Unplated steel shall not be used.
- E. Cable ties (tie wraps): Comply with requirements of Section 34 22 05, TES Common Work Results for Conductors and Cable.
- F. Sealing Strip: Water and humidity resistant moisture barrier.
 1. Neoprene rubber pad, durometer hardness Shore A 60, tensile strength 900 psi, elongation 300 percent, 1/4 inch by 6 inches.
 2. Acceptable Manufacturer/Product: Biltrite Commercial Neoprene, Style 10.
- G. Field Applied Coatings:
 1. Galvanized Steel Field Coating: Organic cold galvanizing coating as specified in Section 34 21 06, TES Common Work Results for Metals.
 2. Oxide inhibiting joint compounds:
 - a. Non-petroleum based compound with evenly suspended zinc particles.
 - b. Approved Manufacturer/Product: Burndy, Penetrox A-13, or approved equal.

2.4 POLE-MOUNTED BLUE LIGHT

- A. Comply with product requirements in Section 34 21 17, TES Substation Design and Assembly
- B. Mounting: Suitable for pipe-mounting on OCS pole.

2.5 PADLOCKS

- A. Key as directed by Engineer.
- B. All locks keyed alike for each application, unless directed otherwise by the Engineer.
- C. Indoor:
 - 1. Heavy duty, rekeyable padlock, with minimum 3/8-inch diameter boron-alloy shackle with 2-inch clearance.
- D. Outdoor:
 - 1. Same as interior but outdoor-type with weather cover.
 - 2. Acceptable Manufacturer/ Product: Master Lock, Master Pro Series 6121KALJ.

2.6 FACTORY ASSEMBLY

- A. Torquing:
 - 1. Torque bolted connections in accordance with manufacturer's recommendations.
 - 2. Use a torque wrench calibrated within the past 12 months and bearing a calibration sticker.

3. Torque busses and bus connections per manufacturer's recommendations or according to the following table.

SILICON BRONZE BOLT STANDARD DRY TORQUE		
Bolt Size Inches	Threads/ inch	Inch Pounds
1/4	20	68.8
	28	87
5/16	18	123
	24	131
3/8	16	219
	24	240
7/16	14	349
	20	371
1/2	13	480
	20	502
9/16	12	632
	18	697
5/8	11	1030
	18	1154
3/4	10	1416
	16	1382

4. Torque cable connections per manufacturer's recommendations, or according to the following table.

STEEL BOLT STANDARD DRY TORQUE IN FOOT POUNDS							
		SAE Grade					
Bolt Size Inches	Course Threads/ inch	0-1-2	3	5	6	7	8
1/4	20	6	9	10	12.5	13	14
5/16	18	12	17	19	24	25	29
3/8	16	20	30	33	43	44	47
7/16	14	32	47	54	69	71	78
1/2	13	47	69	78	106	110	119
9/16	12	69	103	114	150	154	169
5/8	11	96	145	154	209	215	230
3/4	10	155	234	257	350	360	380

5. Apply torque mark after torquing connection.

PART 3 - EXECUTION**3.1 FIELD INSTALLATION**

- A. Requirements of Article titled "Factory Assembly" apply to field installation.
- B. Seal equipment enclosures against dust, whenever dusty conditions are present inside the rooms or outside, during the construction period.
- C. Provide seismic anchorage and bracing in accordance with submitted design and calculations.

3.2 INSTALLATION OF TES SUBSTATION AT PROJECT SITE

- A. Comply with requirements of Kansas City, including but not limited to the following:
 - 1. Obtain any required permits.
 - 2. Comply with installation requirements at the site.
 - 3. Obtain required inspections and approval.
- B. Before setting substation in place, provide a sealing strip between substation base and concrete slab.
- C. Anchor substation to slab using Contractor-furnished design sealed by a structural engineer registered in the State of Missouri.

3.3 TEMPORARY POWER AND HEAT

- A. Provide temporary heat within 24 hours of setting substation to prevent condensation inside the substation until permanent power is connected.
- B. Provide sufficient heat to maintain substation at 65 degrees, day and night.
- C. Provide temporary power to heater.
- D. A portable generator may be used as an alternate to temporary utility power.

3.4 INSTALLATION OF EXTERIOR BLUE LIGHT ON OCS POLE

- A. Provide blue light on remote OCS pole at locations indicated on Contract Drawings.
- B. Connect blue light to associated TES substation, as indicated on Contract Drawings, such that it illuminates for alarms indicated in Section 34 21 31, TES Substation Automation System (SAS).

PART 4 - MEASUREMENT AND PAYMENT**4.1 MEASUREMENT**

- A. The quantities of accepted work will be measured in the following units. All measurements will be plan measure except for authorized changes.
 - 1. Description: Lump Sum

4.2 PAYMENT

- A. Payment will be made at the respective unit or lump-sum price listed in the proposal and shall be full compensation for all labor, materials, and equipment necessary to complete the respective unit in place. There will be no separate measurement or payment for any item of work not specifically identified and listed in the proposal, and all such work shall be considered a subsidiary item with all costs pertaining thereto included in the prices for other items listed in the proposal. At the Engineer's option, partial payment may be made for any lump sum item listed in the proposal, providing that the Contractor is diligently and satisfactorily pursuing full completion of such partially complete item in accordance with the approved job progress schedule.

END OF SECTION

THIS PAGE INTENTIONALLY LEFT BLANK

SECTION 34 21 06**COMMON WORK RESULTS FOR METALS****PART 1 - GENERAL****1.1 SUMMARY**

- A. This Section includes the following:
 - 1. Galvanizing.
 - 2. Welding.
 - 3. Shop-applied powder coat.
 - 4. Shop-applied paint coating system.

1.2 DEFINITIONS

- A. Hot-dip galvanizing: Dipping steel members and assemblies into molten zinc for lasting, or long-term corrosion protection. Resultant zinc coating fuses permanently with base steel material.
- B. Galvanneal: Zinc-iron alloy coating created on sheet steel by a continuous hot-dipping process followed by heat treatment in an annealing furnace.

1.3 RELATED SECTIONS

- A. SECTION 01 33 00 – Submittal Procedures

1.4 REFERENCED STANDARDS

- A. Section incorporates by reference the latest revisions of the following documents:
- B. The American Society for Nondestructive Testing (ASNT)
 - 1. ASNT CP-105, Standard Topical Outlines for Qualification of Nondestructive Testing Personnel
 - 2. Recommended Practice No. SNT-TC-1A: Personnel Qualification and Certification in Nondestructive Testing

 4. SSPC-SP6, Commercial Blast Cleaning
 5. SSPC-SP8, Pickling

1.5 SUBMITTALS

- A. Procedures: SECTION 01 33 00 – Submittal Procedures.
- B. Galvanizing:
 - 1. Certification:
 - a. Notarized certificates of compliance with ASTM requirements specified in this Section.
 - b. Certification that galvanizing is in conformance with this Section, signed by the galvanizer; include a detailed description of all material and methods used.
 - c. Certification of membership in American Galvanizers Association, signed by the galvanizer.
 - 2. Product Data:
 - a. Materials used for shop applied galvanizing.
 - b. Materials for field repair of shop applied galvanizing demonstrating conformance with specified standard. Include manufacturer's written directions for storage, handling, and application.
 - 3. Testing:
 - a. Source Quality Control inspection and test reports
 - b. Field Quality Control inspection and test reports
- C. Welding:
 - 1. Certification: Furnish notarized certificates of compliance with ASTM requirements specified in this Section.
 - 2. Welder Qualifications:
 - a. Submit record of AWS qualification for each welder to be employed in the Work.
 - b. Submit certified copies of qualification test records for each welder, welding operator and tack welder to be employed in the Work.
 - c. Submit welders' identification marks (I.D.) for each welder along with qualifications.
 - 3. Welding Procedures:
 - a. Before welding, submit the procedure that will be used for qualifying welding procedures.
 - b. For procedures other than those prequalified in accordance with AWS D1.1/D1.1M, submit a copy of procedure qualification test records in accordance with the qualification requirements of AWS D1.1/D1.1M.
 - 4. Welding Records and Data:
 - a. Submit records of ultrasonic testing to the Engineer upon completion.

-
- b. If field welding is permitted, submit descriptive data for field welding equipment.
- D. Shop-Applied Powder Coat:
- 1. Certification:
 - a. Certification that galvanizer is a member of Powder Coating Institute (PCI).
 - b. Certification that the finish is in conformance with this Section, signed by the applier.
 - c. Certification that the applicator has been authorized to provide the coating formulator's warranty.
 - 2. Product Data:
 - a. Descriptive and technical data sheets describing products proposed for use.
 - b. Documentation of application process.
 - 3. Qualifications Submittals (for each applicator) minimum 60 days before work is scheduled:
 - a. Evidence that powder coat applicator is PCI 3000 or PCI 4000 Certified.
 - b. Evidence that the applicator is an approved and authorized applicator of the coating formulator's products.
 - c. Evidence that the applicator is experienced in applying powder coat successfully to the specified substrate (e.g. galvaneal with minimum coating weight A25).
 - d. Applicator's quality control procedures.
 - 4. Powder Coat Samples: Submit for each color and substrate one 12-inch square of heavy gage sheet metal with the primer, top coat, and graffiti coat applied. Stagger each coat such that the Engineer's can view each.
 - 5. Testing: Certified test results evidencing compliance of applied coatings with the application and testing requirements specified in this Section.
 - 6. Repair:
 - a. Manufacturer recommended repair procedures and materials procedures for field touchup of marred or damaged coatings using air-drying spray materials in matching colors.
 - b. If repair is necessary, submit repair sample after salt spray testing.
 - 7. Maintenance Information: Manufacturer's recommended maintenance materials and procedures.
- E. Shop-Applied Paint Coating System:
- 1. Certifications.
 - a. Certification that the finish is in conformance with this Section, signed by the applier.

- b. Certification that the applicator has been authorized to provide the coating formulator's warranty.
2. Product Data:
 - a. Performance characteristics: For each substrate used, the tested performance characteristics of the coating.
 - b. Documentation of application process.
3. Paint Coating System Samples: Submit for each color and substrate one 12-inch square of heavy gage sheet metal with the primer, top coat, and graffiti coat applied. Stagger each coat such that the Engineer's can view each.

1.6 QUALITY ASSURANCE

- A. Comply with the requirements of the Project Quality Plan.
- B. Single Source for Galvanized and Finished Metal Fabrications:
 1. Use products of one manufacturer on each specific item to ensure exact color match and finish appearance.
- C. Galvanizing:
 1. Galvanizing firm shall be member of American Galvanizers Association Inc. (AGA).
 2. Inspection and Tests:
 - a. Inspections, test and samples shall conform with ASTM Specifications and Standards.
 - b. Inspection rights and privileges, procedures and acceptance or rejection of galvanized steel materials shall conform with ASTM A123/A123M.
- D. Welding:
 1. Welder Qualifications:
 - a. Welding shall be done by qualified, certified welders who make only those welds for which they have been qualified in accordance with AWS, or other approved qualifying procedures.
 - b. Welders, Welding operators, and tack welders shall be certified in accordance with AWS D1.1/D1.1M.
 - c. For sheet steel, welders shall be qualified in accordance with AWS QC7 and AWS D1.3/D1.3M, Qualification Section.
 - d. Records of welder qualification tests shall be made available for review upon the Engineer's request.
 2. Welding Procedure Qualification:
 - a. Welding procedures shall be prequalified or qualified in accordance with AWS D1.1/D1.1M.
 - b. For sheet steel, proposed welding procedures shall be qualified in accordance with AWS D1.3/D1.3M. Prequalification is not applicable to sheet steel.

3. Welding Inspector Qualifications:
 - a. Welds to be inspected by the Contractor shall be inspected and certified by an AWS Certified Welding Inspector (CWI).
 - b. CWI shall be certified in accordance with AWS QC1.
 4. Nondestructive Testing Personnel Qualifications:
 - a. Qualified and certified in accordance with SNT-TC-1A and ASNT CP-105.
 - b. Certified for NDT Level I and working under a person or persons certified for NDT Level II or Level III.
 5. Welding Records:
 - a. Retain mill certificates and certified copy of reports for analyses and tests required by referenced ASTM and AWS specifications.
 - b. Retain radiographs upon completion of fabrication.
 - c. Retain certifications that magnetic particle and dye-penetrant inspections have been satisfactorily completed.
- E. Shop-Applied Powder Coating:
1. Powder coating firm shall be member of the Powder Coating Institute (PCI).
 2. Applicator Qualifications:
 - a. Engage an experienced coating applicator that is PCI 3000 or PCI 4000 certified.
 - b. Applicator shall have demonstrated the ability to properly apply the coating to the specified substrate and have quality control procedures firmly established in its shop.
 - c. Engineer may, at his option, visit the applicator's facility to confirm adherence to quality control procedures.

1.7 DELIVERY, STORAGE, AND HANDLING

- A. Deliver, handle, and store metal fabrications in a manner that prevents damage to the item, its galvanizing, and its finish.

1.8 WARRANTY

- A. Scope: Warranty applies to the following:
 1. Coating applied to shop welds.
 2. Shop-applied powder coat.
 3. Shop-applied paint coating system.
- B. Warranty Period: 5 years.

- C. Furnish written warranty starting on date of conditional acceptance stating that shop-applied coating will not blister, peel, crack, chalk, change color or have other forms of degradation during warranty period.
- D. Coating failure:
 - 1. In the event that coating failure occurs within warranty period, replace item indicating coating failure, including full cost of labor and materials for such replacement.
 - 2. Replacement items shall be new and finished with same type coating meeting requirements of this Section.
 - 3. Replacement items shall match adjacent members.
- E. The Engineer may permit field repairs in lieu of replacement, provided coating failure is minor in scope and field repair material and method employed match its adjacent member. Repairs shall be compatible with original surface.

PART 2 - PRODUCTS

2.1 SHOP-APPLIED GALVANIZING

- A. General:
 - 1. Wherever materials are called out as "hot-dip galvanized" or "galvanized," provide a zinc coating after fabrication in accordance with ASTM A123/A123M.
 - 2. Hardware items such as bolts or other threaded fasteners shall be hot-dip galvanized after fabrication in accordance with A153/A153M.
 - 3. Specified materials or products that are not readily available in the specified hot-dip finish, shall be custom hot dipped after manufacture by an independent galvanizer.
- B. Selection, Design, and Fabrication Before Galvanizing:
 - 1. Verify with supplier or fabricator that material is chemically suitable for galvanizing.
 - 2. Warpage: Design assemblies as recommended in ASTM A384/A384M to limit warpage and distortion during hot-dip galvanizing.
 - a. Notify the Engineer of potential warpage problems that require modification in design before proceeding with steel fabrications.
 - b. Costs for alternative designs shall be performed at no additional cost to Owner.
 - 3. Design and fabricate assemblies requiring shop fabrication using methods recommended in ASTM A385/A385M to obtain high quality hot-dip galvanized coating.
 - 4. Embrittlement: Select proper steel, design assemblies, and thermally treat before galvanizing as recommended in ASTM A143/A143M to withstand normal galvanizing operations without embrittlement.
 - 5. Galvanizer Coordination Drawings: Furnish shop drawings to galvanizer of non-standard fabrications, tubular fabrications, and fabrications with materials of different thicknesses.

6. Inspect iron and steel hardware before galvanizing and verify suitability for galvanizing. Replace items that are not suitable for galvanizing.
 7. When the item to be galvanized incorporates threaded assemblies, make provisions in thread size to accommodate galvanizing and galvanize disassembled.
 8. Weld, drill, and assemble galvanized members before galvanizing.
- C. Hot-Dip Galvanizing Material:
1. Galvanizing bath shall contain 0.05 to 0.09 percent nickel by weight.
 2. Zinc for galvanizing: Conform to ASTM B6, as specified in ASTM A123/A123M.
- D. Preparation:
1. Remove all welding slag, splatter, and burrs.
 2. Clean all surfaces in conformance with SSPC SP6, Commercial Blast Cleaning.
 3. Pickle all surfaces in conformance with SSPC SP8, Pickling.
 4. Safeguard against increasing the likelihood of steel embrittlement during pickling in accordance with ASTM A143/A143M.
 5. Mask galvanized members that are to be field or shop welded after galvanizing to a distance of 1 inch from weld line before galvanizing.
- E. Hot-Dip Galvanizing:
1. Select a galvanizer with galvanizing kettle large enough to accommodate the largest member or assembly requiring hot-dip galvanizing. Progressive dipping shall not be used.
 2. Hot-dip galvanize structural steel and metal fabrications as indicated in conformance with ASTM A123/A123M.
 3. Hot-dip galvanize bolts or other threaded fasteners after fabrication in accordance with A153/A153M.
 4. Thickness of zinc coating: Conform to requirements of ASTM A123/A123M or ASTM A153/A153M, whichever is applicable.
 5. Finish, uniformity, and adherence of coating: Conform to requirements of ASTM A123/A123M or ASTM A153/A153M, whichever is applicable.
 6. Galvanized members on which powder coat or paint will be applied shall not be quenched by the galvanizer.
 7. Galvanizer's Stamp: Galvanized materials shall be marked with the galvanizer's stamp.
- F. Mechanical Galvanizing shall not be used.

2.2 WELDING

- A. Weldability of Steel: For structural steel requiring impact test qualification and for corrosion resistant structural steel, establish weldability of steel and procedures for welding it by qualification in accordance with AWS D1.1/D1.1M, to match the notch toughness and weathering characteristics of the base metal.
- B. Rod/Electrodes:
1. Electrodes for structural plate, shapes, pipe, tubes, and bars shall conform to AWS A5 Series Standards and shall be coated rods or wire of size and classification number as recommended by their manufacturers for the conditions of actual use.
 2. Electrodes for sheet steel shall conform to AWS A5 Series Standards and shall be coated rods or wire of size and classification number, as recommended by their manufacturers for the conditions of actual use.
 3. Matching filler metal requirements shall conform to AWS D1.1/D1.1M, Table 3.1.
- C. Stud Shear Connectors: Only products of manufacturers qualified in accordance with AWS D1.1/D1.1M will be accepted for this Work.
- D. Shop Welding:
1. Perform shop welding as indicated in accordance with AWS D1.1/D1.1M, and AWS D1.3/D1.3M, as applicable to the Work.
 2. Welders shall mark adjacent to completed welds their welder I.D., using metal stamp, metal engraving, keel, paint stick, or other appropriate marking material.
 3. Welding of stud shear connectors shall conform to AWS D1.1/D1.1M, Section 7. "Stud Welding," and the stud manufacturer's instructions.
- E. Coating Shop Welds:
1. Coat shop welds made after hot-dip galvanizing and areas masked to permit welding as follows:
 - a. Provide an inorganic ethyl silicate primer containing 85 percent zinc by weight in the dry film.
 - b. Prepare surface in strict compliance with manufacturer's recommended procedures.
 - c. Apply a single coat of 75 microns dry film thickness in strict accordance with manufacturer's application instructions.
 - d. Top coat is required only if surrounding surface is painted, or if necessary to match color of surrounding area.
 - e. Where top coating is required, provide a compatible product and apply according to manufacturer's instructions to achieve good cohesion and prevent pinholing.
 2. Color: Match color of surrounding area.

2.3 SHOP-APPLIED POWDER COAT

- A. Provide shop-applied polyester triglycidyl isocyanurate (T.G.I.C.) coatings, thermo-cured color finish systems based on dry, powdered resins, commonly known as "powder coat."
- B. Powder coat system shall meet the requirements listed below in the Article titled "Source Quality Control" in the Paragraph titled "Shop-Applied Powder Coating Testing," when applied on the specified substrate, e.g. hot dip galvanized steel or galvanized sheet steel.
- C. Preparation before coating:
 - 1. Hot-dip galvanized per ASTM A123/A123M: Prepare surface in accordance with ASTM D7803.
 - 2. Galvanized per ASTM A653/A653M: Prepare surface in accordance with ASTM D7803
 - 3. Cleaning:
 - a. Clean surfaces to be coated as follows:
 - 1) Remove all dust, dirt, and other surface debris by vacuuming, wiping dry with clean cloths or compressed air.
 - 2) Rinse scrubbed surfaces with clean water until foreign matter is flushed from surface.
 - 3) Allow surfaces to drain completely and allow to thoroughly dry.
 - 4) Use water blasting only when necessary for extreme cases of contamination by oily residue and where hand washing is impractical.
 - 5) If the above procedures do not clean the substrate surfaces, clean the surfaces with high pressure water washing.
 - 4. Pretreatment:
 - a. Wash parts in a four stage iron-phosphate washer for steel or zinc-phosphate washer for galvanized steel, or in accordance with primer manufacturer's recommendations.
 - b. Dry parts before application of powder coating.
 - c. Treatment of the substrate: ASTM D3451.
- D. Powder Coat:
 - 1. Primer: Apply primer compatible with powder top coat, as confirmed by powder coat manufacturer.
 - 2. Top Coat: Acceptable Manufacturer/Product: Tiger Drylac, or approved equal.
 - 3. Anti-Graffiti Coating:
 - a. Apply as final coat on exterior surfaces.

- b. Powder coating intended for easy removal of typical spray paint used for graffiti.
 - c. Compatible with top coat.
- E. Dry Film Thickness:
 - 1. Primer: 3.5 mils minimum.
 - 2. Top coat: 3.5 mils minimum.
 - 3. Anti-graffiti coating: As recommended by manufacturer.
- F. Perform mechanical processing such as sawing, drilling, milling, cutting, and bending before applying shop applied coatings.
- G. Coating shall meet the testing requirements of ASTM D3451 and other standards indicated below:
 - 1. Physical Properties of Powder Coatings:
 - a. Measurement of film thickness: ASTM D6132 or ASTM D7091.
 - b. Abrasion resistance: ASTM D968.
 - c. Adhesion: ASTM D3359, Method B, 5B.
 - d. Elongation (flexibility): Mandrell Bending Test, ASTM D522, equal to or greater than 3 mm.
 - e. Household chemical resistance: ASTM D1308.
 - f. Detergent resistance: ASTM D2248.
 - g. Chip resistance: ASTM D3170.
 - h. Gloss:
 - 1) Interior: 25 to 40 percent reflective gloss.
 - 2) Exterior: ASTM D523, 80 to 90 plus.
 - i. Pencil hardness:
 - 1) Interior: ASTM D3363, F minimum.
 - 2) Exterior: ASTM D3363, 4H (minimum).
 - j. Impact resistance: ASTM D2794, 80 (in/lb), no appearance of cracks.
 - 2. Accelerated Artificial Weathering: ASTM D6695, ASTM G151, ASTM G155.
 - 3. Accelerated Environmental Exposure:
 - a. Salt spray:
 - 1) Interior: ASTM B117, maximum undercut failure of 1/16 inch at scribed test lines; no blistering.

-
- 2) Exterior: ASTM B117, 500 hours, maximum undercut failure 1 (mm); no blistering.
 - b. Humidity Resistance: ASTM D2247, 500 hours, maximum undercutting 1 mm, no blistering.
- H. Perform mechanical processing such as sawing, drilling, milling, cutting, and bending before applying shop applied coatings.
- I. Cleaning:
1. Clean surfaces to be coated as follows:
 - a. Remove all dust, dirt, and other surface debris by vacuuming, wiping dry with clean cloths or compressed air.
 - b. Rinse scrubbed surfaces with clean water until foreign matter is flushed from surface.
 - c. Allow surfaces to drain completely and allow to thoroughly dry.
 - d. Use water blasting only when necessary for extreme cases of contamination by oily residue and where hand washing is impractical.
 - e. If the above procedures do not clean the substrate surfaces, clean the surfaces with high pressure water washing.
- J. Pretreatment:
1. Wash parts in a four stage iron-phosphate washer for steel or zinc-phosphate washer for galvanized steel, or in accordance with primer manufacturer's recommendations.
 2. Dry parts before application of power coating.
 3. Treatment of the substrate: ASTM D3451.
- K. Application:
1. Edges: Treat and finish as required to ensure specified minimum dry film coating thickness is achieved. Precoating of edges may be required.
 2. Apply primer in accordance with manufacturer's written application instructions.
 3. Apply top coat in accordance with manufacturer's written application instructions.
 4. Allow surfaces to cure for time period in accordance with manufacturer's cure curves.
 5. Inspect parts after cooling.
- L. Color:
1. TES Substation Enclosure Exterior: Color will be provided by the Engineer.
 2. TES Substation Enclosure Interior: RAL 9010, Pure White.
 3. Electrical Equipment: Munsell Color System 8.3G 6.1/0.5 (ANSI 61 grey).

2.4 SHOP-APPLIED PAINT COATING SYSTEM

- A. General Requirements:
1. Coatings must be certified VOC compliant and conform to applicable regulations and EPA standards.
 2. Material Compatibility:
 - a. Provide primers, finish coat materials and related materials that are compatible with one another and the steel substrate.
 - b. Furnish documentation from manufacturer demonstrating compatibility in both application and service based on testing and field experience.
 3. Material Quality:
 - a. Provide highest grade of coatings as regularly manufactured by acceptable coating manufacturers.
 - b. Materials not displaying manufacturer's identification as a best-grade product will not be acceptable.
 4. Coating system shall meet the requirements listed below in the Article titled "Source Quality Control" in the Paragraph titled "Shop-Applied Paint Coating System Testing," when applied on the specified substrate, e.g. hot dip galvanized steel or galvanized sheet steel.
- B. Primer: Polyamide epoxy, 4-6 mils DFT.
- C. Top Coat:
1. High solids, pigmented, aliphatic polyurethane, minimum 4 mils DFT.
 2. Color: As specified, as indicated, or as directed by the Engineer.
- D. Anti-Graffiti Coat:
1. Clear, aliphatic polyurethane non-sacrificial coating designed to resist graffiti and protect the underlying substrate.
 2. From the same manufacturer and compatible with approved top coat.
- E. Acceptable Manufacturers/Brands:
1. AkzoNobel/ICI Paints/Devco High Performance Coatings;
 2. Carboline;
 3. PPG Protective and Marine Coatings ;
 4. Tnemec; or approved equal.
- F. Shop-Applied Paint Coating Application:
1. Prepare steel in accordance with paint manufacturer's recommendations.
 - a. Verify with paint manufacturer that proposed surface cleaner is compatible with approved paint coating system.

- b. Apply paint as soon as possible after surface preparation.
2. Primer:
 - a. Shop-apply in accordance with SSPC-PA 1, SSPC-PA 2, SSPC-PS 13.01, and manufacturer's instructions.
 - b. Verify DFT in accordance with SSPC-PA 2.
3. Top coat: Shop-apply in accordance with manufacturer's instructions.
4. Graffiti coat: Shop apply two coats in accordance with manufacturer's instructions.

2.5 SOURCE QUALITY CONTROL

- A. Shop Inspections and Tests by the Engineer:
 1. Galvanizing, shop applied coatings, and welds are subject to inspections and tests by the Engineer.
 2. The Engineer will make test results available to the Contractor.
- B. Galvanizing:
 1. Shop Galvanizing Inspection and Test:
 - a. Inspect and test galvanizing for full coverage and adhesion to steel in accordance with ASTM A123/A123M or ASTM A153/A153M, whichever is applicable.
 - b. Inspection and test shall include the following:
 - 1) Visual examination of samples and finished products.
 - 2) Tests to determine weight or mass of zinc coating per square foot of steel surface.
 - 3) Tests to determine distribution and uniformity of zinc coating.
 - 4) Tests to determine thread fittings of units, washers to bolts.
 - c. Test hardware or assemblies susceptible to embrittlement in accordance with ASTM A143/A143M. The Engineer will make the final determination on whether embrittlement testing is required.
 - d. Shop Galvanizing Repair:
 - 1) Grind rough areas to produce a uniform surface.
 - 2) Repair steel grinding, scratches and other damage, in accordance with ASTM A780/A780M.
 - 3) Sprayed Zinc: Clean and preheat to assure freedom from loose material, moisture, oil grease, or other foreign matter before applying zinc. Apply zinc coating by metallizing spray to clean and dry surfaces.

-
- 4) Zinc-Based Solders and Wire:
 - a) Clean to remove loose material and contaminates, and heat to approximately 572 degrees F.
 - b) Apply zinc-alloy repair compound by spreading material over heated surface in accordance with compound manufacturer's instructions.
 - c) Remove repair compound residues with damp cloth or by rinsing with water.
 - 5) Organic cold galvanizing coating:
 - a) Minimum 95 percent metallic zinc by weight in dried film.
 - b) Approved Manufacturer: ZRC Products Company, or approved equal.
2. Dry film thickness of applied repair materials: Not less than galvanized coating thickness required by ASTM A53/A53M, A123/A123M, or A153/A153M.
- C. Welding Inspections and Tests by the Contractor:
1. Visual Inspection:
 - a. All welds shall be visually examined in accordance with AWS D1.1/D1.1M.
 - b. Quality of welds and standards of acceptance shall be in accordance with AWS D1.1/D1.1M.
 2. Inspection and Testing Type Requirements:
 - a. Nondestructive Testing: Conform to AWS B1.10M/B1.10.
 - b. Liquid Penetrant Inspection: Liquid dye penetrant inspection of welds shall conform to ASTM E165.
 - c. Magnetic Particle Inspection: Magnetic particle inspection of welds shall conform to ASTM E709.
 - d. Ultrasonic Testing: Comply with AWS D1.1/D1.1M and ASTM E164, as applicable.
 - e. Radiographic Testing: Comply with AWS D1.1/D1.1M and ASTM E94 and ASTM E1032, as applicable.
 3. Inspect complete and partial joint penetration groove welds and fillet welds using magnetic particle inspection as follows:
 - a. One out of five (20 percent) of complete joint penetration groove welds of tee and corner joints.
 - b. One out of ten (ten percent) of partial joint penetration groove welds and fillet welds.
 4. Random Testing: Randomly test 10 percent of welds by either liquid penetrant inspection or magnetic particle inspection.

5. Additional Testing: If random testing reveals possible flaws, test the welds in question, and additional welds if directed by the Engineer, using ultrasonic or radiographic testing. Requirement for this additional testing shall be at no additional cost to the Owner and shall be at the sole discretion of the Engineer.
 6. Test complete joint penetration groove welds by radiographic testing as follows:
 - a. One out of ten (ten percent) with thickness equal to or less than 3/4 inch.
 - b. One out of two (50 percent) with thickness greater than 3/4 inch and equal to or less than 1.5 inches.
 - c. 100 percent for thickness greater than 1.5 inches.
 - d. Complete joint penetration groove welds not accessible for radiographic testing shall be subjected to ultrasonic testing. The extent shall be the same as specified for radiographic testing.
 7. Inspection and Test Results:
 - a. Forward test result information to the Engineer immediately after test results are available.
 - b. State the acceptance or rejection of fabricated components, so that repairs and reinspection or testing may be performed as soon as possible.
 8. Repairs:
 - a. Repair unacceptable welds in accordance with AWS D1.1/D1.1M.
 - b. Reinspect or retest repaired or corrected welds as specified for the original weld.
- D. Shop-Applied Powder Coating Testing:
1. Coating shall meet or exceed the following testing requirements and performance criteria of ASTM D3451 and other standards indicated below.
 2. Physical Properties of Powder Coatings:
 - a. Measurement of film thickness: ASTM D6132 or D7091.
 - b. Abrasion resistance: ASTM D968.
 - c. Adhesion: ASTM D3359, Method B, 5B.
 - d. Elongation (flexibility): Mandrell Bending Test, ASTM D522, equal to or greater than 3 mm.
 - e. Household chemical resistance: ASTM D1308.
 - f. Detergent resistance: ASTM D2248.
 - g. Chip resistance: ASTM D3170.
 - h. Gloss:
 - 1) Interior: 25 to 40 percent reflective gloss.
 - 2) Exterior: ASTM D523, 80 to 90 plus.

- i. Pencil hardness:
 - 1) Interior: ASTM D3363, F minimum.
 - 2) Exterior: ASTM D3363, 4H (minimum).
 - j. Impact resistance: ASTM D2794, 80 (in/lb), no appearance of cracks.
 - 3. Accelerated Artificial Weathering: ASTM D6695, ASTM G151, ASTM G155.
 - 4. Accelerated Environmental Exposure:
 - a. Salt spray:
 - 1) Interior: ASTM B117, maximum undercut failure of 1/16 inch at scribed test lines; no blistering.
 - 2) Exterior: ASTM B117, 500 hours, maximum undercut failure 1 (mm); no blistering.
 - b. Humidity Resistance: ASTM D2247, 500 hours, maximum undercutting 1 mm, no blistering.
- E. Shop-Applied Paint Coating System Testing:
- 1. Primer shall meet or exceed the following testing requirements and performance criteria of the standards indicated below:
 - a. Abrasion Resistance per ASTM D4060 (CS17 Wheel, 1,000 grams load), 1 kg Load: 200 mg loss.
 - b. Adhesion per ASTM D4541: 1050 psi.
 - c. Corrosion Weathering per ASTM D5894, 13 Cycles, 4,368 Hours: Rating 10 per ASTM D714 for blistering; Rating 7 per ASTM D610 for rusting.
 - d. Direct Impact Resistance per ASTM D2794: 160 inch pounds.
 - e. Flexibility per ASTM D522, 180 degree Bend, 1 inch Mandrel: Passes.
 - f. Pencil Hardness per ASTM D3363: 3B.
 - g. Moisture Condensation Resistance per ASTM D4585, 100 degrees F, 2000 Hours: Passes, no cracking or delamination.
 - h. Dry Heat Resistance per ASTM D2485: 250 degrees F.
 - 2. Top Coat shall meet or exceed the following testing requirements and performance criteria of the standards indicated below:
 - a. Abrasion Resistance per ASTM D4060, CS17 Wheel, 1,000 Cycles 1kg Load: 87.1 mg loss.
 - b. Adhesion per ASTM D4541: 1050 psi.
 - c. Direct Impact Resistance per ASTM D2794: Greater than 28 inch pounds.
 - d. Indirect Impact Resistance per ASTM D2794: 12-14 inch pounds.
 - e. Dry Heat Resistance per ASTM D2485: 200 degrees F.

- f. Salt Fog Resistance per ASTM B117 9,000 Hours: Rating 10 per ASTM D714 for blistering.
- g. Flexibility per ASTM D522, 180 Degree Bend, 1/8 Inch Mandrel: Passes.
- h. Pencil Hardness per ASTM D3363: 2H.
- i. Moisture Condensation Resistance per ASTM D4585, 100 degrees F, 1000 Hours: No blistering or delamination.
- j. Xenon Arc Test per ASTM D4798: Pass 300 hours.

PART 3 - EXECUTION

3.1 INSTALLATION

- A. Field Welding: Shall be performed as specified for shop welding.

3.2 SITE QUALITY CONTROL

- A. Galvanizing: After delivery of substation, inspect and repair damage to galvanizing.
 - 1. Repair field cutting of metal, welds, steel grinding, scratches and other damages, and coat masked areas, in accordance with ASTM A780/A780M.
 - 2. Dry film thickness of applied repair materials: Not less than galvanized coating thickness required by ASTM A53/A53M, A123/A123M, or A153/A153M.
- B. Shop Applied Coating: After delivery of substation, inspect and repair damage to shop applied coating.
 - 1. Repair minor film scratches and other blemishes in film surfaces in accordance with coating manufacturer's recommended procedures and materials.
 - a. Submit recommended procedures and materials.
 - b. Prepare a sample demonstrating the proposed repair procedures and materials, and subject to salt spray test per ASTM B117.
 - c. Submit the sample after testing.
 - 2. Finished repairs shall match original finish for color and gloss, shall adhere to original finish, and shall exhibit no removal of coating film or blistering during dry adhesion testing when tested in accordance with ASTM D3359.
 - 3. Remove coated items damaged beyond repair and replace with newly fabricated and coated items.
- C. Welding Inspections and Tests:
 - 1. Perform tests of field welds as specified for shop welds.
 - 2. Engineer will perform visual inspections of field welds as specified for shop welds.

PART 4 - MEASUREMENT AND PAYMENT**4.1 MEASUREMENT**

A. The quantities of accepted work will be measured in the following units. All measurements will be plan measure except for authorized changes.

1. Description: Lump Sum

4.2 PAYMENT

A. Payment will be made at the respective unit or lump-sum price listed in the proposal and shall be full compensation for all labor, materials, and equipment necessary to complete the respective unit in place. There will be no separate measurement or payment for any item of work not specifically identified and listed in the proposal, and all such work shall be considered a subsidiary item with all costs pertaining thereto included in the prices for other items listed in the proposal. At the Engineer's option, partial payment may be made for any lump sum item listed in the proposal, providing that the Contractor is diligently and satisfactorily pursuing full completion of such partially complete item in accordance with the approved job progress schedule.

END OF SECTION

SECTION 34 21 08**TES DIELECTRIC EPOXY FLOORING****PART 1 - GENERAL****1.1 SUMMARY**

- A. This Section includes trowel-applied, dielectric, epoxy-resin flooring for TES substation floors.

1.2 RELATED SECTIONS

- A. SECTION 01 33 00 – Submittal Procedures
- B. SECTION 34 21 90 – TES Testing

1.3 REFERENCED STANDARDS

- A. Section incorporates by reference the latest revisions of the following documents:
- B. ASTM International (ASTM)
 - 1. ASTM D149, Standard Test Method for Dielectric Breakdown Voltage and Dielectric Strength of Solid Electrical Insulating Materials at Commercial Power Frequencies
 - 2. ASTM D695, Standard Test Method for Compressive Properties of Rigid Plastics
 - 3. ASTM D4541, Standard Test Method for Pull-Off Strength of Coatings Using Portable Adhesion Testers
 - 4. ASTM F2170, Standard Test Method for Determining Relative Humidity in Concrete Floor Slabs Using in situ Probes

1.4 SUBMITTALS

- A. Procedures: SECTION 01 33 00 – Submittal Procedures.
- B. Product Data:
 - 1. Epoxy flooring materials and performance characteristics.
 - 2. Preparation and installation instructions.
- C. Installer Certificates: Signed by manufacturers certifying that installers comply with requirements in Article titled "Quality Assurance."
- D. Operation and Maintenance Data:
 - 1. Submit manufacturer's cleaning and maintenance instructions.
 - 2. Submit immediately after approval of product data.

1.5 QUALITY ASSURANCE

- A. Comply with the requirements of the Project Quality Plan.
- B. Installer Qualifications:
 - 1. Engage an installer who is certified in writing by epoxy flooring manufacturer as qualified to install manufacturer's products.
 - 2. Workers performing installation must be skilled and experienced in the installation of the approved product.

1.6 DELIVERY, STORAGE, AND HANDLING

- A. Deliver materials to assembly site in supplier's original wrappings and containers, labeled with source's or manufacturer's name, material or product brand name, and lot number.
- B. Store materials in their original, undamaged packages and containers, inside a well-ventilated area protected from weather, moisture, soiling, extreme temperatures, and humidity.

PART 2 - PRODUCTS**2.1 PERFORMANCE REQUIREMENTS**

- A. Provide flooring capable of the following when applied at 1/4-inch thickness:
 - 1. Dielectric service, in accordance with ASTM D149: 58,000 Vdc.
 - 2. Bond strength to concrete in accordance with ASTM D4541: 400 psi minimum.
 - 3. Abrasion Resistance: Not more than 0.5 grams loss when tested with Tabor abrader with 1000 gram load for 1000 cycles.
 - 4. Compressive strength per ASTM D695: 8500 psi.
- B. Performance of In-Place Flooring: Capable of withstanding testing conditions specified in 34 21 90, TES Testing without arcing or passing current beyond specified limit.

2.2 EPOXY-RESIN FLOORING

- A. Epoxy-Resin Flooring: Subject to compliance with requirements, provide Hallemite Dielectric Grey Amazite by RBC Industries, Inc., or approved equal.
 - 1. Thickness: 1/4 inch nominal.
 - 2. Color: Manufacturer's standard grey.
- B. Materials:
 - 1. Epoxy-Resin Matrix: Manufacturer's standard recommended for use indicated.
 - 2. Aggregates: Silica sand in gradation recommended by resin manufacturer.

2.3 SHOP APPLICATION

- A. Application Conditions:
1. Environmental Limitations: Comply with manufacturer's written instructions for substrate temperature, ambient temperature, moisture, ventilation, and other conditions affecting flooring installation.
 2. Provide permanent lighting or, if permanent lighting is not in place, simulate permanent lighting conditions during flooring installation.
 3. Close spaces to traffic during flooring application and for not less than 24 hours after application unless manufacturer recommends a longer period.
- B. Preparation:
1. Clean substrates of substances, including oil, grease, and curing compounds, that might impair flooring bond. Provide clean, dry, and neutral substrate for flooring application.
 2. Rough sand metallic floors as recommended by manufacturer to insure adhesion.
 3. Apply masking at stop points and at adjacent surfaces that are not to be coated, so that the flooring will finish at clean lines.
- C. Epoxy-Resin Flooring Installation:
1. Apply the epoxy to the area shown on Contract Drawings.
 2. Place and finish flooring according to manufacturer's written instructions.
 3. Installation Tolerance: Limit variation in flooring surface from level to 1/4 inch in 10 feet; non-cumulative.
 4. Where the edge joins the bare floor, taper the material from the full thickness to the height of the floor over a minimum of a 6-inch wide area.
 5. Ensure that matrix components and fluids from grinding operations do not stain flooring by reacting with divider and control-joint strips.
 6. Primer: Apply to flooring substrates according to manufacturer's written instructions.
 7. Install epoxy floor coating to a minimum thickness of 1/4 inch as a one piece surface.
 8. Where the epoxy floor covering meets a wall insulating panel, the floor covering shall completely fill gap to a minimum thickness of 1/4 inch.

2.4 PROTECTION

- A. During equipment installation, provide protective covering to keep the epoxy floor clean and free from damage.

2.5 SOURCE QUALITY CONTROL

- A. Inspect floor for cracks and joints. Repair in accordance with manufacturer's recommendations.
- B. Cut out and replace flooring areas that evidence lack of bond with substrate.
- C. Cut out flooring areas in panels defined by strips and replace to match adjacent flooring, or repair panels according to manufacturer's written recommendations, as approved by the Engineer.
- D. Testing: Test in accordance with Section 34 21 90, TES Testing. If flooring fails to provide specified level of electrical insulation, apply additional layers of epoxy until specified levels are achieved.

PART 3 - EXECUTION**3.1 VMF FIELD APPLICATION**

- A. Coordinate schedule so that building systems are fully installed before installation of dielectric floor to prevent damage to floor.
- B. Building and premises shall be clean, warm, and dry before installation of dielectric epoxy floor.
- C. Prepare concrete floor as directed by manufacturer to insure adhesion.
- D. Verify that concrete substrate is dry and moisture-vapor emissions are within acceptable levels according to manufacturer's written instructions.
 - 1. Moisture Testing: Perform tests indicated below.
 - a. In-Situ Probe Test: Perform relative-humidity test using in-situ probes in accordance with ASTM F 2170.
 - b. Proceed with installation only after substrates have a maximum 75 percent relative-humidity-level measurement.
- E. Block drains to prevent the entrance of epoxy-resin.
- F. Requirements of Articles titled "Shop Application" and "Protection" apply to field fabrication.

3.2 FIELD QUALITY CONTROL

- A. Inspection: After delivery to site, inspect floor for shipping damage.
- B. Testing:
 - 1. Prefabricated Substations: After delivery to site, test in accordance with Section 34 21 90, TES Testing, to ensure that floor has not been damaged during shipping.
 - 2. Built-in-Place VMF Substation: After installation of floor and before installation of substation equipment, test in accordance with Section 34 21 90, TES Testing.

PART 4 - MEASUREMENT AND PAYMENT**4.1 MEASUREMENT**

A. The quantities of accepted work will be measured in the following units. All measurements will be plan measure except for authorized changes.

1. Description: Lump Sum

4.2 PAYMENT

A. Payment will be made at the respective unit or lump-sum price listed in the proposal and shall be full compensation for all labor, materials, and equipment necessary to complete the respective unit in place. There will be no separate measurement or payment for any item of work not specifically identified and listed in the proposal, and all such work shall be considered a subsidiary item with all costs pertaining thereto included in the prices for other items listed in the proposal. At the Engineer's option, partial payment may be made for any lump sum item listed in the proposal, providing that the Contractor is diligently and satisfactorily pursuing full completion of such partially complete item in accordance with the approved job progress schedule.

SECTION 34 21 10**TES SELF-CONTAINED EYEWASH EQUIPMENT****PART 1 - GENERAL****1.1 SUMMARY**

- A. This section includes self-contained eyewash equipment for installation in TES substations.

1.2 REFERENCED STANDARDS

- A. Section incorporates by reference the latest revisions of the following documents:
- B. American National Standards Institute (ANSI)
1. ANSI Z358.1, Standard for Emergency Eyewash and Shower Equipment

1.3 SUBMITTALS

- A. Procedures: Section 01 33 00, Submittal Procedures.
- B. Product Data:
1. Eyewash station.
 2. Eyewash solution cartridge.
- C. Operation and Maintenance Data:
1. Submit manufacturer's operating and maintenance instructions on products specified in this Section.
 2. Submit immediately after approval of product data

PART 2 - PRODUCTS**2.1 MATERIALS**

- A. Eyewash Stations:
1. Self-contained eyewash station meeting the requirements of ANSI Z358.1 using factory-sealed cartridges of eyewash solution.
 2. Eyewash stations shall be suitable for wall mounting at locations indicated on Contract Documents and incorporate a fluid reservoir for discharged solution.
- B. Eyewash Saline Assembly:
1. Factory-sealed cartridge assembly containing contaminant-free, pH-balanced saline solution with integral nozzle(s) for solution delivery in a gentle flow meeting ANSI Z358.1 requirements.
 2. Cartridge assemblies shall have a two-year shelf life from date of manufacture.

2.2 MANUFACTURER

- A. Provide eyewash station and cartridges that are products of a single manufacturer.
- B. Acceptable Manufacturer/ Product: Honeywell Safety Products, Fendall Pure Flow 1000 or approved equal.

2.3 FACTORY ASSEMBLY

- A. Provide one eyewash station complete with eyewash fluid in each substation.
- B. Install eyewash station in accordance with manufacturer instructions immediately adjacent to battery installation. Locations shall meet requirements of ANSI Z358.1.
- C. Install eyewash solution cartridge(s) in accordance with manufacturer instructions.
- D. Provide translucent 6-mil polyethylene sheeting as a secure and dust-proof, temporary cover over each completed eyewash station.

PART 3 - EXECUTION

3.1 FIELD INSTALLATION

- A. Requirements of Article titled "Factory Assembly" apply to field installation.
- B. Provide factory-sealed eyewash saline assembly upon delivery of substation to site. Assembly shall have minimum 22-months shelf life remaining at time of delivery.

3.2 SITE QUALITY CONTROL

- A. Remove temporary cover after final commissioning of substation and verify that eyewash station is clean and ready to use.

PART 4 - MEASUREMENT AND PAYMENT

4.1 MEASUREMENT

- A. The quantities of accepted work will be measured in the following units. All measurements will be plan measure except for authorized changes.
 - 1. Description: Lump Sum

4.2 PAYMENT

- A. Payment will be made at the respective unit or lump-sum price listed in the proposal and shall be full compensation for all labor, materials, and equipment necessary to complete the respective unit in place. There will be no separate measurement or payment for any item of work not specifically identified and listed in the proposal, and all such work shall be considered a subsidiary item with all costs pertaining thereto included in the prices for other items listed in the proposal. At the Engineer's option, partial payment may be made for any lump sum item listed in the proposal, providing that the Contractor is diligently and satisfactorily pursuing full completion of such partially complete item in accordance with the approved job progress schedule.

END OF SECTION

SECTION 34 21 12

LOW-VOLTAGE PANELBOARDS

PART 1 - GENERAL

1.1 SUMMARY

- A. This Section includes the following:
 - 1. Circuit breaker panel boards, including dc distribution panelboard.
 - 2. Enclosed circuit breakers.

1.2 RELATED SECTIONS

- A. SECTION 34 21 05 – Common Work Results for TES
- B. SECTION 34 21 06 – TES Common Work Results for Metals

1.3 REFERENCED STANDARDS

- A. Section incorporates by reference the latest revisions of the following documents:
- B. ASTM International (ASTM)
 - 1. ASTM B187, Specification for Copper Bar, Bus Bar, Rod and Shapes
- C. National Electrical Manufacturers Association (NEMA)
 - 1. NEMA PB 1, Panelboards
 - 2. NEMA 250, Enclosures for Electrical Equipment (1000 Volts Maximum)
- D. National Fire Protection Association (NFPA)
 - 1. NFPA 70, National Electrical Code (with City of El Paso amendments)
- E. Underwriters Laboratories Inc. (UL)
 - 1. UL 67, Panelboards
 - 2. UL 489, Molded-Case Circuit Breakers, Molded-Case Switches, and Circuit-Breaker Enclosures

1.4 SUBMITTALS

- A. Procedures: Section 01 33 00.
- B. Product Data:
 - 1. Circuit breakers.
 - 2. Circuit breaker identification.

- C. Shop Drawings:
1. Submit shop drawings and electrical diagrams as follows:
 - a. Panelboards and Load Centers:
 - 1) Show general arrangement, location and identification of the enclosure.
 - 2) Identify each circuit.
 - 3) Show location and identification of terminals.
 - 4) Show location of barriers.
 - 5) Furnish wiring diagrams.
 - b. Circuit Breakers: Show circuit for which intended, voltage ratings, insulation level, current rating and interrupting ratings.
- D. Operation and Maintenance Data:
1. Submit manufacturer's operating and maintenance instructions on products specified in this Section, including the following:
 - a. Description of the switchboard and its components.
 - b. Manufacturer's operating and maintenance instructions, parts list, illustrations and diagram for components.
 - c. Recommended list of spare parts.
 - d. Wiring diagram.
 - e. Electrical characteristics of each component including relays or solid-state circuitry.
- E. Factory Test Reports: Submit copies of certified reports of factory tests performed in accordance with the applicable referenced standards and specification requirements.

1.5 QUALITY ASSURANCE

- A. Comply with the requirements of the Project Quality Plan.
- B. Qualifications: Manufacturer that has been regularly engaged in the manufacture of similar equipment and meets UL requirements.
- C. Conform to UL 489, NEMA PB 1, and NFPA 70, as applicable.
- D. Components of the same type, size, rating, functional characteristics and manufacture shall be interchangeable.
- E. Each item shall be UL labeled.

1.6 DELIVERY, STORAGE, AND HANDLING

- A. Ship each unit securely wrapped, packaged and labeled for safe handling in shipment and to avoid damage or distortion.
- B. Store in secure and dry storage facility.

PART 2 - PRODUCTS**2.1 PANELBOARDS AND LOAD CENTERS**

- A. Comply with NEMA PB 1 and UL 67.
- B. Enclosure:
1. NEMA 250 Type 1, fabricated from galvanized steel, surface-mounted unless otherwise indicated, tamperproof.
 2. Gutter size:

Main Bus Rating (Amperes)	End Gutter Size (Inches)	Side Gutter Size (Inches)
225 and below	6	5
400 and over	8	8

3. Provide backplate of reinforced steel for mounting of interior components.
 4. Provide device or mechanism for enclosure grounding.
 5. Dead-front type.
- C. Cover and Trim:
1. Designed for surface mounting.
 2. Door:
 - a. Hinged, fitted with a combination latch and door lock, accommodating a master key.
 - b. Provide one flat key tumbler cylinder-type, nickel-plated door lock conforming to the station master key system, two keys per lock.
 3. Circuit Directory: Provide a directory frame with acrylic plastic face mounted on the back of the door.
 4. Finish: Powder coat as specified in Section 34 21 06, TES Common Work Results for Metals.
- D. Bus Bars:
1. ASTM B187, 98 percent conductivity copper, with silver-plated contact surface.
 2. Provide neutral bus of the same rating as that of phase bus.
 3. Provide a full-rated separate grounding bus.
- E. Circuit Breakers: Bolt-on type complying with UL 489.
- F. Additional Requirements for TES Substation Ac Auxiliary Panel:
1. Provide main breaker in panel.

2. If panel is not located on face of switchgear, provide an additional main breaker accessible from the front of switchgear without opening a compartment.
- G. Additional Requirements for Dc Panelboards:
1. Designed for two-wire, 125 Vdc ungrounded power distribution service.
 2. Circuit breakers: Two-pole, 10,000 A interrupting rating at 250 Vdc minimum.
- H. Identification: Provide nameplate or other machine-made permanent identification for each circuit breaker, giving each a unique sequential number.

2.2 ENCLOSED CIRCUIT BREAKERS

- A. Molded case, bolt-on type, quick-make quick-break, with thermal-magnetic type overload trip, interchangeable unit for frame rated 125 A and above, complying with UL 489.
- B. Enclosure: NEMA 250 Type 12, fabricated from galvanized steel, surface-mounted unless otherwise indicated.
- C. Finish: Powder coat as specified in Section 34 21 06, TES Common Work Results for Metals.

2.3 FACTORY ASSEMBLY

- A. Mounting Height: Locate top 6 feet, 6 inches above finished floor and the bottom not less than 12 inches above finished floor, unless specifically indicated otherwise.
- B. Anchor in accordance with seismic requirements in Section 34 21 05, Common Work Results for TES.
- C. Identification:
1. Mount sequential numbers directly on each circuit breaker or on the cover or trim adjacent to each breaker.
 2. Provide each panelboard and load center with an accurate, printed circuit directory.
 - a. Identify each circuit, spare breakers, and spaces.
 - b. Numbers on circuit directory must correspond to sequential numbers mounted on each breaker.
 - c. Install in the factory provided directory frame mounted on the back of the door.

2.4 SOURCE QUALITY CONTROL

- A. In addition to the manufacturer's standard tests, as a minimum perform the following tests at the manufacturer's plant:
1. 60 Hz dielectric tests
 2. Mechanical operations tests
 3. Electrical operation tests

PART 3 - EXECUTION**3.1 FIELD INSTALLATION**

- A. Requirements in Article titled "Factory Assembly" apply to field installation.

PART 4 - MEASUREMENT AND PAYMENT**4.1 MEASUREMENT**

- A. The quantities of accepted work will be measured in the following units. All measurements will be plan measure except for authorized changes.

1. Description: Lump Sum

4.2 PAYMENT

- A. Payment will be made at the respective unit or lump-sum price listed in the proposal and shall be full compensation for all labor, materials, and equipment necessary to complete the respective unit in place. There will be no separate measurement or payment for any item of work not specifically identified and listed in the proposal, and all such work shall be considered a subsidiary item with all costs pertaining thereto included in the prices for other items listed in the proposal. At the Engineer's option, partial payment may be made for any lump sum item listed in the proposal, providing that the Contractor is diligently and satisfactorily pursuing full completion of such partially complete item in accordance with the approved job progress schedule.

SECTION 34 21 13

TES SWITCHBOARDS

PART 1 - GENERAL

1.1 SUMMARY

- A. This Section includes the following:
 - 1. Switchboard to feed rectifier transformer in VMF.
 - 2. Protective relays.
 - 3. Meters and current transformers.

1.2 RELATED SECTIONS

- A. SECTION 34 21 05 – Common Work Results for TES
- B. SECTION 34 21 06 – TES Common Work Results for Metals
- C. SECTION 34 21 17 – TES Substation Design and Assembly
- D. SECTION 34 21 31 – TES Substation Automation System (SAS)
- E. SECTION 34 21 80 – TES Spare Parts and Special Tools
- F. SECTION 34 21 90 – TES Testing

1.3 REFERENCED STANDARDS

- A. Section incorporates by reference the latest revisions of the following documents:
- B. ASTM International (ASTM)
 - 1. ASTM A653/A653M, Standard Specification for Steel Sheet, Zinc-Coated (Galvanized) or Zinc-Iron Alloy-Coated (Galvannealed) by the Hot-Dip Process
- C. Institute of Electrical and Electronics Engineers (IEEE)
 - 1. IEEE C57.13, Standard Requirements for Instrument Transformers
- D. National Electrical Contractors Association (NECA)
 - 1. NECA 400, Standard for Installing and Maintaining Switchboards
- E. National Electrical Manufacturer's Association (NEMA)
 - 1. NEMA AB1, Molded-Case Circuit Breakers, Molded Case Switches, and Circuit-Breaker Enclosures
 - 2. NEMA PB 2, Deadfront Distribution Switchboards
- F. National Fire Protection Association (NFPA)
 - 1. NFPA 70, National Electrical Code

1.4 SUBMITTALS

- A. Procedures: Section 01 33 00, Submittal Procedures.
- B. Product Data:
 - 1. Submit manufacturers' product data for specified equipment and materials. Include the following information for each item:
 - a. Manufacturer's model number or item identification.
 - b. UL listing and rating.
 - c. Critical dimensions and mounting arrangement.
 - d. Replacement parts list.
- C. Spare Parts and Special Tools:
 - 1. Submit a list of spare parts to be provided under this Section.
 - 2. Submit at the same time as product data.
 - 3. Provide part numbers for each part, including a detailed break down of each spare part assembly and set, as defined in Section 34 21 80, TES Spare Parts and Special Tools.
 - 4. Submit a list of special tools to be provided under this Section, as defined in Section 34 21 80, TES Spare Parts and Special Tools.
- D. Shop Drawings:
 - 1. Show materials and methods of construction, door arrangement, conduit hubs and knockout locations.
 - 2. Circuit Breakers: Show circuit for which intended, voltage ratings, insulation level, current rating and interrupting ratings.
 - 3. Single line diagrams.
 - 4. Physical arrangement drawings and weight of equipment and major components.
 - 5. Unit wiring diagrams.
 - 6. Circuit breakers, controls and indications.
 - 7. Show space available for conduit and bus duct entrance and for routing and training of cables.
 - 8. Schematic diagrams for electrically operated equipment.
 - 9. Setting diagrams and templates if anchoring in concrete is required.
 - 10. Assembly and erection diagrams if shipped in sections or if some parts are shipped separately and not installed at the factory.
 - 11. Interconnection diagrams for circuits having externally located instruments, controls, alarms, or similar devices.

- E. Calculations: Submit sizing calculations for protection current transformers and metering current transformers. Obtain Engineer's approval before procuring current transformers.
- F. Testing:
 - 1. Submit test procedures that meet the requirements of Section 34 21 90, TES Testing, for the following:
 - a. Factory Design Tests.
 - b. Factory Production Tests.
 - 2. Submit test reports that meet the requirements of Section 34 21 90, TES Testing, for the following:
 - a. Factory Design Tests.
 - b. Factory Production Tests.
- G. Operation and Maintenance Data:
 - 1. Submit manufacturer's operating and maintenance instructions on products specified in this Section.
 - 2. Submit immediately after approval of product data.

1.5 SPARE PARTS

- A. Provide spare parts in accordance with Section 34 21 80, TES Spare Parts and Special Tools.
- B. List below applies to items in this Specification Section:
 - 1. Switchboard circuit breaker: Provide 1 spare.
 - 2. Circuit breaker operating mechanism charging motor: Provide 1 spare.
 - 3. Circuit breaker operating mechanism spring: Provide 1 spare assembly.
 - 4. Circuit breaker solenoids: Provide 1 spare set.
 - 5. Metering current transformers: Provide 1 spare set.
 - 6. Protection current transformers: Provide 1 spare set.
 - 7. Potential transformers: Provide 1 spare set.
 - 8. Potential transformer primary and secondary fuses: Provide 1 spare set.
 - 9. Ac protective relays (non-IED): Provide 1 spare set.
 - 10. Ac switchgear IEDs: Provide 1 spare set.
 - 11. Ac ammeter and voltmeter: Provide 1 spare set if separate from IEDs.
 - 12. Switchboard control circuit mini-breakers: Provide 1 spare set.
 - 13. Transducers: Provide 1 spare set.
 - 14. Indicating LEDs, including those for trip circuit monitor: Provide 1 spare set.

1.6 QUALITY ASSURANCE

- A. Comply with the requirements of the Project Quality Plan.
- B. Qualifications: Manufacturer that has been regularly engaged in the manufacture of similar equipment and meets UL requirements.

1.7 DELIVERY, STORAGE, AND HANDLING

- A. Shipping:
 - 1. If approved by the Engineer, switchboards may be broken down into convenient shipping sections after tests are completed.
 - 2. Shipping split terminals and connections disconnected for shipping shall be properly identified and protected.

PART 2 - PRODUCTS**2.1 GENERAL REQUIREMENTS**

- A. Metal-enclosed, self-supporting, dead front, freestanding, circuit-breaker type for indoor service.
- B. Comply with NEMA PB 2, NFPA 70, as applicable.
- C. Each item shall be UL labeled.
- D. Provide the required number of vertical sections designed for bolting together to form a rigid switchboard.
- E. Switchboards shall be assembled, wired and tested at the manufacturer's plant.
- F. Components of the same type, size, rating, functional characteristics and manufacture shall be interchangeable.

2.2 RATINGS

- A. Current rating: Based on operation in a 25 degree C room ambient and as required for the load.
- B. Bus bracing: 100 kA RMS momentary.

2.3 ENCLOSURE

- A. Type:
 - 1. Freestanding, reinforced with adequate steel framework to form a rigid structure.
 - 2. Designed for group assembly as part of complete switchgear.
- B. Physical Size:
 - 1. Maximum 90 inches high.
 - 2. Width and depth adequate to accommodate and connect the equipment.
 - 3. Adequate space to accommodate bending radius requirements of cables.

- C. Material: Zinc-coated steel sheet conforming to ASTM A653/A653M, zinc coating designation G90.
- D. Workmanship: Fabricate with a smooth outer surface free from burrs, ridges and other blemishes.
- E. Finish:
 - 1. Powder coat as specified in Section 34 21 06, TES Common Work Results for Metals.
 - 2. Color: Refer to Section 34 21 06, TES Common Work Results for Metals.
- F. Configuration: Align vertical sections front and rear.
- G. Barriers: Switchboards in the same line-up fed electrically from different feeders shall have barriers such that a fire caused by an internal fault at one switchboard shall not spread to another switchboard.
- H. Access: Equip with front doors and front or side access panels.
- I. Nameplates:
 - 1. Provide a nameplate on each switchboard and its components and devices as specified in Section 34 21 17, TES Substation Design and Assembly.
 - 2. Label each control switch and pilot light with one inch wide nameplate showing the function and the number of unit in 1/2-inch high letters.

2.4 SWITCHBOARD BUSES

- A. Bus: Silver-plated copper buses of sufficient size to limit the current density to 750 A per square-inch cross section.
- B. Main Buses:
 - 1. Extend main buses horizontally from the incoming line sections to all distribution sections if indicated on the same line-up.
 - 2. Make provision for extending the main buses for future vertical sections.
- C. Section Buses: Extend section buses vertically from the main bus through each vertical section.
- D. Neutral bus: Fully rated.
- E. Ground Buses:
 - 1. Extend a ground bus through the length of the switchboard.
 - 2. Firmly bolt to each vertical section in at least two places.
 - 3. Make provision for connection to the building or station grounding system near each end of the ground bus.
 - 4. Make provision for future extension of the ground bus.
- F. Phasing: Phase buses A-B-C from left-to-right, top-to-bottom and front-to-rear as viewed from the front of the switchboard.

2.5 SWITCHBOARD CIRCUIT BREAKERS

- A. Type: Draw-out, insulated-case, stored energy, electrically operated, three phase, 60 Hz, in accordance with NEMA AB 1.
- B. Closing time: Maximum five cycles.
- C. Insulation rating of plug shall be the same as the breaker rating.
- D. Circuit breakers shall be capable of performing 4,000 close-open cycles at rated load, 80 percent power factor and rated voltage and 4,000 close-open cycles at no load without maintenance or replacement of parts.
- E. Breakers shall have control power and motor charging device of 125 Vdc.
- F. Breakers shall be equipped with field-replaceable contacts.

2.6 PROTECTIVE RELAYS

- A. Ac Protective Relay - Intelligent Electronic Device (IED):
 - 1. For each ac breaker provide a multi-function protective relay IED and related transducers. Device shall have an onboard HMI useful for viewing breaker stations and adjusting protective relay settings.
 - 2. IED shall communicate with the SAS via protocol specified in Section 34 21 31, TES Substation Automation System (SAS).
 - 3. Provide the following functions, at minimum:
 - a. Ac undervoltage (ANSI Device 27):
 - 1) Primary function: Trip and annunciate when the ac input voltage drops to 80 percent of nominal voltage. Setpoint shall be field adjustable.
 - 2) Relay shall also trip and annunciate upon loss of voltage due to utility outage.
 - 3) Relay shall contain field adjustable time delay.
 - b. Phase sequence relay (ANSI Device 47):
 - 1) Three-phase voltage protective relay connected to provide open phase protection.
 - 2) This relay shall contain a field adjustable time delay.
 - c. Ac overvoltage (ANSI Device 59):
 - d. Phase fault time overcurrent (ANSI Device 50/51):
 - 1) Primary function shall be to provide overload and fault protection for loads served.
 - 2) Relay shall be designed to compile a composite time overcurrent characteristic curve which shall best match the normal and overload requirements of the load and to match the thermal and mechanical withstand of transformers.

- 3) Relay shall provide for both instantaneous and time delay overcurrent protection.
 - e. Ground fault time overcurrent (ANSI Device 50N/51N):
 - 1) A residual instantaneous and time delay relay connected to provide sensitive ground fault detection.
 - 2) This relay shall be field adjustable.
 - f. Control/Position of ac breaker (ANSI Device 52).
 - g. Reverse Power (Device 32):
 - 1) Provide in incoming feeder cubicle connecting to utility service switchgear.
 - 2) This device shall trip and lock-out associated circuit breaker when it detects a flow of power from substation back toward the utility.
 - h. Local/Remote control (Device 43)
 4. Device shall have chart recording features with PC software used for downloading and analyzing faults. Transient fault recording function shall capture analog and digital pre-fault and post-fault waveforms and data. Fault recording shall be stored in non-volatile memory.
- B. Lockout (Device 86):
1. Provide on the ac circuit breaker compartment.
 2. Reset switch handle:
 - a. Heavy-duty switchboard type pistol-grip handle.
 - b. Acceptable Manufacturer: Electroswitch or approved equal.
 3. Provide indication of "lockout" and "normal" at the reset switch.
 4. When circuit breaker is tripped by lockout relay, it shall remain locked out until manually reset.
- C. Provide other protective relaying functions as indicated on one-line diagram in Contract Drawings.
- D. Trip Circuit Monitors:
1. Provide a trip circuit monitor for monitoring coil in the tripped and reset position for each of the following:
 - a. Circuit breaker trip coil.
 - b. Lockout relay trip coil.
 2. Indication and Operation:
 - a. Green LED that illuminates when the trip coil is energized and turns off when the coil is de-energized.
 - b. NO and NC Form C contacts for indication of a failed trip coil.

- c. Red LED that illuminates upon failure of the trip coil. This indication shall illuminate under no condition other than an unhealthy coil.
- d. 200 millisecond delay to allow for auxiliary contacts to transfer.
- e. LEDs:
 - 1) Plug-in replaceable with a life of 100,000 hours.
 - 2) Protected against reverse polarity by a diode.
- f. Control Power: 125 Vdc.

2.7 POWER METER

- A. Capable of revenue-accuracy metering of electrical parameters including voltage, current, frequency, power factor, kW, kVAR, kWh, and kVAh, and values of kW and kVA demand.
- B. MV90 compatible: Programmable to mimic values metered by KCP&L during a 15-minute sliding window.
- C. Features: Data logging, internal web server, 4 MB of internal memory.
- D. Communications:
 - 1. Modbus TCP/IP Ethernet.
 - 2. Monitor with SAS. Electrical parameters shall be viewable at the SAS HMI, as specified in Alarm Points List in Section 34 21 31, TES Substation Automation System.
- E. Approved Manufacturer/Product: Electro Industries/GaugeTech, Shark 200, or approved equal.

2.8 INSTRUMENT TRANSFORMERS

- A. Instrument transformers shall conform to IEEE C57.13, with the additional requirements indicated below.
- B. Current transformers:
 - 1. Shall be capable of withstanding thermal and mechanical ratings of the circuit breaker.
 - 2. Molded-rubber or epoxy construction, wound-type or bushing-mounted.
 - 3. Wound-type current transformers:
 - a. Provide separate compartment isolated from the control panel and all other equipment.
 - b. Provide a mounting frame that bolts securely to the switchgear frame.
 - c. Full-wave impulse insulation level: 125 kV.
 - d. Secondary terminal blocks shall have covers with integral shorting bars and secondary wiring shall be run to readily identifiable terminal block points in the control compartment.

- e. Terminal block points shall also have integral shorting bars for the current transformer leads.
- 4. Bushing-type current transformers: Low-voltage, ring-core, high-accuracy type designed for secure mounting on the primary contact support bushings.
- 5. Accuracy:
 - a. Protective relaying: Relaying accuracy classification, under the burdens imposed by the specified devices.
 - b. Power Meters: Accuracy Class 0.3 at burden B-0.5.
 - 1) If this metering accuracy is not available, perform an analysis of expected accuracy of metering equipment for loads from 1 percent to 150 percent of actual load rating and submit for approval.
 - 2) Bushing current transformers that will not provide accuracy of plus or minus 0.6 percent at 1 percent load and plus or minus 1.0 percent at full load will be rejected and require installation of wound-type current transformers.
- 6. Submit sizing calculations for protection current transformers and metering current transformers.
- 7. Provide separate sets of current transformers for protective relaying and metering.
- C. Potential Transformers:
 - 1. Molded-rubber or epoxy construction.
 - 2. Transformers shall have full-wave impulse insulation level of 10 kV.
 - 3. Primary and secondary circuits of potential transformers shall be fused by means of non-renewable cartridge-type fuses.

2.9 SOURCE QUALITY CONTROL

- A. Factory Production Tests:
 - 1. Meters, Instruments and Instrument Transformers:
 - a. Check for accuracy, performance and operation in accordance with IEEE C57.13.
 - 2. Power Meter: Test accuracy and functionality.
 - 3. In addition to the manufacturer's standard tests, as a minimum perform the following tests at the manufacturer's plant:
 - a. 60 Hz dielectric tests.
 - b. Mechanical operations tests.
 - c. Grounding of instruments.
 - d. Transformer case tests.
 - e. Electrical operation tests.

- f. Control wiring checks.

PART 3 - EXECUTION

3.1 FIELD INSTALLATION

- A. Install switchboards in locations indicated on Contract Drawings in accordance with NECA 400.
- B. Anchor in accordance with seismic requirements in Section 34 21 05, Common Work Results for TES.
- C. Install supporting members, fastenings, framing, hangers, bracing, brackets, straps, bolts and angles as required to set and rigidly connect the switchboard.
- D. Power Meter: Connect to SAS via Ethernet (see Section 34 21 31, TES Substation Automation System (SAS)). Test to verify connectivity using the Engineering Laptop.
- E. Field Touch up Painting:
 - 1. After installations are complete, thoroughly clean surfaces where shop finish is damaged, including bolts, nuts, washers and welds and refinish each item with the same coating system as used for shop coating.
 - 2. Provide matching touch-up coating by approved spray methods, or by brush where approved.

PART 4 - MEASUREMENT AND PAYMENT

4.1 MEASUREMENT

- A. The quantities of accepted work will be measured in the following units. All measurements will be plan measure except for authorized changes.
 - 1. Description: Lump Sum

4.2 PAYMENT

- A. Payment will be made at the respective unit or lump-sum price listed in the proposal and shall be full compensation for all labor, materials, and equipment necessary to complete the respective unit in place. There will be no separate measurement or payment for any item of work not specifically identified and listed in the proposal, and all such work shall be considered a subsidiary item with all costs pertaining thereto included in the prices for other items listed in the proposal. At the Engineer's option, partial payment may be made for any lump sum item listed in the proposal, providing that the Contractor is diligently and satisfactorily pursuing full completion of such partially complete item in accordance with the approved job progress schedule.

END OF SECTION

SECTION 34 21 14**TES MEDIUM-VOLTAGE AC CIRCUIT-BREAKER SWITCHGEAR****PART 1 - GENERAL****1.1 SUMMARY**

- A. This Section includes the following:
 - 1. Metal-clad, medium-voltage ac circuit breaker switchgear for TES substation primary protection.
 - 2. Incoming fusible, load break disconnect switch.
 - 3. Utility metering equipment.

1.2 RELATED SECTIONS

- A. SECTION 34 21 06 – TES Common Work Results for Metals
- B. SECTION 34 21 17 – TES Substation Design and Assembly
- C. SECTION 34 21 18 – TES Lighting
- D. SECTION 34 21 31 – TES Substation Automation System (SAS)
- E. SECTION 34 21 73 – TES Studies
- F. SECTION 34 21 80 – TES Spare Parts and Special Tools
- G. SECTION 34 21 90 – TES Testing
- H. SECTION 34 21 95 – TES Operation and Maintenance Data

1.3 DEFINITIONS

- A. Intelligent Electronic Device (IED): Refers to any digital or numerical-based protection, metering, control, or monitoring device that has processing, recording and reporting capabilities and a local human machine interface (HMI); used in electrical switchgear.

1.4 REFERENCED STANDARDS

- A. Section incorporates by reference the latest revisions of the following documents:
- B. American National Standards Institute (ANSI)
 - 1. ANSI C39.1, Requirements for Electrical Analog Indicating Instruments
- C. Institute of Electrical and Electronics Engineers (IEEE)
 - 1. IEEE 242, Recommended Practice for Protection and Coordination of Industrial and Commercial Power Systems
 - 2. IEEE 1653.2, Standard for Uncontrolled Traction Power Rectifiers for Substation Applications Up to 1500 Vdc Nominal Output

3. IEEE C37.06, Standard for Ac High-Voltage Circuit Breakers Rated on a Symmetrical Current Basis-Preferred Ratings and Related Required Capabilities for Voltages Above 1000 V
 4. IEEE C37.09, Standard Test Procedure for AC High-Voltage Circuit Breakers Rated on a Symmetrical Current Basis
 5. IEEE C37.12, Guide for Specifications of High-Voltage Circuit Breakers (over 1000 Volts)
 6. IEEE C37.20.2, Standard for Metal-Clad Switchgear
 7. IEEE C37.20.3, Standard for Metal-Enclosed Interrupter Switchgear
 8. IEEE C37.46, Standard Specifications for High Voltage (> 1000 V) Expulsion and Current-limiting Power Class Fuses and Fuse Disconnecting Switches
 9. IEEE C37.90, Standard for Relays and Relay Systems Associated with Electric Power Apparatus
 10. IEEE C37.90.1, Standard Surge Withstand Capability (SWC) Tests for Relays and Relay Systems Associated with Electric Power Apparatus
 11. IEEE C57.13, Standard Requirements for Instrument Transformers
- D. Kansas City Power & Light (KCP&L)
1. KCP&L S3, Point of Delivery Requirements for Privately Owned Substations, 15 kV Class
 2. KCP&L S8, Metering Transformer Installation in Metal-Clad Switchgear – 15 kV and Below
- E. National Electrical Contractors Association (NECA)
1. NECA 430, Standard for Installing Medium-Voltage Metal-Clad Switchgear

1.5 SUBMITTALS

- A. Procedures: Section 01 33 00, Submittal Procedures.
- B. Product Data: Catalog data and other pertinent information concerning design and application ratings, service performance, and reliability, including the following:
1. Complete details of circuit breakers, drawout mechanism, manual racking handle, and interface with drawout mechanism.
 2. Relays.
 3. Control switches.
 4. Indicating lamps.
 5. Protective devices.
 6. Surge arresters.
 7. Cubicle heaters and humidistat.
 8. Protection devices with coordination curves and setting procedures.

- C. Spare Parts and Special Tools:
 - 1. Submit a list of spare parts to be provided under this Section.
 - 2. Submit at the same time as product data.
 - 3. Provide part numbers for each part, including a detailed break down of each spare part assembly and set, as defined in Section 34 21 80, TES Spare Parts and Special Tools.
 - 4. Submit a list of special tools to be provided under this Section, as defined in Section 34 21 80, TES Spare Parts and Special Tools.
- D. Shop Drawings:
 - 1. Manufacturer's detailed, dimensioned drawings for each type of switchgear assembly.
 - 2. Manufacturer's schematic wiring and interconnection diagrams.
- E. Operation and Maintenance Data:
 - 1. Manufacturer's operating and maintenance instructions, parts list, illustrations and diagram for components.
 - 2. Recommended list of spare parts.
 - 3. Submit immediately after approval of product data

1.6 SPARE PARTS

- A. Provide spare parts in accordance with Section 34 21 80, TES Spare Parts and Special Tools.
- B. List below applies to items in this Specification Section:
 - 1. Ac circuit breaker, complete with truck: Provide 1 spare.
 - 2. Circuit breaker operating mechanism charging motor: Provide 2 spares.
 - 3. Circuit breaker operating mechanism spring: Provide 2 spare assemblies.
 - 4. Circuit breaker solenoids: Provide 2 spare sets.
 - 5. Metering current transformers: Provide 1 spare set.
 - 6. Protection current transformers: Provide 1 spare set.
 - 7. Potential transformers: Provide 1 spare set.
 - 8. Potential transformer primary and secondary fuses: Provide 1 spare set.
 - 9. Ac protective relays (non-IED): Provide 1 spare set.
 - 10. Ac switchgear IEDs: Provide 1 spare set.
 - 11. Ac ammeter and voltmeter: Provide 1 spare set if separate from IEDs.
 - 12. Ac switchgear control circuit mini-breakers: Provide 3 spare sets.

13. Transducers: Provide 1 spare set.
14. Indicating LEDs, including those for trip circuit monitor: Provide 1 spare set.

1.7 QUALITY ASSURANCE

- A. Comply with the requirements of the Project Quality Plan.
- B. The ac metal clad switchgear shall be UL labeled or shall be furnished with a Field Evaluation label in accordance with Section 34 21 17, TES Substation Design and Assembly.

PART 2 - PRODUCTS

2.1 GENERAL

- A. Ac switchgear shall form a line-up of dead-front, totally enclosed, free-standing switchgear suitable for indoor service, and include an incoming disconnect switch, utility metering, and a circuit breaker to feed rectifier transformer.
- B. Switchgear shall be metal-clad and conform to the requirements of IEEE C37.20.2, except as otherwise indicated.

2.2 RATINGS

- A. Ac switchgear shall have the following ratings:
 1. Nominal Voltage: 13.2 kV.
 2. Maximum Voltage: 15 kV rms.
 3. Frequency: 60 Hz.
 4. Insulation Level, 60 Hz Withstand: 36 kV.
 5. Insulation Level, Impulse Withstand: 95 kV.
 6. Continuous Current: 1200 A.
 7. Rated Short Circuit Current: 25 kA.
 8. Maximum Dimensions: 36 inches wide, 96 inches deep, 95 inches high or as indicated.

2.3 AC SWITCHGEAR STRUCTURE

- A. Construction:
 1. Rigid, self-supporting, and self-contained.
 2. Structural elements electrically welded or bolted together.
 3. Sheet steel, minimum 11 gage.
 4. Shall support equipment under normal loads, short-circuit conditions, and specified seismic conditions.
 5. Ac switchgear enclosure shall be divided, barriered, and partitioned into separate vertical sections.

6. Finish: Powder coat in accordance with Section 34 21 06, TES Common Work Results for Metals.
- B. Circuit Breaker Compartments:
1. Design to allow draw-out circuit breakers to be easily drawn in or out of their housing.
 2. Provide guide rails or cradles for positioning the removable elements as an integral part of the equipment. Guides shall ensure proper alignment.
 3. Provide self-aligning, self-coupling, primary and secondary disconnecting devices that allow the draw-out breakers to connect or disconnect from the buses and auxiliary circuits.
 4. Connection of control wiring to the ac breaker shall be by sliding contacts. A plug-style disconnect is acceptable, provided the breaker cannot be mechanically racked into the connected position with the plug disconnected.
 5. Provided automatic protective shutters to cover live medium-voltage terminals and prevent accidental contact with live parts as the removable element of breaker is drawn out of the cubicle.
 6. Provide a manual racking mechanism for horizontal draw-out of each circuit breaker:
 - a. Mechanism shall have three circuit breaker positions: Disconnected, test, and connected.
 - b. Provide positive stops to prevent over-travel at each position with labels clearly identifying the breaker's position.
 - c. Mechanism shall be designed for racking of circuit breaker in and out of connected and disconnected position with the compartment front door in the closed and latched position.
 - 1) With door closed and latched, the socket for insertion of manual racking handle shall be within 1 inch of face of door for ease of use. An extension on the socket may be provided to satisfy this requirement.
 - 2) An arrangement that makes it difficult to align the manual racking handle with the socket without opening the door is not acceptable.
 - d. Manual racking handle:
 - 1) Handle shall be designed such that it does not require a user with special skills to insert or operate.
 - 2) Provide a universal joint if necessary to prevent the user from knocking his knuckles on the floor while racking a breaker.
 - 3) Engineer may reject manual racking handle after delivery if it has not been designed for ease of use. If rejected, provide a handle that addresses the use issues at no additional cost to the City.
 - 4) Provide one at each switchgear location.

-
7. Breaker case and frame shall be grounded when the breaker is in the connected and test positions by means of positive contact with a copper ground bus.
 8. Provide the following interlocks:
 - a. Prevent either electrical or manual operation of the breaker unless it is in the connected or test position.
 - b. A positive mechanical interlock shall prevent racking in or out unless the breaker is in the OPEN position.
 - c. Circuit breaker, complete with the operating mechanism shall be capable of being removed from the enclosure only in the disconnected position.
- C. Control/ Terminal Board Compartment:
1. Controls, including programmable controllers, instrumentation, control relays, terminal boards, control wiring and control devices shall be housed in a separate control/terminal board compartment.
 - a. Compartment shall be barriered from the power wiring and buswork compartments.
 - b. Exception: Where controls and terminal boards are dedicated to circuit breaker function, they may be located in the circuit breaker compartment.
 2. Protective relays, meters, instruments and control devices shall be mounted on front compartment doors and shall be located such that meters and displays can be operated and read by a person standing at floor level.
- D. Access Doors:
1. Access to all components shall be from the front and the rear.
 2. Equipment access panels located on the side or top of the enclosures are prohibited.
 3. Provide each compartment with separate hinged front and rear access doors for servicing.
 4. Opening of any front door shall not expose circuits in adjacent compartments.
 5. Construction:
 - a. Sheet steel, 11 gage minimum.
 - b. Reinforce against distortions using suitable flanges and stiffening members.
 6. Hinges: Stainless steel heavy-duty type.
 7. Latches:
 - a. Doors shall be securely fastened in the closed position with a three point latch easily opened without the use of tools.
 - b. Two latches will be allowed if front panel consists of more than one full-length door.

8. Handles: Provide each door with a heavy duty-handle with provisions for a padlock.
 9. Door Stops: Provide each door with a heavy-duty stop to hold it securely in the open position.
- E. Heaters: Provide two strip-type heaters in each switchgear cubicle to prevent condensation.
1. Operating voltage for heating strips shall not exceed 50 percent of heater rated voltage.
 2. Provide an individual humidistat in each cubicle to control heaters.
 3. Locate humidistat in an area of each cubicle so that it can measure the average humidity in the cubicle.
 4. Provide a digital heater ammeter on the front of each cubicle enclosure to indicate current and operation of heaters.
- F. Lights: Provide a light in each cubicle in accordance with Section 34 21 18, TES Lighting.
- G. Warning Signs:
1. Front Access Doors: Sign on each stating "DANGER: LIVE PARTS" and "DANGER: HIGH VOLTAGE."
 2. Rear Access Doors: Sign on each stating "DANGER: LIVE PARTS" and "DANGER: HIGH VOLTAGE."

2.4 BUSES AND CONNECTIONS

- A. Power Bus:
1. Material: Silver-plated, electrical grade copper.
 2. Continuous current rating: Minimum 1200 A for main bus and circuit breaker connections.
- B. Ground Bus:
1. Material: Electrical grade copper.
 2. Size: Minimum 2 inch by 1/4 inch.
 3. Extend the full length of ac switchgear assembly and bond to each switchgear section by solidly bolting the bus to a non-removable structural member.
- C. Main Bus:
1. Extend three-phase horizontal bus the full length of ac switchgear assembly.
 2. Insulate entire length of main bus, including joints, with 30 kV, flame-retardant, non-hygroscopic, track-resistant insulation free from internal voids.
 3. Corona Prevention:
 - a. There must not be air gaps between the bus and the bus insulation.

- b. Where bus passes through cubicle barriers, there must not be air gaps between the bus insulation and the opening through which it passes.
- D. Connections:
- 1. Silver-plated, electrical grade copper bus.
 - 2. Connections include but are not limited to bus taps, circuit breaker connections, CT and PT connections, transformer connections, and surge arrester connections.
 - 3. Join with a minimum of two bolts per joint and Belleville washers. Hardware shall be silicon bronze.
 - 4. Cable connections are not permitted.
- E. Buses and bus connections shall be adequate to withstand thermal and mechanical stresses associated with short-circuit currents equal to the momentary and three-second rating of the circuit breaker.

2.5 INCOMING DISCONNECT SWITCH SECTION

- A. Description: Load break, fusible, airbreak disconnect switch, meeting the requirements of KCP&L S3.
- B. Switch Cubicle:
- 1. Mechanical Interlock:
 - a. The switch must be open before the door can be opened.
 - b. The door must be closed before the switch can be closed.
 - 2. Observation Window: Ample sized, high-impact, gasketed, positioned so that position of all three switches can easily be seen through the closed door.
 - 3. Safety Barrier: Metal, grounded, bolted closed in front of switch to prevent inadvertent contact with live parts; barrier must allow full-view inspection of the switch blade position.
 - 4. Operating Mechanism Cover: Hinged, with quarter turn nylon latches, to discourage casual tampering.
 - 5. Switch Position Indicators:
 - a. Green LED with label "OPEN"
 - b. Red LED with label "CLOSED"
 - 6. Locking Provisions: Suitable for padlocking switch in the open or closed position.
- C. Switch:
- 1. Switching mechanism:
 - a. Three-pole, gang-operated.
 - b. Manual quick-make, quick-break over-toggle type not requiring use of chain or cable
 - c. Heavy-duty coil spring to provide opening and closing energy.

- d. Normal Operation: Opening and closing speed independent of the operator; not possible to tease switch into intermediate position.
 - e. Maintenance Operation: Slow closing possible to check switch blade engagement; slow opening possible to check operation of arc-interrupting contacts.
 - 2. Contacts: Separate main and break contacts for maximum endurance during fault-close and load-interrupting duty.
 - 3. Barriers:
 - a. Insulating barriers between each phase and between the outer phases and the enclosure.
 - b. Isolating barrier between operating chain and switch blades.
 - 4. Grounds:
 - a. Positive beryllium copper grounds on each phase with switch in open position.
 - b. Grounds shall be visible through viewing window.
 - 5. Switch shall be removable from the structure as a complete operational component.
- D. Fuses:
 - 1. Provide fault protection using fuses with continuous ratings as determined based on load served.
 - 2. Provide UL certification for fuse/switch integrated momentary and fault close ratings.
- E. Service Entrance:
 - 1. Make provisions for bottom (underground) service entrance and termination of the 13.2 kV incoming service cables. Conductors will be installed and terminated by KCP&L.
 - 2. Verify conduit entry locations to ensure proper termination of utility incoming cables.
 - 3. Provide a copper ground conductor equivalent to 2/0 copper minimum around the inside of the enclosure walls in the cable termination compartment and solidly ground to the ac switchgear ground bus. Provide a grounding horn for use with portable grounds.

2.6 UTILITY METERING SECTION

- A. Section shall meet requirements of Kansas City Power & Light (KCP&L) S8, referenced codes and standards, and additional requirements of KCP&L, whether published or not.
- B. Coordinate with KCP&L directly to verify requirements before preparing shop drawings.
- C. Submit switchgear shop drawings to KCP&L in accordance with KCP&L S8 and as directed by KCP&L. If clarification of submittal requirements is needed, contact KCP&L directly.

- D. Submit shop drawings to Engineer at the same time as submittal to KCP&L and obtain approval from both KCP&L and Engineer before starting manufacturing.
- E. Obtain KCP&L-furnished PTs and CTs from KCP&L and install in switchgear in accordance with KCP&L S8 and as directed by KCP&L.
- F. Furnish and install terminal blocks and PT and CT secondary wiring in accordance with KCP&L S8 and as directed by KCP&L.
- G. Enclosure access doors:
 - 1. Interior and exterior: Hinged on one side except as otherwise indicated with a two-point latch mechanism padlockable by KCP&L.
 - 2. Access doors on enclosures containing revenue metering equipment shall be labeled, "UTILITY METERING CUBICLE: NO CUSTOMER EQUIPMENT."

2.7 MEDIUM-VOLTAGE CIRCUIT BREAKER SECTION

- A. General:
 - 1. Circuit breaker shall be a draw-out type and utilize vacuum interrupters having load and fault break capabilities and shall conform to or exceed the requirements of IEEE C37.06 and IEEE C37.12.
 - 2. Circuit breakers shall be identical and physically and electrically interchangeable.
 - 3. Circuit breaker frame shall be provided with a full front metal shield to prevent access to any live primary bus or load terminals when the circuit breaker is in the connected position.
 - 4. Provide a truck or fifth wheel at each switchgear location to facilitate one-person breaker removal and turning.
 - 5. Provide means for padlocking the ac breaker in the open position.
 - 6. Circuit breaker insulation:
 - a. Noncombustible, non-hygroscopic and track-resistant.
 - b. Mechanical strength and physical characteristics shall match the stresses imposed by the circuit breaker rated momentary current.
- B. Minimum ratings:
 - 1. Nominal System Voltage: 13.2 kV 3-phase.
 - 2. Maximum Voltage: 15 kV rms.
 - 3. Frequency: 60 Hz.
 - 4. Insulation Level, 60 Hz: 36 kV, rms.
 - 5. Insulation Level, impulse: 95 kV, crest.
 - 6. Continuous Current: 1200 A.
 - 7. Short Circuit Current at Maximum Voltage: 25 kA rms.
 - 8. Fault Clearing Time: Five cycles max.

- C. Circuit Breaker Operating Mechanism:
1. Motor-charged and spring-operated unless otherwise approved by Engineer.
 2. Mechanism shall be designed to prevent overcharging.
 3. The mechanism shall ensure that the release of stored energy for closing the circuit breaker main contacts is prevented unless the mechanism has been fully charged.
 4. The stored-energy closing mechanism shall automatically charge itself within 15 seconds after closing of the breaker.
 5. Energy storage shall be sufficient for an open-close-open cycle at maximum rated short circuit current.
 6. Provide manual cranking capability to permit spring charging in the event motor power is unavailable. Provide one manual crank at each switchgear location.
 7. Provide manual trip and close buttons on front of circuit breaker.
 8. Withdrawal of circuit breaker from enclosure:
 - a. Provide an interlock to prevent withdrawal when the mechanism is fully charged.
 - b. Alternately, provide automatic controlled discharge of the stored energy when the circuit breaker is withdrawn from or inserted into the enclosure.
 9. Circuit breaker shall be electrically and mechanically trip free. The operating mechanism shall be non-pumping.
 10. Operation counter: Four-digit, non-resettable, register-type mechanical operations counter. Provide on each circuit breaker to record each close/open cycle.
- D. Circuit Breaker Control Voltage:
1. Control voltage: 125 Vdc.
 2. Closing mechanism voltage range: Plus or minus 15 percent of the nominal dc control voltage.
 3. Tripping mechanism voltage range: Plus or minus 25 percent of the nominal dc control voltage.
- E. Circuit Breaker Control Switches:
1. Open/Close: Switch located on breaker HMI and SAS HMI touch screen (see Section 34 21 31, Substation Automation System (SAS)).
 2. SAS HMI control switch shall permit open and close operations when the circuit breaker is in the connected position.
 3. Breaker HMI control switch shall permit open and close operations when the circuit breaker is in the test position.
 4. Provide a switch for resetting the circuit breaker after a trip and provide a mechanical trip indication at the control switch.

- F. Auxiliary contacts:
1. Provide a minimum of six electrically separate sets of reversible auxiliary contacts, in addition to those required for the circuit breaker control circuit.
 2. Auxiliary contacts shall be operated by the breaker mechanism in both the "connected" and "test" positions.
 3. Spare auxiliary contacts shall be wired to the outgoing terminal blocks.
- G. Indicating LEDs:
1. Provide indicating LEDs on the front of the circuit breaker enclosure to indicate the state of the circuit breaker:
 - a. Closed breaker: Red LED.
 - b. Tripped or open breaker: Green LED.
 2. Provide an amber LED above each local/remote switch which shall be illuminated when switch is in local position.
 3. Provide a white LED indicating light on the front of the circuit breaker enclosure to indicate the stored-energy closing mechanism is charged.

2.8 PROTECTIVE RELAYS

- A. General Requirements:
1. Conform to the applicable sections of IEEE C37.90.
 2. Cases: Rustproof metal or high-impact plastic rectangular cases with test switches, panel-mount form factor.
 3. Contacts: Silver-to-silver non-welding.
 4. Non-IED Relays: Self-resetting with seal-in, hand-resetting targets indicating relay operation.
 5. Arrangement:
 - a. Devices including switches, relays, indicating lights and test plugs shall be conveniently accessible and easily visible.
 - b. The grouping shall be modular and place related functions in proximity.
 - c. Devices of the same general type shall be manufactured by the same company and shall be similarly arranged and mounted.
 6. Mounting:
 - a. Flush mounted, plumb and square with the lines of the panels and as recommended by the manufacturer, with wiring connections on the back of the relay.
 - b. Mount on hinged or removable panels and not on a fixed portion of the switchgear.
 7. Color: Match color of switchgear. See Section 34 21 06, TES Common Work Results for Metals for color.

- B. Provide the following protective and monitoring devices at a minimum, as shown in the Contract Drawings. Additional protective devices recommended by Contractor or equipment manufacturers may be installed with Engineer approval.
- C. Ac Protective Relay - Intelligent Electronic Device (IED):
1. For each medium-voltage ac breaker provide a multi-function protective relay IED and related transducers:
 - a. IED must capture real-time voltage and current for a triggered event with pre- and post-trigger sampling data useful for analyzing trip information, and store in non-volatile memory.
 - b. IED shall communicate with the SAS via protocol specified in Section 34 21 31, TES Substation Automation System (SAS).
 2. Provide the following functions, at minimum:
 - a. Ac undervoltage (ANSI Device 27):
 - 1) Primary function: Trip and annunciate when the ac input voltage drops to 80 percent of nominal voltage.
 - 2) Relay shall also trip and annunciate upon loss of voltage due to utility outage.
 - 3) Relay shall contain field adjustable time delay.
 - b. Phase sequence relay (ANSI Device 47):
 - 1) Three-phase voltage protective relay connected to provide open phase protection.
 - 2) This relay shall contain a field adjustable time delay.
 - c. Ac overvoltage (ANSI Device 59):
 - d. Phase fault time overcurrent (ANSI Device 50/51).
 - 1) Primary function shall be to provide overload and fault protection for loads served.
 - 2) Relay shall be designed to compile a composite time overcurrent characteristic curve which shall best match the normal and overload requirements of the load and to match the thermal and mechanical withstand of transformers.
 - 3) Relay shall provide for both instantaneous and time delay overcurrent protection.
 - e. Ground fault time overcurrent (ANSI Device 50N/51N):
 - 1) A residual instantaneous and time delay relay connected to provide sensitive ground fault detection.
 - 2) This relay shall be field adjustable.
 - f. Control/Position of ac breaker (ANSI Device 52).

- g. Reverse Power (Device 32):
 - 1) Provide in incoming feeder cubicle connecting to utility service switchgear.
 - 2) This device shall trip and lock-out associated circuit breaker when it detects a flow of power from substation back toward the utility.
 - h. Local/Remote control (Device 43)
 - 3. Device shall have chart recording features with PC software used for downloading and analyzing faults. Transient fault recording function shall capture analog and digital pre-fault and post-fault waveforms and data.
- D. Provide the following additional ac protective relay:
- 1. Lockout (Device 86H):
 - a. Provide on the ac circuit breaker compartment.
 - b. Reset switch handle:
 - 1) Heavy-duty switchboard type pistol-grip handle.
 - 2) Acceptable Manufacturer: Electroschalt or approved equal.
 - c. Provide indication of "lockout" and "normal" at the reset switch.
 - d. When the main ac circuit breaker is tripped by the lockout relay, the following sequence of events shall occur:
 - 1) Dc feeder circuit breakers shall be opened for TES substations.
 - 2) Ac breaker shall remain locked out until manually reset.
- E. Trip Circuit Monitors:
- 1. Provide a trip circuit monitor for monitoring the trip coil on each of the following:
 - a. Medium voltage ac circuit breaker.
 - b. Lockout relay.
 - 2. Indication and Operation:
 - a. Green LED that illuminates when the trip coil is energized and turns off when the coil is de-energized.
 - b. NO and NC Form C contacts for indication of a failed trip coil.
 - c. Red LED that illuminates upon failure of the trip coil.
 - d. 200 millisecond delay to allow for auxiliary contacts to transfer.
 - e. LEDs: Plug-in replaceable with a life of 100,000 hours; protected against reverse polarity by a diode.
 - f. Control Power: 125 Vdc.
 - g. Manufacturer: E-max RAW-1D or approved equal.

- F. Protective device coordination: Perform a coordination study for the ac system in accordance with Section 34 21 73, TES Studies.

2.9 INSTRUMENTS AND METERS

- A. Analog instruments and meters ANSI C39.1.
1. Provide analog switchboard type ammeter and voltmeter, with 250 degree scales, rated for use with corresponding transformer.
 2. Cases shall be dust proof and covered with a non-reflecting glass window.
 3. The accuracy of all indicating instruments shall be within 1 percent of full scale reading.
 4. Voltmeters and ammeters shall be rated for use with the corresponding transformer.
 5. Scales shall be of a suitable range, equal to the associated potential or current transformer primary rating.
 6. Provide incoming line phase selector switches for connection to the line transformers for the ammeter and voltmeter.

2.10 INSTRUMENT TRANSFORMERS

- A. Instrument transformers shall conform to IEEE C57.13, with the additional requirements indicated below.
- B. Current transformers:
1. Shall be capable of withstanding thermal and mechanical ratings of the circuit breaker.
 2. Molded-rubber or epoxy construction, wound-type or bushing-mounted.
 3. Wound-type current transformers:
 - a. Provide separate compartment isolated from the control panel and all other equipment.
 - b. Provide a mounting frame which bolts securely to the switchgear frame.
 - c. Full-wave impulse insulation level: 125 kV.
 - d. Secondary terminal blocks shall have covers with integral shorting bars and secondary wiring shall be run to readily identifiable terminal block points in the control compartment.
 - e. Terminal block points shall also have integral shorting bars for the current transformer leads.
 4. Bushing-type current transformers: Low-voltage, ring-core, high-accuracy type designed for secure mounting on the primary contact support bushings.

5. Accuracy: Relaying accuracy classification, under the burdens imposed by the specified devices.
- C. Potential transformers (PTs):
1. Drawout-type, molded-rubber or epoxy construction.
 2. Transformers shall have full-wave impulse insulation level of 125 kV.
 3. Primary and secondary circuits of potential transformers shall be fused by means of non-renewable cartridge-type fuses meeting requirements of IEEE C37.46.
 4. Grounding of trunion: Trunion or other conveyance mechanism on which drawout PTs are mounted shall be continuously grounded in the fully inserted position, while being withdrawn, and when in the fully withdrawn position.
 5. Grounding of PT: Primary of PT shall be grounded, as soon as the primary circuit is disconnected, while the PT is being withdrawn and in the fully withdrawn position.
 - a. Grounds shall be beryllium copper.
 - b. Provide a viewing window in the PT drawer for viewing grounds. Grounding in the fully withdrawn position shall be visible from the exterior of the switchgear, without removing panels or parts, by a person standing on the floor.
 6. Fuses:
 - a. Primary fuses shall be completely disconnected before a person can access the transformer or its high-voltage fuses.
 - b. Secondary circuit fuses shall be installed in the low-voltage circuits and shall be located to permit replacement when the switchgear is in operation.
 7. Rating: Adequate for the burden requirements of the accuracy classification and capable of carrying rated load continuously without excessive heating or damage.

2.11 SOURCE QUALITY CONTROL

- A. Factory Design Tests:
1. Tests shall consist of all Design Tests as specified in IEEE C37.20.2.
 2. Perform tests on the ac switchgear assembly and each component of the ac switchgear.
 3. The main ac circuit breaker test shall be performed in accordance with the design tests as described in IEEE C37.09.
- B. Factory Production Tests:
1. Ac Circuit Breaker: Prior to mounting inside ac switchgear, perform the following on each ac circuit breaker in accordance with IEEE C37.09:
 - a. Nameplate check.
 - b. Control and secondary wiring checks.

- c. Clearance and mechanical adjustment check tests.
 - d. Mechanical operation tests.
 - e. Timing tests.
 - f. Stored energy system tests.
 - g. Conductivity of the current path test.
 - h. Low-frequency withstand voltage tests on major insulation components.
 - i. Current transformer.
 - j. Resistors and coils.
2. Ac switchgear: Perform production tests as part of TES Substation Factory Acceptance Tests, as specified in Section 34 21 90, TES Testing.

2.12 MANUFACTURE

- A. Manufacture switchgear in accordance with the referenced ANSI and IEEE standards.

2.13 INSTALLATION

- A. Install switchgear in TES substation enclosure in accordance with manufacturer's installation instructions and NECA 430.

2.14 SURGE ARRESTERS

- A. Provide surge arresters in Service Switchgear.
- B. Connect the surge arrester ground terminals directly to the switchgear ground bus connected to the station grounding electrode.

2.15 TRANSFER TABLE

- A. Provide transfer table at each substation for removing and lowering PTs and draw-out fuse trunions.
- B. Table shall be capable of being raised and lowered hydraulically from floor to trunion levels.

PART 3 - EXECUTION

3.1 INSTALLATION

- A. Install ac switchgear in accordance with Section 34 21 17, TES Substation Design and Assembly, and Contract Drawings.

PART 4 - MEASUREMENT AND PAYMENT

4.1 MEASUREMENT

- A. The quantities of accepted work will be measured in the following units. All measurements will be plan measure except for authorized changes.
 1. Description: Lump Sum

4.2 PAYMENT

- A. Payment will be made at the respective unit or lump-sum price listed in the proposal and shall be full compensation for all labor, materials, and equipment necessary to complete the respective unit in place. There will be no separate measurement or payment for any item of work not specifically identified and listed in the proposal, and all such work shall be considered a subsidiary item with all costs pertaining thereto included in the prices for other items listed in the proposal. At the Engineer's option, partial payment may be made for any lump sum item listed in the proposal, providing that the Contractor is diligently and satisfactorily pursuing full completion of such partially complete item in accordance with the approved job progress schedule.

END OF SECTION

SECTION 34 21 16

TES SUBSTATION ENCLOSURES

PART 1 - GENERAL

1.1 SUMMARY

- A. This Section includes the following:
 - 1. Prefabricated enclosures for TES substations.
 - 2. HVAC for prefabricated enclosures.
 - 3. Testing of prefabricated enclosures.

1.2 RELATED SECTIONS

- A. SECTION 34 21 05 – Common Work Results for TES
- B. SECTION 34 21 06 – TES Common Work Results for Metals
- C. SECTION 34 21 08 – TES Dielectric Epoxy Flooring
- D. SECTION 34 21 17 – TES Substation Design and Assembly
- E. SECTION 34 21 31 – TES Substation Automation System (SAS)
- F. SECTION 34 21 80 – TES Spare Parts and Special Tools
- G. SECTION 34 21 90 – TES Testing
- H. SECTION 34 22 26 – TES Grounding and Bonding

1.3 DEFINITIONS

- A. Galvanneal: As defined in Section 34 21 06, TES Common Work Results for Metals.

1.4 REFERENCED STANDARDS

- A. Section incorporates by reference the latest revisions of the following documents:
- B. American Institute of Steel Construction (AISC)
 - 1. AISC 303, Code of Standard Practice for Steel Buildings and Bridges
 - 2. AISC 360, Specification for Structural Steel Buildings
- C. ASTM International (ASTM)
 - 1. ASTM A384/A384M, Standard Practice for Safeguarding Against Warpage and Distortion During Hot Dip Galvanizing of Steel Assemblies
 - 2. ASTM A653/A653M, Standard Specification for Steel Sheet, Zinc-Coated (Galvanized) or Zinc-Iron Alloy-Coated (Galvannealed) by the Hot-Dip Process
 - 3. ASTM E136 , Standard Test Method for Behavior of Materials in a Vertical Tube Furnace at 750°C

- D. Institute of Electrical and Electronics Engineers (IEEE)
 - 1. IEEE 1653.2, Standard for Uncontrolled Traction Power Rectifiers for Substation Applications Up to 1500 V DC Nominal Output
 - 2. IEEE C37.20.1, Standard for Metal-Enclosed Low-Voltage Power Circuit Breaker Switchgear
- E. International Code Council (ICC)
 - 1. International Building Code
 - 2. International Mechanical Code
 - 3. International Energy Conservation Code
- F. National Electrical Manufacturers Association (NEMA)
 - 1. NEMA 250, Enclosures for Electrical Equipment (1000 Volts Maximum)
 - 2. NEMA ICS 6, Industrial Control and Systems: Enclosures
- G. National Fire Protection Association (NFPA)
 - 1. NFPA 70, National Electrical Code

1.5 SUBMITTALS

- A. Procedures: Section 01 33 00, Submittal Procedures.
- B. Product Data:
 - 1. Seam caulking.
 - 2. Thermal and acoustical insulation, including weather stripping.
 - 3. Entry doors, including material, construction, and sealing gasket material.
 - 4. Door hardware, including hinges, handles, locks, panic bars, and door closer.
 - 5. Exterior equipment access door hardware including latches, hinges, gaskets, and door stops.
 - 6. HVAC units.
 - 7. HVAC control unit and thermostat.
- C. Spare Parts:
 - 1. Submit a list of spare parts to be provided under this Section.
 - 2. Submit at the same time as product data.
 - 3. Provide part numbers for each part, including a detailed break-down of each spare part assembly and set, as defined in Section 34 21 80, TES Spare Parts and Special Tools.

- D. Shop Drawings:
1. Structural and architectural plans to scale including the following:
 - a. Plans, elevations, and sections, including HVAC, door frames and openings, equipment mounting, lifting and anchorage details, and lighting.
 2. Drawings for fabrication including the following:
 - a. Floor plan showing framing and floor plate; equipment outlines and weights; floor openings; and welds and bolted connections.
 - b. Wall plans including framing, posts, beams, and other structural members; welds and bolted connections; interior and exterior wall panel details including interlocking, assembly of wall panels, and caulking; and connection of wall panel to base showing required z-type channel and wall panel lapped over floor seam.
 - c. Roof plan showing framing; welds and bolted connections; roof panel details including interlocking and rain cap, assembly of roof panels, and caulking; details of roof penetrations and the means used to prevent ingress of water; and connection of roof to walls.
 - d. Details of construction of doors, frames, welds, bolted connections and the means used to prevent ingress of water;.
 - e. Penetrations for cable, conduit, ventilation, or other purposes.
 - f. Clear indication on each drawing of each type of material, including type of galvanized finish, if any; and dimensions, gauge or thickness.
 3. Enclosure equipment grounding details, including ground grid connections.
- E. Compliance Certificates: For enclosure materials and performance.
- F. Calculations:
1. Structural:
 - a. Design calculations for the enclosure including analysis calculations for equipment, roof, wind, and seismic loadings, and for any temporary supports, certified by a structural engineer registered in the State of Missouri.
 - b. Design calculations for anchorage and supports, certified by a Professional Engineer registered in the State of Missouri.
 2. HVAC:
 - a. Sizing of heating, ventilating, and air conditioning units, including tabulation of interior equipment heat gains, infiltration gains/losses, conductive gains/losses and solar gains, certified by a mechanical engineer registered in the State of Missouri.

- G. Testing:
 - 1. Submit test procedures that meet the requirements of Section 34 21 90, TES Testing for the following:
 - a. Factory Design Tests.
 - b. Factory Production Tests.
 - 2. Submit test reports that meet the requirements of Section 34 21 90, TES Testing for the following:
 - a. Factory Design Tests.
 - b. Factory Production Tests.
- H. Operations and Maintenance Data:
 - 1. Submit manufacturer's operating and maintenance instructions on products specified in this Section, including the following requirements:
 - a. Repair procedure for powder coat finish.
 - 2. Submit immediately after approval of product data.

1.6 SPARE PARTS

- A. Provide spare parts in accordance with Section 34 21 80, TES Spare Parts and Special Tools.
- B. List below applies to items in this Specification Section.
 - 1. Lock cylinders: Keyed for TES substation doors; provide 4 spare.
 - 2. Padlocks: Keyed for TES substation equipment access doors: Provide 6 spare.

1.7 QUALITY ASSURANCE

- A. Comply with the requirements of the Project Quality Plan.
- B. Qualifications:
 - 1. Manufacturer of the pre-fabricated metal buildings shall be a company regularly engaged in the production of pre-fabricated galvanized steel buildings with a powder coat finish, and as approved by Engineer.
 - a. Manufacturer shall have constructed at least 50 similar buildings in the last 10 years.
 - b. Manufacturer shall be experienced in forming galvanized conforming to ASTM A653/A653M with minimum coating weight A25.
 - c. Once a manufacturer is approved, it shall not be discharged or otherwise replaced by the Contractor without the written approval of Engineer.
 - d. Personnel working on metal buildings shall be experienced, skilled, and familiar with building construction, including installing air conditioning, heating and ventilation systems.

2. Where engineering calculations are called out, they shall be performed by a professional engineer registered in the State of Missouri.
3. Welding shall be performed by Certified Welders. Refer to Section 34 21 06, TES Common Work Results for Metals, for detailed requirements.

PART 2 - PRODUCTS

2.1 GENERAL REQUIREMENTS

- A. Each substation enclosure shall be a shop assembled, free-standing, self supporting, steel building, utilizing channel perimeter framework and rigidly braced with channel and angle cross members.
- B. Completed assembly shall be designed for shipment for installation at site.
- C. The enclosure shall be a totally integrated weatherproof unit that houses the indicated substation equipment. The enclosure shall provide a dry, vermin proof, condensation free, stable internal ambient temperature environment.

2.2 ENCLOSURE DESIGN

- A. Design enclosures and components for the service life specified in Section 34 21 17, TES Substation Design and Assembly.
- B. Design enclosure in accordance with AISC 303, AISC 360, International Building Code, and local building codes to withstand live roof loading, wind loading, and seismic loading based on the service conditions specified in Section 34 21 17, TES Substation Design and Assembly, and the stresses caused during loading, transportation, unloading and installation.
- C. Access to the substation equipment will be from the sides and the rear. Enclosure design must allow the removal of all major equipment from outside or inside of the substation enclosure without disassembly of the equipment.
- D. Design enclosure for securing to a reinforced concrete slab as indicated on the Contract Drawings.
- E. Ratings:
 1. Complete enclosure shall have a NEMA 250 Type 4 rating.
 2. Doors, removable panels, joints, walls, roofs, floors, vents, louvers and outdoor accessories shall be weatherproof under environmental conditions specified in 34 21 17, TES Substation Design and Assembly.
- F. Structural design engineering calculations and drawings shall be sealed by a professional engineer registered in the State of Missouri.

2.3 BASE

- A. Fabricate from welded structural steel beams, rigidly braced with steel cross members to provide adequate strength for lifting the complete assembly, including all equipment.
- B. Structural steel:
 1. Hot-dip galvanized before welding in accordance with Section 34 21 06, TES Common Work Results for Metals.

2. Avoid using structural steel members with nonsymmetrical sections to minimize warpage and distortion during hot-dip galvanizing, as recommended by ASTM A384/A384M.
- C. Welds:
1. Mask steel in weld areas before galvanizing in accordance with Section 34 21 06, TES Common Work Results for Metals.
 2. Touch up welds as required in Section 34 21 06, TES Common Work Results for Metals.

2.4 ENTRY STEP

- A. Provide a single step at each entry door welded or bolted to the base.
- B. Design:
1. Design such that water may not become trapped on or in the structure.
 2. Comply with the IBC and 29 CFR 1910.24.
 3. Include in structural design engineering calculations sealed by a professional engineer registered in the State of Missouri.
 4. If design includes bolted attachment, bolt heads must be on the interior and nuts on the exterior, with bolt heads tack welded on the interior so they cannot turn if tightening is required.
- C. Dimensions:
1. Step depth: Minimum 10 inches, measured from outer edge of door threshold.
 2. Step width: Width of door.
 3. Height: 7 inches below interior finished floor height, plus or minus 1/2 inch.
- D. Material:
1. Support structure: Steel.
 2. Step: Steel grating, non-skid.
- E. Finish:
1. Hot-dip galvanized after fabrication in accordance with Section 34 21 06, Common Work Results for Metals.
 2. If step is welded to base, mask steel in weld areas before galvanizing in accordance with Section 34 21 06, TES Common Work Results for Metals.
 3. Coat welds made after hot-dip galvanizing in accordance with Section 34 21 06, TES Common Work Results for Metals.

2.5 FLOOR

- A. Fabricate from steel plate stitch-welded to the base, with cutouts as indicated or required.
- B. Steel plate: Minimum 1/4 inch.

- C. The floor shall withstand the weight of the heaviest circuit breaker, rectifier transformer or other equipment item which may have to be moved along the floor, without significant deflection.
- D. Indicate in engineering calculations the piece of equipment that may be moved along the floor that was used for floor calculations.
- E. Cutouts:
 - 1. Provide access to cables or conduits that penetrate floors as indicated on Contract Drawings or as otherwise necessary.
 - 2. Provide insulated protection on edges for cable penetrations to prevent damage to cable insulation.
 - 3. Provide removable cover plates for openings:
 - a. Ac switchgear: 11 gage steel with stainless steel hardware to latch it in place.
 - b. Dc switchgear: 1/4-inch glastic with non-metallic hardware to latch it in place.
 - c. Other penetrations: 1/4-inch glastic with non-metallic hardware to latch it in place.

2.6 WALLS

- A. Exterior walls:
 - 1. Material: Sheet steel panels, of a grade to be determined by Contractors structural design engineer.
 - 2. Coating:
 - a. Galvanneal meeting the requirements of ASTM A653/A653M with minimum coating weight A25.
 - b. Galvanneal shall not be quenched by the steel manufacturer or galvanizer or chemically treated in a way that inhibits powder coating.
 - 3. Thickness:
 - a. Minimum 11-gauge.
 - b. The specified minimum thickness shall apply to the base metal only.
 - 4. Interlock adjoining panels with J-type interlocking, as indicated in Figure 1, below.
 - 5. Seal seams with manufacturer recommended caulking.

Figure 1: Cross Section Wall Panels J-Type Interlocking

6. At wall-panel base, provide Z-type channel and lap exterior wall panel over the floor seam to prevent drain back, as illustrated in Figure 2, below.

Figure 2: Cross Section Wall-Panel Base Z-Type Channel

- B. Interior walls:
 1. Material: Same as exterior walls, above.
 2. Coating: Same as exterior walls, above.
 3. Thickness:
 - a. Minimum 14-gauge.
 - b. The specified minimum thickness shall apply to the base metal only.

2.7 ROOF

- A. Shed type, with pitch as shown on Contract Drawings, fabricated from interlocking sheet steel panels.
 1. Material: Same as exterior walls, above.
 2. Coating: Same as exterior walls, above.
 3. Thickness: Same as exterior walls, above.
 4. Interlocking: J-type, with standing seams and rain caps over seams, as indicated in Figure 3, below.
 5. Seal seams with manufacturer recommended caulking.

Figure 3: Cross Section Roof Panels Standing Seams With Rain Cap

- B. Roof penetrations:
1. Shall be used only with approval of the Engineer.
 2. If used, shall be minimal, with each flashed and waterproofed.
- C. Gutters and Downspouts:
1. Material: Same as exterior walls, above.
 2. Coating: Same as exterior walls, above.
 3. Thickness: Same as exterior walls, above.
 4. Gutters: Provide one on each long side of the enclosure
 5. Down spouts:
 - a. Provide one at each end of each gutter, a pair for each gutter.
 - b. Design: Angle at the bottom and extend far enough from enclosure to divert water minimum 12 inches beyond foundation slab.

2.8 THERMAL AND ACOUSTICAL INSULATION

- A. General Requirements:
1. Insulating materials shall have a certified classification of "non combustible" as defined by ASTM E136.
 2. Flame proofing of insulating materials will not be acceptable. Proof of certification shall be by one of the following:
 - a. UL label or listing.
 - b. National Bureau of Standards test results.
 - c. Certified test report from a nationally recognized testing laboratory.
- B. Thermal Insulation:
1. Enclosure thermal insulation shall comply with International Energy Conservation Code.
 2. Floor: Solid insulating panels.

- C. Acoustical insulation: Provide where needed to control continuous sound levels outside substations.

2.9 ENTRY DOORS

- A. Provide a minimum of two entry doors, located as indicated on the Contract Drawings.
- B. Material: Minimum 14 gauge sheet steel, galvanized in accordance with ASTM A653/A653 with minimum coating weight A40.
- C. Insulation: R value in accordance with applicable energy code.
- D. Size: Not smaller than shown on Contract Drawings.
- E. Door Hardware:
 - 1. Hinges: Stainless steel with stainless steel hinge pins.
 - 2. Panic hardware: One or three point crash-bar safety latches to permit opening doors from within under all conditions.
 - 3. Door Handles: Shaped such that they are easy to grasp with one hand and do not require tight grasping, pinching, or twisting of the wrist to operate. Door knobs are not acceptable.
 - 4. Locks: Self-locking, tamper proof, integrated with entry handles.
 - a. Locks all keyed alike.
 - b. Owner to provide keying requirements.
 - c. Provide two keys for each substation enclosure.
 - 5. Door Closer:
 - a. Heavy duty, highly corrosion resistant; all external body components of aluminum, zinc alloy or stainless steel material with stainless-steel fasteners.
 - b. Shall close door firmly and have hold-open position.
- F. Sealing:
 - 1. Doors shall be tightly sealed with neoprene gaskets.
 - 2. Secure seals to the doors so as to allow easy replacement.
 - 3. Design of doors shall prevent intrusion of water around the seams.

2.10 EXTERIOR EQUIPMENT ACCESS DOORS

- A. Provide hinged doors where shown on Contract Drawings:
 - 1. Equipment doors shall allow access to the rear of the ac switchgear, rectifier transformer, rectifier, and dc switchgear from the outside of the substation for regular maintenance.
 - 2. Opening the rectifier transformer rear double doors shall allow removal of the transformer as a unit from the outside of the substation.

- B. Material: Minimum 11 gauge sheet steel, galvanized in accordance with ASTM A653/A653M with minimum coating weight A25.
- C. Provide stiffening members as required.
- D. The exterior equipment access doors shall meet or exceed the requirements of NEMA ICS 6 for weatherproof NEMA 250 Type 4 enclosures.
- E. Latches:
 - 1. Three-point, padlockable, heavy-duty stainless steel switchgear type.
 - 2. Handle shall be located at working height referenced to actual final grade elevation at site.
- F. Hinges:
 - 1. Stainless steel, with stainless steel hinge pins and hardware.
 - 2. Provide a minimum of three concealed hinges.
- G. Door gaskets: Neoprene. Secure seals to doors to allow easy replacement.
- H. Door stop: Provide one for each door to hold it in the open position
- I. Padlock: Provide one padlock complying with Section 34 21 05, Common Work Results for TES, for each external door.

2.11 GROUNDING PADS

- A. Provide four copper grounding pads, bonded to the steel base of the enclosure at the corners as indicated on the Contract Drawings, for connection of 2-hole cable lugs.
 - 1. Grounding pads shall be on the interior of the base.
 - 2. Coordinate location of ground pads with location of access holes and adjust location of ground pads on switchgear side of the enclosure, if necessary, to make them accessible.
- B. Provide openings in floor for access, with removable cover plates as described above in Article titled " Floor."
 - 1. Size: Minimum 10 inches x 12 inches.
 - 2. Location: Coordinate access openings with equipment layout such that no part of the minimum size opening will be obstructed by the equipment. Openings in equipment provided for cable entrance may also be used for access to grounding pads.
- C. Connect enclosure grounding pads to enclosure interior perimeter ground specified in Section 34 22 26, TES Grounding and Bonding.

2.12 HEATING, VENTILATING, AND AIR CONDITIONING (HVAC)

- A. Interior Environment: Provide thermostatically controlled HVAC system to prevent condensation and maintain the interior temperature between 65 degrees F and 77 degrees F under all operating conditions.

- B. General Requirements:
1. HVAC system shall comply with the International Mechanical Code.
 2. HVAC units shall be controlled by the same thermostat and control unit.
 3. High Temperature Alarm:
 - a. If substation interior temperature reaches 85 degrees F send alarm to SAS. See Section 34 21 31, TES Substation Automation System (SAS).
 - b. Alarm temperature set point shall be field adjustable.
 4. Supply voltage: Either 120 Vac or 208/240 Vac, single-phase.
 5. Finish color: Match finish color of substation enclosure.
 6. HVAC Units: Unitary, packaged, wall-mounted type, hermetically-sealed compressors, UL listed, AHRI performance certified, with economizer cycle, meeting minimum efficiency requirements of the International Energy Conservation Code.
- C. Ventilation and Air Conditioning: Design system for heat gain in the substation under the following simultaneous conditions.
1. Maximum loading of the rectifier transformer per IEEE 1653.2 for Heavy Duty Traction Service.
 2. Exterior design conditions per International Energy Conservation Code.
 3. Maximum solar heat gain.
- D. Ventilation system shall provide sufficient air changes during heating periods to prevent battery-evolved hydrogen gases from exceeding a 1 percent concentration level.
- E. Heating: Design based on conduction and infiltration heat loss with exterior design conditions per International Energy Conservation Code and substation de-energized (no heat gain from interior equipment).
- F. Air Intakes:
1. Grill: Provide over filter to prevent entrance of foreign objects.
 2. Filters: Provide micro-glass, high-efficiency disposable filters in filter frames.
 3. Exterior: Provide tamper-proof hardware for filters located on exterior of enclosure.
- G. Provide two HVAC units for each substation enclosure with each unit capable of maintaining the interior environment specified above.
- H. Economizer Cycle Cooling:
1. Provide HVAC units in conjunction with an exhaust fan to allow cooling using only exterior air when that air is less than 60 degrees F.
 2. Equip inlet and exhaust ducts for economizer cooling with gasketed, motorized dampers to seal the enclosure when economizer cooling is not possible.

3. Economizer design shall maintain zero or slightly positive pressure within the substation enclosure at maximum ventilation rate.
- I. Redundant Operation:
 1. HVAC units shall operate with one unit on standby.
 2. Failure of the operating unit shall cause the other unit to commence operation automatically.
 3. Provide controls to manually and automatically alternate the units to minimize wear on each unit.

2.13 FINISHES

- A. Exterior metal surfaces:
 1. Roof and walls: Powder coat in accordance with Section 34 21 06, TES Common Work Results for Metals.
 2. Gutters and downspouts: Powder coat in accordance with Section 34 21 06, TES Common Work Results for Metals.
 3. Floor bottom and support structure: Shop-applied paint coating system in accordance with Section 34 21 06, TES Common Work Results for Metals.
 4. Color: See Section 34 21 06, TES Common Work Results for Metals.
- B. Interior metal walls and ceiling:
 1. Powder coat in accordance with Section 34 21 06, TES Common Work Results for Metals.
 2. Color: See Section 34 21 06, TES Common Work Results for Metals.
- C. Interior floor surfaces:
 1. Shop-applied paint coating system in accordance with Section 34 21 06, TES Common Work Results for Metals.
 2. Dielectric epoxy floor, where indicated on Contract Drawings, in accordance with Section 34 21 08, TES Dielectric Epoxy Flooring.
 3. Floor shall have a non-skid finish.
 4. Color: Shop-applied paint coating system shall match color of dielectric epoxy flooring. See Section 34 21 08, TES Dielectric Epoxy Flooring.

2.14 SOURCE QUALITY CONTROL

- A. Factory Design Tests:
 1. Coating qualification test: Perform in accordance with IEEE C37.20.1.
- B. Factory Production Tests:
 1. Rain test for outdoor LV switchgear:
 - a. Perform on each substation in accordance with IEEE C37.20.1. An existing design test will not be accepted; this test will not be waived.

- b. In addition to IEEE C37.20.1 requirements, address HVAC systems as follows:
 - 1) Test first with HVAC systems installed but not operating.
 - 2) If HVAC systems have louvered openings that open when the system is in operation, retest with all such openings in the fully open position.
- c. Replace IEEE C37.20.1 satisfaction of test requirements with the following: the enclosure shall have satisfactorily met the requirements of this test if during the visible inspection no water is found.

PART 3 - EXECUTION

3.1 INSTALLATION

- A. Installation of HVAC units after substation delivery shall comply with the following:
 - 1. International Mechanical Code.
 - 2. NFPA 70.
- B. Provide condensate drain pipe for HVAC units.

PART 4 - MEASUREMENT AND PAYMENT

4.1 MEASUREMENT

- A. The quantities of accepted work will be measured in the following units. All measurements will be plan measure except for authorized changes.
 - 1. Description: Lump Sum

4.2 PAYMENT

- A. Payment will be made at the respective unit or lump-sum price listed in the proposal and shall be full compensation for all labor, materials, and equipment necessary to complete the respective unit in place. There will be no separate measurement or payment for any item of work not specifically identified and listed in the proposal, and all such work shall be considered a subsidiary item with all costs pertaining thereto included in the prices for other items listed in the proposal. At the Engineer's option, partial payment may be made for any lump sum item listed in the proposal, providing that the Contractor is diligently and satisfactorily pursuing full completion of such partially complete item in accordance with the approved job progress schedule.

END OF SECTION

SECTION 34 21 17**TES SUBSTATION DESIGN AND ASSEMBLY****PART 1 - GENERAL****1.1 SUMMARY**

- A. This Section includes the following
 - 1. Designing and assembling prefabricated TES substations.
 - 2. Designing and installing a field erected TES substation in the vehicle maintenance facility (VMF).
 - 3. Miscellaneous materials, equipment, and components including but not limited to wiring devices and cover plates, smoke detector, blue light, Knox box, mobile work station, fire extinguisher, relays, switches, pushbuttons, indicating lights, terminal blocks, ac and dc breaker test stations, ETS buttons and enclosures, corrosion control junction box, communications rack, electrical insulating materials, signage and identification materials.
 - 4. Software to upload and download settings for intelligent electronic devices (IEDs).

1.2 RELATED SECTIONS

- A. SECTION 34 21 05 – Common Work Results for TES
- B. SECTION 34 21 08 – TES Dielectric Epoxy Flooring
- C. SECTION 34 21 14 – TES Medium-Voltage Ac Circuit-Breaker Switchgear
- D. SECTION 34 21 18 – TES Lighting
- E. SECTION 34 21 19 – TES Dc Switchgear

- G. SECTION 34 21 70 – VMF TES Control and APS
- H. SECTION 34 21 80 – TES Spare Parts and Special Tools
- I. SECTION 34 22 05 – TES Common Work Results for Conductors and Cable
- J. SECTION 34 22 33 – TES Raceway and Boxes

1.3 DEFINITIONS

- A. Intelligent Electronic Device (IED): Refers to any digital or numerical-based protection, metering, control, or monitoring device that has processing, recording and reporting capabilities and a local human machine interface (HMI).

1.4 REFERENCED STANDARDS

- A. Section incorporates by reference the latest revisions of the following documents:

- B. American National Standards Institute (ANSI)
 - 1. ANSI Z535.2, Environmental Facility and Safety Signs
- C. Code of Federal Regulations (CFR)
 - 1. 29 CFR 1926.200, Accident Prevention Signs and Tags
 - 2. 47 CFR Part 15, Radio Frequency Devices
- D. Federal Transit Administration (FTA)
 - 1. FTA QA/QC Guidelines FTA-IT-90-5001-02.1.

 - 2. IEEE C37.90.2, Standard for Withstand Capability of Relay Systems to Radiated Electromagnetic Interference from Transceivers
- F. International Organization of Standards (ISO)
 - 1. Quality Management Systems - Fundamentals and Vocabulary - ISO 9000
 - 2. Quality Management Systems - Requirements - ISO 9001
- G. National Electrical Contractors Association (NECA)
 - 1. NECA 1, Standard Practice of Good Workmanship in Electrical Construction
- H. National Electrical Manufacturers Association (NEMA)
 - 1. NEMA 250, Enclosures for Electrical Equipment (1000 Volts Maximum)
 - 2. NEMA WD 1, General Requirements for Wiring Devices
 - 3. NEMA WD 5, Specific-Purpose Wiring Devices
- I. National Fire Protection Association (NFPA)
 - 1. NFPA 70, National Electrical Code (NEC)

1.5 SUBMITTALS

- A. Procedures: Section 01 33 00, Submittal Procedures.
- B. Product Data: Submit manufacturer's product data for products specified in this Section if not submitted under another Section:
 - 1. Wiring devices.
 - 2. Cover plates.
 - 3. Smoke detectors.
 - 4. Exterior blue light.
 - 5. Knox box.

6. Mobile work station.
 7. Fire extinguisher.
 8. Relays.
 9. Switches.
 10. Pushbuttons.
 11. Indicating lights.
 12. Terminal blocks.
 13. Ac and dc breaker test stations.
 14. ETS buttons and enclosures.
 15. Corrosion control junction box.
 16. Communications rack.
 17. Electrical insulating laminate.
 18. Identification:
 - a. Baked porcelain enameled steel signs,
 - b. Vinyl signs,
 - c. Conduit identification labels,
 - d. Nameplates.
- C. Samples:
1. "While in use" wet or damp location cover.
 2. Each type of identification product
- D. Identification Schedule: Submit a schedule of proposed nameplates and labels, including material, size, color, text, and location, before ordering.
- E. Submit a request for permission to perform a Field Evaluation for equipment that is not labeled or listed.
- F. Shop Drawings:
1. Comply with Owner's drafting standards.
 2. Drawing Scale:
 - a. Use only standard architectural or engineering scale. Non-standard scales, such as 15 inches equals 1 foot, will not be accepted.
 - b. Drawings must be properly converted to pdf format such that scalability is maintained.
 3. Provide each of the drawing types listed below for TES substations.
 4. One-line Diagrams: Provide for each substation.

5. Three-line Diagrams: Provide for each substation.
6. Schematic Diagrams:
 - a. Format by subsystem, using identical device symbols and wire designators for each subsystem.
 - b. Clearly delineate interfaces, from page to page and subsystem to subsystem.
 - c. These drawings shall include at least the following information:
 - 1) Wire connections, terminations and identification.
 - 2) Nominal voltages, equipment and equipment ratings, currents, frequencies, significant resistance values, and the rating of all loads.
 - 3) All low voltage dc control circuits.
 - 4) Schematic location (page number, for example) of the energization portion of each device (such as the coil in a relay) noted adjacent to the operating portions (such as relay interlocks) of the device.
7. Wiring diagrams: Provide a set for each substation:
 - a. Show all wiring, raceways, conduits, and connections.
 - b. Provide equipment connection, intra-cubicle, and inter-cubicle wiring diagrams.
 - c. Connection diagrams: Show the internal wiring and terminal block arrangement within each piece of equipment and identify each outgoing power and control connection and wire.
 - d. Interconnection diagrams: Show wiring from the equipment terminal blocks, to external equipment connections, terminal blocks, and devices.
 - e. Show nominal voltages, equipment and equipment ratings, currents, frequencies, significant resistance values, and the rating of all loads.
 - f. Label devices identical to the actual device and show their locations on panels.
 - g. Each terminal block and device shall have its own unique numbers and letters for identification.
 - h. As a minimum, provide the following information for each wire segment:
 - 1) Wire code (schematic designation).
 - 2) Origin (FROM device and terminal).
 - 3) Destination (TO device and terminal).
 - 4) Wire size.
8. Substation Equipment and Raceway Drawings: Show actual equipment to be provided and raceways, with all drawn to scale.

-
9. Panel schedules: Submit for each panel to be provided.
 10. Equipment arrangement drawings:
 - a. Show actual equipment to be provided and details of installation, drawn to scale, using layout provided in Contract Drawings.
 - b. Alternate substation equipment layouts may be proposed by Contractor, subject to Engineer's approval.
 - c. Provide the following drawings:
 - 1) Certified substation footprint with locations of openings for incoming and outgoing feeders within 45 days of NTP.
 - 2) Substation plans and elevations showing the equipment layout, including equipment numbers, locations, and dimensions.
 - 3) Equipment front elevations and wall elevations showing the location of each piece of equipment and dimensions.
 - 4) Installation and mounting details for all equipment, including installation of the transformer enclosure partitions, method of anchorage for each piece of equipment, and method for providing electrical isolation for the dc switchgear.
 - 5) Raceway layout plans showing cable trays, conduits, including numbers, locations, and dimensions.
 11. Signage drawings to scale with text:
 - a. Exterior substation number designation and location.
 - b. Warning signs and locations.
 - c. Interior manufacturer's identification and location, if any.
- G. Substation ANSI Device Table:
1. Provide a set of device tables for substation ANSI devices in a single section in the schematic book.
 2. Arrange the table in a logical fashion by system device type.
 3. Provide data for all system and subsystem components including, but not limited to the following:
 - a. Electrical control and power components (groups, panels, pc cards, contactors, relays, circuit breakers, capacitors, inductors, resistors, specialized modules, rectifiers, diodes, fuses and other components, as appropriate).
 - b. Electrical equipment (rectifiers, transformers, switchgear, substation automation system (SAS), interface terminal board, and the like).
 4. Include the following data:
 - a. Equipment and associated number where a device is located.
 - b. Elementary schematic drawing number where the device appears.

-
- c. A brief description of the device.
 - d. Manufacturer's model or style number.
 - e. Manufacturer's name and type number of the device.
 - f. Device rating.
 - g. Number, rating, and types of contacts on device, if applicable.
 - h. Remarks on any other relevant features of the device.
- H. Bill of Materials (BOM): Provide the following in spreadsheet format:
- 1. Contract number.
 - 2. Supplier number.
 - 3. Column for Owner's stores number.
 - 4. Other data required for procurement of materials used in the construction of all parts of the electrification system.
 - 5. Cross-reference between related drawings and the BOMs.
 - 6. Generic description or specification.
 - 7. Brand name, where applicable.
 - 8. Manufacturer's part number.
 - 9. Original manufacturer or supplier, including address, telephone number, e-mail address, FAX number, and contact person.
 - 10. Notation on parts that are custom manufactured only upon request.
- I. Software:
- 1. Provide interface and configuration software for uploading settings to and downloading event history from intelligent electronic device (IED).
 - 2. Include software license for Owner.
- J. Operations and Maintenance Materials:
- 1. Submit manufacturer's operating and maintenance instructions on products specified in this Section.
 - 2. Submit immediately after approval of product data.
- K. Substation History Books:
- 1. The substation "history book" shall contain a complete record for each substation, shall be kept up to date throughout the manufacturing process, and may be inspected by the Engineer at any time.
 - 2. Format:
 - a. Furnish a table of contents at the front of the book indicating the page number for each type of information included.

- b. Separate major sections with tabs.
- c. Furnish with consecutive numbering on each page.
3. Provide a history book for each substation, with the following information at a minimum:
 - a. Copy of approved plan review, if plan review is required by state law or city ordinance.
 - b. Factory production test reports.
 - c. Description and completion dates of substation modifications, and a list of modifications pending with expected completion dates.
 - d. A record of abnormalities that occur during the manufacture of the substation or its subsystems, including their authorized repair procedures.
 - e. List of substation defects that were identified by the Contractor's QA or the Engineer during assembly, commissioning, and testing, and the disposition of each as verified by inspection.
 - f. List of serial-numbered apparatus.
 - g. Shipping documents.
 - h. Field acceptance test reports.
 - i. Integrated testing reports.
 - j. Final relay settings.
 - k. Copy of final rail voltage monitoring and grounding system settings.
 - l. Copy of permit signed off by the issuing department.
 - m. Open items status list.
4. Changes in recorded data that are made during performance of the Contract shall be clearly identified and justified to the satisfaction of the Engineer.

1.6 SPARE PARTS

- A. Provide spare parts in accordance with Section 34 21 80, TES Spare Parts and Special Tools.
- B. List below applies to items in this Specification Section.
 1. Blue light: Provide 2 spare.

1.7 QUALITY ASSURANCE

- A. Comply with the requirements of the Project Quality Plan.

- B. Quality Assurance (QA) Requirements for TES Substation Manufacturer:
1. Assign a QA Manager responsible for managing and with authority for acting on all quality matters relate to TES substation manufacture and assembly, and who has the following qualifications:
 - a. Minimum 5 years overall quality experience.
 - b. Minimum 2 years prior experience as a QA Manager, on transit project(s) of comparable complexity to this Contract.
 - c. Minimum 2 years as a Quality Control (QC) Manager or Supervisor, Quality Engineer, Quality Auditor or QC Inspector.
 2. Quality Plan:
 - a. Submit a Quality Plan that addresses the 15 quality elements identified in FTA QA/QC Guidelines FTA-IT-90-5001-02.1.
 - b. Provide descriptions of, and references to Quality procedures and work instructions, including specified requirements unique to this Contract, that relate to quality system elements defined in Quality Management Systems - Fundamentals and Vocabulary ISO 9000 and Quality Management Systems - Requirements ISO 9001.
 - c. Include the following elements in the Quality Plan:
 - 1) QA/QC Organization and staff, including job description and an organizational chart showing relationship between Contractor's General Manager, Project Manager, Quality Manager, Subcontractors, and consultants.
 - 2) Documented Quality System.
 - 3) Design Control.
 - 4) Document Control and Submittal Management.
 - 5) Subcontractor, Consultant and Supplier Control.
 - 6) Identification, Traceability and Receiving, Handling, Storage and Control of Products, Materials and Equipment.
 - 7) Process Control and control of special fabrication processes, e.g. welding and powder coating.
 - 8) Inspection and Testing.
 - 9) Control of measuring and test equipment.
 - 10) Inspection and Test Reporting.
 - 11) Identification, Control and Correction of Non-conforming Conditions.
 - 12) Corrective Actions.
 - 13) Quality Records.
 - 14) Training.

- 15) Configuration control for software.
- 16) Change control for factory drawings, fabrications, assembly, wiring, testing, and as-built drawings.

C. Qualifications:

1. Electrical work at TES substation manufacturer's plant shall be performed by electrical workers skilled in the installation of electrical equipment and knowledgeable in the requirements of NFPA 70 and NECA 1, as certified by manufacturer's Quality Plan.

D. Performance Requirements:

1. Each component, subassembly and assembly provided for TES substations shall be of a proven design with a history of at least 5 years successful operation at the time of Contract award in similar railroad or rail transit service.
2. Use off-the-shelf service-proven equipment and hardware approved by the Engineer.
3. TES Substation Expected Service Life: 50 years in continuous service, 24 hours a day, 365 days a year.

E. Listed and Labeled Equipment and Material:

1. Provide wherever standards for these products have been established.
2. Materials that are not listed or labeled require approval by Engineer before use.
3. Products that have not been tested or certified for the use intended shall not be used when equivalent listed or labeled materials are available.
4. The label or listing will be acceptable as sufficient evidence that the materials and equipment do conform to the specified standards.
5. Electrical equipment and material not listed or labeled shall be furnished with a Field Evaluation label provided by an approved Testing Laboratory, and certifying that the equipment conforms to the requirements of UL and ANSI.
 - a. This product evaluation may be performed in the factory or on-site as approved by Engineer.
 - b. A request for permission to perform a Field Evaluation in the factory or onsite shall be submitted to Engineer for approval.

F. TES Substation Systemic Failure:

1. Monitor substation component failures during the commissioning, testing, and warranty phase.
2. Systemic Failure: Failure of 10 percent or more of the same components used for the same function during this time period.
3. Within 30 days of receiving notification of systemic failure, begin a program to repair or replace all components of the type involved in the systemic failure.
4. Develop the repair or replacement for the components to remedy the nature and probable cause of the component failure.

5. Submit proposed repair or replacement to the Engineer for approval.
6. Components shall be replaced at no cost to the Owner.

1.8 WARRANTY

- A. Provide an extended warranty for unproven equipment.
- B. Unproven equipment means equipment that meets any one of the criteria described below:
 1. Equipment that is not service proven in the rail transit industry in the United States. To be service proven equipment shall have been in use for a minimum of five years.
 2. Equipment or assemblies that have not been used before by this manufacturer in the rail transit industry in the United States.
 3. Equipment or assemblies that use software developed from the ground up for this project.

PART 2 - PRODUCTS

2.1 TES SUBSTATION DESIGN

- A. General:
 1. Design prefabricated and built-in-place substations that comply with the requirements of the Contract Documents.
 2. Submit product data, shop drawings, and samples, as specified, for Engineer approval before starting procurement or manufacturing.
 3. The proposed substation equipment must fit within the space as shown in Contract Drawings.
- B. Prefabricated Substations:
 1. Furnish shop drawings that show the layout of every aspect of prefabricated substation such that each substation built from the shop drawings is identical to the others in every respect.
 2. Substations shall have identical electrical equipment, traction power equipment, and appurtenances; and identical layout of equipment, appurtenances, raceways, wiring, terminal blocks and wiring connections.
 3. Equipment shall be fully interchangeable without modification.
 4. Changes made to the design after manufacturing has started must be documented and implemented in every substation.
- C. Built-in-Place VMF Substation:
 1. Furnish shop drawings that show the layout of every aspect of VMF substation, including size and location of building systems and appurtenances, locations of each wiring device, and layout of substation equipment and raceways.
 2. The VMF substation shall be identical to prefabricated substations to the extent possible.

3. Coordinate final design and layout of VMF building systems and appurtenances in TES substation room with approved substation equipment, including the following:
 - a. Coordinate location of wiring devices, fire protection system components, and other wall-mounted equipment with location of wall-mounted electrical insulating laminate and substation equipment.
 - b. Ac Feeds from Building Electrical Room:
 - 1) Coordinate with approved final equipment layouts.
 - 2) Include TES substation in building electrical coordination study.
 - c. HVAC: Coordinate design of building HVAC system to accommodate the layout and heat output of approved substation equipment.
 - d. Lighting: Lay out and install building lighting system to coordinate with layout of substation equipment and provide lighting levels required in Section 34 21 18, TES Lighting.
 - e. Fire Protection System: The substation room must be a separate zone in the building fire alarm system. Provide alarm contact to operate lockout trip relay, ANSI Device 86 upon detection of smoke based only on that zone.
- D. Maintainability: Conveniently locate devices requiring regular calibration, resetting or operation within easy reach of personnel.
- E. Noise Compliance: Design substation to comply with applicable noise regulations with substation equipment operating at rated full load capacity, and sound measured from outside substation on all sides.
- F. Radio Frequency Interference:
 1. Design substation equipment, protective relays meters, instruments and devices to minimize the radio frequency generated in accordance with 47 CFR Part 15.
 2. Design substation equipment, protective relays, meters, instruments and devices such that they are immune to misoperations caused by ambient radio frequency signals, in accordance with IEEE C37.90.2.
- G. Design Conference:
 1. TES substation design conference will be held at substation manufacturer's facility within 60 days after NTP. Substation design personnel and a representative of the Contractor are required to attend. The following will be discussed:
 - a. Basic substation layouts.
 - b. One-line diagram.
 - c. Proposed basic substation parts.
 - d. Proposed sequence of substation work.
 - e. Design, production and field testing procedures.
 - f. Submittal list.

2.2 TES SUBSTATION DESCRIPTION AND DESIGN CRITERIA

- A. Prefabricated TES Substation General Parameters:
1. Provide complete factory assembled TES substation in weatherproof enclosure.
 2. Substation rating: 350 KW, heavy traction service.
 3. Substations will be unattended.
 4. Dc System Voltage:
 - a. 750 Vdc at rated load.
 - b. Maximum Voltage with Regeneration: 900 Vdc.
 - c. Regulation: 4.5 percent between 1 percent and 200 percent load.
- B. VMF TES Substation General Parameters:
1. Provide field assembled TES substation in VMF
 2. Substation rating: 150 kW, heavy traction service.
 3. Substations will be unattended.
 4. Dc System Voltage:
 - a. 750 Vdc at rated load.
 - b. Maximum Voltage with Regeneration: 900 Vdc
 - c. Regulation: 4.5 percent between 1 percent and 200 percent load.
- C. Environmental Requirements: Provide substation suitable for operation without impairments at its standard ratings throughout the range of worst values listed below:
1. Ambient Outdoor Temperature: Minus 25 degrees F to 115 degrees F.
 2. Maximum Ambient Outdoor Humidity: 100 percent.
 3. Design Wind Speed: 110 mph.
 4. Accumulated Snow: 30 inches.
 5. Accumulated Ice: 3 inches.
 6. Seismic: Comply with Section 34 21 05, Common Work Results for TES.
 7. Altitude: 1,026 feet above sea level.
- D. Utility Data: Power to the TES substations will be supplied from Kansas City Power & Light (KCP&L) at 13.2 kV. Other required utility data may be obtained from KCP&L.

2.3 UTILITY METERING

- A. Utility Metering Section: See Section 34 21 14, TES Medium-Voltage Ac Circuit-Breaker Switchgear.
- B. Meter base: Furnished by KCP&L.

2.4 WIRING DEVICES AND COVER PLATES

- A. General Requirements:
1. Type: NEMA WD 1, heavy-duty general-use type.
 2. Color: Grey, or as selected by Engineer.
 3. Wiring: Back or side wired.
 4. Terminals: Screw type or combination screw-clamp type.
 5. Terminal screws: No. 8 or larger, captive or terminal type.
- B. Switches:
1. Tumbler-type toggle switches that operate in any position.
 2. Voltage rating: 120-277 Vac.
 3. Fully enclosed with entire body and cover of molded phenolic, urea, or melamine. Do not use fiber, paper, or similar flammable insulating material for body or cover.
 4. Mounting yoke: Metal with plaster ears, insulated from the mechanism and fastened to the switch body by bolts, screws, rivets, or other substantial means.
 5. Switch contacts: Silver or silver alloy.
 6. Applications:
 - a. Lighting: Fully-rated 20 A at 120 V or 277 V.
 - b. Straight resistance loads: May be snap switches as specified in this Section, of the proper rating up to 30 A at 120-277 V.
 7. Testing: Capable of withstanding tests as outlined in NEMA WD 1. If requested by Engineer, submit evidence that the types of switches proposed have satisfactorily withstood these tests.
- C. Convenience Receptacles:
1. Bodies and Bases: Fire-resistant, nonabsorptive, hot-molded phenolic.
 2. Plaster ears: Metal, integral with supporting member.
 3. Configuration: 20R, single- or duplex-type as indicated.
 4. Contacts: Double-grip bronze type with spring steel backup clips so that both sides of each male prong of the plug will be in firm contact. Applies also to grounding contact.
- D. Locking-blade Receptacles: NEMA WD 5.
- E. GFCI Receptacles: Duplex receptacles, 120 V, 60 Hz, 20 A with built-in test, reset buttons, and ground fault tripped indication.
1. Trip: Interrupt the circuit within 1/30 second on a 5 milliampere earth leakage current.

2. Use GFCIs designed for end of run installation or with provisions for feeding through to protect other outlets on the circuit.
- F. Cover Plates:
1. Interior cover:
 - a. Device covers: Raised, galvanized steel.
 - b. Provide multi-gang plates where required. Segmented cover plates are not acceptable.
 2. Exterior and wet or damp location cover:
 - a. NEC-compliant "while-in-use" cover.
 - b. Heavy-duty, die-cast aluminum, powder coated.
 - c. Listed for wet locations, rated NEMA 250 Type 3R, with neoprene gasket.
 - d. Padlockable.
 - e. Depth: Minimum 3-1/4 inches.
 - f. Submit sample for approval.

2.5 SMOKE DETECTORS

- A. Ionization photoelectric type.
- B. Plug-in unit with mounting plate hard wired.
- C. Integrally self-monitoring, self-diagnostic, with visual trouble indication.
- D. Designed to reduce false alarms from dust, insects, radio frequency interference (RFI), and external light.

2.6 EXTERIOR BLUE LIGHT

- A. LED blue color light, 360 degrees illumination, suitable for wet locations.
- B. Light shall incorporate a failsafe circuit with an annunciator indicating failure of the LED, power supply, or fuse.
- C. Approved Manufacturer/Product: Federal Signal LED Pulsator 212650-3, or approved equal.

2.7 KNOX BOX WITH LOCK

- A. 6 inches by 6 inches by 4 inches.

2.8 MOBILE WORKSTATION

- A. Construction:
 1. Heavy-duty structural foam.
 2. Capacity: 750 pounds.

- B. Features:
 - 1. Wheels: Four 5-inch casters.
 - 2. Drawers: Four, with ball bearing door slides.
 - 3. Cabinet with adjustable shelf.
 - 4. Built-in drawer lock.
- C. Nominal Dimensions:
 - 1. Width: 49 inches.
 - 2. Depth: 26 inches.
 - 3. Height: Nominal 38 inches.
- D. Approved Manufacturer/Product: Rubbermaid TradeMaster, Model 4533-88 or approved equal.

2.9 FIRE EXTINGUISHER

- A. CO2, 20 pound.
- B. Portable, appropriate for equipment provided.

2.10 CIRCUIT BREAKERS AND DISCONNECT SWITCHES

- A. Provide breakers and switches with auxiliary contacts where position indications from circuit breakers or disconnect switches are required.
- B. Auxiliary relays are not acceptable to monitor position indication of circuit breakers or disconnect switches.

2.11 RELAYS

- A. Drop-out Voltage: 80 V.
- B. Contacts:
 - 1. Current rating: Based on continuous, inrush, or interrupting requirements for the duty category, whichever is most stringent, and then derated by at least a factor of four.
 - 2. Voltage rating: Contacts shall be rated for a minimum of twice the applied voltage.
 - 3. Select materials for the actual loads and not solely on the device rating. Silver bifurcated contacts and gold alloy bifurcated cross-bar contacts are preferred on low level and dry circuits, respectively.
- C. Coils:
 - 1. Coils of all devices shall be suppressed, except where performance may be affected.
 - 2. Unsuppressed coils are permitted only with written approval of the Engineer.
- D. Service Life: Relays shall have a guaranteed mechanical service life of at least 50 years.

- E. Protective relays: IEEE C37.90, utility grade, immune from inadvertent operation due to ambient EMI, including radio frequency signals.
- F. Auxiliary and control relays:
 - 1. Heavy duty, UL listed.
 - 2. Mechanical durability: Minimum 50,000 cycles.
 - 3. Electrical durability: Minimum 100,000 cycles for resistive load.

2.12 SWITCHES

- A. Control Switches: Selector switch type, heavy duty rated, with metal operator.
- B. Position Switches (Device 33): Roller-plunger type switch, rated heavy or medium duty, brass or steel plunger, metallic enclosure, rated for 20,000 operations, minimum.
- C. Cubicle Lighting Door Switches: Roller-plunger type switch, rated heavy or medium duty, brass or steel plunger, metallic enclosure, voltage and current rating suitable for approved luminaires, rated for 20,000 operations, minimum.
- D. Cubicle Lighting External Switches: Panel-mount rocker type; rated heavy or medium duty; voltage and current rating suitable for approved luminaires; rated for 20,000 operations, minimum; "on" and "off" positions indicated on the switch by "1" and "0".
- E. Intrusion Detection Door Switches: Magnetic, rated heavy or medium duty, metallic case, screw mounted.

2.13 PUSHBUTTONS

- A. Heavy duty, 600 V, 30 mm size,
- B. Momentary contact or latching, as indicated or as appropriate for design.

2.14 INDICATING LIGHTS

- A. Long-life, high-brightness using LED arrays and integral current limiting resistors.
- B. Indicators shall be selected to permit maximum visibility in direct sunlight from all viewing angles.

2.15 TERMINAL BLOCKS

- A. Heavy-duty molded nylon, DIN rail mounted, 600 V, minimum current rating equal to overcurrent protective device, spring-loaded captive screws with pressure plates,
- B. Acceptable Manufacturer/ Product: GE CR151K Series or approved equal.

2.16 AC AND DC BREAKER TEST STATIONS

- A. Ac: Capable of tripping ac breaker.
- B. Dc: Capable of tripping dc breaker.
- C. Umbilical cord:
 - 1. For connecting to breaker.
 - 2. Provide strain relief where cord connects to cabinet.

3. Provide means to conveniently stow umbilical cord when not in use.

2.17 EMERGENCY TRIP STATIONS (ETS)

- A. ETS Buttons:
 1. Heavy duty, industrial grade, pushbutton operator and contact block, rated for the load, minimum 2-inch diameter mushroom head, red.
 2. TES Substations: Momentary contact.
 3. VMF Shop: See Section 34 21 70, VMF TES Control and APS.
- B. Protective cover: Provide cover or shield to prevent inadvertent activation. Engineer will determine whether proposed protective cover is suitable for the intended purpose.
- C. Enclosure:
 1. Substation Interior: NEMA 250, Type 1.
 2. Substation Exterior: NEMA 250 Type 4X, stainless steel, gasketed, hinged, lockable. Provide padlock complying with Section 34 21 05, Common Work Results for TES.

2.18 CORROSION CONTROL JUNCTION BOX

- A. Box:
 1. Hinged cover electrical cabinet complying with Section 34 22 33, TES Raceway and Boxes.
 2. Size box to allow easy access for testing.
- B. Test Jacks: Panel-mount with recessed closed entry design.
 1. Body material: Nylon.
 2. Color:
 - a. Negative bus: Black
 - b. Earth ground: Green
 3. Contact Material: Beryllium copper silver plate.
 4. Size: Accepts 0.080 tip.
 5. Terminal: Brass, tin plated.
 6. Current rating: 10 A.
 7. Breakdown Voltage: 5700 A
 8. Acceptable Manufacturer/ Product: Keystone Electronics, fully insulated panel mount test jacks, deluxe.
- C. Labeling: Comply with Article below titled "Identification."
 1. Provide "Corrosion Control Junction Box" nameplate on cabinet.

2. Provide "Negative Bus" and "Earth Ground" labels under test jacks according to colors, above.

2.19 COMMUNICATIONS RACK

- A. Steel, fully enclosed, 19 inch, with adjustable front and rear rackmount rails, and removable side panels.
- B. Wall-mountable, with hinged wall bracket that allows cabinet to swing out from wall.
- C. Height: 18 U
- D. Front Door: Ventilated, removable, with means for locking.
- E. Side Panels: Ventilated, removable, locking.
- F. Capacity: 250 lbs.
- G. Provide 1 U horizontal cable manager.
- H. Provide grounding lug.
- I. Acceptable Manufacturer/Product: Tripp Lite Smartrack Series, SRW18US, or approved equal.

2.20 ELECTRICAL INSULATING MATERIALS

- A. Wherever "electrical insulating laminates", "laminates" or "glastic barrier" are called out in the Contract Documents, use the following:
 1. Acceptable Manufacturer/Product: Roehling Glastic Composites, Glastic 1494, or approved equal.
 2. Thickness: 1/4 inch.
- B. Electrically Insulated Floor Covering: Specified in Section 34 21 08, TES Dielectric Epoxy Flooring.
- C. Prohibited insulating materials.
 1. Electrical insulating paper, also called "fish paper".
 2. Electrical tape of any type.

2.21 MISCELLANEOUS PRODUCTS

- A. Cable ties: See Section 34 22 05, TES Common Work Results for Systems Conductors and Cable.
- B. Metallic fasteners: See Section 34 21 05, Common Work Results for TES.

2.22 SOFTWARE

- A. Provide interface and configuration software for uploading settings to and downloading event history from intelligent electronic device (IED).
- B. Provide software that will work with each type of IED provided under a Division 34 specification section.
- C. Software shall work on a standard laptop with Microsoft Windows 7 operating system.

2.23 SIGNAGE

- A. Substation Number Sign: Provide on two sides of the enclosure in location approved by Engineer.
1. Sign material: Baked porcelain enameled steel, with the porcelain enamel forming a complete ceramic envelope around the steel plate.
 2. Color: Black lettering on a white background, or as directed by Engineer.
 3. Number designation: "TES Substation - XX," where "XX" is a number that will be provided by the Engineer.
 4. Lettering height: 6 inches, minimum.
 5. Location: As approved by Engineer.
 6. Attachment hardware: Stainless steel.
- B. Warning Signs:
1. Material:
 - a. Exterior locations: Baked porcelain enameled steel (see above under "Substation Number Sign.")
 - b. Interior locations: 3.5 mil adhesive backed vinyl film with digital or screen-printed images.
 2. Color: Compliant with 29 CFR 1926.200 and ANSI Z535.2.
 3. Text:
 - a. Substation Entry doors: "DANGER; HIGH VOLTAGE" and "DO NOT ENTER."
 - b. Substation Exterior equipment access doors: "DANGER: LIVE PARTS" and "DANGER HIGH VOLTAGE."
 - c. Substation Cubicles with 750 V or above: "DANGER: LIVE PARTS" and "DANGER HIGH VOLTAGE."
 - d. Locations where there are live parts after ac main breaker is opened: Submit language appropriate to the specific location for approval.
 4. Location:
 - a. Substation Entry doors: Exterior of door.
 - b. Substation Exterior equipment access doors: Exterior of door and front of removable panel inside exterior door, if any.
 - c. Substation Cubicles with 750 V or above: Front, rear, and side access doors.
- C. Manufacturer's Name: Shall not be placed on the exterior of the enclosure. It will be allowed on the interior of the enclosure but shall be approved by the Engineer.

2.24 IDENTIFICATION

- A. Equipment Identification
1. Provide a number for each piece of equipment such as switchgear sections and circuit breakers, and for devices such as relays, control switches, LED indications, meters, relays, and displays.
 - a. Prefix: TES substation number, as indicated on Contract Drawings.
 - b. Suffix: Indicates the type of equipment or device.
 2. Use the Owner's numbering scheme on submitted Contractor drawings and submittals.
 3. Place the Owner's part number on as-built drawings.
 4. Engineer will furnish numbering standard.
- B. Wire and Cable:
1. Develop an identification scheme for wires and cables for use on Contractor drawings.
 2. For wire sleeve and cable tag requirements, see Section 34 22 05, TES Common Work Results for Conductors and Cable.
- C. Conduit Identification Labels: Laminated, machine-printed labels with high-strength adhesive, black letters on yellow background.
1. 2-inch and smaller conduits: Nominal 3/4-inch wide
 2. 2-1/2-inch and larger conduits: Nominal 1-inch wide labels.
 3. Approved Manufacturer/Product: Brother TZ-series tape, or approved equal.
 4. Use label printer compatible with chosen tape.
- D. Nameplates:
1. Engraved three-layer melamine laminated plastic, not less than 3/32-inch thick. Provide nameplates with black letters on a white background unless otherwise noted.
 2. Equipment nameplates: 1-5/8 inches high with 7/8-inch high characters minimum.
 3. Device nameplates: 7/8-inch high and have 1/4-inch high characters.
 4. Other equipment nameplates shall be sized and lettered according to the equipment and application as approved by the Engineer.
- E. Permanently identify equipment with engraved metal labels containing the following:
1. Supplier's name.
 2. Part number.
 3. Revision level.

- F. Serial Numbers:
1. Assign discrete serial numbers in sequential, numerical order for the total quantity of each component, including spares.
 2. Serial numbers are subject to the Engineer's approval.
 3. Duplicate serial numbers shall not be used within the type or model.
 4. Present to the Engineer as each portion of the installation is completed or when spare components are received.
 5. Track serial number transfers and prepare a list of all serial-numbered apparatus installed in each substation for inclusion in the substation history book.
 6. At a minimum, the following equipment shall have serial numbers applied:
 - a. Ac main breaker.
 - b. Rectifier transformer.
 - c. Rectifier assemblies.
 - d. Interphase transformers.
 - e. Dc feeder breakers.
 - f. Auxiliary power transformer.
 - g. Substation alarm panel HMI.
 - h. Motors within equipment.
 - i. Electronic cards.
 - j. Enclosures.
 - k. Manually-operated disconnect switches.
- G. Identification Schedule: Submit a proposed schedule of nameplates and labels including material, size, color, text, and location, before ordering.

2.25 FACTORY ASSEMBLY

- A. General Requirements:
1. Provide products in accordance with product listings, manufacturer's recommendations, relevant codes and regulations, and standard industry practice for electrical installations.
 2. Provide electrical materials, equipment, appurtenances, and accessories in locations as indicated and in accordance with NECA 1.
 3. Provide supporting members, fastenings, framing, hangers, bracing, brackets, straps, bolts, and angles as required to set and connect the Work rigidly.
 4. Control erection tolerance requirements so as to not impair the strength, safety, serviceability, or appearance of the installations.

-
5. Complete installation: Contract Drawings show electrical equipment diagrammatically and do not show all accessories or fittings that may be required. Provide complete and operable electrical systems and installations in conformance with these Specifications.
- B. Anchoring and Support:
1. Do not weld electrical materials for attachment or support.
 2. Provide anchor bolts and anchorage items as required to comply with Contractor's seismic design.
- C. Installation of Wiring:
1. Provide wiring systems complete as indicated and required for proper service.
 2. Provide ample slack wire for motor loops, service connections, and extensions.
- D. Installation of Utility Metering:
1. Install KCP&L-furnished meter socket on exterior of substation enclosure per KCP&L requirements.
 2. Provide conduit to meter socket and wire per KCP&L requirements.
- E. Installation of Wiring Devices and Cover Plates:
1. Install switches, receptacles, special purpose outlets, and cover plates complete in accordance with NECA 1, NFPA 70, and local electrical codes.
 2. Locate wiring devices at heights in accordance with NECA 1, except as otherwise indicated.
 3. Provide GFCI duplex receptacles on the interior and exterior of prefabricated substation enclosures and where indicated.
 4. Provide a cover plate for each switch, receptacle, and special purpose outlet.
 5. Exterior and damp locations:
 - a. Provide cast metal outlet boxes with threaded hubs as specified in Section 34 22 33, TES Raceway and Boxes.
 - b. Provide with weatherproof cover plate, as specified above.
- F. Installation of Smoke Detectors:
1. Operation: Provide alarm contact to operate lockout trip relay, ANSI Device 86 upon detection of smoke.
 2. Location: Provide at strategic locations to detect smoke or products of combustion such that operation of the circuit breakers will not activate smoke detection system.
- G. Installation of Exterior Blue Light: Blue Light shall illuminate for alarms indicated in Section 34 21 31, Substation Automation System (SAS).
- H. Installation of Knox Box:
1. Provide two on the exterior of each substation as indicated on Contract Drawings.

2. Obtain keying requirements from Kansas City Fire Department.
3. Provide substation key in each Knox box.
- I. Installation of Mobile Workstation: Provide one in each substation.
- J. Installation of Fire Extinguisher:
 1. Provide two per substation.
 2. Mount to the inside wall of the substation enclosure near each entry door.
- K. Installation of Relays:
 1. Wire Terminations: Terminate a maximum of two wires on relay or contactor terminals.
 2. Orientation: Mount and orient relays and contactors as recommended by the supplier or manufacturer.
- L. Installation of Switches:
 1. Provide position switches (Device 33) at the following door locations to trip and lock out the ac main breaker and annunciate the opening of a door:
 - a. Top and bottom of the rectifier interior enclosure doors.
 - b. Top and bottom of the transformer interior enclosure doors.
 - c. Top of positive and negative disconnect switch interior enclosure doors.
 - d. Top of each exterior equipment door that does not provide access to live parts after the ac main breaker is opened.
 - e. Separate control compartments do not require Device 33.
 2. Provide position switches (Device 33) at the following door locations to annunciate the opening of a door, only, without tripping the ac main breaker:
 - a. Top of each exterior equipment door where there is the possibility of access to live parts even after the ac main breaker is opened, such as from utility power or dc power backfeeding from another substation.
 - b. In these locations, provide a glastic barrier inside the exterior door to protect personnel, and attach a warning sign to the glastic cautioning against the specific threat.
 3. Provide position switches (Device 33) at the following locations to indicate switch position:
 - a. Positive switch.
 - b. Negative switch.
 4. Cubicle Lighting Door Switches: Provide a door switch to switch cubicle lighting for each cubicle with interior cubicle lighting, as specified in Section 34 21 18 TES Lighting.

-
5. Cubicle Lighting External Switches: Provide an external switch wired in parallel with the door switch at each location where the lighted cubicle has a viewing window.
 6. Intrusion Detection Door Switches:
 - a. Provide at each entry door and at each exterior equipment access door.
 - b. Wire on two separate zones as follows:
 - 1) Zone One: Entry doors.
 - 2) Zone Two: Exterior equipment access doors.
- M. Installation of Pushbuttons: Provide where indicated or as required.
- N. Installation of Indicating Lights:
1. Position Indication:
 - a. Breaker Closed: Illuminated red light.
 - b. Breaker Open: Illuminated green light.
 - c. Lockout relay normal position: Illuminated red light.
 - d. Lockout relay tripped: Illuminated green light.
 2. Indicating lights: LEDs used on the switchgear sections shall be of the same manufacturer and model.
- O. Installation of Terminal Blocks:
1. Provide wherever there is a wiring connection or splice within switchgear or other electrical equipment.
 2. No other type of splice may be used within switchgear or other electrical equipment.
- P. Installation of Ac and Dc Breaker Test Stations:
1. Provide one ac and one dc wall mounted unit per substation.
 2. Install each test station in close proximity to circuit breakers to be tested.
- Q. Installation of Substation Emergency Trip Stations:
1. Provide four for each substation, two on the interior of each TES substation enclosure next to each entrance and two on the exterior, as shown on Contract Drawings.
 2. Wire emergency trip station pushbuttons in a loop circuit of series wired contacts that energize a summary relay.
 3. Interruption of the series circuit shall cause the substation to shut down by:
 - a. Tripping and locking out the main ac breaker.
 - b. Tripping and locking out all dc feeder breakers.

4. Depressing the exterior emergency trip pushbutton shall cause transfer tripping of the adjacent substations.
 5. See Section 34 21 19, TES Dc Switchgear, for additional transfer trip requirements.
- R. Installation of Corrosion Control Junction Box:
1. Provide in each TES substation.
 2. Locate such that access does not require shutting down substation.
 3. Connect test jacks to dc negative bus and earth ground:
- S. Installation of Communications Rack: Provide one in each TES substation in location indicated on Contract Drawings.
- T. Installation of Insulating Materials:
1. Insulate the following with electrical insulating laminate:
 - a. Walls:
 - 1) If the clearance between the dc switchgear and wall is less than 6 feet, cover wall to full height.
 - 2) Exception: Omit electrical insulating laminate on inside surfaces of rear equipment access doors.
 - b. HVAC ducts: Cover all parts of duct with clearance from dc switchgear less than 6 feet.
 - c. Between rectifier transformer and rectifier:
 - 1) Provide a continuous piece of laminate to isolate the rectifier transformer from the rectifier, as indicated on Contract Drawings.
 - 2) Extend full height barrier into the room far enough to make it physically impossible for a person to touch both the rectifier transformer and the dc equipment at the same time.
 - 3) Reinforce edge with a non-metallic angle or channel fastened to the floor and ceiling for stiffness.
 - d. Between rectifier and negative cubicle.
 - e. Between negative cubicle and dc feeder breakers.
 - f. Metallic surfaces:
 - 1) Within 6 feet of rectifier or dc switchgear.
 - 2) For metallic surfaces not suitable for electrical insulating laminates, such as curved surfaces, provide an alternate, such as sheet rubber or an insulated shield over the surface.
 - g. Arc chutes: Provide a continuous piece of laminate on the ceiling over arc chutes of dc breakers if conductive surfaces are within 3 feet of top of dc switchgear.

2. Fasteners: Secure laminate in place using non-metallic, non-conductive fasteners, in accordance with manufacturer's instructions.
- U. Installation in Vicinity of Rectifier and Dc Distribution Equipment:
1. Within 6 feet of dc rectifier, dc switchgear, and dc distribution equipment, provide non-metallic raceways, boxes, covers, equipment, and supports.
 2. Alternatively, provide substantial insulating barriers to prevent simultaneous contact with dc equipment enclosures and adjacent metal surfaces.
- V. Installation of Cable Ties (tie wraps):
1. Secure cable tie mounting blocks with a screw.
 2. Adhesive type mounting blocks shall not be used unless secured with a screw.
- W. Installation of Dissimilar Material Connections:
1. Not permitted at electrical connections or connections requiring disassembly for maintenance or for removal and replacement of equipment.
 2. Not permitted except at permanent connections.
 3. Provide suitable electrochemical isolation.
 4. Isolation treatments shall be permanent and not require maintenance or replacement for the life of the equipment or installation.
- X. Torque bolted connections in accordance with Section 34 21 05, Common Work Results for TES.
- Y. Installation of Equipment Identification:
1. Provide nameplates for equipment specified in 34 21 xx Sections.
 2. Provide a nameplate with a unique number for each piece of equipment such as switchboard sections, panelboards, circuit breakers, and devices.
 3. Where multiple devices are enclosed in one cubicle, section, or enclosure, provide a nameplate for each individual device, located on the interior or exterior of the cubicle, section, or enclosure, as approved by Engineer.
 4. Where locations of nameplates cannot be adequately described in the identification schedule specified above in the Part 2 Article titled "Identification", provide shop drawings showing the location of each label.
 5. Obtain approval for material, size, color, text, and location of nameplates and labels before installing.
 6. Fasten nameplates to the equipment or device enclosure door with stainless steel machine screws.

PART 3 - EXECUTION

3.1 FIELD INSTALLATION

- A. Requirements of Article, above, titled "Factory Assembly" apply to field installation.

- B. Seal equipment enclosures against dust, whenever dusty conditions are present inside the rooms or outside, during the construction period.
- C. Provide seismic anchorage and bracing in accordance with seismic design and calculations submitted under Section 34 21 05, Common Work Results for TES.

3.2 BUILT-IN-PLACE VMF SUBSTATION

- A. Floor: Install dielectric floor in accordance with Section 34 21 08, TES Dielectric Epoxy Flooring.
- B. Lighting: Install lighting in accordance with Section 34 21 18, TES Lighting.

PART 4 - MEASUREMENT AND PAYMENT

4.1 MEASUREMENT

- A. The quantities of accepted work will be measured in the following units. All measurements will be plan measure except for authorized changes.
 - 1. Description: Lump Sum

4.2 PAYMENT

- A. Payment will be made at the respective unit or lump-sum price listed in the proposal and shall be full compensation for all labor, materials, and equipment necessary to complete the respective unit in place. There will be no separate measurement or payment for any item of work not specifically identified and listed in the proposal, and all such work shall be considered a subsidiary item with all costs pertaining thereto included in the prices for other items listed in the proposal. At the Engineer's option, partial payment may be made for any lump sum item listed in the proposal, providing that the Contractor is diligently and satisfactorily pursuing full completion of such partially complete item in accordance with the approved job progress schedule.

END OF SECTION

THIS PAGE INTENTIONALLY LEFT BLANK

SECTION 34 21 18**TES LIGHTING****PART 1 - GENERAL****1.1 SUMMARY**

- A. This Section includes the following:
 - 1. Interior substation overhead and emergency lighting.
 - 2. Exterior substation lighting.
 - 3. Lighting inside equipment enclosures.

1.2 RELATED SECTIONS

- A. SECTION 34 21 17 – TES Substation Design and Assembly
- B. SECTION 34 21 25 – TES Dc Control Power

1.3 REFERENCED STANDARDS

- A. Section incorporates by reference the latest revisions of the following documents:
- B. Institute of Electrical and Electronics Engineers (IEEE)
 - 1. IEEE C62.41, Guide on Surge Voltages in AC Power Circuits Rated up to 600V
- C. National Fire Protection Association (NFPA)
 - 1. NFPA 70, National Electrical Code
- D. Underwriters Laboratories Inc. (UL)
 - 1. UL 1570, Fluorescent Lighting Fixtures

1.4 SUBMITTALS

- A. Procedures: Section 01 33 00, Submittal Procedures.
- B. Product Data:
 - 1. Document that proposed luminaires, ballast and lamps fully comply with Contract Documents.
 - 2. Indicate luminaire construction, photometric performance, installation, and maintenance requirements.
 - 3. Include clear and legible product specifications, drawings and illustrations of sufficient detail to describe the following:
 - a. Luminaire housing, hardware, and finishes.
 - b. Light controlling elements.

- c. Electrical components, including lampholders, ballast, and provision for conduit entry.
 - d. Support details. Indicate weight of luminaire, complete with lamps.
 4. Include procedures for installation of the complete lighting unit in its final service location.
- C. Shop Drawings: Lighting layout with proposed luminaires indicated by manufacturer and model number.
- D. Calculations: Show that specified lighting levels are achieved with proposed luminaires.
- E. Operations and Maintenance Data:
 1. Submit manufacturer's operating and maintenance instructions on products specified in this Section, including the following:
 - a. Materials and components clearly indicated in the parts list.
 - b. Relamping methods.
 - c. Special tools required.
 - d. Frequency of inspection, tightening, or other service recommended for preventative maintenance.
 2. Submit immediately after approval of product data.

PART 2 - PRODUCTS

2.1 PERFORMANCE CRITERIA

- A. Each substation shall have interior and exterior lighting to provide the specified minimum light levels.
- B. Minimum Lighting Levels:
 1. Interior: 70 footcandles at 30 inches horizontal above the aisle floor.
 2. Exterior: 2 footcandles, measured at ground level.
 3. Emergency Lighting: Minimum 2 footcandles at floor level.
 4. Minimum lighting levels shall be maintained throughout the substation. Average lighting level shall not be used to meet this requirement.

2.2 COMPONENTS

- A. Ballasts:
 1. Mount ballast securely inside luminaire to obtain the necessary heat dissipation.
 2. Ballasts for fluorescent lamps shall match the characteristics of the lamps, and have the following characteristics:
 - a. Operate lamps at a frequency of 20 kHz or higher without visible flicker.

- b. Listed Class P.
 - c. Total Harmonic Distortion: Less than 10 percent at 277 V.
 - d. Current crest factor: Less than 1.5.
 - e. Power factor: 0.98 minimum.
 - f. Audible noise rating: Class A or better.
 - g. Contain no Polychlorinated Biphenyls (PCBs).
 - h. Transient protection: IEEE C62.41, Category A.
 - i. Inherent thermal protection.
 - j. Provide constant light output with input voltage fluctuation of plus or minus 5 percent.
 - k. Provide instant-start for parallel wiring connection of lamps. Allow remaining lamps to maintain full output, in the event of lamp failure on multiple lamp luminaire.
 - l. Provide reliable lamp starting at 50 degrees F for interior luminaires and 0 degrees F for exterior luminaires.
- B. Lamps:
- 1. Provide lamps used in the illumination system of standard manufacture, readily available, and of the highest efficiency and life consistent with other requirements of the illumination system.
 - 2. Ensure all lamps of each type are provided by a single manufacturer.
 - 3. Fluorescent Lamps:
 - a. Energy-efficient T8, rapid-start fluorescent lamp rated 265 mA.
 - b. Life: Ensure lamps have a rated minimum average life of 20,000 hours.
 - c. Color Temperature: Minimum 3500 degrees K Correlated Color Temperature (CCT).
 - d. Color Rendering Index (CRI): Minimum 78.
 - e. Environmental: Use lamps for T8 fluorescent lighting that have reduced mercury contents that meet U.S. Environmental Protection Agency (EPA) Toxic Characteristic Leaching Procedure (TCLP) test for nonhazardous fluorescent light waste.
- C. Reflector Material: Prefinished, copper-free aluminum alloy, minimum thickness 0.032 inch, Architectural Type 1 with Class M1 anodic coating providing 83 percent reflectivity.

2.3 LUMINAIRES

- A. Interior of Substation Enclosure
- 1. Ceiling mounted, industrial fluorescent luminaire with clear, prismatic diffuser complying with UL 1570.

2. Acrylic lens: Manufactured from virgin-acrylic extrusion or injection molding pellets.
- B. Exterior of Substation Enclosure:
1. Wall-mounted, vandal-resistant, LED luminaire, full cut-off type.
 2. UL listed for 40 degrees C. maximum ambient and wet locations with IP66 ingress rating. Luminaire shall comply with IES LM-79 and LM-80 and be DLC (Design Lights Consortium) qualified.
 3. Housing: Die-cast aluminum, with a hinged door secured by captive stainless steel, tamper-resistant screw. Housing shall incorporate cooling fins specifically design for cooling LED light source and driver. Approximate dimensions of complete luminaire: 6"Wx7"Hx4"D including back-box. Provide with wire guard.
 4. Finish: Epoxy or polyester powder-coat paint, white.
 5. Optical: Sealed LED compartment with anodized, mirror-finish, forward-throw reflector, high-output bright-white (5000K CCT) LED, impact resistant tempered glass lens and silicone sealing gaskets. Luminaire shall deliver at least 1400 lumens, be rated full-cutoff with BUG rating B1-U0-G0 or better, and be suitable for wall-mounting 8 feet or greater above surrounding surface.
 6. Electrical: Integrated electronic LED driver with integral surge protection shall be mounted to housing for effective cooling. Provide luminaires with integral photocontrol or a single NEMA-style, aimable photocontrol wired in luminaire circuit.
 7. Acceptable Product: Lumark XTOR2A-WT-WG or approved equal.
- C. Emergency Lighting:
1. Self contained units containing lamps, battery, battery charger, controls, test switch, and status indicator.
 2. Lighting Heads: High-output 4.5 W LED MR16 lighting heads; minimum two lamps per unit.
 3. Battery:
 - a. Nickel-cadmium, 12 V, rechargeable, sealed, maintenance-free.
 - b. Capacity: Shall supply rated lamp load for 1-1/2 hours, minimum.
 - c. Life expectancy: 10 years.
 4. Battery charger:
 - a. Solid-state, current-limited, temperature-compensated, short-circuit proof, and reverse-polarity protected with plus-or-minus 1 percent regulation.
 - b. Charger shall automatically maintain battery in fully-charged float condition and be capable of providing full recharge in 12 hours.
 5. Unit controls shall energize the lamps automatically upon failure of the ac power supply and disconnect load before battery low-voltage limit is reached.

6. Housing: UV-stabilized, high impact, clear 0.120-inch polycarbonate or 18-gage steel, with a baked enamel finish.
7. Listing: UL listed for emergency lighting.
8. Acceptable Product: Kenall METEL-series LED or approved equal.

2.4 LIGHTING INSIDE EQUIPMENT ENCLOSURES

A. Luminaire:

1. Ceiling and side mounted, LED strip luminaire with clear, prismatic diffuser complying with UL 1570.
2. Minimum illuminance: 30 fc at 1.5 feet.
3. Color Temperature: 6000 K
4. Minimum Length: 6 inches less than cubicle width.
5. MTBF: 40,000 Hours
6. Acceptable Product: LBFA Lux Bar LED light bar, or approved equal.

B. Power Supply:

1. UL listed, sized for load.
2. Input: 125 Vdc
3. Output: Compatible with luminaire voltage.

2.5 FACTORY ASSEMBLY

A. General:

1. Luminaires shall be supplied from the substation ac panelboard.
2. Comply with NFPA 70.
3. Luminaire quantities and locations shown on Contract Drawings are for illustration purposes only and may not be adequate to achieve specified lighting levels. Locate luminaires and provide a quantity sufficient to achieve specified lighting levels.

B. Interior Luminaires:

1. Locate to illuminate the vertical surfaces of equipment.
 - a. Coordinate to avoid interference with overhead raceways or other major wiring or blocking of the light.
 - b. Luminaires shall not be mounted directly above equipment.
2. Switches:
 - a. Provide 3-way switches complying with requirements for switches in Section 34 21 17, TES Substation Design and Assembly.

- b. Mount inside by each entry door.
- C. Exterior luminaires: Locate on substation exterior walls to light all four sides of substation.
- D. Emergency lighting:
 - 1. Provide luminaires complete with lamps in place.
 - 2. Wire unswitched.
- E. Lighting inside equipment enclosures:
 - 1. Comply with NFPA 70.
 - 2. Supply luminaire power supplies from 125 Vdc power specified in Section 34 21 25, TES Dc Control Power.
 - 3. Power supplies shall not be wired in series. Luminaires shall not be wired in series.
 - 4. Provide lighting for control and power cubicles within the ac switchgear, transformer, rectifier, and dc switchgear cubicles.
 - 5. Locate on ceiling and sides to light the interior of each equipment enclosure.
 - 6. Control cubicles: Provide two top or side mounted light bars directed towards the component and terminal mounting panel.
 - 7. Transformer/rectifier enclosure: Provide two top mounted light bars for every 2 feet of enclosure width.
 - 8. Switching:
 - a. For each cubicle door, provide door switch as specified in Section 34 21 17, TES Substation Design and Assembly.
 - b. For each cubicle door with a viewing window, provide an external switch as specified in Section 34 21 17, TES Substation Design and Assembly, in addition to door switch.

PART 3 - EXECUTION

3.1 INSTALLATION

- A. Requirements of Article titled "Factory Assembly" apply to field installation.

PART 4 - MEASUREMENT AND PAYMENT

4.1 MEASUREMENT

- A. The quantities of accepted work will be measured in the following units. All measurements will be plan measure except for authorized changes.
 - 1. Description: Lump Sum

4.2 PAYMENT

- A. Payment will be made at the respective unit or lump-sum price listed in the proposal and shall be full compensation for all labor, materials, and equipment necessary to complete the respective unit in place. There will be no separate measurement or payment for any item of work not specifically identified and listed in the proposal, and all such work shall be considered a subsidiary item with all costs pertaining thereto included in the prices for other items listed in the proposal. At the Engineer's option, partial payment may be made for any lump sum item listed in the proposal, providing that the Contractor is diligently and satisfactorily pursuing full completion of such partially complete item in accordance with the approved job progress schedule.

SECTION 34 21 19

TES DC SWITCHGEAR

PART 1 - GENERAL

1.1 SUMMARY

- A. This Section includes the following:
 - 1. Dc switchgear for TES substations, including the following sections:
 - a. Negative switch (89N) and positive switch (89P) sections
 - b. Feeder breaker sections
- B. Number of dc circuit breakers and the configuration of each TES substation are shown on the Contract Drawings.

1.2 RELATED SECTIONS

- A. SECTION 34 21 06 – TES Common Work Results for Metals
- B. SECTION 34 21 08 – TES Dielectric Epoxy Flooring
- C. SECTION 34 21 17 – TES Substation Design and Assembly
- D. SECTION 34 21 18 – TES Lighting
- E. SECTION 34 21 25 – TES Dc Control Power
- F. SECTION 34 21 31 – TES Substation Automation System (SAS)
- G. SECTION 34 21 73 – TES Studies
- H. SECTION 34 21 80 – TES Spare Parts and Special Tools
- I. SECTION 34 21 90 – TES Testing

1.3 DEFINITIONS

- A. Intelligent Electronic Device (IED): See definition in Section 34 21 17, TES Substation Design and Assembly.

1.4 REFERENCED STANDARDS

- A. Section incorporates by reference the latest revisions of the following documents:
- B. Institute of Electrical and Electronics Engineers (IEEE)
 - 1. IEEE C37.14, Standard for Low-Voltage Dc Power Circuit Breakers Used in Enclosures
 - 2. IEEE C37.16, Standard for Preferred Ratings, Related Requirements, and Application Recommendations for Low-Voltage Ac (635 V and below) and Dc (3200 V and below) Power Circuit Breakers

3. IEEE C37.20.1, IEEE Standard for Metal-Enclosed Low-Voltage Power Circuit Breaker Switchgear
 4. IEEE C37.30.1, Standard Requirements for AC High-Voltage Air Switches Rated Above 1000 V
 5. IEEE C37.41, Standard Design Tests for High-Voltage (>1000 V) Fuses, Fuse and Disconnecting Cutouts, Distribution Enclosed Single-Pole Air Switches, Fuse Disconnecting Switches, and Fuse Links and Accessories Used with These Devices
 6. IEEE C37.90, Standard for Relays and Relay Systems Associated with Electric Power Apparatus
- C. International Electrotechnical Commission (IEC)
1. IEC 60077-1, Railway applications - Electric equipment for rolling stock - Part 1: General service conditions and general rules
 2. IEC 60077-3, Railway applications - Electric equipment for rolling stock - Part 3: Electrotechnical components - Rules for d.c. circuit-breakers

1.5 SUBMITTALS

- A. Procedures: Section 01 33 00, Submittal Procedures.
- B. Product Data: Complete manufacturer's product descriptions and catalog data, including information on the following:
1. Design and application ratings.
 2. Details of circuit breaker, internal components, arc chute, contacts, and closing and tripping mechanisms.
 3. Details of switchgear, drawout mechanism, interlocks, and shutters.
 4. Relays, controls, switches, indicators, load measuring devices, resistors and cubicle heaters.
 5. Key Operated Mechanical Interlock: Kirk key catalog data.
 6. Bus insulating material.
 7. Certified service performance, reliability and 5-year proven service history record, including a complete device history of the following:
 - a. Multi-function relays.
 - b. Circuit breakers.
- C. Spare Parts and Special Tools:
1. Submit a list of spare parts to be provided under this Section.
 2. Submit at the same time as product data.
 3. Provide part numbers for each part, including a detailed break down of each spare part assembly and set, as defined in Section 34 21 80, TES Spare Parts and Special Tools.

4. Submit a list of special tools to be provided under this Section, as defined in Section 34 21 80, TES Spare Parts and Special Tools.
- D. Shop Drawings:
1. Arrangement drawings.
 2. Schematic wiring diagrams.
 3. Interconnection diagrams.
 4. Bus insulating drawings.
- E. Complete details of transfer trip scheme.
- F. Kirk key scheme, including description, and detailed arrangement drawings.
- G. Testing:
1. Submit test procedures that meet the requirements of Section 34 21 90, TES Testing, for the following:
 - a. Factory Design Tests.
 - b. Factory Production Tests.
 2. Submit test reports that meet the requirements of Section 34 21 90, TES Testing, for the following:
 - a. Factory Design Tests.
 - b. Factory Production Tests.
- H. Operations and Maintenance Data:
1. Submit manufacturer's operating and maintenance instructions on products specified in this Section, including the following:
 - a. Manufacturer's operating and maintenance instructions, parts list, illustrations and diagram for components.
 - b. Wiring diagram.
 2. Submit immediately after approval of product data.

1.6 SPARE PARTS

- A. Provide spare parts in accordance with Section 34 21 73, TES Spare Parts and Special Tools.
- B. List below applies to items in this Specification Section.
1. Dc circuit breaker: Complete with truck and accessories. Provide 3 spares.
 2. Main contacts for dc circuit breaker: Provide 2 spare assemblies.
 3. Secondary contacts for dc circuit breaker: Provide 2 spare assemblies.
 4. Dc circuit breaker charging motors: Provide 2 spares.

5. Dc circuit breaker solenoids: Provide 2 spares.
6. Dc circuit breaker springs: Provide 2 spares.
7. Dc protective relays (non-IED): Provide 1 spare set.
8. Dc switchgear IEDs: Provide 1 spare set.
9. Dc ammeter and voltmeter: Provide 1 spare set, if separate from IEDs.
10. Dc switchgear control and auxiliary relays: Provide 1 spare set.
11. Transducers: Provide 1 spare set.
12. Dc switchgear control circuit fuses (if used): Provide 5 spare sets.
13. Dc mini circuit breakers (if used): Provide 1 spare of each rating.
14. Mechanical interlocks: Provide 1 spare set.

1.7 QUALITY ASSURANCE

- A. Comply with the requirements of the Project Quality Plan.
- B. Dc Switchgear:
 1. UL labeled or furnished with a Field Evaluation label in accordance with Section 34 21 17, TES Substation Design and Assembly.
 2. Dc switchgear including circuit breaker shall have 5 years successful operation in service at a transit application.
- C. Manufacturers of dc switchgear and components used in the dc switchgear shall be ISO 9001 certified.

PART 2 - PRODUCTS

2.1 GENERAL

- A. Dc Switchgear: Dead-front, self-ventilated, metal enclosed, free standing, sheet steel enclosures suitable for indoor service.
- B. Circuit Breakers: Provide switchgear with individually enclosed, draw out type, high speed, power circuit breakers rated for use with the transformer-rectifier unit.
- C. Rear Access:
 1. Prefabricated TES Substation: Provide through exterior equipment doors and design such that positive feeder cables and negative return cables can be landed from the rear.
 2. VMF TES Substation: No rear access.
- D. Front Access:
 1. Prefabricated TES Substation: Provide access to removable components of the switchgear from the front.

2. VMF TES Substation: Provide access for landing positive and negative cables and access to removable components of the switchgear.
- E. Bus and Power Wiring:
1. Prefabricated TES Substation: Locate in rear.
 2. VMF TES Substation: Locate in rear, accessible from front.
- F. Complete Assembly: Include dc buses and connections, positive and negative feeder cable terminal connections, indicating lights, terminal blocks, protective and auxiliary relays, control circuitry, wiring and all other devices necessary to make a complete and operable switchgear assembly.
- G. Workmanship: Avoid wiring congestion, train wires neatly, protect wiring from sharp edges.
- H. Standards: Design, materials, construction, and tests shall be in accordance with IEEE C37.14, IEEE C37.20.1, and as further described or modified in this Section.
- I. Finish: Powder coat and color in accordance with Section 34 21 06, TES Common Work Results for Metals.

2.2 RATINGS

- A. The switchgear assembly and circuit breakers shall have the following minimum ratings in accordance with IEEE C37.14 and IEEE C37.16:

Full-Load Voltage	800 Vdc
Maximum Voltage	1000 Vdc
Continuous Current	1000 A
Minimum Frame Size	1000 A
Insulation Level:	
60 Hz withstand	3.7 kV rms
Short circuit rating	30 kA, peak

2.3 SWITCHGEAR ENCLOSURE

- A. Switchgear Structure:
1. Steel, rigid, self-supporting, self-contained, conforming to IEEE C37.20.1 and to requirements indicated below:
 2. Fabricated of electrically welded or bolted sheet steel, 11 gage minimum.
 3. Provide enclosures sufficiently rigid to support equipment under normal loads, short-circuit conditions, and specified seismic conditions.
 4. Apply coating to switchgear assembly in accordance with Section 34 21 06, TES Common Work Results for Metals.
- B. Doors: Sheet steel, 11 gage minimum, properly reinforced against distortion by suitable flanges and stiffening members.
1. Hinges: Heavy duty stainless steel.
 2. Latches: Minimum of three latches shall securely fasten door in the closed position and shall be easily opened without the use of tools.

3. Handle: Heavy duty, padlockable, opens all three latches, easily operated with one hand-motion, one for each door.
 4. Door stops: Heavy duty to hold door securely in the open position. Not easily bent if an attempt is made to close door without releasing door stop.
- C. Heaters: Provide two thermostatically-controlled strip-type heaters in each switchgear cubicle to prevent condensation.
1. Operating Voltage: Shall not exceed 50 percent of heater rated voltage.
 2. Thermostat:
 - a. Provide an individual thermostat for each cubicle.
 - b. Locate thermostat in a general area of each cubicle so that cool air at the lower portion of the enclosure can be sensed by the thermostat.
 3. Digital Heater Ammeter: Provide on the front of each cubicle enclosure to indicate current and operation of heaters.
 4. Power Source: 120 Vac auxiliary power system; use an isolation transformer.
- D. Lights: Provide inside equipment enclosures, as specified in Section 34 21 18, TES Lighting.
- E. Warning Signs:
1. Comply with requirements for warning signs in Section 34 21 17, TES Substation Design and Assembly.
 2. Provide signs on front, rear, and side access doors of cubicles where 600/750 Vdc wiring is present: "DANGER: LIVE PARTS" and "DANGER: HIGH VOLTAGE."
 3. Provide signs on removable rear access doors: "DANGER: HIGH VOLTAGE."
- F. Dc circuit breaker cubicle:
1. Suitable for accommodation of drawout circuit breakers.
 2. Supporting Guide Rails: Provide for positioning removable elements as an integral part of equipment.
 3. Design such that circuit breakers are easily drawn in or out of their housings.
 4. Include stationary disconnecting device contacts for the circuit breakers.
 5. Breakers shall connect or disconnect from buses and auxiliary circuits by means of self-aligning, self-coupling, primary disconnecting devices.
 6. Provide self alignment mechanisms such that misalignment of contact is not possible when circuit breaker elements make contact with stationary contacts.
 7. Control Wiring: Connection to the dc breaker may be by movable contacts or by a plug-style disconnect.
 - a. Plug style disconnect:
 - 1) It shall not be mechanically possible to rack breaker into the connected position with the plug disconnected.

- 2) Locate where easily accessible. Engineer will make final determination whether location is easily accessible.
 - 3) Provide heavy-duty connection hardware not easily bent or broken due to mishandling.
8. Provide suitable shrouds or automatic safety shutters on devices to prevent accidental contact with live parts.
 9. Provide each enclosure with protective shutters that cover live high-voltage terminals when the access door is opened or a dc feeder breaker is racked out of the cubicle.
 10. Provide each compartment with a hinged door or full width drawout panel for front access to the circuit breakers, instruments and terminal blocks.
 11. Provide rear access doors in prefabricated substations to facilitate access to the dc power bus. Doors shall swing fully open against the adjacent door or enclosures.
 12. Provide connections to the dc feeder cables in the rear compartment.
 13. Construct switchgear enclosures to allow for the dissipation of ionized gas from the circuit breaker arc chutes without hazard to personnel from the discharge of hot gas or other materials.
 - a. Release gas from the units to the outside of the switchgear enclosure by means of suitable stacks, louvered vent openings, or vent openings covered with grilles.
 - b. Provide adequate clearance to ground to prevent the possibility of establishing a conducting path to grounded structure or objects when interrupting maximum short-circuit energy at rated maximum voltage.
 - c. Line enclosure surfaces exposed to arcs or ionized gases with flame resistant, high dielectric insulating materials.
 - d. This paragraph is not intended to require the use of arc-resistant switchgear.
 14. Stacking of dc circuit breakers in cubicles is not permitted.
- G. Negative and Positive Switch Cubicles:
1. Mount positive and negative switches in separate isolated cubicles, either stacked or side by side.
 2. Negative switch may be provided as part of rectifier but must be isolated from rectifier.
 3. Cubicles shall have a hinged door with a clear window for viewing negative or positive switch position.
- H. Separate high voltage devices from low voltage controls:
1. If high voltage devices and low voltage controls are located in the same cubicle, identify high and low voltage by color coding mounting panels.
 2. No controls are allowed in rear cable and bus compartment.

- I. The control devices can share the same compartment with the protection devices.
 - 1. Control/protection compartment shall be dead-front and shall consist of hinged swinging panels mounted on the switchgear frame.
 - a. Construct swinging panel doors to support flush and semi-flush mounted devices.
 - b. Swinging panel doors shall not distort from a plane surface in any position.
 - c. Swinging panel doors of control/protection compartment shall be supported by stainless steel hinges.
 - d. Panel doors shall swing open and provide free access to the area behind the panel, the rear of the devices mounted on the panels, wiring, terminal blocks, and auxiliary devices mounted within the compartment.
 - e. Secure swinging panel doors in the closed position with two positive latching or screwed fasteners that can be operated by hand without tools.
 - f. Swinging panel doors shall open 90 degrees and be held with heavy duty stops.

2.4 BUS AND BUS CONNECTIONS

- A. Main horizontal dc switchgear bus shall be an extension of the rectifier bus, run the length of the dc switchgear. Tap to serve each circuit breaker.
- B. Bus: Electrical grade copper with high electrical conductivity, rated 1000 A.
- C. Bolted bus connections: Silver-plated copper.
 - 1. All connections to the bus shall be bolted.
 - 2. Applies to bus taps, circuit breaker connections, cable connections, and connections of devices such as transducers and shunts.
 - 3. Bolts: Silicon bronze of sufficient number and size for application. Minimum two bolts per joint.
 - 4. Washers: Provide a Belville washer for each bolt, properly sized for the application.
 - 5. Conductivity: Each joint shall have conductivity at least equal to that of the bus bar and shall be so clamped that no loss of conductivity will occur during the life of the switchgear.
- D. Insulation:
 - 1. Insulate main bus and feeder bus from each other by one of the following means:
 - a. Electrical insulating laminate barrier that completely encloses bus on both sides and both edges.
 - b. Insulating boot.
 - c. Insulated coating.
 - d. Other approved means.

2. Insulate connections to the bus using a boot.
 3. Mount bus bars on barrier-type insulation or post-type insulators.
- E. Strength: Bus, bus connections, and bus insulation shall withstand thermal and mechanical stresses resulting from maximum available short-circuit current or rms interrupting rating of circuit breakers whichever is greater, without damage or permanent distortion.

2.5 POSITIVE AND NEGATIVE DISCONNECT SWITCHES

- A. Provide a negative dc disconnect switch (Device 89N) and a positive dc disconnect switch (Device 89P) in each substation dc switchgear assembly, as shown in Contract Drawings. Each switch shall meet the following requirements:
1. Type: Manually-operated, single-pole, bolted-pressure type, solid copper blade with silver plated contacts.
 2. Rating: 1000 A continuous current at 1000 Vdc and withstand twice the expected rms bolted short circuit currents.
 3. Insulation level: Sufficient to pass 1 minute 60 Hz dry withstand test at 3.7 kV, rms.
 4. Handle: Provide an insulated operating handle.
 5. Switch Position Indication:
 - a. Provide a green and a red indicating light on the front panel of cubicle for each switch:
 - 1) Green illuminated: Switch open.
 - 2) Red illuminated: Switch closed.
 - b. Provide indication to SAS; see Section 34 21 31, TES Substation Automation System (SAS).
 - c. See Section 34 21 17, TES Substation Design and Assembly, for requirements for Device 33 position switch.
 6. Instructions: Provide a simple operation instruction nameplate on each cubicle door.
- B. Negative Disconnect Switch - 89N:
1. Connection: Install between the negative return cable and the rectifier negative pole.
 2. Interlock with Positive Switch:
 - a. Provide key interlock with positive disconnect switch to ensure negative switch can be opened only when positive switch is open.
 - b. Key removal from the negative disconnect switch shall be possible only when the negative disconnect switch is closed.
 - c. Opening of negative disconnect switch shall require the key to be inserted in the negative disconnect switch.

3. Interlock with Dc Circuit Breakers:
 - a. If negative switch is in the open position it shall not be possible to close a dc circuit breaker.
- C. Positive disconnect switch - 89P:
 1. Connection: Install between the rectifier output and the dc feeder breakers.
 2. Interlock with Negative Switch:
 - a. Key interlock with the negative switch to prevent positive switch from closing when the negative disconnect switch is open.
 - b. Key shall not be removable from the positive switch when the negative disconnect switch is closed.
 - c. With the key removed from the positive switch it shall be mechanically locked open.
 3. Interlock with Ac Switchgear: Key interlock to ensure no-load opening.

2.6 CIRCUIT BREAKERS

- A. Dc circuit breakers: Single-pole, air-break, high-speed, removable type.
 1. Manufacture in accordance with IEEE C37.14, and rate according to the preferred ratings listed in IEEE C37.16, except as indicated in this Section.
 - a. As an alternate, provide dc circuit breakers tested according to IEC 60077-1 and IEC 60077-3.
 2. Suitable for local and remote supervisory control.
 3. Electrically operated and electrically and mechanically trip-free with the mechanism insuring full contact pressure until time of opening.
 4. Insulated to withstand 3.7 kV, rms at 60 Hz for 1 minute.
 5. Peak rated momentary current: 30 kA, minimum.
- B. Instantaneous (Device 76): Provide each dc feeder circuit breaker with a direct-acting, bi-directional, instantaneous overcurrent tripping device adjustable between 150 percent and 350 percent of the breaker rating.
- C. Contacts:
 1. Surfaces of the moving and stationary contact members of the main contacts shall be silver, non-welding silver alloy, or equivalent that combines high conductivity and necessary arc-resistant properties.
 2. Main and secondary contacts of breaker shall be removable for replacement.
- D. Operating mechanism:
 1. Solenoid-operated or motor-charged stored-energy, spring-operated type.
 - a. Connect solenoid operated mechanisms such that the control voltage is removed from the closing coil after a preset time.

-
- b. In the event the breaker does not close or the closing control circuit is not opened, a trip sequence shall be initiated to open the closing control circuit and restore all closing sequence relays to their normal position.
 - c. Motor-charged and spring-operated mechanisms:
 - 1) Mechanism shall be designed to prevent overcharging.
 - 2) The mechanism shall ensure that the release of stored energy for closing the circuit breaker main contacts is prevented unless the mechanism has been fully charged.
 - 3) The stored-energy closing mechanism shall automatically charge itself within 15 seconds after closing of the breaker.
 - 4) Energy storage shall be sufficient for an open-close-open cycle at maximum rated short circuit current.
 - 2. Mechanism shall be non-pumping.
 - 3. Design shall ensure positive opening of the moving contacts and circuit interruption when the tripping impulse is received at the fully closed or any partially open position.
 - 4. Provide control with a shunt trip device with the necessary auxiliary control equipment.
 - E. Breaker Position: Make provisions for moving each breaker to a "connected", "test" and "disconnected" position with positive stops in each position.
 - 1. "Connected" position: Both the primary disconnecting devices and the secondary disconnecting devices shall be in full contact and the breaker shall be in position for normal operation.
 - 2. "Test" position: Primary disconnecting devices shall be open and separated by a safe distance and the secondary disconnecting devices shall be in full contact.
 - 3. "Disconnected" position: Both primary and secondary disconnecting devices shall be open and separated by a safe distance and shutter closed.
 - 4. Position Indicator: Provide an indicator to show the location of the circuit breaker in "connected," "test," or "disconnected" positions.
 - F. Mechanical and Electrical Interlocks:
 - 1. Mechanical:
 - a. Provide interlock to prevent moving circuit breaker in or out of the "connected" position when circuit breaker main contacts are in the closed position.
 - b. Provide interlock to prevent closing the circuit breaker manually unless the breaker is in the "test" or "disconnected" position.
 - 2. Electrical: Provide interlock to prevent closing circuit breaker electrically, unless the circuit breaker is in the "connected" position with the primary disconnecting devices in full contact, or in the "test" position.

- G. Breaker Control:
1. Breaker control switch: Incorporate into SAS HMI and dc breaker protective IED. For additional information on SAS HMI see Section 34 21 31, TES Substation Automation System (SAS), .
 - a. Breaker in Connected Position: Breaker control by SAS HMI.
 - b. Breaker in Test Position: Breaker control by dc breaker IED HMI.
 - c. Request to close a dc feeder breaker shall be governed by the load measure reclose system. See Protective Devices article, below, for details of the load measure reclose system.
 - d. Provide sufficient logic to ensure that a response to an HMI or remote supervisory closure request will not result in an unsafe condition or cause damage to the substation or any of its components.
 2. Bypass Load Measuring:
 - a. Provide control on SAS HMI that allows an authorized operator to bypass load measure system when closing breaker.
 - b. See Section 34 21 31, TES Substation Automation System (SAS) for details of operation.
 3. Manual trip:
 - a. Provide each circuit breaker with mechanical means for manually tripping the circuit breaker in the "test" and "connected" positions.
 - b. This function shall be available with the compartment door closed.
 4. Control power: Provide from 125 Vdc control power system per Section 34 21 25, TES Dc Control Power.
- H. Indication:
1. Electrical:
 - a. Provide red and green indicating lights on each breaker unit for electrical closing and opening of the breaker while in the "test" or "connected" positions.
 - 1) Red light illuminated: Breaker closed.
 - 2) Green light illuminated: Breaker open.
 - 3) Provide long life, high brightness and high visibility, LED array lights.
 - b. Provide indication to SAS; see Section 34 21 31, TES Substation Automation System (SAS).
 2. Mechanical: Provide a mechanical indicator, visible when the door is closed, to show when the circuit breaker is in the "open" and "closed" condition.

-
- I. Auxiliary Contacts:
 - 1. Provide a minimum of four electrically separate sets of reversible auxiliary contacts, in addition to those required for the circuit breaker control circuit.
 - 2. Auxiliary contacts shall be operated by the breaker mechanism in both the "connected" and "test" position.
 - 3. Spare auxiliary contacts shall be wired to the outgoing terminal blocks.
 - J. Arc chutes:
 - 1. Metal plate or magnetic coil type.
 - 2. Suitable for bidirectional current flow.
 - 3. Designed for positive interruption of currents from 0 A to circuit breaker maximum rating.
 - 4. Provide with an air puffer device to extinguish low-current arcs.
 - K. Operations Counter: Provide four digit, non-resettable, register type mechanical operations counter on each circuit breaker to record tripping operations.
 - L. Lockout Provisions:
 - 1. Provide means to permit padlocking the dc breaker in the open position to prevent inadvertent closure without having to withdraw the breaker element.
 - 2. Padlocking means shall not allow breaker to be inserted further than the test position.
 - M. Breaker Truck Wheels:
 - 1. Provide circuit breakers with approved wheels to remove element from cubicle.
 - 2. Fifth Wheel:
 - a. If breaker truck cannot be easily turned when outside the breaker cubicle, provide a fifth wheel.
 - b. Engineer will make the determination whether breaker truck can be easily turned.
 - c. Wheels shall not damage epoxy floor coating.
 - N. Interchangeability:
 - 1. Removable elements of the same type and rating shall be completely physically and electrically interchangeable.
 - 2. Removable elements not of the same type of rating shall not be physically interchangeable.

2.7 TES SUBSTATION DC CABLE CONNECTIONS

- A. Bottom or top feed for negative and positive dc feeders, as required.
- B. Provide ample space for pulling and terminating the feeder cables entering or leaving the switchgear without requiring a less than specified cable bending radius.

- C. Provisions shall be made for the termination of up to four 250 kcmil, 2 kV dc positive cables in each feeder breaker section.
- D. Provide for the termination of up to eight 250 kcmil, 2 kV dc negative return cables on load side of the negative disconnect switch.

2.8 PROTECTIVE DEVICES

- A. General Requirements:
 - 1. Protective relays and multifunction relays provided in dc switchgear shall be Intelligent Electronic Devices (IED) equipped with communication function.
 - 2. Built-in Functions:
 - a. Control.
 - b. Measurement.
 - c. Fault recording: Capture real-time voltage and current for a triggered event with pre- and post-trigger sampling data useful for analyzing trip information, and store in non-volatile memory.
 - 3. Alarm Communication: Send alarms to SAS via protocol specified in Section 34 21 31, TES Substation Automation System (SAS).
 - 4. Screens: LCD.
 - 5. Time Synchronization: Protective IEDs shall synchronize time with SAS.
 - 6. Protective Device Coordination: Perform a coordination study for the dc system in accordance with Section 34 21 73, TES Studies, to obtain preliminary relay settings.
 - 7. Final Settings: Make final adjustments to relaying systems and protective devices during TES Substation Field Acceptance Testing and Integrated Testing specified in Section 34 21 90, TES Testing.
 - 8. Contact Wire Thermal Rise: Set instantaneous and sustained current curves to limit the contact wire thermal rise to less than 165 degrees F.
 - 9. Complete Installation: Provide additional components such as auxiliary relays, isolating diodes and similar devices not shown in the Contract Drawings, but required for a complete installation.
- B. Arrangement and Appearance:
 - 1. Arrange devices such as auxiliary relays, indicating lights and test plugs to be conveniently accessible and easily visible.
 - 2. IED meters and displays shall be located such that they are easy for a person standing at floor level to operate and read.
 - 3. The grouping shall be modular and place related functions in proximity.
 - 4. Mount devices plumb and square with the lines of the panels and mount as recommended by the manufacturer and approved by Engineer.
 - 5. Auxiliary devices shall match the general appearance as far as possible with frames of a compatible approved color and finish.

6. Devices of the same general type shall be manufactured by the same company and shall be similarly arranged and mounted.
 7. Refer to substation one-line diagram in the Contract Drawings for arrangement of protective relays and devices.
- C. At a minimum, provide the following protective functions/devices as shown below and on the substation one-line diagram in the Contract Drawings. Additional protective functions/devices recommended by equipment manufacturers may be installed with Engineer approval.
1. Dc Feeder Multifunction Relay IED:
 - a. Acceptable Manufacturer/Product: Siemens Sitras Pro, or approved equal.
 - b. Functions: Include the following at minimum:
 - 1) Overcurrent: At minimum, provide the following overcurrent protection functions, which shall operate in the forward and reverse current directions:
 - a) Instantaneous Overcurrent Trip.
 - b) Low Level Fault Trip and associated time delay.
 - c) Timed Overcurrent Trip:
 - i. Provide timed overcurrent trip function with inverse time characteristic that can be graphed with the set current, I_{tmd} , as the y-axis, and the time delay, T_{mdDel} , as the x-axis.
 - ii. Tripping shall be initiated when the load current exceeds the set current during the period of time t such that (t/ T_{mdDel}) and (I_{load}/ I_{tmd}) correspond to a point on the curve.
 - 2) Rate of Rise Trip: Shall be initiated if all of the following conditions are met:
 - a) Current di/dt exceeds the trip limit, di/dt .
 - b) Di/dt stays above the trip limit during the delay time, Delay.
 - c) During the delay time current exceeds the current rise limit.
 - c. Load Measure and Reclose:
 - 1) Provide each dc feeder cubicle with a set of automatic reclosing functions and equipment, including the following:
 - a) Load measuring function (Device 82).
 - b) Adjustable time delay reclosing function (Device 83).

- c) Load measuring resistors mounted on the top of the circuit breaker cubicle;
 - d) Associated accessories.
- 2) Initiate the load measuring and automatic reclosing cycle when either the dc circuit breaker receives a "close" command (from the local or remote control), or when the circuit breaker is tripped automatically and attempts to reclose.
 - 3) A "lockout" status or intentionally initiated trip of the dc lockout relay shall disable the load measuring and automatic reclosing cycle.
 - 4) Precede initiation of the load measuring cycle by an adjustable time delay to permit the faulted line section to become fully de-energized.
 - 5) At the commencement of the load measurement cycle, a voltage sensor shall determine whether there is no voltage on the section.
 - 6) If the voltage measuring circuit detects potential on the section, it shall reclose the associated circuit breaker immediately, providing that this potential is greater than a preset value.
 - a) The pickup setting shall be adjustable over the range of 60 to 750 Vdc.
 - b) Initially the pickup voltage shall be set to 560 Vdc.
 - 7) If the voltage measuring circuit detects no potential on the section, the load measuring function shall make repeated load measurements at suitable adjustable time intervals.
 - 8) If a load measurement determines that no fault is present, initiate automatic reclosing of the circuit breaker.
 - 9) A successful reclosure with no automatic trip within five seconds shall complete the measurement cycle and reset the devices to their initial state.
 - 10) Make provision for selection of up to six attempts to complete a successful load measurement and automatic reclosing cycle at 15 second intervals, within a 3 minute period. Set initially at three attempts.
 - 11) If no successful reclosure takes place in the three minute period, the automatic reclosing and load measuring system shall lock out the feeder breaker from closing.
 - 12) Provide each automatic reclosing and load measuring function with test facilities that shall check the functioning of all devices.
 - a) Initiate test cycle with a local "test" push-button, which shall be functional only when the circuit breaker removable element is in the "test" position.

- b) Circuit breaker shall not close until after completing automatic reclosing and load measuring test when the breaker is in the "connected" position.
- 13) Monitor condition of reclosure device.
- d. Incomplete Sequence (Device 148):
 - 1) This function shall detect the failure of a dc circuit breaker to clear a fault within a predetermined time.
 - 2) This function shall actuate the ac lock-out relay (Device 86) when actuated.
- e. Transfer Trip:
 - 1) Provide two types of transfer trip:
 - a) The first type shall be automatically resettable (Device 85). Automatic resetting shall be controlled by the load measure reclose relay and occurs on di/dt faults.
 - b) The second type shall require manual resetting (Device 85L). It shall trip the dc lockout relay (Device 186H) in both the originating and receiving substations, and is required for dc instantaneous over-current, frame faults, rail-to-earth potential faults, incomplete sequence faults, and emergency shutdowns.
 - 2) Configure communication interface devices between substations for transfer trip function over the communications network.
 - 3) Provide communication function blocks or other programming required for relays and IEDs to establish relay-to-relay communication between substations.
 - 4) Monitor the condition of the communication continuously.
 - 5) Generate an alarm if a fault condition is detected.
 - 6) Tripping of a dc breaker shall initiate tripping of the remote active breaker feeding the same power section. If a substation is bypassed, the local breaker shall send the transfer trip signal to the substation beyond the bypassed substation to de-energize the power section.
 - 7) Transfer trip shall be integral to protection relays.
 - 8) Communication for transfer trip must be configured using VLAN. See Section 34 21 31, TES Substation Automation System.
- 2. Reverse Current:
 - a. Provide reverse current detection (Device 32).
 - b. The protection shall detect current flow from the distribution bus into the rectifier unit and trip and lock out the dc feeder breakers and ac circuit breaker.

- c. The trip level shall be initially set to 15 percent of the rated current or as approved by Engineer.
- 3. High Resistance Frame Fault:
 - a. Insulate dc switchgear enclosure from ground.
 - b. Single-point ground enclosure through a separate high resistance ground IED device 64HS (hot structure) and 64GS (grounded structure).
 - 1) Connect IED with insulated 4/0 AWG copper conductor directly to substation ground mat.
 - 2) The 64HS and GS relay shall be the only ground path to the enclosure.
 - 3) The occurrence of any other ground path must be detected and alarmed.

2.9 INSTRUMENTS AND METERS

- A. Instruments and meters shall be integrated into intelligent electronic devices (IEDs).
 - 1. Voltmeters and ammeters shall be rated for use with the corresponding transducers.
 - 2. Scales shall be of a suitable range, equal to the associated potential or current transformer primary rating.
- B. Provide instrument and metering IEDs with capability of communicating with SAS as specified in Section 34 21 31, TES Substation Automation System (SAS).
- C. Instruments and metering devices for measuring dc values shall receive their inputs from isolation converters that shall be provided within the bus compartment of the switchgear.
 - 1. Provide auxiliary devices required for operation of the converters.
 - 2. Provide suitable isolation and insulation in order to ensure safe operation in contact with personnel.
 - 3. VMF Switchgear: Design to be maintainable from the front.

2.10 FACTORY ASSEMBLY

- A. Completely insulate dc switchgear enclosure and rectifier from ground and from the rectifier transformer and the ac switchgear.
 - 1. Insulate and isolate dc switchgear and rectifier from the floor using an epoxy floor covering in accordance with Section 34 21 08, TES Dielectric Epoxy Flooring.
 - 2. Insulate and isolate dc switchgear and rectifier from the transformer using electrical laminate in accordance with Section 34 21 17, TES Substation Design and Assembly.
 - 3. Insulate walls using electrical laminate in accordance with Section 34 21 17, TES Substation Design and Assembly, and as shown on Contract Drawings.

2.11 SOURCE QUALITY CONTROL**A. Factory Design Tests:**

1. Dc Switchgear: Perform Design Tests as specified in IEEE C37.20.1:
 - a. Dielectric tests
 - b. Rated continuous current tests
 - c. Short-time withstand current tests
 - d. Short-circuit current withstand tests
 - e. Mechanical endurance tests
 - f. Flame resistance tests
 - g. Rod entry test
 - h. Coating (paint) qualification test
2. Dc Circuit Breaker: Perform Design Tests as specified in IEEE C37.14.
3. Positive and Negative Disconnect Switches:
 - a. Conduct a complete set of design tests on one switch of each type in accordance with IEEE C37.30.1 and IEEE C37.41.
 - b. Tests to be performed with switch(es) in enclosure assembled in closed, final operational configuration.
4. Dc Protection Relays and Control Devices:
 - a. Perform in accordance with Design Tests in IEEE C37.90.
 - b. Frame Fault Relay (Device 64 HS and GS): Following design tests are required.
 - 1) Continuous and maximum short circuit ratings: Demonstrate by test.
 - 2) Response time and maximum trip time: Demonstrate by test.
 - 3) Maximum trip time for this device shall not exceed 50 ms.

B. Factory Production Tests:

1. Dc Switchgear: Perform during TES Substation Factory Acceptance Tests in accordance with Section 34 21 90, TES Testing.
2. Dc Circuit Breaker:
 - a. Prior to mounting inside dc switchgear, perform the following on each dc circuit breaker in accordance with IEEE C37.14:
 - 1) Calibration test
 - 2) Control, secondary wiring and device check test.

- 3) Dielectric withstand voltage test.
- 4) No-load operation test.
- b. Perform additional testing on each dc circuit breaker after mounting in switchgear during TES Substation Factory Acceptance Tests in accordance with Section 34 21 90, TES Testing.
- 3. Positive and Negative Disconnect Switches: Perform during TES Substation Factory Acceptance Tests in accordance with Section 34 21 90, TES Testing.
- 4. Dc Protection Relays, Control Devices and Meters: Perform in accordance with production tests in IEEE C37.90.

PART 3 - EXECUTION

3.1 INSTALLATION

- A. Insulate dc switchgear in built-in-place substation as required in Part 2, above, in the article titled "Factory Assembly."

PART 4 - MEASUREMENT AND PAYMENT

4.1 MEASUREMENT

- A. The quantities of accepted work will be measured in the following units. All measurements will be plan measure except for authorized changes.
 - 1. Description: Lump Sum

4.2 PAYMENT

- A. Payment will be made at the respective unit or lump-sum price listed in the proposal and shall be full compensation for all labor, materials, and equipment necessary to complete the respective unit in place. There will be no separate measurement or payment for any item of work not specifically identified and listed in the proposal, and all such work shall be considered a subsidiary item with all costs pertaining thereto included in the prices for other items listed in the proposal. At the Engineer's option, partial payment may be made for any lump sum item listed in the proposal, providing that the Contractor is diligently and satisfactorily pursuing full completion of such partially complete item in accordance with the approved job progress schedule.

END OF SECTION

SECTION 34 21 23**TES TRANSFORMER-RECTIFIER UNIT****PART 1 - GENERAL****1.1 SUMMARY**

- A. This Section includes rectifier-transformers and rectifiers, which are referred to in this Section as the "Transformer-Rectifier Unit," for the TES substations.

1.2 RELATED SECTIONS

- A. SECTION 01 33 00 – Submittal Procedures
- B. SECTION 34 21 06 – TES Common Work Results for Metals
- C. SECTION 34 21 08 – TES Dielectric Epoxy Flooring
- D. SECTION 34 21 13 – TES Switchboards
- E. SECTION 34 21 17 – TES Substation Design and Assembly
- F. SECTION 34 21 18 – TES Lighting
- G. SECTION 34 21 18 – TES Medium-Voltage Ac Switchgear
- H. SECTION 34 21 31 – TES Substation Automation System (SAS)
- I. SECTION 34 21 80 – TES Spare Parts and Special Tools
- J. SECTION 34 21 90 – TES Testing
- K. SECTION 34 22 10 – TES Low-Voltage Conductors and Cable

1.3 REFERENCED STANDARDS

- A. Section incorporates by reference the latest revisions of the following documents:
- B. American Society for Testing and Materials (ASTM)
 - 1. ASTM D116, Vitrified Ceramic Materials for Electrical Applications
- C. Institute of Electrical & Electronics Engineers (IEEE)
 - 1. IEEE 519, Recommended Practices and Requirements for Harmonic Control in Electrical Power Systems
 - 2. IEEE 1653.2, Standard for Uncontrolled Traction Power Rectifiers for Substation Applications Up to 1500 Vdc Nominal Output
 - 3. IEEE C37.20.3, Standard for Metal-Enclosed Interrupter Switchgear
 - 4. IEEE C57.12.01, General Requirements for Dry-Type Distribution and Power Transformers Including Those with Solid-Cast and/or Resin Encapsulated Windings

5. IEEE C57.12.91, Standard Test Code for Dry-Type Distribution and Power Transformers
 6. IEEE C57.18.10, Standard Practices and Requirements for Semiconductor Power Rectifier Transformers
- D. National Electrical Manufacturers Association (NEMA)
1. NEMA TR 1, Transformers, Regulators and Reactors
 2. NEMA SG 6, Power Switching Equipment

1.4 SUBMITTALS

- A. Procedures: SECTION 01 33 00 – Submittal Procedures.
- B. Product Data: Manufacturer's product descriptions and catalog data for the following:
 1. Transformer-Rectifier Unit
 - a. Enclosures: Gauge of steel, finish, door hardware.
 - b. Relays, protective devices, control switches, over temperature devices and failed diode indication device.
 - c. Ratings.
 - d. Internal wiring: Wire type and size.
 - e. Information concerning design and application ratings.
 - f. Information concerning service, performance and reliability.
 - g. Documents confirming the substation system rating.
 2. Rectifier:
 - a. Bus and bus insulators.
 - b. Diodes
 - c. Fuses
 - d. Dc surge arresters
 - e. Cooling fans
 3. Rectifier-transformer:
 - a. Bus and bus insulators.
 - b. Core steel.
 - c. Transformer winding insulation system.
 - d. Transformer Data: Weight, impedance, and primary and secondary BIL
 - e. Transformer temperature monitor.
 4. Interphase transformer

- C. Spare Parts and Special Tools:
1. Submit a list of spare parts to be provided under this Section.
 2. Submit at the same time as product data.
 3. Provide part numbers for each part, including a detailed break down of each spare part assembly and set, as defined in SECTION 34 21 80 – TES Spare Parts and Special Tools.
 4. Submit a list of special tools to be provided under this Section, as defined in SECTION 34 21 80 – TES Spare Parts and Special Tools.
- D. Shop Drawings:
1. Transformer-Rectifier Unit
 - a. Detail drawings for transformer-rectifier unit, including interphase transformer, surge arrester arrangement, and connection between rectifier and transformer.
 2. Rectifier:
 - a. Outline drawing showing dimensions, front, back and side elevations of enclosure, overall dimensions, and lifting lugs.
 - b. Detail drawing of connection between rectifier and positive switch
 - c. Rectifier enclosure and door latch details.
 - d. Rectifier nameplate drawing.
 - e. Wiring, schematic, and connection diagrams.
 - f. Rectifier monitoring and protection schematic and wiring diagram.
 - g. Bill of materials.
 3. Rectifier-Transformer:
 - a. Outline drawing showing dimensions, front, back and side elevations of enclosure, overall dimensions, and lifting lugs.
 - b. Detail drawing of connection between Ac main breaker and rectifier-transformer.
 - c. Transformer enclosure and door latch details.
 - d. Transformer nameplate drawing with nameplate details.
 - e. Wiring, schematic, and connection diagrams.
 - f. Insulation system details.
 - g. Transformer primary and secondary busing arrangements showing bus construction details
 - h. Transformer tap changer arrangement details.
 - i. Bill of materials.

4. Transformer temperature monitor/protection device schematic and wiring diagram including the location of the temperature sensor.
- E. Calculations:
1. Transformer design calculations, including hottest spot temperature rise in accordance with IEEE C57.12.01.
 2. Transformer calculation of winding temperature during a short circuit in accordance with IEEE C57.12.01.
 3. Bus sizing calculations: Rectifier and rectifier-transformer.
 4. Proof the transformer-rectifier unit design and construction conforms to IEEE 519.
- F. Submit the following upon completion of transformer manufacture:
1. Measured present worth of transformer energy losses, including the following:
 - a. Table 1, with actual measured losses from the transformer.
 - b. Table 2 calculation, using the new value from Table 1.
 2. Comparison of calculated and measured present worth of transformer energy losses, as described in the Article below titled "Transformer Design Optimization."
- G. Submit test procedures that comply with Section 34 21 90, TES Testing.
1. Design Tests.
 2. Production Tests.
- H. Submit test reports that comply with Section 34 21 90, TES Testing.
1. Design Tests: Provide design test reports for each type of transformer-rectifier unit within 30 Days after completion of testing.
 2. Production Tests: Provide production test reports for each transformer-rectifier unit within 30 Days after completion of testing.
- I. Operations and Maintenance Data:
1. Submit manufacturer's operating and maintenance instructions on products specified in this Section, including the following:
 - a. Submit manufacturer's operating and maintenance instructions, parts list, illustrations and diagram for components for products specified in this Section.
 - b. Wiring diagram.
 - c. Diagram showing recommended safety grounding during maintenance.
 2. Submit immediately after approval of product data.

1.5 SPARE PARTS

- A. Provide spare parts in accordance with SECTION 34 21 80 – TES Spare Parts and Special Tools.

- B. List below applies to items in this Specification Section.
 - 1. Rectifier-transformer: Provide 1 spare.
 - 2. Transformer temperature monitor complete with temperature sensors: Provide 1 spare assembly.
 - 3. Rectifier diodes: Provide 7 spare.
 - 4. Rectifier diode protection fuses: Provide 7 spare.
 - 5. Rectifier over-temperature: Provide 7 spare assemblies.
 - 6. Interphase transformer: Provide 1 spare.

1.6 QUALITY ASSURANCE

- A. Comply with the requirements of the Project Quality Plan.
- B. Rectifier-transformer shall be UL labeled or shall be furnished with a Field Evaluation label in accordance with Section 34 21 17, TES Substation Design and Assembly.
- C. Rectifier shall be UL labeled or shall be furnished with a Field Evaluation label in accordance with Section 34 21 17, TES Substation Design and Assembly.

1.7 WARRANTY

- A. Provide an extended warranty of 5 years for rectifier-transformers.

PART 2 - PRODUCTS

2.1 TRANSFORMER-RECTIFIER UNIT - GENERAL REQUIREMENTS

- A. Transformer-rectifier unit shall be manufactured in accordance with the referenced standards.
- B. Transformer-rectifier unit consists of a separate rectifier-transformer and a rectifier, as shown on Contract Drawings.
 - 1. Provide each unit complete with auxiliaries, controls, wireways, interconnecting ac and dc buses, enclosures and necessary hardware, wiring and devices from the high voltage side of the transformer to the dc bus connections to the dc switchgear and negative enclosure.
 - 2. Except as otherwise specified, the transformer-rectifier shall conform to IEEE C57.12.01, C57.12.91, 519, and 1653.2, and NEMA SG 6 and TR 1.
- C. Dc output of the transformer-rectifier unit shall feed the metal enclosed dc switchgear that controls and protects the power supply to the Overhead Contact System (OCS).
- D. Enclosures for Transformer and Rectifier:
 - 1. Construct from sheet steel, 11 gage minimum, properly reinforced against distortion by suitable flanges and stiffening members.
 - 2. Doors:
 - a. Minimum 11 gage sheet steel.

- b. Doors 36 inches or wider shall include vertical stiffeners, minimum 3 stiffeners for a 36-inch door, with one additional stiffener for each additional 12 inches of door width.
- 3. Finish: Powder coat in accordance with 34 21 06, TES Common Work Results for Metals.
- 4. Color: In accordance with Section 34 21 06, TES Common Work Results for Metals.
- E. Design Loading Condition: Transformer-rectifier units shall meet the duty cycle specified in IEEE 1653.2 for extra heavy traction service.
- F. Efficiency: Overall efficiency of each transformer-rectifier assembly shall be greater than 98 percent at its continuous rating.
- G. Power Factor: Displacement power factor of each transformer-rectifier assembly shall be 0.95 or greater from 25 percent to full load at rated ac voltage.
- H. Voltage Regulation:
 - 1. Minimum 4-1/2 percent between 1 percent and 200 percent load with the nominal ac voltage maintained at the transformer primary and the transformer set at the rated voltage tap.
 - 2. Engineer may allow minor variations in regulation based upon submitted design curve.
- I. Dummy Load:
 - 1. Limit the no-load voltage to the value specified.
 - 2. Provide a bleeder resistance dummy load, if required, to prevent excessive voltage rise at no-load.
- J. Provide protection against transient surge voltages on the dc side of the rectifier. If fuses are used in suppression networks, they shall be monitored by visual indicators and equipped with indication devices wired to local Annunciator.
- K. Short Circuit Ratings:
 - 1. Design transformer, including terminal connections and buswork, to withstand a full short circuit with shorted low-voltage terminals and rated voltage on the high-voltage terminals, in accordance with IEEE C57.12.01. The duration of the short-circuit current shall be minimum 1 second.
 - 2. Design all parts of the rectifier unit, including the terminal connections and buswork, to withstand a maximum dc fault on the dc positive bus, without damage, for the period required for the back-up protection to operate and open the ac circuit breaker.

2.2 TRANSFORMER-RECTIFIER UNIT RATINGS AND CONFIGURATION

- A. Mainline transformer-rectifier units:
 - 1. Rating: 750 Vdc, 350 kW measured at output terminals.
 - 2. Configuration: 12-pulse, double-way, in accordance with IEEE 1653.2, Circuit 31.

3. Convert 13.2 kV, 60 Hz ac, three-phase, three-conductor primary power to 750 Vdc at 100 percent of full load.
 4. Ac power source: 13.2 kv switchgear; see Section 34 21 18, TES Medium-Voltage Ac Switchgear.
- B. VMF transformer-rectifier unit:
1. Rating: 750 Vdc, 150 kW measured at output terminals.
 2. Configuration: 6-pulse, in accordance with IEEE 1653.2.
 3. Convert 480 V, 60 Hz ac, three-phase, three-conductor primary power to 750 Vdc at 100 percent of full load.
 4. Ac power source: 480 Vac switchboard; see SECTION 34 21 13 – TES Switchboards.

2.3 PROTECTIVE DEVICES AND RELAYS FOR TRANSFORMER-RECTIFIER UNIT

- A. Coordinate protection to prevent false tripping or malfunction.
- B. Supply an insulating dust cover for each internally-mounted device or the chamber that accommodates these devices.
- C. Compartment: Mount control devices, relays and protective devices within the rectifier and transformer enclosure within a separate barriered compartment in compliance with IEEE C37.20.3.
1. Devices shall be readily accessible without disassembling interior portions of the rectifier assembly.
 2. Control wiring shall be contained within the cubicle.
 3. Control wiring shall be barriered from and not intermixed with 750 Vdc power wiring.
 4. No 750 Vdc devices shall be mounted in control compartment.
 5. Locate devices such that heat from other equipment does not affect operation.
- D. Control Power: Power supply for protective devices and relays shall use 125 Vdc auxiliary power system.
- E. Transformer Temperature Monitor (TTM) Device 49:
1. Shall be manufactured for the purpose and have a service proven history.
 2. Shall incorporate a hot-spot winding temperature indicator located where the highest temperature reading is obtained during Design testing.
 3. Provide with two-step, electrically independent contacts that close on rising temperatures for alarm (first step) and tripping (second step).
 - a. First stage, 49T1:
 - 1) Initiate an alarm on the TTM and SAS. Refer to Section 34 21 31 – TES Substation Automation System (SAS).

- 2) Set initially at the temperature reached during the 2-hour heat run at 150 percent rated output, and annunciate when this temperature is reached.
 - b. Second stage, 49T2: Initiate an alarm on the TTM and SAS, trip and lock out the main ac breaker, and open the main dc circuit breaker.
 - c. Temperature set points, T1 and T2, shall be factory-preset when transformer is provided, as recommended by the manufacturer and approved by Engineer, and field adjustable
4. Display temperature continuously on a digital display mounted on the surface of transformer panel.
 - a. Accuracy: Within 1.5 percent of the full-scale reading.
 - b. Scale: Degrees Celsius.
 - c. Peak Temperature:
 - 1) Peak temperature shall be displayed when requested by the activation of a front panel mounted pushbutton.
 - 2) Peak temperature shall be resettable via a separate front panel mounted pushbutton.
 - 3) TTM shall store the peak temperature reached by the rectifier-transformer.
5. Enclosure:
 - a. NEMA 1 enclosure for low voltage terminals.
 - b. Cover: Hinged- or screw-type.
6. Terminal strips: Provide covers and mount on back panel.
7. Barriers: Provide where necessary to separate conductors with different voltage insulation ratings, such as thermocouple wiring and 125 Vdc control wiring.
8. Mounting Securely mount enclosure to the transformer frame.
 - a. Mount in a location readily accessible from the front as indicated, but not to restrict access to the transformer coils for maintenance.
 - b. Do not mount the enclosure in removable panels.
9. Control Wiring:
 - a. Control wiring shall be 600 V switchboard wire. See Section 34 22 10, TES Low-Voltage Conductors and Cable, for switchboard wire requirements.
 - b. Size: Minimum 14 AWG, except for temperature sensor internal wiring.
10. Contacts: Electrically separate and suitable for operation at 125 Vdc.

- F. Provide the following protective devices for the rectifier. Contacts on these devices shall be electrically separated:
1. Rectifier over-temperature (Device 26):
 - a. Over temperature device shall be factory set, two stages (26R1 and 26R2).
 - b. Shall detect first an abnormal rise in diode heat sink or diode temperature and initiate local and remote annunciation.
 - c. Set-point for the alarm shall be set during the factory systems test to the level recorded during the two hour 150 percent heat run.
 - d. An additional rise in heat sink temperature will trip and lock out the ac main breaker, open the main positive circuit breaker and shall alarm on the SAS. Refer to SECTION 34 21 31 – TES Substation Automation System (SAS).
 - e. Devices shall be isolated from the bus voltage.
 2. Frame fault protection for the rectifier: Provide high resistance frame fault protection for the rectifier cubicles.
 3. Provide failed diode indications 98R1 and 98R2.
 4. Refer to Contract Drawings for additional protective devices.

2.4 RECTIFIER

- A. General:
1. Provide rectifier assembly as an integral part of the dc switchgear.
 2. Rectifier assembly shall be constructed in accordance with IEEE C37.20.3, except as modified in this Section.
 3. Rectifier shall include silicon diodes, internal buses, terminals for connection to external power and control wiring or buses, shunts, base or bleeder load resistors, protective devices, control wiring, terminal blocks, compartments, cubicles, and all other necessary accessories.
 4. All rectifier assemblies shall be identical, except for necessary differences in the VMF rectifier.
- B. Rating and configuration:
1. IEEE 1653.2 extra heavy traction service.
 2. Dc Insulation: 1200-Volt Class.
 3. Mainline rectifiers:
 - a. Rated 750 Vdc, 350 kW, with natural convection air cooling.
 - b. Continuous current rating at 100 percent: 583 A.
 - c. Twelve-phase, double-way, 12-pulse rectification.

4. VMF rectifier:
 - a. Rated 750 Vdc, 150 kW, with natural convection air cooling.
 - b. Continuous current rating at 100 percent: 250 A.
 - c. Six-phase, double-way, 6-pulse rectification.
 5. Cooling fans:
 - a. Provide fans for forced air cooling to increase continuous current rating by 33 percent.
 - b. Rectifier shall not suffer loss of life when operated at the IEEE 1653.2 extra heavy traction service overload.
- C. Enclosure:
1. Mount rectifier assembly in a metal fully-enclosed switchgear section or compartment.
 2. The switchgear section shall be indoor, self-ventilated, metal enclosed structure with barriers, compartments, hinged doors as required by IEEE C37.20.3, except as modified in this Section.
 3. Assemble enclosure with a rigid self-supporting structural steel framework.
 - a. Structural members shall be of sufficient strength to support the buswork under short circuit conditions.
 - b. Principal structural members shall be electrically welded or bolted together.
 - c. Provide lifting eyes for lifting the rectifier unit from the top.
 - d. The completed package shall be capable of being skidded or rolled any direction.
 - e. Provide jacking lugs at each base corner.
 4. Doors:
 - a. Provide convenient access doors on the front and rear of the section for normal maintenance and inspection.
 - b. Latches: Equip each door with a heavy duty latch to hold the door fully and securely closed.
 - c. Hinges: Stainless steel heavy-duty type.
 - d. Door Stops:
 - 1) Provide heavy-duty door stops to hold the door in the open position.
 - 2) Not easily bent if an attempt is made to close door without releasing door stop.
 - e. Window: Provide an ample sized, wired glass, gasketed observation window on each door to observe diode blown fuse indicators.

- f. Install front-mounted indicating and control devices without damaging the exposed finished surfaces.
 5. Lights: Provide inside equipment enclosures, as specified in Section 34 21 18, TES Lighting.
- D. Bus and Connections:
 1. Rectifier buses shall be made of rigid, high conductivity, electrical grade copper.
 2. Buses shall be suitably braced between each other and to the enclosure with high-strength, non-tracking porcelain or fiberglass insulators.
 3. Buses shall be braced to safely withstand the available short-circuit current without damage to the bus or the rectifier.
 4. Where aluminum heat sinks are bonded to a copper bus, coat connection with oxide inhibitor to prevent bimetallic corrosion.
 5. Bus connections shall be bolted using a minimum of four bolts per joint.
 - a. Wherever bolted together, the mating surfaces of copper buses shall be silver-plated.
 - b. Bolted connections shall be made with Belleville washers.
 6. Buses shall extend through the compartment walls to rear bus compartment and connected to the dc switchgear.
 7. Rectifier section shall be designed as an integral part of the dc switchgear line up and shall be insulated from the ac and dc switchgear, substation grounds, or other enclosures.
 8. Metal barriers, electrically bonded to the frame, shall be provided between dc positive and negative buses and terminal connections within the rectifier.
- E. Dc surge arrester:
 1. Rectifier unit shall be equipped with dc surge arresters.
 2. The arresters shall limit the reverse voltage across rectifier silicon diodes to a value less than 75 percent of the peak-reverse-voltage rating of the diode by limiting the rise of the transient on the positive to negative bus.
 3. Ensure that arresters will fail in a safe manner without damage to equipment and will self extinguish. Install in separate enclosure if necessary.
- F. Silicon Diodes:
 1. Silicon diodes shall be hermetically sealed and mounted on adequate heat sinks.
 2. Diodes shall be rated and tested in accordance with IEEE 1653.2 for extra heavy traction service.
 3. Rectifier shall be able to withstand a bolted fault on the dc switchgear bus without exceeding the safe diode junction temperature on the active diode for the time it takes the ac breaker to clear the fault.
 4. Each diode shall be capable of withstanding, at its maximum operating temperature during blocking periods, repetitive voltages having a value 250

- percent of its working peak reverse voltage without a permanent change in diode characteristics.
5. Each individual diode shall have a peak inverse voltage rating equal to at least 266 percent of the applied peak inverse voltage at no load.
 6. Parallel stacks of diodes, when used, shall be electrically and geometrically similar and as symmetrical as practical to help balance the normal and surge electrical characteristics of each.
 7. Design rectifier to maintain current balance between parallel-connected diodes, if used, in each phase.
 - a. The current for each diode of a parallel-connected stack shall not differ from its proportionate share of the total current by more than plus or minus 10 percent, between 50 percent and 150 percent of the rated capacity.
 - b. Current balancing shall not be achieved by use of selectively matched diodes.
- G. Fuses:
1. Provide one current limiting fuse in series with each phase.
 - a. Each fuse shall have adequate interrupting capacity
 - b. Provide a visual fuse failure indication.
 - c. Fuse failure indication shall be visible from outside rectifier through observation window.
 2. Size fuses to the diode current rating. Diodes shall not open or fail on an external dc fault or rated overload condition.
 - a. Only the fuse connected to a failed (shorted) diode shall open.
 - b. No other rectifier diodes or fuses shall fail or be damaged when one diode fails.
 3. Fuses: 750 V minimum, indicating type, affixed with micro switches for Device 98.
- H. Diode Failure:
1. Diode failure 1 (98R1): If one diode fails, or if one entire leg fails, send alarm to SAS.
 2. Diode failure 2 (98R2): If one leg has failed, and a second leg fails, trip the ac lockout relay (Device 86).
- I. Special Tools: Provide special tools to remove or install the diodes and/or diode fuses and/or hardware with each substation rectifier.
- J. Internal Wiring: 2 kV switchboard wire, per Section 34 22 10, TES Low-Voltage Conductors and Cable.
- K. Heating and Cooling System:
1. Auxiliary heating will be by a thermostatically-controlled space heater within the substation. Heaters mounted within the rectifier enclosure are not necessary.

2. Rectifier shall be natural convection air-cooled.
 - a. Circulation of ambient air shall do all necessary cooling at the IEEE 1653.2 extra heavy traction service loading specified.
 - b. Cooling ducts shall not be used.
 3. All rectifiers shall be equipped with fans and thermostats for future forced air cooling.
- L. Maintenance: Heat transfer surfaces and characteristics shall be designed for easy cleaning and to minimize accumulations of dust and other contaminants expected in the operating environment.
- M. In accordance with this Specification, voltages other than 125 Vdc control power are not permitted within the enclosure unless a specific requirement is stated in this Contract.
- N. Nameplate:
1. Provided each rectifier with a corrosion resistant metal nameplate containing the following information at a minimum:
 - a. Name of Manufacturer.
 - b. Descriptive Name.
 - c. Type Designation.
 - d. Serial Number(s).
 - e. Output Rated Power.
 - f. Output Rated Voltage.
 - g. Output Rated Current.
 - h. Overload Currents - Magnitude and Duration.
 - i. Weight.
 - j. Schematic Diagram Number.

2.5 RECTIFIER-TRANSFORMER

- A. Provide dry-type rectifier-transformer of VPI (Vacuum Pressure Impregnation).
- B. Ratings and Configuration:
1. Ventilated, self-cooled Class AA/FA.
 2. Transformer capacity shall be as required to achieve the specified transformer-rectifier unit rating.
 3. IEEE 1653.2 extra heavy traction service duty cycle.
 4. Transformer shall not suffer loss of life when operated at the specified duty cycle overload.
 5. Insulation Class: 220 degrees C class.

6. Temperature Rise: Limit winding hottest-spot temperature rise and average winding temperature rise to the values given in IEEE C57.12.01 for the specified insulation class.
 7. Cooling fans:
 - a. Provide fans for forced air cooling, controlled by transformer temperature monitor.
 - b. Fans shall increase the overall rating of rectifier-transformer by 33 percent of its rated output current without exceeding specified temperature rise.
 8. Select the transformer impedance to provide the rectifier output voltage specified.
- C. Windings:
1. Material: Copper.
 2. Windings shall not absorb moisture and shall be suitable for both storage and operation in adverse environments, including prolonged storage in 100 percent humidity at temperature from minus 30 degrees C to 40 degrees C.
 3. Primary windings mainline:
 - a. Delta-connected.
 - b. 95 kV BIL.
 4. Secondary windings mainline:
 - a. Connected for 12-pulse rectification.
 - b. 20 kV BIL
 5. Primary windings VMF:
 - a. Delta connected.
 - b. 20 kV BIL
 6. Secondary windings VMF:
 - a. Connected for 6-pulse rectification.
 - b. 20 kV BIL.
- D. Taps:
1. Provide full capacity taps on primary voltage windings:
 - a. Two above rated voltage in 1.25-percent steps;
 - b. Two below rated voltage in 2.5 percent steps;
 - c. One at rated voltage.
 - d. Taps to the nearest turn are acceptable if the exact percentage cannot be achieved.

2. Tap changing shall be by movable silver plated copper bus links for de-energized tap changing.
 3. Taps shall be brought out the side of the transformer, not the top.
 4. Insulate jumpers from the transformer taps to the tap changer board and primary bus and keep as short as possible so as not to interfere with access to the coils for maintenance.
 5. Tap connections shall be accessible through the front hinged enclosure doors.
 6. Identify tap connections so that the tap selected is clearly visible through the observation window.
 7. Securely bolt the tap-changing bus links in position.
 8. Design of links and connectors shall make it impossible to short out sections of windings, or to select taps outside the prescribed range, by incorrectly connecting the links.
- E. Connections:
1. Switchboard: Connect the high-voltage side using electrical grade copper bus with silver plated joints.
 2. Rectifier: Connect the low voltage side using electrical grade copper bus with silver plated joints.
- F. Bus supports:
1. Securely support bus from transformer frame using porcelain insulators.
 2. Size bus supports for mechanical strength and ability to withstand a bolted fault without distortion.
 3. Porcelain insulators: ASTM D116, rated for the line-to-line voltage application, free of imperfections. Insulators that have been re-touched with paint shall not be used.
- G. Bus Bars:
1. Size:
 - a. Minimum 1/4-inch by 2-inch, sized for mechanical strength and ability to withstand a bolted fault without distortion.
 - b. Size bus for a current density of 750 A per square inch, or a maximum temperature of 90 degrees C at a 40 degree C ambient, whichever results in a larger size.
 2. Bolted connections: Use a minimum of two silicon bronze bolted connections with Bellville washers on high and low voltage ac and dc buses.
- H. Conductors within Transformer Enclosure:
1. Conductors not connected to transformer primary or secondary:
 - a. Voltage rating: 600 V.
 - b. Temperature rating: 105 degrees C.

-
- c. Protection:
 - 1) Enclose in GRS conduit securely strapped to the transformer frame or base, or to the enclosure if conduit does not obstruct removable panels or doors.
 - 2) If conduit must be secured to both frame or base and enclosure, insert a short section of liquidtight flexible metallic conduit for vibration isolation.
 - 3) Conductors may be unprotected for a maximum of 8 inches at the point of connection.
 - 2. Cable jumpers from the secondary taps on the coil to the bus:
 - a. Sized for maximum loading for IEEE 1653.2 extra heavy traction service.
 - b. Temperature rating: 105 degrees C.
 - c. Voltage rating: 2 kV.
 - d. Insulation level: 133 percent.
 - I. Maintainability:
 - 1. Design transformer so that parts that require maintenance are readily accessible from the front and rear.
 - 2. Ensure that bottom and top of coils are readily accessible for cleaning without removing buswork, panels, or obstructions of any kind.
 - J. Transformer Enclosure and Base:
 - 1. Enclosure:
 - a. Enclose transformer in a rigid, self-supporting and self-contained, electrically welded or bolted, indoor, steel enclosure.
 - b. Enclosure shall not rely on transformer frame for support. Avoid attachments to transformer frame.
 - c. Vibration isolation: If enclosure is attached to transformer at any point, provide vibration isolation at attachment points.
 - 2. Front door:
 - a. The entire front of the transformer shall open by padlockable hinged double doors secured by three-point latches.
 - b. Window: Provide an ample sized, wired glass, gasketed observation window in the front hinged doors; position such that the tap connections are readily visible.
 - 3. Ventilation louvers: Design for maximum cooling from the bottom to top.
 - 4. Rear panels:
 - a. The rear of the transformer shall be accessible by removable panels with stainless steel handles and lifting means.

- b. Secure panels with 3/8-inch minimum stainless steel vandal-proof machine screws tapped into machined bosses.
5. Transformer base:
- a. Construct from structural steel members suitable for rolling or skidding in any direction.
 - b. Make provisions for pulling along the centerlines perpendicular to each side.
 - c. Provide jacking facilities at each of the four corners of the base to permit insertion of rollers between floor and base.
 - d. Base construction shall firmly secure the core to prevent relative motion of the core during shipment, handling, or seismic shock.
6. Transformer frame:
- a. Provide lifting hooks or eyes on the transformer frame with a safety factor of four to facilitate lifting the unit.
 - b. The structure shall be sufficiently rigid to withstand maximum transformer short circuit currents without deformation.
7. Transformer Mounting: Design to minimize vibration by using vibration isolation dampers.
8. Lights: Provide inside equipment enclosures, as specified in Section 34 21 14, TES Lighting.
9. Nameplate:
- a. Provide rectifier-transformer with a corrosion-resistant metal nameplate marked in accordance with IEEE C57.12.01.
 - b. Securely fasten to the front of the enclosure.
- K. Ac Surge Arrester:
- 1. Provide ac surge arresters on the rectifier-transformer primary side.
 - 2. Provide a separate compartment for ac surge arresters within transformer enclosure.
 - 3. Compartment shall be rigid steel, self-supporting and self-contained, electrically welded or bolted.

2.6 TRANSFORMER DESIGN OPTIMIZATION

- A. Optimize the transformer design and select appropriate materials to provide transformers with the lowest possible life cycle cost.
- 1. Definition of Life Cycle Cost: The sum of the cost of procurement and the cost of energy losses over the equipment's expected life.
 - 2. Calculate cost of energy losses over the transformer's expected life by:
 - a. First, calculating annual cost of transformer energy losses (see Table 1, below);

- b. Second, using the calculated annual cost of transformer energy losses to calculate the present worth of transformer energy losses over the 30-year expected life (see Table 2, below).

TABLE 1 – TRANSFORMER ENERGY LOSS SCHEDULE			
Column 1	Column 2	Column 3	Column 4
Transformer Load (as percentage of rated power)	Transformer Energy Losses (at Column 1 Loads) (kW)	Estimated Annual Hours (of operation at given loads) (Hours)	Annual Transformer Energy Losses (kWh)
0 percent			
20 percent			
60 percent			
100 percent			
150 percent			
220 percent			
300 percent			
Total Transformer Annual Energy Losses E_L (kWh)			

- B. Using Table 1 - Transformer Energy Loss Schedule:
 - 1. In Column 2, enter transformer energy losses in kW for each indicated transformer load in Column 1. Include energy losses in the transformer windings, steel core, and busbars, and demand requirements of auxiliary equipment such as cooling fans.
 - 2. In Column 4 calculate the Transformer Annual Energy Losses in kWh by multiplying the Transformer Energy Losses entered in Column 2 by the Estimated Annual Hours provided in Column 3.
 - 3. Total the numbers in Column 4 and enter in the box at the bottom of Table 1 for the Transformer Annual Energy Losses, E_L .
 - 4. Use this number to calculate the Present Worth of Transformer Energy Losses in Table 2.

TABLE 2 – PRESENT WORTH OF TRANSFORMER ENERGY LOSSES		
Equation:	$PW = N \cdot E_L \cdot e^{-[1/(1+i) + (1+k)/(1+i)^2 + \dots + (1+k)^{n-1}/(1+i)^n]}$	
SYMBOL	DESCRIPTION	VALUE
PW	Present worth of transformer energy losses (Dollars)	\$ _____
N	Number of transformer units	5 (mainline only)
E_L	Transformer annual energy losses (kWh)	from Table 1
E	Utility energy rate (Dollars/kWh)	0.09
i	Interest rate	0.04 (4 percent)
k	Average energy cost escalation factor	0.04
n	Transformer expected life (years)	30

- C. Using Table 2 - Present Worth of Transformer Energy Losses:
1. Calculate the Present Worth of Energy Losses, PW, in dollars over a 30-year period using the equation and values in Table 2.
 2. Insert the calculated Present Worth of Transformer Energy Losses into the Request for Proposal Bid List, where indicated.
- D. Measured Present Worth of Transformer Energy Losses:
1. After transformer is manufactured, measure the actual losses for the transformer at the load levels specified in Table 1.
 2. Update Table 1 with the measured values and recalculate Transformer Annual Energy Losses.
 3. Calculate the Present Worth of Transformer Energy Losses using Table 2, with the new value of Transformer Annual Energy Losses based on measured values.
- E. Comparison of Calculated and Measured Present Worth of Transformer Energy Losses:
1. Compare the Calculated Present Worth of Transformer Energy Losses (entered on the Price Page) with the Measured Present Worth of Transformer Energy Losses (calculated using measured values of a transformer manufactured for this project).
 2. If the Measured Present Worth of Transformer Energy Losses exceeds the Calculated Present Worth of Transformer Energy Losses, the Engineer will issue a unilateral deductive Change Order to deduct the dollar value of the difference between the two.
 3. If the Measured Present Worth of Transformer Energy Losses is equal to or less than the Calculated Present Worth of Transformer Energy Losses, no action will be taken.

2.7 INTERPHASE TRANSFORMER

- A. Design interphase transformer in coordination with transformer-rectifier unit to meet the specified voltage regulation and maximize efficiency, under Kansas City service conditions.
- B. Design, submit product data and shop drawings, and test in accordance with IEEE 1653.2.

2.8 FACTORY ASSEMBLY

- A. Completely insulate rectifier from ground and from the rectifier-transformer and the ac switchgear.
 - 1. Insulate and isolate rectifier from the floor using an epoxy floor covering in accordance with Section 34 21 08, TES Dielectric Epoxy Flooring.
 - 2. Insulate and isolate rectifier from the transformer using electrical laminate in accordance with Section 34 21 17, TES Substation Design and Assembly.

2.9 SOURCE QUALITY CONTROL

- A. Factory Design Tests:
 - 1. Transformer-Rectifier Unit Test:
 - a. General Requirements:
 - 1) Existing test reports will not be accepted in lieu of this test.
 - 2) Transformer-rectifier unit shall be tested as a complete assembly including interconnecting bus and enclosures. Ac switchgear is a required part of the assembly only for the short circuit test. Dc switchgear is not required.
 - b. Short circuit test:
 - 1) Conduct at a certified laboratory.
 - 2) Power supply shall be minimum 10 MVA.
 - 3) Transformer taps on high-voltage windings shall be connected at the center position of the five available taps.
 - 4) Set ac breaker for the IEEE 1653.2 short-time overload for extra heavy traction service.
 - 5) Perform in accordance with IEEE C57.12.91, to fully evaluate the capability of all windings.
 - a) Apply fault on the rectifier secondary.
 - b) Make recommended terminal measurements.
 - c. Rated current test:
 - 1) Perform in accordance with IEEE 1653.2.
 - 2) Thermocouple locations shall be indicated in test procedure and approved by the Engineer.
 - 3) Transformer temperature rise determined by any of the thermocouples shall not exceed specified values.
 - 4) Verify efficiency, voltage regulation, and power factor at loads shown in IEEE 1653.2 for extra heavy traction service.

-
- d. Audible sound level test:
 - 1) Perform audible sound level tests in accordance with IEEE C57.12.91 using A-weighting, except apply 3-foot distance.
 - 2) Maximum sound level shall not exceed 60 dBA at 100 percent load measured 3 feet away from assembly.
 - 3) For 12-pulse Circuit 31 rectifier-transformers, include interphase transformer in transformer-rectifier assembly.
 - 4) Measure sound level with rectifier-transformer in its enclosure with all panels bolted closed.

 - 2. Rectifier:
 - a. Dielectric tests: In accordance with IEEE 1653.2.
 - b. Rated voltage test: Subject rectifier to 110 percent of ac rated voltage for 5 minutes with the dc circuit open.
 - c. Current unbalance test:
 - 1) In accordance with IEEE 1653.2.
 - 2) Test may be performed during the design test for transformer-rectifier unit.
 - d. Loss measurement test: Comply with IEEE 1653.2.
 - e. Rated current test:
 - 1) At reduced voltage.
 - 2) After temperature stabilization at rated load.
 - 3) Include the overloads outlined in IEEE 1653.2.
 - 4) Perform with one diode removed from each phase arm. Engineer to select diodes to be removed for test.
 - 5) Shall demonstrate that the maximum safe junction temperature for each diode is not exceeded.
 - 6) Verify efficiency, voltage regulation, and power factor at loads shown in IEEE 1653.2 for extra heavy traction service.

 - 3. Rectifier-transformer:
 - a. Resistance measurements: Take in accordance with IEEE C57.12.91 except that they shall be taken for all tap settings.
 - b. Impedance and load loss: Perform tests in accordance with IEEE C57.18.10 except perform on all windings on all tap settings.
 - c. Commutating reactance: Calculate from load loss tests in accordance with IEEE C57.18.10.

- d. Impulse test:
 - 1) Perform in accordance with IEEE C57.12.91.
 - 2) Perform after completion of short circuit tests.
 - e. Temperature rise tests: Perform in accordance with IEEE C57.12.91 for extra heavy traction service.
 - f. Partial discharge test: Perform after completion of all other tests.
 - g. Engineer shall be the sole judge of the serviceability of transformer after completion of design testing.
- B. Factory Production Tests:
- 1. Rectifier:
 - a. Dielectric tests: Perform in accordance with IEEE 1653.2.
 - b. Continuity tests: Perform for all cables and buses.
 - c. Rated voltage test: Perform in accordance with IEEE 1653.2.
 - 2. Rectifier-transformer:
 - a. Dielectric tests: Perform in accordance with IEEE C57.12.91.
 - b. Applied-voltage test: Perform in accordance with IEEE C57.12.91.
 - c. Induced-voltage tests: Perform in accordance with IEEE C57.12.91.
 - d. Resistance measurements: Take for all windings on all taps.
 - e. Ratio tests: Perform on the rated voltage connections and on all taps in accordance with IEEE C57.12.91.
 - f. Polarity and phase relation tests: Perform in accordance with IEEE C57.12.91.
 - g. No-load losses and excitation current: Determine in accordance with IEEE C57.12.91.
 - h. Partial discharge test:
 - 1) Subject transformer to an induced voltage of 1.5 times the rated voltage at a frequency between 100 and 400 Hz.
 - 2) Partial discharge extinction level shall be reached at an induced voltage of not less than 1.2 times the rated line-to-line voltage.
 - 3) Partial discharge extinction level will be defined as the point when the reading at 1.9 MHz is less than 10 microvolts or 13 picocoulombs.

PART 3 - EXECUTION**3.1 INSTALLATION**

- A. Insulate rectifier in built-in-place substation as required in Part 2, above, in the article titled "Factory Assembly."

PART 4 - MEASUREMENT AND PAYMENT**4.1 MEASUREMENT**

- A. The quantities of accepted work will be measured in the following units. All measurements will be plan measure except for authorized changes.
 - 1. Description: Lump Sum

4.2 PAYMENT

- A. Payment will be made at the respective unit or lump-sum price listed in the proposal and shall be full compensation for all labor, materials, and equipment necessary to complete the respective unit in place. There will be no separate measurement or payment for any item of work not specifically identified and listed in the proposal, and all such work shall be considered a subsidiary item with all costs pertaining thereto included in the prices for other items listed in the proposal. At the Engineer's option, partial payment may be made for any lump sum item listed in the proposal, providing that the Contractor is diligently and satisfactorily pursuing full completion of such partially complete item in accordance with the approved job progress schedule.

THIS PAGE INTENTIONALLY LEFT BLANK

SECTION 34 21 24**TES DRY TYPE TRANSFORMERS****PART 1 - GENERAL****1.1 SUMMARY**

- A. This Section includes low voltage two-winding dry-type transformers.
- B. Refer to Section SECTION 34 21 23 – TES Transformer-Rectifier Unit for rectifier transformer requirements.

1.2 RELATED SECTIONS

- A. SECTION 01 33 00 – Submittal Procedures
- B. SECTION 34 21 05 – Common Work Results for TES
- C. SECTION 34 21 06 – TES Common Work Results for Metals
- D. SECTION 34 21 14 – TES Medium-Voltage Ac Switchgear
- E. SECTION 34 21 23 – TES Transformer-Rectifier Unit
- F. SECTION 34 21 80 – TES Spare Parts and Special Tools

1.3 REFERENCED STANDARDS

- A. Section incorporates by reference the latest revisions of the following documents:
- B. Institute of Electrical and Electronics Engineers (IEEE):
 - 1. IEEE C57.12.01, General Requirements for Dry-Type Distribution and Power Transformers Including Those with Solid-Cast and/or Resin Encapsulated Windings
 - 2. IEEE C57.12.91, Standard Test Code for Dry-Type Distribution and Power Transformers
- C. National Electrical Manufacturer's Association (NEMA):
 - 1. NEMA 250, Enclosures for Electrical Equipment (1000 Volts Maximum)
 - 2. NEMA TP 1, Guide for Determining Energy Efficiency for Distribution Transformers
- D. National Fire Protection Association (NFPA)
 - 1. NFPA 70, National Electrical Code (with amendments by the Authority Having Jurisdiction)

1.4 SUBMITTALS

- A. Procedures: SECTION 01 33 00 – Submittal Procedures.

- B. Product Data: Submit manufacturer's product data of manufactured materials and equipment including the following:
 - 1. Outline and support point dimensions of enclosures and accessories.
 - 2. Unit weights.
 - 3. Voltage, kVA and impedance ratings and characteristics.
 - 4. Loss data.
 - 5. Efficiency at 25, 50, 75 and 100 percent rated load.
 - 6. Sound level.
 - 7. Tap configuration.
 - 8. Insulation system type and rated temperature rise.
- C. Spare Parts and Special Tools:
 - 1. Submit a list of spare parts to be provided under this Section.
 - 2. Submit at the same time as product data.
 - 3. Provide part numbers for each part, including a detailed break down of each spare part assembly and set, as defined in SECTION 34 21 80 – TES Spare Parts and Special Tools.
- D. Sizing Calculations: Submit calculations for sizing of the Station Service Transformer. Allow for 20 percent additional future load. At a minimum, the transformer shall be rated 25 kVA.
- E. Operation and Maintenance Data:
 - 1. Submit manufacturer's operating and maintenance instructions on products specified in this Section.
 - 2. Submit immediately after approval of product data.

1.5 SPARE PARTS

- A. Submit spare parts in accordance with SECTION 34 21 80 – TES Spare Parts and Special Tools.
- B. List below applies to items in this Specification Section:
 - 1. Station service transformer: Provide 1 spare of each size.

PART 2 - PRODUCTS

2.1 DRY TYPE TWO-WINDING TRANSFORMERS

- A. Dry Type Transformers: IEEE C57.12.01; factory-assembled, air cooled dry type transformers; ratings as shown on Contract Drawings.
- B. Insulation system and average winding temperature rise for rated kVA as follows:
 - 1. 1 to 15 kVA: Class 185 insulation, 80 degrees C rise.

-
2. 16 to 500 kVA: Class 220 insulation, 115 degrees C rise.
- C. Load Ratings and Transformer Cooling: Load ratings, unless noted otherwise, are assumed to be AA (air convection cooling).
 - D. Windings: Copper primary and secondary.
 - E. Winding Taps:
 1. Transformers Less than 15 kVA: Two 5 percent, full-capacity taps below rated voltage on primary winding.
 2. Transformers larger than 15 kVA and smaller than 500 kVA: Two 2.5 percent full-capacity taps above rated voltage and four 2.5 percent full-capacity taps below rated voltage on primary windings.
 - F. Energy Efficiency: NEMA TP 1.
 - G. Sound Levels: Shall not exceed the following when tested according to IEEE C57.12.91.
 1. 10 to 50 kVA: 45 dB.
 2. 51 to 150 kVA: 50 dB.
 3. 151-300 kVA: 55 dB.
 4. 301 to 500 kVA: 60 dB.
 - H. Basic Impulse Level:
 1. Low-Voltage Dry-Type Transformers:
 - a. Transformers less than 300 kVA: 10 kV.
 - b. Transformers 300 kVA and larger: 30 kV.
 2. Medium-Voltage Dry-Type Transformers: 95 kV.
 - I. Ground core and coil assembly to enclosure by means of a visible, flexible copper grounding strap.
 - J. Mounting:
 1. 75 kVA and less: Suitable for wall, floor, or trapeze mounting, or mounting internal to switchgear.
 2. Larger than 75 kVA: Suitable for floor or trapeze mounting.
 - K. Coil Conductors: Continuous windings with terminations brazed or welded.
 - L. Enclosure:
 1. Construction: Heavy gage sheet steel, ventilated.
 2. Type:
 - a. Indoor: NEMA 250 Type 1.
 - b. Outdoor: NEMA 250 Type 3R.

3. Finish: Powder coat complying with Section 34 21 06, TES Common Work Results for Metals.
 4. Standards compliance: NEMA 250, NFPA 70, IEEE C57.12.01.
 5. Enclosure requirements do not apply to transformer located within ac switchgear cubicle, as indicated on Contract Drawings
- M. Isolate core and coil from enclosure using vibration-absorbing mounts.
- N. Nameplate: Include transformer connection data.

2.2 STATION SERVICE TRANSFORMER

- A. Calculate size of the Station Service Transformer as follows:
1. Calculate load per NFPA 70 based on heating, cooling, lighting, and other loads.
 2. Allow for 20 percent additional future load.
 3. At a minimum, the transformer shall be rated 25 kVA.
 4. Provide primary fused disconnect and secondary circuit breaker complying with NFPA 70.

2.3 FACTORY ASSEMBLY

- A. Install transformers plumb and level.
- B. Use copper bus for both primary and secondary connections.
- C. Mount transformers inside substation on vibration isolating pads suitable for isolating the transformer noise from the structure.
- D. Provide restraints for vertical and horizontal seismic motion in accordance with the seismic requirements in Section 34 21 05, Common Work Results for TES.
- E. Station Service Transformer: Mount inside ac switchgear enclosure, as described in Section 34 21 14, TES Medium-Voltage Ac Switchgear. No station service transformers are required for built-in-place substation.

PART 3 - EXECUTION

3.1 FIELD INSTALLATION

- A. Requirements of Article titled "Factory Assembly" apply to field installation.

3.2 FIELD QUALITY CONTROL

- A. Check for damage and tight connections before energizing transformer.
- B. Measure primary and secondary voltages and make appropriate tap adjustments.

PART 4 - MEASUREMENT AND PAYMENT**4.1 MEASUREMENT**

A. The quantities of accepted work will be measured in the following units. All measurements will be plan measure except for authorized changes.

1. Description: Lump Sum

4.2 PAYMENT

A. Payment will be made at the respective unit or lump-sum price listed in the proposal and shall be full compensation for all labor, materials, and equipment necessary to complete the respective unit in place. There will be no separate measurement or payment for any item of work not specifically identified and listed in the proposal, and all such work shall be considered a subsidiary item with all costs pertaining thereto included in the prices for other items listed in the proposal. At the Engineer's option, partial payment may be made for any lump sum item listed in the proposal, providing that the Contractor is diligently and satisfactorily pursuing full completion of such partially complete item in accordance with the approved job progress schedule.

SECTION 34 21 25

TES DC CONTROL POWER

PART 1 - GENERAL

1.1 SUMMARY

- A. This Section includes the following:
 - 1. Battery charger/eliminator and batteries.
 - 2. Enclosed low-voltage switches and fuses.
 - 3. Dc distribution panelboard circuit breakers.
 - 4. Dc control circuit overcurrent protection.
 - 5. Low voltage dc power supply.

1.2 RELATED SECTIONS

- A. SECTION 01 33 00 – Submittal Procedures
- B. SECTION 34 21 12 – TES Low-Voltage Panelboards
- C. SECTION 34 21 17 – TES Substation Design and Assembly
- D. SECTION 34 21 31 – TES Substation Automation System (SAS)
- E. SECTION 34 21 80 – TES Spare Parts and Special Tools
- F. SECTION 34 21 90 – TES Testing

1.3 REFERENCED STANDARDS

- A. Section incorporates by reference the latest revisions of the following documents:
- B. Institute of Electrical and Electronics Engineers (IEEE)
 - 1. IEEE 485, Recommended Practice for Sizing Lead Acid Batteries for Stationary Applications
- C. National Electrical Manufacturers Association (NEMA)
 - 1. NEMA FU 1, Low Voltage Cartridge Fuses
 - 2. NEMA KS 1, Enclosed and Miscellaneous Distribution Equipment Switches (600 Volts Maximum)
 - 3. NEMA 250, Enclosures for Electrical Equipment (1000 Volts Maximum)
 - 4. NEMA PE 5, Utility Type Battery Chargers
- D. Underwriters Laboratories (UL)
 - 1. UL 489, Molded-Case Circuit Breakers, Molded-Case Switches, and Circuit-Breaker Enclosures

1.4 SUBMITTALS

- A. Procedures: SECTION 01 33 00 – Submittal Procedures.
- B. Product Data:
 - 1. Submit manufacturers' product data for specified equipment and materials.
- C. Spare Parts and Special Tools:
 - 1. Submit a list of spare parts to be provided under this Section.
 - 2. Submit at the same time as product data.
 - 3. Provide part numbers for each part, including a detailed break down of each spare part assembly and set, as defined in SECTION 34 21 80 – TES Spare Parts and Special Tools .
 - 4. Submit a list of special tools to be provided under this Section. List requirements are defined in SECTION 34 21 80 – TES Spare Parts and Special Tools and required special tools are described below in Part 2.
- D. Calculations:
 - 1. Battery capacity calculations, including load calculations.
- E. Testing:
 - 1. Submit test procedures that meet the requirements of SECTION 34 21 90 – TES Testing for the following:
 - a. Factory Design Tests.
 - 2. Submit test reports that meet the requirements of Section SECTION 34 21 90 – TES Testing, for the following:
 - a. Factory Design Tests.
- F. Operations and Maintenance Data:
 - 1. Submit manufacturer's operating and maintenance instructions on products specified in this Section.
 - 2. Submit immediately after approval of product data.

1.5 MAINTENANCE MATERIAL SUBMITTALS

- A. Spare Parts:
 - 1. Deliver spare parts in accordance with SECTION 34 21 80 – TES Spare Parts and Special Tools.
 - 2. Furnish the following items specified in this Section:
 - a. Battery cells: Provide 4 spares of each type.
 - b. Battery charger/eliminator: Provide 1 spare.
 - c. Mini circuit breakers: Provide 2 spare sets.

- d. Low voltage dc power supply: Provide 2 spares each type.
- B. Special Tools and Accessories: Submit product data and provide the following accessories for normal operation and maintenance:
 - 1. Cell lifting sling complete with strap and spreader bar.
 - 2. Battery log book.
 - 3. Quart of terminal grease, if recommended.
 - 4. Set of special tools for maintenance.
 - 5. Micro ohmmeter for testing battery connection resistance.
 - 6. Set of cell identification numbers.

1.6 DELIVERY, STORAGE, AND HANDLING

- A. Ship batteries separate from substation.

1.7 WARRANTY

- A. Batteries: Furnish warranty of one (1) year from the date of the battery is placed in service and additional warranty of 9 years, pro rata, to deliver not less than 90% of its rated capacity.

PART 2 - PRODUCTS

2.1 GENERAL

- A. Batteries and associated charger/eliminators shall operate in parallel, with the charger charging the battery while supplying the continuous connected loads.
- B. Batteries shall supply peak short time current demands and, when the ac supply to the charger is interrupted, supply the entire connected load.
- C. Batteries and charger/eliminators shall be rated for operation within the temperature range specified in SECTION 34 21 31 – TES Substation Automation System (SAS), and shall be capable of operation up to 100 degrees F.
- D. After a continuous 10 hours of battery charger outage, trip and lockout the high-voltage ac circuit breaker, via the 86H relay and trip and lockout the dc circuit breakers via the 186H relays.

2.2 BATTERY CHARGER/ELIMINATOR

- A. Charger/eliminators: Solid-state, constant voltage, automatic, fully regulated, with output voltage temperature compensation, silicon controlled rectifier, convection cooled, complying with NEMA PE 5. Provide battery charger/eliminators to meet the following requirements:
 - 1. Rated for continuous operation, float-charging the battery, and for recharging the battery from a cell voltage of 1.1 V to 85 percent of battery capacity in a maximum of 8 hours, while simultaneously supplying the load demands.
 - 2. Input voltage Rating:
 - a. Mainline: 240 Vac, 60 Hz, single phase.

- b. VMF: 208/120 Vac, 60 Hz, single phase.
 3. Output voltage and current: Matched to the requirements of the battery and the load.
 4. Output voltage regulation: Plus or minus 0.25 percent of output voltage over its complete load range with a plus or minus 10 percent variation of input ac voltage. Output ripple shall not exceed 30 mV rms.
 5. Output current limiting: Adjustable from 90 percent to 115 percent of output nominal current rating, and factory set at 110 percent.
 6. Filtered output to maintain ripple within the specified limits when the battery is disconnected.
 7. Adjustable 0 to 72 hour equalizing time charger, manually set for supplying an equalizing voltage per cell as recommended by battery manufacturer.
 8. Ac Input and Dc Output circuit breakers: Molded-case type complying with the requirements in UL 489.
 9. Enclosures: NEMA 250, Type 12 with hinged covers, lockable handles and two point (minimum) latches.
- B. Provide the following additional features/options:
1. Dc voltmeter with 0 V to 200 V range.
 2. Dc ammeter
 3. Ac input pilot light marked "AC POWER ON."
 4. Two-position selector switch marked "FLOAT" and "EQUALIZE."
 5. Output ground fault pilot lights for positive and negative poles.
 6. Input line surge and transient-protective devices.
 7. Battery charger failed alarm.
 8. Battery undervoltage alarm.
 9. Battery overvoltage alarm.
 10. Ground fault alarm.
- C. Send alarms to SAS, as specified in SECTION 34 21 31 – TES Substation Automation System (SAS).

2.3 BATTERIES

- A. Batteries shall be designed specifically for float application and shall be sized for the specified duty cycle.
1. Type: Heavy-duty, valve regulated, lead acid, absorbed glass mat.
 2. Venting:
 - a. Batteries shall not vent gas under normal operation.

-
- b. Provide one-way self-resealing, safety pressure-relief valves.
3. Battery containers:
- a. Plastic, heat-resistant, flame retardant, impact resistant.
 - b. Covers shall be cemented in place to provide a permanent leak-proof seal.
 - c. Effectively seal at cell terminal posts with non-corrosive material.
 - d. Clearly and permanently mark polarity of cell terminal posts.
- B. Ratings:
- 1. Ampere-hour capacity: Select in accordance with IEEE 485 taking into account the calculated loads from all devices, as indicated on the Contract Drawings, for a 10-hour discharge rate to a final cell voltage of 1.75 V for the specified duty cycle.
 - 2. Battery duty cycle:
 - a. Duration: Period of 10 hours with the battery charger/eliminator out of service, assuming batteries are in a fully charged state at the beginning of the 10 hours.
 - b. Load:
 - 1) Normal continuous demand of the substation auxiliary loads, including relays, indicating lamps, dc-connected lights, and alarm panel.
 - 2) Trip and reclose cycle of one dc feeder breaker every hour.
 - 3) Trip and reclose of the ac breaker after two hours and again after eight hours.
- C. Lockout: Provide a timer such that after a continuous 10 hours of battery charger outage, timer shall trip and lockout the main ac circuit breaker via the 86 relay and trip and lockout the dc circuit breakers via the 186 relays.
- D. Connections:
- 1. Provide inter-cell connector buses.
 - 2. Provide nickel plated solid copper terminal plates, connectors, plates, and lugs.
- E. Battery Racks:
- 1. Provide a four tier structural steel battery support racks sized to allow 1/2 inch between batteries.
 - 2. Include insulating plastic strips to cover all supports, hold downs, and restraining rails that are in contact with cells.
 - 3. Finish with a caustic-resistant paint coat.
- F. Provide an insulating, electrolyte-resistant, plastic mat under each battery rack, extending a minimum of 12 inches outside the rack.

- G. Battery Rack Top:
 - 1. Clear polycarbonate, minimum 1/4 inch thick, with sharp edges removed.
 - 2. Dimensions: Minimum overall 1 inch longer and wider than battery rack length and width.
- H. Provide battery bank with a stainless steel nameplate. Nameplate shall be attached to the battery rack using stainless steel rivets and marked with the following information:
 - 1. Manufacturer's name.
 - 2. Month and year of manufacture.
 - 3. Battery and cell type.
 - 4. Ampere rating: 1 minute, 1 hour, and 5 hour.

2.4 FUSED DISCONNECT SWITCH

- A. Provide NEMA 250 Type 12, 2-pole, fused disconnect switch for isolation of the battery with the following requirements:
 - 1. Rating: 250 Vdc, current rating to match batteries.
 - 2. NEMA KS 1: Quick-make, quick-break, load interrupter enclosed knife switch with externally operable handle interlocked to prevent opening front cover with switch in ON position.
 - 3. Handle lockable in OFF position.
- B. Fuse Clips: Suitable for Class R or J fuses with fuse rejection devices installed.
- C. Fuses: NEMA FU 1 rated to provide short circuit protection for the battery and battery cables.
- D. Coordinate fuse and switch ratings with the output circuit breaker in the battery charger.
- E. Install disconnect switches where indicated on Contract Drawings or required by Codes with external handle centered 60 inches above finished floor or grade level.
- F. Install fuse-rejection devices in fuse clips if required.
- G. Install fuses in fusible disconnect switches.

2.5 DC DISTRIBUTION PANELBOARDS

- A. Comply with requirements of SECTION 34 21 12 – TES Low-Voltage Panelboards.
- B. Circuit breakers: 125 Vdc, 2-pole.

2.6 DC CONTROL CIRCUIT PROTECTION AND ALARMS

- A. Within switchgear, dc control circuits shall be protected by mini circuit breakers. Fuses shall not be used.
- B. Mini circuit breakers: 125 Vdc, 1-pole.

- C. Provide an undervoltage alarm (Device 127) for each dc control circuit.
 - 1. If a circuit from the dc distribution panelboard feeds downstream mini circuit breakers, each of those circuits controlled by a mini circuit breaker is considered a control circuit for the purposes of this requirement.
 - 2. Provide alarm to SAS; see SECTION 34 21 31 – TES Substation Automation System (SAS).

2.7 LOW-VOLTAGE DC POWER SUPPLY

- A. Voltage: 24 V or 48 V, but not both.
- B. Power supply shall be powered from TES substation 125 Vdc power source. Power supply shall be redundant:
 - 1. Provide a main low-voltage power supply with automatic transfer to a backup low-voltage power supply, or operate two low-voltage power supplies in parallel.
 - 2. Provide two circuits, each one fed from its own breaker in the 125 Vdc distribution panelboard, to power the two low-voltage power supplies.

2.8 FACTORY ASSEMBLY

- A. Install charger, battery rack, and other specified equipment within each substation enclosure secure, plumb and level and in true alignment with related adjoining work.
- B. Install supporting members, fastenings, framing, hangers, bracing, brackets, straps, bolts, and angles as required to set and rigidly connect the Work.
- C. Temporarily install batteries to conduct factory testing, then remove before shipping.
- D. Anti-oxidants and other solvents that can cause cracking of cell jars shall not be used on batteries.
- E. Verify that float and recharging rates are set to the values recommended by battery manufacturer.

2.9 SOURCE QUALITY CONTROL

- A. Factory Design Tests:
 - 1. Battery Charger: Tests shall comply with design tests described in NEMA PE 5.
- B. Factory Production Tests:
 - 1. Test the following:
 - a. Cell voltages.
 - b. Pressure-relief vent operation and reseal.
 - c. Cell jar leakage.

PART 3 - EXECUTION

3.1 FIELD INSTALLATION

- A. Requirements of Article titled "Factory Assembly" apply to field installation.
- B. Following installation of each prefabricated substation at site, install battery cells on battery racks in accordance with manufacturer's recommendations. Verify that there is minimum 1/2 inch between each battery and adjacent batteries.
- C. Install specified battery rack top after installing battery cells. Secure to top of rack posts.
- D. After battery installation provide an equalizing charge as recommended by battery manufacturer.
- E. Mount battery rack and batteries per seismic requirements.

3.2 FIELD QUALITY CONTROL

- A. Test function of batteries and charging system and test terminal connection resistance after delivery of prefabricated substations and installation of built-in-place substation in conformance with SECTION 34 21 90 – TES Testing.

PART 4 - MEASUREMENT AND PAYMENT

4.1 MEASUREMENT

- A. The quantities of accepted work will be measured in the following units. All measurements will be plan measure except for authorized changes.
 - 1. Description: Lump Sum

4.2 PAYMENT

- A. Payment will be made at the respective unit or lump-sum price listed in the proposal and shall be full compensation for all labor, materials, and equipment necessary to complete the respective unit in place. There will be no separate measurement or payment for any item of work not specifically identified and listed in the proposal, and all such work shall be considered a subsidiary item with all costs pertaining thereto included in the prices for other items listed in the proposal. At the Engineer's option, partial payment may be made for any lump sum item listed in the proposal, providing that the Contractor is diligently and satisfactorily pursuing full completion of such partially complete item in accordance with the approved job progress schedule.

END OF SECTION

SECTION 34 21 31**TES SUBSTATION AUTOMATION SYSTEM (SAS)****PART 1 - GENERAL****1.1 SUMMARY**

- A. This Section includes SAS in TES substations including the following:
 - 1. Programmable Automation Controller (PAC).
 - 2. Human Machine Interface (HMI) Display.
 - 3. Industrial Ethernet switch.
 - 4. HMI design and software applications.
 - 5. SAS/SCADA points list.
 - 6. Local Wide Area Network (LWAN) for transfer trip between substations.

1.2 RELATED SECTIONS

- A. SECTION 01 33 00 – Submittal Procedures
- B. SECTION 34 21 17 – TES Substation Design and Assembly
- C. SECTION 34 22 15 – TES Fiber Optic Cable
- D. SECTION 34 21 25 – TES DC Control Power
- E. SECTION 34 21 80 – TES Spare Parts and Special Tools
- F. SECTION 34 21 90 – TES Testing
- G. SECTION 34 22 10 – TES Low Voltage Conductors and Cable
- H. SECTION 34 22 15 – TES Fiber Optic Cable

1.3 ABBREVIATIONS

- A. CPU Central Processing Unit
- B. DNP3 Distributed Network Protocol
- C. DVI Digital Visual Interface
- D. GPS Global Positioning System
- E. HDMI High Definition Multimedia Interface
- F. HMI Human Machine Interface
- G. IED Intelligent Electronic Device
- H. I/O Input/Output

I.	LAN	Local Area Network
J.	LWAN	Local Wide Area Network
K.	MAC	Media Access Control
L.	NTP	Network Time Protocol
M.	PAC	Programmable Automation Controller
N.	QoS	Quality of Service
O.	SAS	Substation Automation System
P.	SCADA	Supervisory Control and Data Acquisition
Q.	SFP	Small Form-factor Pluggable
R.	SNTP	Simple Network Time Protocol
S.	SSD	Solid State Drive
T.	TFT	Thin Film Transistor
U.	TCP/IP	Transmission Control Protocol/Internet Protocol
V.	TRAIM	Time-Receiver Autonomous Integrity Monitoring
W.	USB	Universal Serial Bus
X.	VGA	Video Graphics Array
Y.	VLAN	Virtual Local Area Network

1.4 DEFINITIONS:

- A. Intelligent Electronic Device (IED): See definition in SECTION 34 21 17 – TES Substation Design and Assembly.
- B. SAS: A network of PACs and IEDs in the substation operating as a system for control and monitoring of substation equipment.
- C. Supervisory Control and Data Acquisition (SCADA): An industrial control system consisting of SASs and other equipment controlled and monitored by a host workstation, or "Central Control".
- D. Failure: When an SAS component does not operate as designed.
- E. Repeated failure: Two or more failures of the same component; whether IED, communications interface hardware, related hardware, or software.

1.5 REFERENCED STANDARDS

- A. Section incorporates by reference the latest revisions of the following documents, or if standard is adopted by Kansas City, the latest revision adopted:
 - B. Code of Federal Regulations (CFR)
 - 1. CFR Title 47 Part 15, Radio Frequency Devices

- C. Institute of Electrical and Electronics Engineers (IEEE)
 - 1. IEEE C37.90, Standard for Relays and Relay Systems Associated with Electric Power Apparatus
 - 2. IEEE C37.90.2, Standard for Withstand Capability of Relay Systems to Radiated Electromagnetic Interference from Transceivers
 - 3. IEEE 730, Standard for Software Quality Assurance Plans
- D. International Electrotechnical Commission (IEC)
 - 1. IEC 60529, Degrees of protection provided by enclosures (IP Code)
 - 2. IEC 60255-21, Electrical Relays - Part 21: Vibration, shock, bump and seismic tests on measuring relays and protection equipment
 - 3. IEC 61000-4, Electromagnetic compatibility (EMC)
 - 4. IEC 61131-2, Programmable Controllers - Part 2: Equipment Requirements and Tests
 - 5. IEC 61131-3, Programmable Controllers - Part 3: Programming Languages
- E. International Organization for Standardization (ISO)
 - 1. ISO 9001, Quality Management Systems - Requirements
- F. National Fire Protection Association (NFPA)
 - 1. NFPA 70, National Electrical Code
- G. Underwriters Laboratories (UL)
 - 1. UL 60950-1, Information Technology Equipment – Safety – Part 1: General Requirements

1.6 SUBMITTALS

- A. Procedures: SECTION 01 33 00 – Submittal Procedures.
- B. Design Submittals:
 - 1. A written document describing the design, method of communication, and implementation of the selected communications protocol for the SAS and related components.
 - 2. Detailed design of the SAS and related components. Refer to Shop Drawings, below.
 - 3. Submit full-scale color screen shots of SAS applications displayed on the Human Machine Interface (HMI).
 - 4. Provide documentation demonstrating that specified requirements for service proven design have been met. Include contact information for transit agencies where units are in service.

-
- C. Product Data: Include technical details and operating manuals of the system and subsystems including hardware, software, MTBF information, communications protocol specifications and show compliance with the specified requirements.
1. PACs.
 2. HMI/Industrial Computer.
 3. Input/Output (I/O) modules
 4. Ethernet switches.
 5. Media converters.
 6. Network cables.
 7. HMI Development Software.
 8. Time server and GPS antenna.
 9. Laptop computer.
- D. Spare Parts and Special Tools List:
1. Submit a list of spare parts to be provided under this Section.
 2. Submit at the same time as product data.
 3. Furnish part numbers for each part, including a detailed break down of each spare part assembly and set, as defined in SECTION 34 21 80 – TES Spare Parts and Special Tools.
 4. Submit a list of special tools to be provided under this Section, as defined in SECTION 34 21 80 – TES Spare Parts and Special Tools.
- E. Shop Drawings:
1. Block diagrams
 2. Input/output maps
 3. Equipment layout drawings
 4. Ladder logic diagrams
 5. Wiring schematic
 6. Bill of Materials
- F. Software:
1. Provide development software for the SAS, including any software required to program, maintain, and download events/records for the PACs and HMI.
 2. Provide source code developed for the PACs and HMI in electronic format as directed by the Engineer.
 3. Furnish software licenses for application, interface, development software, and all other software, as described in Software Intellectual Property Rights Section below.

- G. Testing:
1. Submit test procedures that meet the requirements of SECTION 34 21 90 – TES Testing, for the following:
 - a. Factory Design Tests.
 - b. Operational Tests.
 2. Submit test reports that meet the requirements of SECTION 34 21 90 – TES Testing, for the following:
 - a. Factory Design Tests.
 - b. Operational Tests.
- H. System Support Plan for support during commissioning and warranty period.
- I. Operations and Maintenance Data:
1. Submit manufacturer's operating and maintenance instructions on products specified in this Section, including the following:
 - a. Submittal information identified above.
 - b. Manufacturer's operating and maintenance instructions, parts list, illustrations and diagram for components.
 2. Submit immediately after approval of product data.

1.7 SPARE PARTS

- A. Deliver spare parts in accordance with SECTION 34 21 80 – TES Spare Parts and Special Tools.
- B. List below applies to items in this Specification Section.
1. PACs: Provide 1 spare of each type used.
 2. HMI and Industrial Computer: Provide 1 spare.
 3. Ethernet switch: Provide 1 spare of each type.
 4. Media converters: Provide 1 spare of each type used.

1.8 QUALITY ASSURANCE

- A. Comply with the requirements of the Project Quality Plan.
- B. SAS components must be UL labeled.
- C. SAS components that are not UL certified may be furnished with a Field Evaluation label provided by a third party testing laboratory. The testing laboratory shall be approved by the Engineer.
- D. Alarm panel component manufacturers shall be ISO 9001 certified.
- E. A software quality assurance plan shall be used in accordance with IEEE 730. The plan shall describe a mechanism for orderly software development.

1.9 SOFTWARE INTELLECTUAL PROPERTY RIGHTS

- A. Furnish an irrevocable license to Owner for application software developed under this Contract, including source code.
- B. Furnish an irrevocable license to Owner for interface software for SAS components.
- C. Furnish an irrevocable license to Owner for development software for SAS components and HMI.

1.10 REQUIREMENTS FOR SERVICE PROVEN DESIGN

- A. SAS components and software shall be of a proven design. Provide evidence of at least 15 identical units that have been in successful operation in rail transit projects for a minimum of 3 years.

1.11 RELIABILITY AND MAINTAINABILITY

- A. SAS shall be fail-safe, such that a hardware or software failure condition shall not result in an unsafe equipment state.
- B. Failure of an SAS component shall not damage other equipment or inhibit status indication of the equipment.
- C. Investigate repeated failure in the SAS and provide a failure analysis report outlining the root cause of failure. Provide recommendations for correcting the failure and apply the corrective action at no cost to the Owner.
- D. The following components shall have a minimum mean time between failure (MTBF):
 - 1. PAC: 100,000 hours
 - 2. HMI: 50,000 hours
 - 3. Ethernet Switch: 200,000 hours
- E. SAS shall be capable of accommodating upgrades, bug-fixes, patches and modifications.
 - 1. Monitor the need for system modifications and supply such changes at no additional cost to the Owner for a period of 5 years.
 - 2. Fully document changes and submit documentation to the Engineer.

1.12 ENVIRONMENTAL REQUIREMENTS

- A. SAS components shall be designed to operate in the environment in which they will be installed and shall comply with and fully function in the environmental conditions specified in Section 34 21 17, TES Substation Design and Assembly.
- B. Electrical interfaces shall meet the applicable ANSI and IEEE Standards for service, EMI immunity, and surge-withstand requirements.
- C. The presence of transients on communication interfaces shall not cause disoperation or blocking of critical communications.

1.13 WARRANTY

- A. Provide on-site and remote support for the specified SAS throughout the entire warranty period. Support shall include assistance with operation and maintenance of the system.

- B. Develop a comprehensive System Support Plan and submit to Engineer.

PART 2 - PRODUCTS

2.1 GENERAL

- A. Provide an SAS for monitoring and control of TES substation equipment at each substation capable of interfacing with other SASs and SCADA.
- B. SAS shall consist of the following components:
1. Programmable automation controllers (PAC) or industrial computers.
 2. HMI panel/Industrial Computer.
 3. Ethernet switch.
 4. Media converters.
 5. Network cables.
 6. Power supplies.
- C. Devices shall use commercial off-the-shelf products to minimize integration and future maintenance efforts.
- D. Devices shall be of the same brand and model with similar modules and programming to achieve similarity between substations.
- E. Provide terminal blocks, in accordance with SECTION 34 21 17 – TES Substation Design and Assembly, and wiring as required for alarms.
- F. SAS components shall comply with the following requirements:
1. Mechanical shock and bump withstand level: IEC 60255-21-2, Response and Withstand Section, Class 1.
 2. Vibration withstand level: IEC 60255-21-1, Response and Withstand Section, Class 2.
 3. Seismic withstand level: IEC 60255-21-3, Class 2.
 4. Electromagnetic field impulse withstand level: IEC 61000-4-3, 10 V/m.
 5. Electromagnetic field radio frequency withstand level: ANSI C37.90.2, 35 V/m.
 6. Storage Temperature: Minus 20 degrees to 60 degrees C.
 7. Operating Temperature: Zero degrees to 40 degrees C.
 8. Maximum humidity: 90 percent without condensation.
 9. Provide product data verifying compliance.
- G. SAS I/O Design:
1. Provide a list of all SAS component I/O and incorporate in the design for monitoring and indication to the HMI.

2. Provide 10 additional I/O points at each substation for indication or monitoring upon request at no additional cost to the Owner.
- H. SAS component memory and removable storage shall be solid-state, non-volatile, and shall not utilize mechanically-driven (hard-drive based) components.
- I. SAS shall be designed such that no supply-power fault will result in loss of data or require any manual re-work such as programming or reconfiguration.

2.2 POWER REQUIREMENTS

- A. SAS and PAC shall be powered by 125 Vdc plus or minus 15 percent or 24 V or 48 V plus or minus 20 percent. See SECTION 34 21 25 – TES Dc Control Power, for requirements.

2.3 TIME SYNCHRONIZATION

- A. Time Server:
1. Network Protocol: IEEE 1588 PTP C37.238
 2. Time Accuracy:
 - a. Locked to GPS: Plus or minus 50 ns RMS, 150 ns peak to peak UTC, with minimum 4 satellites tracked.
 - b. Holdover/Aging: 18 milliseconds per day
 3. GPS receiver: 12 channel parallel receiver with TRAIM
 4. PTP Server: IEEE 1588-2008 (PTP version 2) Grandmaster
 5. Mechanical/ Environmental:
 - a. Operating temperature: Minus 20 degrees C to 70 degrees C
 - b. Humidity: Up to 95 percent
 6. Compliance:
 - a. UL 60950-1
 - b. CFR Title 47 Part 15, Class A
- B. GPS Antenna:
1. Compatible with substation master clock.
 2. Roof mountable.
 3. Provide with lightning arrester.
- C. Synchronize SAS components as follows:
1. PAC and IEDs.
 2. SAS with other SASs.
 3. SAS with NTP server.
- D. SAS must synchronize using PTP.

- E. Acceptable Manufacturer/ Product: Symmetricom SyncServer SGC-1500 with L1 GPS antenna, or approved equal.

2.4 SAS NETWORK

- A. Connect IEDs to the SAS via Ethernet over fiber.
- B. Use VLANs for transfer trip between dc relay IEDs through the communications network.
- C. Communications Protocol: Ethernet TCP/IP, Modbus TCP/IP, or approved equal.

2.5 PAC

- A. Provide PACs at each substation for interfacing with other SAS components equipped with the following:
 - 1. Chassis or backplane.
 - 2. Redundant power supplies.
 - 3. Primary central processing unit (CPU).
 - 4. I/O modules.
 - 5. Ports: RJ45, RS232/RS485, USB.
 - 6. Removable flash memory with a minimum of 1 GB.
 - 7. Resident executable program and code.
 - 8. Communication Protocols: Modbus TCP/IP, DNP3, Profinet, Ethernet TCP/IP.
- B. PAC shall provide the following functions:
 - 1. Monitor and control of substation equipment.
 - 2. Log substation alarms and events as a server. The use of a dedicated or separate event log server is acceptable.
 - 3. Communicate alarms and status to the HMI and SCADA.
 - 4. Operate independently of a failure of any other SAS component or their intercommunications.
 - 5. Retain programming, configuration and memory (including data logs) even with loss or degradation of supply power.
- C. Repair and Replacement:
 - 1. PAC and associated modules shall be replaceable on site without requiring factory rewiring.
 - 2. PAC modules shall have free-standing terminals to allow changing modules without disturbing field wiring.
- D. Programming facilities (logic, available functions and supported data types) shall be non-proprietary, shall be compliant with IEC 61131-3, and shall use the C or C++ standard programming language.

2.6 HUMAN MACHINE INTERFACE (HMI) HARDWARE

- A. Provide an industrial touch screen monitor with industrial computer for the SAS HMI that is compatible with the PAC for controlling substation equipment and monitoring substation events and alarms.
- B. HMI and ancillary devices shall be flush mounted in a door of the dc switchgear.
 - 1. Locate at a height appropriate for easy access by a person of average height.
 - 2. Locate such that a person standing in front of the HMI is not standing in front of a circuit breaker.
- C. Screen:
 - 1. LED backlit LCD, active matrix TFT.
 - 2. Touch screen: Resistive or capacitive.
 - 3. Size: Minimum 22-inches diagonal.
 - 4. Resolution: Minimum 1920 x 1080 pixels.
 - 5. Brightness: Minimum 420 cd/m2.
 - 6. Contrast Ratio: 1000:1.
 - 7. Aspect Ratio: 16:9
 - 8. Input: VGA, DVI, HDMI.
- D. Industrial Computer
 - 1. Provide an industrial computer for interfacing with the PAC through the substation LAN and run HMI touch screen applications for display on the HMI screen.
 - 2. Interface with the substation LAN must use Ethernet.
 - 3. Minimum Specifications:
 - a. Rack mountable, 2U minimum
 - b. Intel Core i7
 - c. 8GB RAM
 - d. DVI, HDMI ports for connectivity to HMI display
 - e. Ethernet, USB 3.0 ports
 - f. 256GB SSD Hard Drive
 - g. Windows 7 Professional 64-bit
 - h. Operating Temperature: Minus 40 to 74 degrees C
 - i. Alarm Output for Monitoring by PAC and SCADA
 - j. Dual Power supply

2.7 HMI DESIGN AND SOFTWARE APPLICATIONS

- A. Provide HMI and software applications similar to the layouts shown on Contract Drawings.
- B. Design:
 - 1. Navigation bar:
 - a. Accessible from any application.
 - b. Contains buttons to navigate to other applications.
 - 2. Buttons, text, and icons:
 - a. Sized appropriately for ease of use.
 - b. Designed with button responses to show button actions, e.g. selected, not selected.
 - c. Intuitively designed and representative of the equipment being monitored or controlled.
 - 3. Input keyboards:
 - a. Alpha: QWERTY.
 - b. Numeric: 10-key.
 - c. Automatically display the appropriate keyboard when an input is required.
 - d. Provide a cancel button that closes the keyboard.
- C. Provide the following HMI software applications:
 - 1. Header Screen:
 - a. Displayed at all times and similar in design to what is shown on Contract Drawings.
 - b. Display the time, date, name of substation, system name, and SCADA control panel.
 - c. Time and Date:
 - 1) Time shall be synchronized with time server.
 - 2) Time format: 00:00:00.
 - 3) Date format: December 10, 2013.
 - d. SCADA Control Panel: Contains local/remote buttons for enabling or disabling remote control by SCADA and indicating the current control status
- D. Control Screen:
 - 1. Displays equipment status and provides local control of substation equipment.

2. Status indications:
 - a. Display in real time and refresh at least every second.
 - b. Display local/remote status for each breaker.
 - c. Display test/disconnected status for each breaker.
 - d. Display energized/de-energized status for equipment.
 - e. Display opened/closed status of disconnect switches.
 - f. Display adjacent substation breaker energized/de-energized status.
 - g. Display line and load voltage and current for ac and dc breakers
3. Color Code:
 - a. Energized Equipment: Red.
 - b. De-energized Equipment: Green.
 - c. Uncertain Equipment State: Grey.
 - d. Color shall indicate the energized, de-energized, or uncertain state of each piece of equipment, including the busbar, feeder cables, transformer, and rectifier.
4. Control operation:
 - a. Control operation sequence:
 - 1) Select object.
 - 2) Confirm object selection (confirm or cancel).
 - 3) Select operation (close, open, or cancel).
 - 4) Confirm operation (confirm or cancel).
 - b. A combined message window shall not be used; each step shall have an individual window. Collapse previous windows after selection.
 - c. Selection, confirmation, and execution information must be clear and displayed without abbreviations.
 - d. Selection and confirmation of operation shall be automatically cancelled after 60 seconds if the operation is not executed.
 - e. Provide a cancel button for each control step.
5. Bypass Load Measuring:
 - a. Provide option for dc breaker close operation that allows selection of bypass mode, which bypasses the load measuring system.
 - b. Upon confirmation of this operation, a warning shall flash on the screen stating "LOAD MEASURING BYPASSED."

6. Password Protection:
 - a. Selection of an object shall be password protected.
 - b. Selection of bypass load measuring shall require an additional level of password protection.
 7. If a protection function is triggered, the related equipment alarm field shall flash until it is acknowledged.
- E. Alarm Screen:
1. Display each alarm shown in Alarm Points List, at the end of this Section.
 2. Layout: See Contract Drawings.
 3. New Alarm: Flashing red.
 4. Acknowledged alarm: Solid red.
 5. New alarms resolved before acknowledgment: Flashing yellow.
 6. Resolved Alarm: Grey.
 7. Alarms shall be acknowledged by touching an Acknowledge button.
 8. The Alarms button in the navigation bar must follow the same color logic as above.
- F. Events Screen:
1. Layout and Format: See Contract Drawings.
 2. Log each alarm and equipment event with time and date stamp.
 3. Event log shall display a minimum of 1000 events. Implement page turn buttons to view alarms exceeding the length of one page.
 4. Events must not be capable of being deleted.
 5. Overwrite the oldest entry in the log with new events.
 6. Display the most recent entry at the top of the screen.
 7. Events shall be downloadable to a laptop and USB flash drive without deletion from the SAS.
 8. File format: Compatible with Microsoft Excel.
- G. Network Status Screen:
1. Layout: See Contract Drawings.
 2. Application must indicate the communication/operational status of each SAS component.
 3. Normal: Green.
 4. Error: Red.
 5. Unknown: Yellow.

- H. Settings Screen:
 - 1. Provide a settings screen application for adjusting time, editing user management/password settings, editing alarm screen windows, and viewing PAC I/O Status.
 - 2. Time setting: Provide both manual adjustment options and automatic SNTP synchronization with an NTP server.
 - 3. Viewing permissions: No password required.
 - 4. Editing permissions: Password required.
- I. Help Screen:
 - 1. Provide a help screen containing operational instructions and descriptions for the SAS HMI applications described above.
 - 2. Organize and display help topics in an outline format with individual topics that expand to display information when selected.
 - 3. Provide a legend defining the symbols and abbreviations used in the HMI screens.

2.8 HMI DEVELOPMENT SOFTWARE

- A. Provide a user-friendly PC/Windows based development environment suitable for application software updating and modification.
- B. The environment shall be dedicated solely to creating control/monitoring software. It shall use familiar, standardized editors bundled into a single application.
- C. The environment shall include a graphics editor and online help that simplify development of application software.
- D. The environment shall comply with Microsoft Windows Graphical User Interface (GUI) and IEC 61131-2 and IEC 61131-3 standards for programmable logic controllers.
- E. Provide de-bug, documentation and machine startup facilities in the environment.
- F. Provide complete user training for the application of development environment in accordance with SECTION 01 79 00, Demonstration and Training.
- G. Provide complete user documentation for the environment complying with SECTION 01 78 23, Operations and Maintenance Data.
- H. Software must be compatible with Windows 7.
- I. Approved Manufacturer: Wonderware, Vijeo Designer, or approved equal.

2.9 ETHERNET SWITCH

- A. Provide industrial managed Ethernet switches for connecting SAS components and SCADA.
- B. Ports:
 - 1. Copper: 10/100/1000 Base T RJ45.
 - 2. SFP: 100/1000 base-X for fiber.

3. Spare: 20 percent.
- C. Layer 2 Function:
1. VLAN: Up to 8 groups.
 2. Port Configuration.
 3. QoS.
 4. Security: MAC filter, switch access.
- D. Operating temperature: minus 40 to 70 degrees C
- E. Redundant power supply.

2.10 ENGINEERING LAPTOP COMPUTER

- A. Provide a laptop computer for use to interface with the SAS and other IEDs in the substation LAN.
- B. Development and interface software for IEDs and SAS components must be preinstalled on the computer.
- C. End user software and firmware developed for IEDs and SAS components must be loaded on the laptop computer with files descriptively labeled showing their intended purpose.
- D. Specifications:
1. Intel Core i7
 2. 8GB RAM
 3. VGA, HDMI ports
 4. Ethernet, USB 3.0 ports
 5. 256GB SSD Hard Drive
 6. Windows 7 Professional 64-bit
 7. 14-inch HD display
 8. LTE mobile broadband
 9. MIL-STD-810G certified for shock, drop, vibration, temperature and humidity
- E. Approved Manufacturer: Panasonic Toughbook 53 or approved equal.

2.11 INTERIOR BLUE LIGHT AND RESET SWITCH

- A. Provide a blue light LED for substation alarm indication located above the HMI panel.
- B. The blue light shall have a label "SUBSTATION TROUBLE ALARM."
- C. The light shall operate as follows:
1. Light flashes when an SAS alarm/event occurs.
 2. Light is solid when all alarms are acknowledged.

3. Light turns off when all alarms are resolved.
- D. Alarm acknowledgement shall be provided by a button on the HMI.
- E. Blue light shall be fail safe.

2.12 EXTERIOR BLUE LIGHT

- A. Activate exterior blue light (see SECTION 34 21 17 – TES Substation Design and Assembly) for the following alarms:
 1. Smoke alarm.
 2. Intrusion Zone 1 alarm (entry doors).
 3. Intrusion Zone 2 alarm (exterior equipment access doors).
 4. Ac breaker trip.
 5. Dc breaker trip without reclose.
 6. Rectifier transformer over temperature (first stage).
 7. Rectifier over temperature (first stage).
 8. Substation high temperature.
 9. Diode failure.
 10. Frame fault.
- B. For Intrusion Zone 1 alarm, provide a time delay, and an override in the HMI only, to allow authorized persons to enter the substation and override the alarm without activating the exterior blue light.

2.13 FACTORY ASSEMBLY

- A. SAS hardware installation shall be identical and interchangeable between substations, including wire numbering, and marking.
- B. Wiring: Interconnecting wiring shall be 14 AWG 600 V switchboard wire in accordance with SECTION 34 22 10 – TES Low Voltage Conductors and Cable.
- C. Wire and Cable Identification:
 1. Wire and cables shall be identified whenever they enter or leave a housing or enclosure, and at all terminals.
 2. Provide labels in accordance with SECTION 34 22 10 – TES Low-Voltage Conductors and Cable.
- D. Terminals: DIN rail mounted.
- E. Spare Capacity:
 1. Design system with a minimum of 30 percent spare capacity. This shall include:
 - a. Wiring terminals.
 - b. Inputs and outputs of same kind per modular controller unit.

c. Spaces for additional modules for each modular PAC unit.

F. Workmanship:

1. Install equipment, enclosures, wire, cable, conduits and wireways in a neat and secure manner, level and plumb, and in true alignment with adjoining work.
2. Equipment enclosures and installation shall comply with local and national codes including, but not limited to UL 508A and NFPA 70.

2.14 ALARMS POINTS LIST

A. Provide the following points for control and monitoring by the SAS and SCADA at each substation:

Device	Description	Device No.	Status	Control
Ac Circuit Breaker and Protective Relay	Breaker closed/open status	52	X	
	Breaker test/disconnected status		X	
	Remote Trip Command		X	X
	Remote Close Command		X	X
	Undervoltage	27	X	
	Overvoltage	59	X	
	Loss of Control power	27ac	X	
	Phase Sequence	47	X

2.15 LWAN FOR TRANSFER TRIP

- A. Connect mainline substations together as a local wide area network (LWAN) for transfer trip as indicated on Contract Drawings.
- B. Connect fiber from adjacent substations to the Ethernet Switch/ Gateway in each substation.
- C. See SECTION 34 22 15 – TES Fiber Optic Cable, for fiber installation requirements.
- D. See SECTION 34 21 19 – TES DC Switchgear, for transfer trip functional requirements.

2.16 SOURCE QUALITY CONTROL

- A. Factory Design Tests:
 - 1. Perform with all accessories attached in accordance with design tests in IEEE C37.90.
 - 2. Demonstrate electrical operation and accuracy of all components.
 - 3. Test from alarm panel to initiating devices for proper operation.
- B. Factory Production Tests:
 - 1. Test all components for proper operation and function.
 - 2. Test control wiring continuity by actual electrical operation of control devices.
 - 3. Test inputs and outputs for proper operation and short circuits.
 - 4. Communications: Verify communications and SCADA information is retrievable from the SCADA interface point.
 - 5. HMI: Verify that display, screens, and user interface operate in accordance with Specifications.

PART 3 - EXECUTION

3.1 INSTALLATION

- A. Install SAS in VMF substation as required in Part 2, above, in the article titled "Factory Assembly."

3.2 INTEGRATION WITH SCADA NETWORK

- A. Program and configure SAS switches and SAS components to establish communication between substations and to a host SCADA workstation over the SCADA network.
- B. Configure dc multifunction IEDs and SAS components to communicate transfer trip signals over the Ethernet based communications network using VLAN.

PART 4 - MEASUREMENT AND PAYMENT**4.1 MEASUREMENT**

- A. The quantities of accepted work will be measured in the following units. All measurements will be plan measure except for authorized changes.
 - 1. Description: Lump Sum

4.2 PAYMENT

- A. Payment will be made at the respective unit or lump-sum price listed in the proposal and shall be full compensation for all labor, materials, and equipment necessary to complete the respective unit in place. There will be no separate measurement or payment for any item of work not specifically identified and listed in the proposal, and all such work shall be considered a subsidiary item with all costs pertaining thereto included in the prices for other items listed in the proposal. At the Engineer's option, partial payment may be made for any lump sum item listed in the proposal, providing that the Contractor is diligently and satisfactorily pursuing full completion of such partially complete item in accordance with the approved job progress schedule.

THIS PAGE INTENTIONALLY LEFT BLANK

SECTION 34 21 33**RAIL-VOLTAGE MONITORING AND GROUNDING SYSTEM****PART 1 - GENERAL****1.1 SUMMARY**

- A. This Section includes the following:
 - 1. Requirements for the Rail Voltage Monitoring and Grounding System for each mainline TES substation.
 - 2. Rail Voltage Monitoring and Grounding System includes a bi-directional switching device and an integrated Device 64V protective relay function for voltage and current monitoring and tripping of dc feeder circuit breakers.

1.2 RELATED SECTIONS

- A. SECTION 01 33 00 – Submittal Procedures
- B. SECTION 34 21 17 – TES Substation Design and Assembly
- C. SECTION 34 21 25 – TES DC Control Power
- D. SECTION 34 21 31 – TES Substation Automation System (SAS)
- E. SECTION 34 21 80 – TES Spare Parts and Special Tools
- F. SECTION 34 21 90 – TES Testing
- G. SECTION 34 22 10 – TES Low-Voltage Conductors and Cable

1.3 ABBREVIATIONS AND ACRONYMS

- A. Rail-to-Ground System: Rail-Voltage Monitoring and Grounding System.
- B. R2G: Rail Voltage Monitoring and Grounding System.
- C. SAS: Substation Automation System

1.4 DEFINITIONS

- A. Controller: A programmable logic controller (PLC) and human machine interface (HMI) device.
- B. Rail voltage:
 - 1. Zero potential: Equal to earth potential.
 - 2. Positive voltage: Ground positive with respect to rail.
 - 3. Negative voltage: Ground negative with respect to rail.
- C. Current:
 - 1. Positive current is current that flows from ground to rail.

2. Negative current is current that flows from rail to ground.

1.5 SUBMITTALS

- A. Procedures: SECTION 01 33 00 – Submittal Procedures.
- B. Product Data:
 1. Product descriptions and catalog data for system components.
 2. Information concerning design and application ratings.
 3. Information concerning service, performance and reliability and locations where units are currently in service.
 4. Measures used to prevent failure of switch.
- C. Spare Parts and Special Tools:
 1. Submit a list of spare parts to be provided under this Section.
 2. Submit at the same time as product data.
 3. Provide part numbers for each part, including a detailed breakdown of each spare part assembly and set, as defined in SECTION 34 21 80 – TES Spare Parts and Special Tools.
 4. Submit a list of special tools to be provided under this Section, as defined in Section 34 21 80, TES Spare Parts and Special Tools.
- D. Shop drawings:
 1. Manufacturer's arrangement and outline dimensions for each device.
 2. Logic diagram.
 3. Wiring schematics.
 4. Connection diagrams.
 5. HMI screen shots.
- E. Submit test procedures that comply with SECTION 34 21 90 – TES Testing.
 1. Design Test.
 2. Production Tests: Provide production test reports for each component.
- F. Submit test reports that comply with SECTION 34 21 90 – TES Testing.
 1. Design Test.
 2. Production Tests: Provide production test reports for each component.
- G. Operation and Maintenance Data:
 1. Submit manufacturer's operating and maintenance instructions on products specified in this Section, including the following:
 - a. Submittal information identified above.

- b. Parts list, illustrations and diagram for components for products specified in this Section.
 - c. Wiring diagram.
2. Submit immediately after approval of product data.

1.6 SPARE PARTS

- A. Provide spare parts in accordance with SECTION 34 21 80 – TES Spare Parts and Special Tools.
- B. List below applies to items in this Specification Section.
 1. Rail-to-Ground System complete assembly, including PLC, HMI, and switch: Provide 1 assembly.
 2. Enclosure door key: Provide 2 spare keys for each substation.

PART 2 - PRODUCTS

2.1 RAIL-TO-GROUND SYSTEM (R2G)

- A. General Requirements:
 1. Provide an R2G at each TES substation for monitoring and protecting against rail-to-ground overvoltages and overcurrents.
 2. R2G shall be of proven design with minimum 3-years successful operation in a rail application.
 3. R2G shall be a self-contained unit with a bi-directional switching element, voltage transducer, current transducer, and PLC/HMI controller suitable for use in a 750 Vdc traction power system.
- B. Controller:
 1. Dedicated PLC.
 2. Form C contacts for overvoltage, overcurrent, and summary alarm signals.
 3. Sufficient memory to store 500 events
- C. HMI Display:
 1. Type: Industrial LCD touch screen monitor with resistive touch.
 2. Size: 12-inch active matrix, minimum.
 3. Color: 18-bit color.
 4. Resolution: 1600 x 1200.
 5. Contrast Ratio: 600:1.
- D. Bi-Directional Switch:
 1. Composed of phase-controlled stud-type thyristors.
 2. Continuous Current Rating: Minimum 800 A.

3. Current Withstand: 30 kA for 100 ms and 50 kA for peak value half sine wave.
- E. Enclosure: Steel, with a latching access door that is lockable; all enclosures keyed alike.
- F. LED indications:
 1. Provide LED indicators mounted on the enclosure
 - a. Red LED: Switch is closed and conducting
 - b. Yellow LED: Event has occurred. LED will remain flashing until acknowledged.
- G. Acknowledge Button:
 1. Provide a momentary push button on the outside of the enclosure for the local acknowledgement of the yellow LED event alarm
- H. Control power: Refer to Section 34 21 25 TES Dc Control Power
- I. Communications:
 1. Protocol: Modbus TCP/IP, Ethernet TCP/IP, or approved equal.
 2. Device shall be capable of being remotely monitored by the SAS, as specified in Section 34 21 31, TES Substation Automation System (SAS), and SCADA.
 3. R2G shall communicate alarms and switch status to the SAS.

2.2 HMI APPLICATION DESIGN

- A. General Design Requirements:
 1. Provide HMI applications for displaying event notifications, rail voltage and current data, and device configuration information.
 2. HMI must provide a means of field programming time and date, voltage and current triggers, and communications settings.
 3. HMI must have password protection for functions related to changing the configuration of the device.
 4. Current date and time must be displayed at all times.
 5. R2G must synchronize time and date with the SAS.
- B. Event Log:
 1. Record events and retain for seven days minimum in non-volatile memory.
 2. Create events for the following:
 - a. Overvoltage, with voltage at the time of event;
 - b. Overcurrent, with current at the time of event;
 - c. Switch trigger;
 - d. Thyristor fail;

-
- e. Breaker trip;
 - f. Breaker lockout;
 - g. R2G fault.
- 3. Events must be date and time stamped.
 - 4. Events shall be downloadable onto a laptop computer and USB thumb drive.
 - 5. Event log must be viewable using Microsoft Excel.
 - 6. See Section 34 21 17, TES Substation Design and Assembly, for requirement to supply software.
- C. Waveform Capture:
- 1. Log and capture voltage and current data upon voltage and current triggers.
 - 2. Waveform information shall be downloadable onto a laptop computer and USB thumb drive.
 - 3. Waveform information must display the voltage and current before and after the trigger event.
 - 4. Log must be viewable using Microsoft Excel.
- D. Overvoltage Protection:
- 1. Long-Time Overvoltage:
 - a. Voltage setting range: 0 to 200 V, positive or negative, in 1 V increments.
 - b. Time delay setting range: 0 to 20 seconds in 0.1-second increments.
 - c. Default setting: Plus/minus 50 V and 10-second delay.
 - 2. Short-Time Overvoltage:
 - a. Voltage setting range: 0 to 200 V, positive or negative, in 1 V increments.
 - b. Time-delay setting range: 0 to 10 seconds in 0.1-second increments.
 - c. Default setting: Plus/minus 95 V and 1-second delay.
 - 3. Each voltage trigger shall close the R2G switch.
- E. Switch Operation:
- 1. Time duration of closure shall be dependent on the current flowing through switch and the natural characteristics of the thyristor.
 - 2. Provide an option for disabling conduction of the switch in each direction. This option must be field adjustable using the HMI.
- F. Overcurrent Protection:
- 1. When switch is conducting, the R2G shall monitor current through the switch and provide two overcurrent-protection triggers.

2. Long-time overcurrent:
 - a. Current setting range: 0 to 100 A, positive or negative, in 1 A increments.
 - b. Time-delay setting range: 0 to 60 seconds in 0.1-second increments.
 - c. Default setting: Plus/minus 5 A and 50-second delay.
 3. Instantaneous overcurrent:
 - a. Current setting range: 0 to 100 A, positive or negative, in 1 A increments.
 - b. Time-delay setting range: 0 to 60 seconds in 0.1-second increments.
 - c. Default setting: Plus/minus 20 A and 0.5-second delay.
 4. Each overcurrent stage shall trigger any one of three user-selectable responses:
 - a. Trip and reclose dc breakers with breakers reclosing one-by-one.
 - b. Trip and lockout dc breakers.
 - c. Trip and lockout dc breakers and transfer trip adjacent substations.
 5. The R2G shall trip and lockout the breaker on a repeat overcurrent trigger if it occurs within a user-adjustable time. The user-adjustable settings are as follows:
 - a. Repeat Trigger Function: Enabled, Disabled.
 - b. Time-Window Setting range: 2 to 60 seconds in 1-second increments. The setting shall not be less than the instantaneous-overcurrent time delay.
 - c. Default setting: 60 seconds.
- G. If the current or voltage value measured by the R2G is lower than its setting, the grounding device counters shall be reset.
- H. R2G shall be fail-safe as described in the following two scenarios, at minimum:
1. A malfunction of the control component shall cause grounding switch to close until control component is restored.
 2. An alarm signal shall be sent to SAS if a thyristor or control component fails.

2.3 CONNECTIONS

- A. Ground R2G enclosure and internal ground reference busbar to the structure earth using 4/0 copper, 2 kV insulated cable, as specified in Section 34 22 10, TES Low-Voltage Conductors and Cable.
- B. Connect the R2G negative reference to the negative return using 4/0 copper 2 kV insulated cable.

2.4 SOURCE QUALITY CONTROL

- A. Factory Design Tests:
1. Perform on the first unit before it is installed in a substation. Comply with requirements for factory design tests in Section 34 21 90, TES Testing. This test must be conducted and will not be waived on the basis of existing test reports.
 2. Perform a heat run test to verify 800A continuous current rating.
 3. Perform functional tests to verify the requirements in this Section.

PART 3 - EXECUTION

Not Used.

PART 4 - MEASUREMENT AND PAYMENT**4.1 MEASUREMENT**

- A. The quantities of accepted work will be measured in the following units. All measurements will be plan measure except for authorized changes.
1. Description: Lump Sum

4.2 PAYMENT

- A. Payment will be made at the respective unit or lump-sum price listed in the proposal and shall be full compensation for all labor, materials, and equipment necessary to complete the respective unit in place. There will be no separate measurement or payment for any item of work not specifically identified and listed in the proposal, and all such work shall be considered a subsidiary item with all costs pertaining thereto included in the prices for other items listed in the proposal. At the Engineer's option, partial payment may be made for any lump sum item listed in the proposal, providing that the Contractor is diligently and satisfactorily pursuing full completion of such partially complete item in accordance with the approved job progress schedule.

END OF SECTION

THIS PAGE INTENTIONALLY LEFT BLANK

SECTION 34 21 40**TES DC DISCONNECT SWITCHES****PART 1 - GENERAL****1.1 SUMMARY**

- A. This Section includes the following:
 - 1. Manual, no-load-break, non-grounding, pole-mounted dc disconnect switches mounted inside non-metallic switch enclosure for installation on tapered tubular poles or ornamental joint use poles.
 - 2. Manual, no-load-break, non-grounding, wall-mounted dc disconnect switches to connect/disconnect dc power to Vehicle Maintenance Facility (VMF) OCS.
 - 3. Manual, no-load-break, non-grounding, pad-mounted dc disconnect switches located at each TES substation to connect/disconnect substation from OCS.

1.2 RELATED SECTIONS

- A. SECTION 34 21 05 – Common Work Results for TES
- B. SECTION 34 21 17 – TES Substation Design and Assembly
- C. SECTION 34 21 31 – TES Substation Automation System (SAS)
- D. SECTION 34 21 70 – TES Vehicle Maintenance Facility (VMF) Interlocking
- E. SECTION 34 21 90 – TES Testing
- F. SECTION 34 22 29 – TES Raceway and Equipment Hangers and Supports
- G. SECTION 34 23 78 – OCS Disconnect Switch Installation

1.3 REFERENCED STANDARDS

- A. Section incorporates by reference the latest revisions of the following documents:
- B. ASTM International (ASTM)
 - 1. ASTM B187/B187M, Standard Specification for Copper, Bus Bar, Rod and Shapes and General Purpose Rod, Bar, and Shapes
- C. Institute of Electrical and Electronics Engineers (IEEE)
 - 1. IEEE C2, National Electrical Safety Code
 - 2. IEEE C37.34, Standard Test Code for High-Voltage Air Switches
- D. National Fire Protection Association (NFPA)
 - 1. NFPA 70, National Electrical Code

1.4 SUBMITTALS

- A. Procedures: Section 01 33 00, Submittal Procedures.

-
- B. Product Data:
1. Complete manufacturer's descriptions and catalog data for each type of switch including the following:
 - a. Materials.
 - b. Isolation method, circuit and wiring diagrams.
 - c. Operating mechanism and assembly details.
 - d. Model numbers or serial numbers.
 2. Complete manufacturer's descriptions and catalog data for enclosure including the following:
 - a. Materials.
 - b. Hardware.
 3. Fiberglass framing channel or other spacer for pad-mounted switches.
- C. Shop Drawings:
1. Manufacturer's general and detailed dimensional drawings including the following:
 - a. Enclosure for pad-mount and pole-mount type and polycarbonate shroud for wall-mount type.
 - b. Switch.
 - c. Manual operator.
 - d. Insulators.
 - e. Mounting brackets and mounting for each type of switch mounting.
 - f. Signage.
 2. Each shop drawing shall provide a complete list of its component materials for that specific type of assembly, including the identification of materials such as pipes, brackets, bolts, cables, jumpers and cable connectors.
 3. Pole-mounted switches: See Section 34 23 78, OCS Disconnect Switch Installation for special requirements for assembly references.
 4. Submit for approval before installing the first switch.
- D. Instructions:
1. Manufacturer's recommended installation instructions, including checks/tests after installation.
 2. Manufacturer's adjustment procedures.
- E. Manufacturer's certification that each switch has been correctly installed and adjusted.
- F. Submit test procedures that comply with Section 34 21 90, TES Testing.
1. Design Tests.

2. Production Tests.
- G. Submit test reports that comply with Section 34 21 90, TES Testing.
1. Design Tests: Provide design test reports for each type of disconnect switch within 30 Days after completion of testing.
 2. Production Tests: Provide production test reports for each disconnect switch within 30 Days after completion of testing.
- H. Operations and Maintenance Data:
1. Submit manufacturer's operating and maintenance instructions on products specified in this Section, including the following:
 - a. Submittal information identified above.
 - b. List of recommended spare parts.
 2. Submit immediately after approval of product data.

PART 2 - PRODUCTS

2.1 TYPE

- A. Single-pole, single-throw, non-load-break bolted pressure switch, non-grounding with manual operator. Design shall comply with the applicable requirements given in IEEE C37.34 and ASTM B187/B187M.

2.2 SWITCH RATINGS

- A. General:
1. Minimum insulation level: 3.7 kV rms.
 2. Momentary peak current withstand: Not less than 90 kA.
 3. Short time current: Not less than 70 kA, average, for 0.25 seconds.
 4. Continuous current rating: As indicated for each type; switch contact temperature rise shall not exceed 50 degrees C above a maximum ambient temperature of 40 degrees C.
- B. Voltage: 1000 Vdc
- C. Continuous Current:
1. Pole Switches: 2000 A
 2. Wall-Mounted Switches: 1000 A
 3. Pad-Mounted Switches: 2000 A

2.3 SWITCH CONSTRUCTION

- A. Switch Contacts:
1. Moving and stationary contact surfaces shall be silver-plated copper or silver-plated copper alloy.

2. Contacts shall be self-aligning, wear-compensating, with wiping action on switch closing.
 3. Hinge and jaw contacts shall be bolted-pressure type with non-ferrous or stainless steel self-clamping mechanism, or other approved high-pressure type contact arrangement.
- B. Other Current-Carrying Parts: High conductivity copper or copper alloy.
- C. Emergency Operation: Switch shall be capable of breaking load currents under emergency conditions.
- D. Cable Termination: Provide separate insulated cable strain posts for termination of cables, designed to prevent cable movement from affecting adjustment of switch.

2.4 SWITCH STATUS

- A. For pad-mounted switches, provide position switch.
- B. Auxiliary Contacts: Isolate from 750 Vdc to prevent inadvertent shorting of 750 Vdc with low-voltage control signals used for switch position.

2.5 CABLE TERMINATIONS

- A. Line and load side terminals: Silver-plated copper bus, ASTM B187/B187M.
- B. Provide sufficient size bus to accommodate the number and size of dc power copper cables, entering from below or from above, as indicated.
- C. Buses shall accommodate the number and size of feeder cables as indicated on the Contract Drawings and have provisions for NEMA drilled (2 or 4 hole) cable terminal lugs.
- D. Clearance: Switch design shall provide a minimum 2-inches clearance from live parts to grounded parts after cables are terminated. Minimum clearance shall be maintained at all points of travel while the switch is being thrown.

2.6 INSULATION

- A. Switch assembly shall have double insulation, consisting of two independent insulators each rated for the system voltage, as follows:
1. Between the switch and the operating handle.
 2. Between the switch and the pole, wall, or pad upon which it is mounted.

2.7 SWITCH ENCLOSURE FOR PAD-MOUNT AND POLE-MOUNT SWITCHES

- A. Description:
1. Material: Rigid, fiberglass-reinforced polyester.
 2. Design:
 - a. Rain-tight, with design conforming in general to NEMA 250 Type 4X.
 - b. Ventilated, tamperproof.
 - c. Weatherproof, heavy service construction, suitable for outdoor application.

- B. Size and Arrangement:
1. Size enclosure to accommodate switch, internal linkages, operating gear, cabling, and terminations without electrical shorting or damage due to chafing on feeder cable insulation.
 2. Maintainable components shall be readily accessible through the door opening.
 3. Provide sufficient space for the manipulation of required tools.
- C. Materials:
1. Minimum 1/4-inch thick polyester with 40 percent glass fiber and 60 percent resin.
 2. Resin system:
 - a. Compounded for fire retardancy and good dielectric characteristics.
 - b. Complying with UL 94 V E-1 (minimum) flammability rating.
- D. Exterior Finish:
1. Polyester base material coating, 18 to 20 mils thick; Pleogen 2907 Iso-Gel, American Colors 66-20060, or approved equal.
 2. Color: Subject to approval of Engineer.
- E. Door and Hardware:
1. Heavy duty, single hinged door.
 2. Swing: Capable of opening through minimum 180-degrees.
 3. Sealing gasket: Neoprene, memory-type, that ensures a tight seal.
 4. Latching mechanism:
 - a. Three-point door latching assembly (top, middle, and bottom)
 - b. Handle: Padlockable.
 - c. Use non-metallic parts inside enclosure; or
 - d. Insulate metal parts inside enclosure with fiberglass channel such that no metal parts are visible inside enclosure; or
 - e. Coat with high dielectric epoxy coating material, 15 mils minimum thickness.
 5. Hinge: Continuous, stainless steel, full length of door, 12 gauge minimum, concealed with door in closed position.
 6. Locking Hasp: Stainless steel.
- F. Drip shield: Fiberglass, installed to protect door hardware from dripping water, ice/snow build-up, and settling dust.
- G. Vents:
1. Adequate size to ensure heat dissipation and prevent condensation,

2. Weatherproof, rodent proof, and tamperproof design.
- H. Drain Plugs:
1. Provide automatic, corrosion-proof, condensation drain plugs installed in enclosure bottom.
 2. Plugs shall be tamperproof design.
 3. Provide with stainless steel screening.
- I. Mounting Provisions:
1. Enclosure for switches indicated on OCS poles shall have provisions for mounting to a pole
 2. Enclosure for switches indicated at each substation shall have provisions for pad mounting.

2.8 WALL MOUNTED SWITCH

- A. Wall Switch Insulated Standoffs: Fiberglass-reinforced thermoset polyester, moisture and heat resistant; rated minimum 1000 V.
- B. Shield: Clear polycarbonate, minimum 1/4-inch thick.

2.9 MANUAL OPERATOR

- A. General:
1. Each switch shall have a manual operating mechanism for operation of switch.
 2. Operating mechanism shall operate smoothly and easily
 3. Handle Position:
 - a. Closed: Handle in the up position.
 - b. Open: Handle in the down position.
- B. Pole-Mounted Switch:
1. Provide insulated linkage from handle at ground level to switch.
 2. Handle shall be padlockable in the open or closed position.
- C. Wall-Mounted Switch:
1. Provide insulated linkage from handle at floor level to switch.
 2. Handle shall be padlockable in the open or closed position.
 3. Mechanical Interlock: Provide in accordance with Section 34 21 70, TES Vehicle Maintenance Facility (VMF) Interlocking and APS
- D. Pad-Mounted Switch: Provide a dead-front operating handle.

2.10 SIGNAGE

- A. Provide "ON" and "OFF" labels for manual operators.

- B. Signage on Face of Enclosure:
1. Switch data nameplate complying with Section 34 21 17, TES Substation Design and Assembly, Article titled "Identification."
 2. "Danger High Voltage" sign complying with Section 34 21 17, TES Substation Design and Assembly, Article titled "Warning Signs."
 3. "DO NOT OPERATE UNDER LOAD" signage using materials specified for nameplates in Section 34 21 17, TES Substation Design and Assembly, Article titled "Identification" with size as specified for equipment nameplates.

2.11 PADLOCKS

- A. Comply with requirements in Section 34 21 05, Common Work Results for TES.

2.12 SOURCE QUALITY CONTROL

- A. Switch assemblies shall be factory-assembled and precision aligned on base material and not be susceptible to distortion during installation.
- B. Factory Design Tests:
1. Perform on one switch of each type to prove compliance with Specifications.
 2. Tests shall be conducted generally in accordance with those described in IEEE C37.34, including the following:
 - a. Dielectric tests.
 - b. Short time current test.
 - c. Temperature rise test.
 - d. Interrupting current test: Test and certify that switches are suitable for use on dc circuits with prospective fault current capabilities of 100 kA.
 3. Mechanical Tests:
 - a. Subject a sample switch and assembly to a maximum number of openings and closings to establish a life cycle capability.
 - b. Perform continuous and overload current-temperature tests before and after.
 - c. Perform inspection, using a feeler gauge (or other approved method), of each contact and assembly point.
 - d. Acceptance criteria:
 - 1) Pass continuous and overload current-temperature tests.
 - 2) No gaps at contact or assembly points.
 - 3) Operating handle mechanism shall operate smoothly and easily.
- C. Factory Production Tests:
1. Perform on each switch to check the quality and uniformity of workmanship and materials used.

2. Tests shall be conducted generally in accordance with those described in IEEE C37.34, including the following:
 - a. Operation of all components.
 - b. Power frequency dielectric withstand.
 - c. Electrical resistance of current path.
 - d. Insulation resistance and high-potential test.

PART 3 - EXECUTION

3.1 SWITCH INSTALLATION

- A. Install pole-mounted disconnect switches in accordance with Section 34 23 78, OCS Disconnect Switch Installation.
- B. Install disconnect switches at the locations shown on the Contract Drawings.
- C. Install in accordance with approved manufacturer's instructions.
- D. Provide mounting supports and additional hardware, as required, such as bolts, couplings, bushings, connectors, grounding conductors, and all basic electrical materials for a complete installation.
- E. Installation shall conform to NFPA 70 and IEEE C2.
- F. Operating Handle: Mount at 4 feet above grade or floor.
- G. VMF Disconnect Switches:
 1. Wall mount on specified insulated standoffs.
 2. Provide specified shroud material and enclose switch as indicated on Contract Drawings.
- H. Pad-Mounted Disconnect Switches:
 1. Under the bottom of the enclosure, provide fiberglass framing channel in accordance with Section 34 22 29, TES Raceway and Equipment Hangers and Supports, or other non-corroding spacers to allow drainage from specified condensation drain plug.
 2. Secure each switch enclosure to a concrete pad outside substation, as indicated on Contract Drawings.
 3. Wire to SAS to provide switch status indication, as specified in Section 34 21 31, TES Substation Automation System (SAS), and indicated on Contract Drawings.

3.2 CONNECTION OF CABLES

- A. Provide cable clamps on line and load side of switches to prevent stress on connectors and switch jaws.
- B. Orient bolts securing cable lugs such that they do not reduce the electrical clearance to grounded parts of the switch.

3.3 SUPERVISION BY SWITCH MANUFACTURER

- A. Install first switch under the direct supervision of a qualified representative of the switch manufacturer.
- B. Manufacturer's qualified representative shall certify that each switch is correctly installed and adjusted after installation and before initial energization.

3.4 ENERGIZATION

- A. Demonstrate to the satisfaction of the Engineer final switch positions and correct operation of each switch before energizing OCS.

3.5 PADLOCKS

- A. Quantities:
 - 1. Provide one indoor padlock for each switch in the VMF.
 - 2. Provide one outdoor padlock for each pole-mounted exposed switch.
 - 3. Provide two outdoor padlocks for each pad-mounted and each pole-mounted enclosed switch.
- B. Provide two keys for each padlock.

PART 4 - MEASUREMENT AND PAYMENT**4.1 MEASUREMENT**

- A. The quantities of accepted work will be measured in the following units. All measurements will be plan measure except for authorized changes.
 - 1. Description: Lump Sum

4.2 PAYMENT

- A. Payment will be made at the respective unit or lump-sum price listed in the proposal and shall be full compensation for all labor, materials, and equipment necessary to complete the respective unit in place. There will be no separate measurement or payment for any item of work not specifically identified and listed in the proposal, and all such work shall be considered a subsidiary item with all costs pertaining thereto included in the prices for other items listed in the proposal. At the Engineer's option, partial payment may be made for any lump sum item listed in the proposal, providing that the Contractor is diligently and satisfactorily pursuing full completion of such partially complete item in accordance with the approved job progress schedule.

SECTION 34 21 46**TES VMS AC MOTOR CONTROL CENTER (MCC)****PART 1 - GENERAL****1.1 SUMMARY**

- A. This Section includes ac motor control center and related components in Vehicle Maintenance Facility (VMF) TES substation.

1.2 RELATED SECTIONS

- A. SECTION 34 21 06 – TES Common Work Results for Metals
- B. SECTION 34 21 12 – TES Low-Voltage Panelboards
- C. SECTION 34 21 17 – TES Substation Design and Assembly
- D. SECTION 34 21 46 – TES VMS Ac Motor Control Center
- E. SECTION 34 21 80 – TES Spare Parts and Special Tools
- F. SECTION 34 22 05 – TES Common Work Results for Conductors and Cable
- G. SECTION 34 22 10 – TES Low-Voltage Conductors and Cable

1.3 REFERENCED STANDARDS

- A. Section incorporates by reference the latest revisions of the following documents:
- B. National Fire Protection Association (NFPA)
 - 1. NFPA 70, National Electrical Code (NEC)

1.4 SUBMITTALS

- A. Procedures: Section 01 33 00, Submittal Procedures.
- B. Product Data:
 - 1. Submit manufacturers' product data for specified equipment and materials. Include the following information for each item:
 - a. Manufacturer's model number or item identification.
 - b. UL listing and rating.
 - c. Critical dimensions and mounting arrangement.
 - d. Replacement parts list.
- C. Spare Parts and Special Tools:
 - 1. Submit a list of spare parts to be provided under this Section.
 - 2. Submit at the same time as product data.

3. Provide part numbers for each part, including a detailed break down of each spare part assembly and set, as defined in Section 34 21 80, TES Spare Parts and Special Tools.
 4. Submit a list of special tools to be provided under this Section, as defined in Section 34 21 80, TES Spare Parts and Special Tools.
- D. Shop Drawings:
1. Submit shop drawings and electrical diagrams showing materials and methods of construction, bus inside enclosure, door arrangement, breakers, motor starters, disconnects, and indicating lights.
- E. Test Reports:
1. Submit copies of certified reports of factory and field tests performed in accordance with the applicable referenced standards and specification requirements.
- F. Operation and Maintenance Data:
1. Submit manufacturer's operating and maintenance instructions on products specified in this Section, including the following:
 - a. Description, including part number and manufacturer, of MCC, each type of circuit breaker, contactor, relay, control switch, and related components.
 - b. Parts list, illustrations and diagram for components.
 - c. Wiring diagram.

1.5 SPARE PARTS

- A. Provide spare parts in accordance with Section 34 21 80, TES Spare Parts and Special Tools.
- B. List below applies to items in this Specification Section:
1. APS circuit breaker and contactor: Provide 1 spare assembly.
 2. APS control switch: Provide 1 spare.

1.6 QUALITY ASSURANCE

- A. Comply with the requirements of the Project Quality Plan.
- B. Manufacturer's Qualifications:
1. Manufacturer of MCC must be regularly engaged in the manufacture of similar equipment.
 2. Manufacturer of MCC and components used in the dc switchgear must be ISO 9001 certified.
- C. MCC shall be UL labeled or furnished with a Field Evaluation label in accordance with Section 34 21 17, TES Substation Design and Assembly.

PART 2 - PRODUCTS**2.1 AC MOTOR CONTROL CENTER (MCC)****A. General Description:**

1. Provide a free-standing, totally enclosed, dead front structure containing a main circuit breaker, individual enclosed control units, a common bus bar for distributing power to the control units, and wire trough and conductor entrance areas for incoming and outgoing loads and control wires.
2. Each control unit includes a breaker, magnetic motor starter (contactor), and an external disconnect handle.
3. Refer to Contract Drawings for elevation and schematic drawings.
4. Complete assembly shall comply with NFPA 70.

B. MCC Rating: 480 V, 3-phase, 4-wire, 60 Hz unless otherwise indicated.**C. MCC Enclosure:**

1. NEMA Type 12.
2. Steel structure with the following gauges:
 - a. Vertical sections: Minimum 12 gauge.
 - b. Internal structural parts: Minimum 14 gauge.
 - c. Doors: Minimum 14 gauge.
3. Finish: Powder coat in accordance with Section 34 21 06, TES Common Work Results for Metals.
4. Color:
 - a. Exterior: In accordance with Section 34 21 06, TES Common Work Results for Metals.
 - b. Interior back panels: White.

D. MCC Bus Bars: Silver plated copper.**E. APS Motor Starter (Contactor):**

1. Rating: 200 A continuous, 208 Vac, three phase, 60 Hz.
2. Control Voltage: 120 Vac.
3. Auxiliary Contacts: Provide for interlocking.
4. See Section 34 21 46, TES VMS Ac Motor Control Center for APS requirements.

F. Main Circuit Breaker:

1. Thermal magnetic, molded case.
2. Rating: 400 A

- G. APS Circuit Breakers:
1. Thermal magnetic, molded case.
 2. Rating: 200 A.
- H. Branch Circuit Breaker
1. Thermal magnetic, molded case.
 2. Rating: 100 A.
 3. To feed VMS TES substation ac panel; see Section 34 21 12, TES Low-Voltage Panelboards, for ac panel requirements.
- I. Control Wiring:
1. Factory-installed.
 2. Control Power: 120 Vac.
 3. Wire:
 - a. 600 V switchboard wire complying with Section 34 22 10, TES Low-Voltage Conductors and Cable.
 - b. Minimum Size: No. 14 AWG.
 - c. For wiring across hinged joints: Class D stranded wire, minimum size No. 12 AWG.
 4. Wire Terminals: Tinned copper ring compression terminals with insulated sleeve installed in accordance with the manufacturer's recommendations.
 5. Terminal Blocks: In accordance with Section 34 21 17, TES Substation Design and Assembly. Provide a minimum of ten percent spare terminals.
 6. Wire Connections: Make only on terminal blocks.
- J. Control Switches:
1. For each contactor, provide a control switch that complies with Section 34 21 17, TES Substation Design and Assembly.
 2. Mount on each MCC APS control compartment door to turn control power on and off for each contactor.
- K. LED Indication:
1. For each contactor, provide panel mount indicating lights that comply with Section 34 21 17, TES Substation Design and Assembly.
 - a. Red: Contactor closed.
 - b. Green: Contactor open.
 2. Mount on each MCC APS control compartment door to indicate status of each contactor.

2.2 IDENTIFICATION AND WARNING SIGNS

- A. Wire Identification:
1. Provide each wire with plastic heat shrink sleeve, meeting the requirements of Section 34 22 05, TES Common Work Results for Conductors and Cable.
 2. Print with the number indicated on the wiring diagrams.
 3. Attach within 6 inches of terminal connections.
 4. Heat shrink sleeves after installation.
- B. Equipment Identification: Provide equipment and device nameplates on face of panel in accordance with Section 34 21 17, TES Substation Design and Assembly. See Contract Drawings for contactor numbering.
- C. Warning Signs: Provide "DANGER HIGH VOLTAGE" signs on each section door that comply with Section 34 21 17, TES Substation Design and Assembly.

2.3 SOURCE QUALITY CONTROL

- A. In addition to the manufacturer's standard tests, as a minimum perform the following tests at the manufacturer's plant:
1. Electrical operation tests.
 2. Control wiring checks.

PART 3 - EXECUTION

Not Used

PART 4 - MEASUREMENT AND PAYMENT**4.1 MEASUREMENT**

- A. The quantities of accepted work will be measured in the following units. All measurements will be plan measure except for authorized changes.
1. Description: Lump Sum

4.2 PAYMENT

- A. Payment will be made at the respective unit or lump-sum price listed in the proposal and shall be full compensation for all labor, materials, and equipment necessary to complete the respective unit in place. There will be no separate measurement or payment for any item of work not specifically identified and listed in the proposal, and all such work shall be considered a subsidiary item with all costs pertaining thereto included in the prices for other items listed in the proposal. At the Engineer's option, partial payment may be made for any lump sum item listed in the proposal, providing that the Contractor is diligently and satisfactorily pursuing full completion of such partially complete item in accordance with the approved job progress schedule.

SECTION 34 21 50

DC SURGE ARRESTERS

PART 1 - GENERAL

1.1 SUMMARY

- A. This Section includes the following:
 - 1. Product and installation requirements for dc surge arresters in TES substations.
 - 2. Product requirements for dc surge arresters for OCS.

1.2 RELATED SECTIONS

- A. SECTION 34 21 80 – TES Spare Parts and Special Tools
- B. SECTION 34 21 90 – TES Testing
- C. SECTION 34 22 10 – TES Low-Voltage Conductors and Cable
- D. SECTION 34 22 26 – TES Grounding and Bonding
- E. SECTION 34 23 77 – OCS Surge Arrester Installation

1.3 REFERENCED STANDARDS

- A. Section incorporates by reference the latest revisions of the following documents:
- B. American Society for Testing and Materials (ASTM)
 - 1. ASTM B3, Soft or Annealed Copper Wire
 - 2. ASTM B172, Rope-Lay Stranded Conductors having Bunch Stranded Members
- C. American National Standards Institute (ANSI)
 - 1. ANSI C62.11, Standard for Metal-Oxide Surge Arresters for Ac Power Circuits (> 1 kV)
- D. National Electrical Manufacturer's Association (NEMA)
 - 1. NEMA 250, Enclosures for Electrical Equipment (1000 Volts Maximum)

1.4 SUBMITTALS

- A. Procedures: Section 01 33 00, Submittal Procedures.
- B. Product Data:
 - 1. Descriptive data on the surge arresters to be provided.
 - 2. Shop (installation) drawings to scale showing the surge arrester installation.
- C. Spare Parts and Special Tools:
 - 1. Submit a list of spare parts to be provided under this Section.

- 2. Submit at the same time as product data.
 - 3. Provide part numbers for each part, including a detailed break down of each spare part assembly and set, as defined in Section 34 21 80, TES Spare Parts and Special Tools.
 - 4. Submit a list of special tools to be provided under this Section, as defined in Section 34 21 80, TES Spare Parts and Special Tools.
- D. Submit factory test reports within 30 days after conducting tests:
- 1. Design test reports.
 - 2. Production test reports.

1.5 SPARE PARTS

- A. Provide spare parts in accordance with Section 34 21 80, TES Spare Parts and Special Tools.
- B. List below applies to items in this Specification Section.
 - 1. Dc surge arrester, complete with mounting bracket and minimum 3-foot extra-flexible grounding conductor: Provide 10 spares.

1.6 QUALITY ASSURANCE

- A. Comply with the requirements of the Project Quality Plan.
- B. Manufacturer's Qualifications:
 - 1. Manufacturer shall have minimum 5 years of successful use of its surge arrester at light rail or street car facilities.
 - 2. Excessive failures of the proposed surge arrester at one or more transit facilities disqualifies the product for use on this project.

PART 2 - PRODUCTS

2.1 DC SURGE ARRESTERS

- A. Dc surge arresters shall be outdoor style, intermediate class and shall be designed, constructed, and tested in accordance with the general requirements of ANSI C62.11.
- B. Surge arresters shall be of the metal oxide varistor (MOV) type.
- C. MOV elements shall be fully encapsulated in epoxy.
- D. Minimum conduction voltage: 1000 V.
- E. Energy discharge capability: 2.6 kJ for currents 500 A or less.
- F. Reverse voltage across rectifier silicon diodes: Arresters shall limit to a value less than 75 percent of the peak-reverse-voltage rating of the diode by limiting the rise of the transient on the positive to negative bus.
- G. Acceptable Manufacturer/Supplier: Reuel/Balfour Beatty Rail, Inc., IMP-1, or approved equal.

2.2 GROUNDING CONDUCTOR

- A. Extra-flexible bare cable: Copper, 4/0 AWG, Class I stranding, ASTM B3, ASTM B172.
- B. Insulated cable: Copper, 4/0 AWG, 2 kV rated insulation. Refer to Section 34 22 10, TES Low-Voltage Conductors and Cable, for requirements.
- C. Splice: C-type compression connector, Burndy Hyground or approved equal.

2.3 SOURCE QUALITY CONTROL

- A. Design Testing:
 - 1. Test to Failure:
 - a. Perform test on one surge arrester.
 - b. Install surge arrester in proposed enclosure, or in approved alternate mounting arrangement, complete with cables connected.
 - c. Test to failure at two times energy rating and verify that arc clears and that enclosure does not fail catastrophically.
 - d. If enclosure does not contain the surge arrester failure, submit a new surge arrester, new enclosure, or both, and retest.
- B. Production Testing:
 - 1. Energy Test:
 - a. Test each surge arrester and provide test report.
 - b. Test at 80 percent of rated energy.
 - 2. Voltage Test (minimum requirement; additional tests may be performed):
 - a. Test each surge arrester after completion of the energy test and provide test report.
 - b. Test using a calibrated ac dielectric test set capable of reading leakage values.
 - c. Apply 1000 Vac for 30 seconds. Maximum allowable leakage current 15 mA.
 - d. Increase voltage to 1100 Vac for 5 seconds. Maximum allowable leakage current 30 mA.

2.4 TES SUBSTATION ASSEMBLY

- A. Negative: Provide surge arresters connected between the negative bus and the ground mat.
- B. Positive: Provide surge arresters between the load side of each dc feeder breaker and substation ground as indicated on Contract Drawings.
 - 1. Wall mount surge arresters on insulated brackets on exterior of substation.
 - 2. Mounting Height: Minimum 8 feet to bottom of surge arrester.

- C. Install in accordance with surge arrester manufacturer's instructions and as indicated on Contract Drawings.
- D. Install conductors with a minimum number of bends. Bends shall be no less than 8-inch radius.
- E. Connection of cable to surge arrester on ungrounded side shall be taped and covered with a heat-shrink insulating sleeve to provide an insulation level of 1000 V.
- F. Ground side of surge arrester: Provide extra flexible grounding conductor, minimum length 3 feet.

PART 3 - EXECUTION

3.1 TES SUBSTATION SURGE ARRESTERS

- A. Connect extra-flexible copper ground to ground-mat pigtail.
- B. If ground-mat pigtail is too short, provide cable and splices to connect ground-mat pigtail to substation surge arrester extra-flexible copper ground.

3.2 OCS SURGE ARRESTERS

- A. See Section 34 23 77, OCS Surge Arrester Installation, for installation requirements.

3.3 TESTING SURGE ARRESTER GROUNDS

- A. Test surge arrester grounds in accordance with Section 34 21 90, TES Testing.
- B. See required maximum values for grounds in Section 34 22 26, TES Grounding and Bonding.

PART 4 - MEASUREMENT AND PAYMENT

4.1 MEASUREMENT

- A. The quantities of accepted work will be measured in the following units. All measurements will be plan measure except for authorized changes.
 - 1. Description: Lump Sum

4.2 PAYMENT

- A. Payment will be made at the respective unit or lump-sum price listed in the proposal and shall be full compensation for all labor, materials, and equipment necessary to complete the respective unit in place. There will be no separate measurement or payment for any item of work not specifically identified and listed in the proposal, and all such work shall be considered a subsidiary item with all costs pertaining thereto included in the prices for other items listed in the proposal. At the Engineer's option, partial payment may be made for any lump sum item listed in the proposal, providing that the Contractor is diligently and satisfactorily pursuing full completion of such partially complete item in accordance with the approved job progress schedule.

END OF SECTION

SECTION 34 21 70**VEHICLE MAINTENANCE FACILITY (VMF) TES CONTROL AND APS****PART 1 - GENERAL****1.1 SUMMARY**

- A. This Section includes the following:
 - 1. Requirements for providing mechanical interlocking for TES equipment in the Vehicle Maintenance Facility (VMF).
 - 2. VMF Emergency Trip Stations (ETS)
 - 3. Requirements for VMF Auxiliary Power Stations (APS)
 - 4. Requirements for ac control power.

1.2 RELATED SECTIONS

- A. SECTION 34 21 17 – TES Substation Design and Assembly
- B. SECTION 34 21 31 – TES Substation Automation System (SAS).
- C. SECTION 34 21 46 – TES VMF Ac Motor Control Center (MCC)

1.3 REFERENCED STANDARDS

- A. Section incorporates by reference the latest revisions of the following documents:
- B. National Electrical Manufacturers Association (NEMA)
 - 1. NEMA 250, Enclosures for Electrical Equipment (1000 Volts Maximum)
- C. National Fire Protection Association (NFPA)
 - 1. NFPA 70, National Electrical Code (NEC)

1.4 SUBMITTALS

- A. Procedures: Section 01 33 00, Submittal Procedures.
- B. Product Data:
 - 1. APS Disconnect Switch.
 - 2. APS Control Panel components.
 - 3. APS cable.
 - 4. APS cable strain relief.
 - 5. APS cable rack.
- C. Shop Drawings:
 - 1. Dimensioned drawings of APS Control Panel with component layout.

2. Schematic and wiring diagrams of interlocking design with narrative description of interlocking.
3. Dimensioned installation drawings showing layout of APS Disconnect Switch, APS Control Panel, and APS cable rack with mounting details and raceway layout.

PART 2 - MATERIALS

2.1 MECHANICAL INTERLOCKING

- A. For interlocking product data requirements, see Contract Drawings.
- B. OCS Disconnect Switches: Key is removable only when switch is in the open position, and switch can be closed only when key is inserted and in the captive position.
- C. APS: Key is removable only when APS disconnect switch is in the open position, and switch can be closed only when key is inserted and in the captive position.

2.2 VMF TES ELECTRICAL INTERLOCKING DESIGN

- A. Design and implement a control and interlocking scheme for VMF TES elements and submit shop drawings with schematic and wiring diagrams. Base design on the following:
 1. VMF ETS and APS Control Schematic in Contract Drawings;
 2. Requirements in this Section;
 3. Requirements in Section 34 21 46, TES VMF Ac Motor Control Center (MCC); and
 4. TES substation manufacturer's detailed design.
- B. Design must include the following:
 1. Emergency Trip Stations (ETS) in VMF Shop.
 2. Auxiliary Power Stations (APS) in VMF Shop.
 3. APS contactors in Ac MCC in VMF TES substation.
 4. Breakers S1-AC1 and S1-F1 in VMF TES substation.

2.3 EMERGENCY TRIP STATIONS IN VMF SHOP

- A. Emergency trip stations are located throughout the Shop so that personnel can quickly shut off OCS power and APS power by depressing one button. For details, see Part 3, below, and VMF ETS and APS Control Schematic in Contract Drawings.
- B. ETS Buttons:
 1. For general requirements, see Section 34 21 17, TES Substation Design and Assembly.
 2. Latching with twist release.
- C. Protective Cover: Section 34 21 17, TES Substation Design and Assembly.
- D. Enclosure: NEMA 250 Type 4.

2.4 AUXILIARY POWER STATIONS

- A. Auxiliary power stations are used to provide power to streetcars in the Shop without energizing the OCS. The following elements are involved, as shown in Contract Drawings:
1. Ac Motor Control Center (MCC): Located in the VMS substation. Each APS is fed from a circuit breaker and contactor in the Ac MCC. See Section 34 21 46, TES VMF Ac Motor Control Center (MCC) and Contract Drawings.
 2. APS Disconnect Switch: Located on the Shop floor adjacent to the APS Control Box. Each one is fed from a contactor in the Ac MCC. See below, and in Contract Drawings.
 3. APS Control Cabinet: Located on the Shop floor adjacent to the APS Disconnect Switch. This is fed from the APS Disconnect Switch and has pushbuttons for controlling power, indicating lights, and an APS cable attached to it. See below, and in Contract Drawings.
 4. APS Cable ("Stinger"): This is coiled up adjacent to the APS Control Cabinet when not in use, and when in use connects to the streetcar. See below, and in Contract Drawings.
 5. Interlocks:
 - a. Mechanical: The APS is mechanically interlocked with the OCS Disconnect Switch in the same bay such that both cannot be energized at the same time. See Mechanical Key Interlocking Scheme in Contract Drawings.
 - b. Electrical: The APS cable attachment plug is interlocked with the APS Control Cabinet such that the contactor in the MCC will open if the attachment plug is inserted or withdrawn from the streetcar receptacle with the APS energized. See VMF ETS and APS Control Schematic in Contract Drawings.
- B. Wiring and assembly of Ac MCC, APS disconnect switch, APS control cabinet, and APS cable with attachment plug shall comply with NFPA 70.
- C. APS Disconnect Switch:
1. Heavy duty, three phase, with auxiliary contacts for switch position indication, and mechanical interlock installed, as described above.
 2. Suitable for mounting on wall or post.
 3. Nameplate as specified in Section 34 21 17, TES Substation Design and Assembly, and as indicated on Contract Drawings.
- D. APS Control Cabinet:
1. Enclosure: Stainless steel, NEMA 250 Type 12, hinged cover, with white-painted back panel, suitable for mounting on wall or post.
 2. Configuration as indicated on Contract Drawings.
 3. Control Power: 120 Vac.

4. Indicating lights:
 - a. NEMA 250 Type 12, and as specified in Section 34 21 17, TES Substation Design and Assembly.
 - b. Color: As indicated on Contract Drawings.
 5. Pushbuttons: NEMA 250 Type 12, and as specified in Section 34 21 17, TES Substation Design and Assembly, for trip and close.
 6. Terminal blocks: As specified in Section 34 21 17, TES Substation Design and Assembly
 7. Nameplates: As specified in Section 34 21 17, TES Substation Design and Assembly, and as indicated on Contract Drawings.
- E. APS Cable ("Stinger"):
1. Jacket: Heavy duty, polyurethane oil and water resistant, Leoni L-FLEXX 290 P or approved equal.
 2. Conductors: 600 V, three 2/0 AWG stranded copper power conductors, one 2/0 AWG neutral, one #6 AWG ground, and two #12 AWG interlock control wires.
 - a. Confirm with streetcar manufacturer the electrical load and size of receptacle and matching attachment plug before ordering cable. Cable and overcurrent protection must be sized for actual load.
 - b. Confirm with streetcar manufacturer whether or not neutral conductor is required before procuring cable.
 3. Strain relief: Stainless steel wire mesh type, with stainless steel threaded end and locknut, suitable for knockout mounting.
 4. Attachment Plug: Compatible with receptacle on streetcar. See Contract Drawings and confirm with streetcar manufacturer before procuring.
 5. Cable Rack: Heavy duty, stainless steel or painted hot-dip galvanized steel, suitable for coiling the entire length of APS cable adjacent to APS Control Cabinet.

2.5 AC CONTROL POWER

- A. Ac Control Power shall be from the VMS TES substation Ac Panel.
- B. Provide an undervoltage alarm (Device 127) for each ac control circuit.
 1. If a circuit from the ac panel feeds downstream mini circuit breakers, each of the circuits controlled by a mini circuit breaker is considered a control circuit for the purposes of this requirement.
 2. Provide alarm to SAS; see Section 34 21 31, TES Substation Automation System (SAS).

PART 3 - EXECUTION

3.1 EMERGENCY TRIP STATIONS (ETS) IN VMF SHOP

- A. Provide specified ETSs in Shop where indicated on Contract Drawings.

- B. Wire ETSs in series, as indicated on Contract Drawings, using ac control power circuit from ac panel in VMS TES substation.
- C. Connect Shop ETS circuit to VMS TES substation to trip and lockout substation main ac breaker, dc feeder breaker, and to open the two APS contactors in Ac MCC. See VMF ETS and APS Control Schematic in Contract Drawings.

3.2 AUXILIARY POWER STATION (APS)

- A. Provide two APSs, in locations indicated on Contract Drawings.
- B. Coordinate wall or post mounting with Engineer.
- C. Provide sufficient APS cable for finished length of 30 feet measured from edge of control box to end of cord cap, or a length to reach the APS receptacle on the streetcar vehicle plus 10 feet, whichever is greater.
- D. Connect APS cable to APS Control Cabinet using specified strain relief.
- E. Connect attachment plug to APS cable.
- F. Provide APS rack adjacent to APS Control Cabinet. Mount securely at a suitable height such that cable can be neatly coiled on the rack when not in use.
- G. Connect each APS Disconnect Switch to its respective contactor in the Ac MCC in the VMS TES substation, as indicated on Contract Drawings.

PART 4 - MEASUREMENT AND PAYMENT

4.1 MEASUREMENT

- A. The quantities of accepted work will be measured in the following units. All measurements will be plan measure except for authorized changes.
 - 1. Description: Lump Sum

4.2 PAYMENT

- A. Payment will be made at the respective unit or lump-sum price listed in the proposal and shall be full compensation for all labor, materials, and equipment necessary to complete the respective unit in place. There will be no separate measurement or payment for any item of work not specifically identified and listed in the proposal, and all such work shall be considered a subsidiary item with all costs pertaining thereto included in the prices for other items listed in the proposal. At the Engineer's option, partial payment may be made for any lump sum item listed in the proposal, providing that the Contractor is diligently and satisfactorily pursuing full completion of such partially complete item in accordance with the approved job progress schedule.

END OF SECTION

SECTION 34 21 73**TES STUDIES****PART 1 - GENERAL****1.1 SUMMARY**

- A. This Section includes requirements for the following computer-based studies and reports for ac and dc switchgear associated with TES substations:
1. Short-circuit study.
 2. Ac coordination study.
 3. Dc coordination study.
 4. Arc-flash hazard analysis study.

1.2 REFERENCED STANDARDS

- A. Section incorporates by reference the latest revisions of the following documents:
- B. American National Standards Institute (ANSI):
1. ANSI Z535.4, Standard for Product Safety Signs and Labels
- C. Institute of Electrical and Electronics Engineers (IEEE):
1. IEEE 241, Recommended Practice for Electric Power Systems in Commercial Buildings
 2. IEEE 242, Recommended Practice for Protection and Coordination of Industrial and Commercial Power Systems
 3. IEEE 399, IEEE Recommended Practice for Power Systems Analysis
 4. IEEE 1015, Recommended Practice for Applying Low-Voltage Circuit Breakers Used in Industrial and Commercial Power Systems
 5. IEEE 1584, Guide for Arc Flash Hazard Calculations
 6. IEEE C37.20.1, Standard for Metal-Enclosed Low-Voltage Power Circuit Breaker Switchgear
 7. IEEE C37.46, Standard Specifications for High Voltage (> 1000 V) Expulsion and Current-Limiting Type Power Class Fuses and Fuse Disconnecting Switches
 8. IEEE C57.96, Guide for Loading Dry-Type Distribution and Power Transformers
- D. Insulated Cable Engineers Association (ICEA)
1. ICEA P-32-382, Short Circuit Characteristics of Insulated Cable
 2. ICEA P-45-482, Short-Circuit Performance of Metallic Shielding and Sheaths

- E. National Electrical Manufacturer's Association (NEMA)
 - 1. NEMA MG 1, Motors and Generators
- F. National Fire Protection Association (NFPA)
 - 1. NFPA 70, National Electrical Code
 - 2. NFPA 70E, Standard for Electrical Safety in the Workplace

1.3 SUBMITTALS

- A. Procedures: Section 01 33 00, Submittal Procedures.
- B. Product Data: Computer software to be used for system simulation.
- C. Product Certificates:
 - 1. For short-circuit and overcurrent protective device coordination study, provide certification of compliance with IEEE 399.
 - 2. For arc-flash hazard analysis, provide certification of compliance with IEEE 1584.
- D. Qualifications: Submit names, contact information and qualifications including references for at least five short-circuit, coordination study and arc-flash calculations of comparable complexity within the last five years.
- E. Provide the following reports for each substation:
 - 1. Input data including completed computer program input data sheets.
 - 2. Short-Circuit Study and Equipment Evaluation Reports.
 - 3. Ac Coordination Study Report: Submit at the same time as Dc Coordination Study Report.
 - 4. Dc Coordination Study Report.
 - 5. Arc Flash Hazard Analysis Report.

1.4 QUALITY ASSURANCE

- A. Comply with the requirements of the Project Quality Plan.
- B. Studies shall use computer programs that are distributed nationally and are in wide use.
 - 1. Software algorithms shall comply with requirements of standards and guides specified in this Section.
 - 2. Manual calculations or calculations using spreadsheet software are not acceptable.
- C. Study Specialist Qualifications:
 - 1. Analysis and reports shall be prepared by an individual experienced in the application of computer simulations to traction power systems.
 - 2. Qualifications shall be submitted for approval and shall document that the individual has at least five years experience and has prepared five studies of comparable complexity.

3. Analysis and reports shall be supervised and signed by a professional electrical engineer licensed in the State of Missouri.
- D. Studies, analysis, and reporting shall comply with the following standards:
1. IEEE 241 and 242 for short-circuit and coordination analysis.
 2. IEEE 399 for general study procedures.
 3. IEEE 1584 and NFPA 70E for arc-flash hazard analysis.
 4. NFPA 70.

PART 2 - PRODUCTS

2.1 SIMULATION SOFTWARE

- A. Acceptable Software: Subject to approval, simulation software shall be the product of one of the following developers.
1. CGI CYME
 2. EDSA Micro Corporation
 3. ESA Inc.
 4. Operation Technology, Inc.
 5. SKM Systems Analysis Inc.

2.2 SOFTWARE REQUIREMENTS

- A. Computer software for short-circuit study shall include analytical features described in IEEE 399 as Mandatory, Very Desirable, and Desirable.
- B. Computer software:
1. Shall be capable of plotting and diagramming time-current characteristic curves as part of the output.
 2. Shall report device settings and ratings of all overcurrent protective devices.
 3. Shall demonstrate selective coordination by computer-generated, time-current coordination plots using different colors for each protective device.

PART 3 - EXECUTION

3.1 DATA COLLECTION AND COORDINATION

- A. Collect data from equipment suppliers, other contractors or subcontractors, Kansas City Power & Light and the Owner in order to complete the analysis.
- B. Coordinate required distribution equipment ratings and protective device settings to provide a fully-integrated distribution system that is properly coordinated and meets the requirements of NFPA 70. Proceed with final analysis only after relevant equipment has been finally determined and submittal information is sufficient to produce accurate simulation results.

3.2 SYSTEM DOCUMENTATION

- A. Collect and tabulate the following input data to support studies.
1. Product data for overcurrent protective devices including devices furnished by others and involved in overcurrent protection.
 2. Resistance and reactance data and fault current data from serving utility.
 3. Electrical Distribution System Diagram. Provide documentation in both paper and electronic formats for the following:
 - a. Circuit breaker and fuse current ratings and types.
 - b. Relays and associated power and current transformer ratings and ratios.
 - c. Transformer ratings including kVA ratings for each cooling type, primary and secondary voltages, connection type, transformer impedance, and X/R ratios. Provide information on transformer over-temperature sensors provided.
 - d. Cable information including number in parallel, conductor material, compaction, sizes, insulation type and temperature ratings, and cable length.
 - e. Busway material, ampacity, and impedance.
 - f. Motor horsepower, full-load current and code letter according to NEMA MG 1.
 4. Equipment data sheets:
 - a. Special load considerations including starting inrush currents and frequent starting.
 - b. Transformer characteristics, including primary protective device recommendations, inrush current, and thermal damage curve.
 - c. Motor full-load current, locked-rotor current, service factor, starting time, type of starter, and thermal damage curve.
 - d. Utility protective device types, ratings and relay settings.
 - e. Special overcurrent protective device settings or types if required by the serving utility.
 - f. Time-current characteristic curves of devices to be coordinated.
 - g. Circuit breaker manufacturer, frame size, interrupting capacity, ampere or current sensor rating, long-time adjustment range, short-time adjustment range, and instantaneous adjustment range.
 - h. Overcurrent relay manufacturer, type, ampere tap range, time-delay range, instantaneous range, and current transformer ratio.
 - i. Panelboard and switchboard, ampere rating and interrupting rating.
- B. Use equipment identification tags that are consistent with electrical distribution system diagrams, overcurrent protective device submittals, input and output data, and recommended device settings.

3.3 SHORT-CIRCUIT STUDY

- A. Calculate maximum available fault current in amperes rms symmetrical at overcurrent protective device positions throughout the electrical distribution system. Calculation shall be for current immediately after initiation of a three-phase bolted fault at each of the following:
 - 1. Switchgear and switchboard bus.
 - 2. Distribution panelboard.
 - 3. Branch circuit panelboard.
- B. Analyze the electrical distribution system from normal and alternate power sources throughout electrical distribution system. Include studies of system switching configurations and alternate operations that could result in maximum fault condition.
- C. Calculate momentary and interrupting duties on the basis of maximum available fault current.
- D. Calculations to verify interrupting ratings of overcurrent protective devices shall comply with IEEE 241 and IEEE 242.
 - 1. For transformer, comply with IEEE C57.96.
 - 2. For low-voltage circuit breakers, comply with IEEE 1015 and IEEE C37.20.1.
 - 3. For low-voltage fuses, comply with IEEE C37.46.
- E. Final Report
 - 1. Indicate calculated X/R ratios and equipment (half-cycle) fault currents on electrical one-line diagram.
- F. Equipment Evaluation Report
 - 1. Overcurrent Protective Devices: Ensure that interrupting ratings are equal to or higher than calculated available half-cycle symmetrical fault current.
 - 2. Devices and equipment rated for asymmetrical fault current: Apply multipliers listed in the Standards to half-cycle symmetrical fault current.
 - 3. Conductors:
 - a. Verify adequacy of phase conductors at maximum three-phase bolted fault currents.
 - b. Verify adequacy of equipment grounding conductors and grounding electrode conductors at maximum ground-fault currents.
 - c. Ensure that short-circuit withstand ratings are equal to or higher than calculated half-cycle symmetrical fault currents.

3.4 AC COORDINATION STUDY

- A. Perform coordination study using approved computer software. Prepare a written report using results of short-circuit study. Comply with IEEE 399.
 - 1. Calculate the maximum and minimum half-cycle short-circuit currents.

2. Calculate the maximum and minimum ground-fault currents.
- B. Comply with IEEE 241 and IEEE 242 recommendations for fault currents and time intervals.
- C. Transformer Primary Overcurrent Protective Devices:
1. Devices shall not operate in response to the following:
 - a. Transformer magnetizing inrush currents.
 - b. Self-cooled, full-load current or forced-air-cooled, full-load current, as appropriate. For transformer equipped for future fan cooling option, overcurrent protective devices shall be capable of resetting to the higher forced-air-cooled rating.
 - c. Permissible transformer overloads according to IEEE C57.96 if required by expected loading or emergency conditions.
- D. Conductor Protection:
1. Protect cables against damage from fault currents according to ICEA P-32-382, ICEA P-45-482, and conductor melting curves in IEEE 242.
 2. Demonstrate that equipment withstands the maximum short-circuit current for a time equivalent to the tripping time of the primary protection or total clearing time of the fuse.
 3. To determine temperatures that damage insulation, use curves from cable manufacturers or from listed standards indicating conductor size and short-circuit current.
- E. Coordination Study Report: Prepare a written report including the following:
1. A table with settings selected for overcurrent protective devices including:
 - a. Device identification tag.
 - b. Current transformer ratios and relay curve, tap, time-dial and instantaneous pickup settings.
 - c. Circuit breaker sensor rating and long-time, short-time and instantaneous trip settings.
 - d. Fuse type and current rating.
 - e. Ground-fault relay pickup and time-delay settings.
 2. Coordination Curves:
 - a. Provide documentation of settings of overcurrent protective devices to achieve selective coordination.
 - b. Provide time-current curves to graphically illustrate that adequate time separation exists between devices installed in series, including utility upstream devices.
 - c. Prepare separate sets of curves for the switching schemes and for emergency periods where the power is fed from an alternate source.

- d. Include the following information:
 - 1) Device identification tag
 - 2) Time and current multipliers for curves.
 - 3) Three-phase and line-to-ground damage points for each transformer.
 - 4) No damage, melting, and clearing curves for fuses.
 - 5) Cable damage curves
 - 6) Transformer inrush points.
 - 7) Maximum fault-current cutoff point.
3. Prepare and include in study completed data sheets for setting of overcurrent protective devices.
4. Graphs shall be plotted in both distinctive colors and line styles for each time-current characteristic and damage curve so that black-and-white copies of graphs are still understandable.
5. Provide both bound color copies and color electronic files in PDF format for report.

3.5 DC COORDINATION STUDY

- A. Include the following as a minimum:
 1. Dc bolted positive to negative and positive to ground fault calculations.
 2. Protective device range and setting calculations showing basis for each recommended relay setting.
 3. Plots of rectifier design capability with actual margin of coordination (from breaker trip to design capability) clearly indicated at each of 100, 150 and 200 percent full-load current and short-circuit current.

3.6 ARC-FLASH HAZARD ANALYSIS

- A. Perform Arc-Flash Hazard Analysis with the aid of computer software intended for this purpose.
- B. Perform analysis in conjunction with short-circuit and coordination studies.
- C. Submit the results of the analysis in a table and include device or bus identification tag, bolted fault and arcing fault current levels, flash protection boundary, distances, personal-protective equipment classes and arc-flash incident energy (AFIE) levels.
- D. Perform the analysis under worst-case fault conditions, and describe in the final report when applicable, how these conditions differ from worst-case bolted fault conditions.
- E. Provide self-adhesive equipment labels in compliance with ANSI Z535.4 to document arc flash hazard and required personal protective equipment.

PART 4 - MEASUREMENT AND PAYMENT**4.1 MEASUREMENT**

A. The quantities of accepted work will be measured in the following units. All measurements will be plan measure except for authorized changes.

1. Description: Lump Sum

4.2 PAYMENT

A. Payment will be made at the respective unit or lump-sum price listed in the proposal and shall be full compensation for all labor, materials, and equipment necessary to complete the respective unit in place. There will be no separate measurement or payment for any item of work not specifically identified and listed in the proposal, and all such work shall be considered a subsidiary item with all costs pertaining thereto included in the prices for other items listed in the proposal. At the Engineer's option, partial payment may be made for any lump sum item listed in the proposal, providing that the Contractor is diligently and satisfactorily pursuing full completion of such partially complete item in accordance with the approved job progress schedule.

END OF SECTION

SECTION 34 21 75

TE SYSTEM ASSURANCE

PART 1 - GENERAL

1.1 SUMMARY

- A. This Section includes developing and implementing a Systems Assurance Program for this Contract, encompassing system safety and reliability engineering to accomplish the following:
1. Avoid, eliminate or reduce potential identified hazards at the early stage of the project life.
 2. Control and minimize hazards to passengers, personnel, and public.
 3. Incorporate fail-safe design principle if possible.
 4. Use high reliability and predictable failure modes components.
 5. Support for the Owner's Safety Certification Program.

1.2 REFERENCED STANDARDS

- A. This Section incorporates by reference the latest revisions of the following documents:
- B. U.S. Department of Transportation, Federal Transit Administration
1. DOT-FTA-MA-26-5005-00-01, Hazard Analysis Guidelines for Transit Projects
<http://www.fta.dot.gov/documents/HAGuidelines.pdf>
 2. DOT-FTA-MA-90-5006-02-01, Handbook for Transit Safety and Security Certification
<http://transit-safety.volpe.dot.gov/publications/safety/SafetyCertification/pdf/SSC.pdf>

1.3 SUBMITTALS

- A. Qualifications:
1. Resume for each proposed person preparing required submittals.
 2. Samples of similar documents prepared by each proposed person for previous projects.
- B. Proposed Software: Product data, list of projects where used, sample output.
- C. System Safety Program Plan (SSPP):
1. Submit the following hazard analyses included in the SSPP in compliance with DOT-FTA-MA-26-5005-00-01:
 - a. Preliminary Hazard Analysis (PHA).
 - b. Fault Tree Analysis (FTA).
 - c. Failure Mode Effect and Criticality Analysis (FMECA).

- d. Operating Hazard Analysis (OHA).
2. For each hazard analysis, include either separate sections or submit separate submittals for each Systems subsystem:
 - a. Traction electrification cabling.
 - b. TES substations
 - c. VMF interlocking.

1.4 QUALITY ASSURANCE

- A. Comply with the requirements of the Project Quality Plan.
- B. Qualifications:
 1. Documents required in this Section shall be prepared by persons with a minimum of 5-years experience preparing comparable documents for the transit industry.
 2. Persons preparing documents for each Systems subsystem shall be experienced in that subsystem.
 3. Provide samples of documents from previous projects that demonstrate familiarity with the process and subject matter.
- C. Software:
 1. Prepare required documents using recognized industry analysis software.

PART 2 - PRODUCTS

2.1 SYSTEM SAFETY PROGRAM PLAN (SSPP)

- A. The SSPP is designed to eliminate and/or control identified hazards. Include the following hazard analyses prepared in accordance with the guidelines in DOT-FTA-MA-26-5005-00-01:
- B. The SSPP is designed to identify and eliminate hazards where possible, and where not possible, to control identified hazards.
- C. Prepare the following safety analyses in accordance with the guidelines in DOT-FTA-MA-26-5005-00-01. Conform to the schedule in DOT-FTA-MA-26-5005-00-01.
 1. Preliminary Hazard Analysis (PHA): Perform during the concept-planning phase.
 2. Failure Mode Effect and Criticality Analysis (FMECA): Perform during preliminary design so that identified changes can be incorporated into the final design. Update during the commissioning and integrated testing phase if additional hazards are identified.
 3. Fault Tree Analysis (FTA): Perform at the beginning of final design.
 4. Operating Hazard Analysis (OHA): Perform during the latter portion of final design. Update during the commissioning and integrated testing phase if additional hazards are identified.

PART 3 - EXECUTION**3.1 IMPLEMENTATION OF SYSTEM SAFETY**

- A. After completion of required safety submittals, implement changes required to eliminate or mitigate hazards, at no cost to the Owner:
 - 1. Change design if necessary to eliminate identified hazards.
 - 2. Where hazards cannot be eliminated, include safety devices and warning devices in design to mitigate hazards.
 - 3. If an identified hazard can be mitigated only by procedures and training, identify specifically where the hazard has been addressed in training program and Operation and Maintenance Manuals.

3.2 SAFETY CERTIFICATION PROGRAM

- A. The Owner may comply with FTA guidelines to implement a Safety Certification Program (reference DOT-FTA-MA-90-5006-02-01).
- B. Support the Owner's implementation of the program as directed by Engineer.
- C. Participation includes activities such as assisting the Owner with development of checklists and documentation, identifying submittals that satisfy requirements of the Certifiable Item List, providing standards to which components are designed and tested, and identifying safety-related instructions in training and maintenance documents.

PART 4 - MEASUREMENT AND PAYMENT**4.1 MEASUREMENT**

- A. The quantities of accepted work will be measured in the following units. All measurements will be plan measure except for authorized changes.
 - 1. Description: Lump Sum

4.2 PAYMENT

- A. Payment will be made at the respective unit or lump-sum price listed in the proposal and shall be full compensation for all labor, materials, and equipment necessary to complete the respective unit in place. There will be no separate measurement or payment for any item of work not specifically identified and listed in the proposal, and all such work shall be considered a subsidiary item with all costs pertaining thereto included in the prices for other items listed in the proposal. At the Engineer's option, partial payment may be made for any lump sum item listed in the proposal, providing that the Contractor is diligently and satisfactorily pursuing full completion of such partially complete item in accordance with the approved job progress schedule.

THIS PAGE INTENTIONALLY LEFT BLANK

SECTION 34 21 80**TES SPARE PARTS AND SPECIAL TOOLS****PART 1 - GENERAL****1.1 SUMMARY**

- A. This Section includes the following:
 - 1. Requirements for providing spare parts indicated in other Sections.
 - 2. Requirements for providing maintenance equipment.

1.2 DEFINITIONS

- A. Assembly: A unit consisting of components or parts that have been fitted together to form a self-contained device or fixture.
- B. Set: The quantity of the stated part that is provided as part of one substation. For example, if the part is "LEDs for Dc Switchgear," and 1 substation has 2 red LEDs, 2 green LEDs, and 1 white LED for Dc Switchgear, then 4 sets consists of 8 red LEDs, 8 green LEDs, and 4 white LEDs.

1.3 SUBMITTALS

- A. Procedures: Section 01 33 00, Submittal Procedures.
- B. Submit all items described below a minimum of 90 days before delivery of first spare parts:
 - 1. Comprehensive list of mandatory spare parts. Include spare parts listed in each section of these Specifications that contains a spare parts requirement. List by Specification section.
 - 2. Comprehensive list of mandatory special tools for each TES substation.
 - 3. List of additional recommended spare parts, special tools, and test and maintenance equipment. List separately the recommended special tools, test, and maintenance equipment that can be shared by substations.
 - 4. Provide part numbers for each part, including a detailed break-down of each spare part assembly and set.
 - 5. Provide a price for each part that can be purchased separately, effective for 1 year after notice to proceed.

1.4 DELIVERY, STORAGE, AND HANDLING

- A. Schedule: Delivery of spare parts shall be complete a minimum of 60 days before initial energization of the first segment of OCS.
- B. Notice and Shipping List: Provide Engineer notice of delivery and a complete shipping list a minimum of 10 days before delivery. Shipping list shall include the following:
 - 1. Quantity of each part.
 - 2. Manufacturer's part number.

3. Serial number, if applicable.
 4. Description.
 5. Spaces for inserting date of delivery, signature of Contractor, and signature of Engineer.
- C. Authorization: Spare parts shall not be shipped until authorized by Engineer.
- D. Location: Deliver spare parts to a location in greater Kansas City, Missouri metropolitan area designated by the Engineer.
- E. Packaging: Package and label spare parts in moisture-proof containers suitable for shipment and storage. Attach copies of shipping list in the package and to the exterior of the package.
- F. Unloading: Unload spare parts in a manner that will prevent damage to the packages and the contents.
- G. Inspection:
1. Engineer will open the packages and inspect spare parts for damage. Damaged parts will be returned to Contractor and shall be replaced with undamaged parts and materials at no additional expense to the Owner.
 2. Assist Engineer in verifying quantity of parts.
 3. Sign shipping list with quantities verified, obtain Engineer's signature, and date. Engineer will retain the signed shipping list.

PART 2 - PRODUCTS

2.1 REPLACEMENT PARTS

- A. Mandatory Spare Parts:
1. Provide quantity and type of spares specified in each Specification Section. Supply of a spare from one Section does not satisfy the requirement for an identical spare specified in a different Section.
 2. Spare parts shall be identical to those submitted for approval and provided in substations.
 3. Unit price: Include on the submitted mandatory and recommended spare parts lists a price for each item that can be purchased separately, effective for 1 year after notice to proceed.
- B. Spare Parts for Warranty Repairs:
1. The capital spare parts or the spare parts ordered by the Owner for support of operations are not to be used by the Contractor for warranty repairs and warranty parts replacements. Engineer will not be responsible for receiving or storing any parts for warranty support.
 2. At the end of the warranty period, the Owner may consider a negotiated price for purchase of parts stocked by the Contractor for warranty support.

- C. Availability of Replacement Parts:
 - 1. Guarantee parts availability for a period of 10 years from Contract award.
 - 2. Provide detailed manufacturing drawings to the Owner at the end of the 10-year period or when the availability of parts ceases after that date.

2.2 MANDATORY SPECIAL TOOLS

- A. Special tools include but are not limited to fixtures, equipment, gages, hand tools, power tools, motors, or other tools and equipment necessary to troubleshoot, maintain, repair, overhaul, assemble, disassemble, and adjust the TES substation and other elements of the traction electrification system that are not commonly available from commercial tool suppliers.
- B. Provide one set of special tools for each substation and one set for the traction electrification system.

2.3 RECOMMENDED SPARE PARTS AND SPECIAL TOOLS

- A. Provide list of recommended spare parts including description, break down, part number, recommended quantity, and unit price.
- B. Provide list of recommended special tools, test, and maintenance equipment. The Owner may or may not exercise purchase of the recommended items.

PART 3 - EXECUTION

Not Used

PART 4 - MEASUREMENT AND PAYMENT

4.1 MEASUREMENT

- A. The quantities of accepted work will be measured in the following units. All measurements will be plan measure except for authorized changes.
 - 1. Description: Lump Sum

4.2 PAYMENT

- A. Payment will be made at the respective unit or lump-sum price listed in the proposal and shall be full compensation for all labor, materials, and equipment necessary to complete the respective unit in place. There will be no separate measurement or payment for any item of work not specifically identified and listed in the proposal, and all such work shall be considered a subsidiary item with all costs pertaining thereto included in the prices for other items listed in the proposal. At the Engineer's option, partial payment may be made for any lump sum item listed in the proposal, providing that the Contractor is diligently and satisfactorily pursuing full completion of such partially complete item in accordance with the approved job progress schedule.

END OF SECTION

THIS PAGE INTENTIONALLY LEFT BLANK

SECTION 34 21 90**TRACTION ELECTRIFICATION SYSTEM (TES) TESTING****PART 1 - GENERAL****1.1 SUMMARY**

- A. This Section includes the following:
 - 1. General testing requirements.
 - 2. Factory Acceptance Testing TES substation and its components.
 - 3. Field Acceptance Testing TES substation and its components.
 - 4. Field testing TES system.
 - 5. Other test requirements appear in other Sections.
- B. The requirements of this Section apply to all Division 34 21 xx and 34 22 xx Sections.

1.2 RELATED SECTIONS

- A. SECTION 34 21 05 – Common Work Results for TES
- B. SECTION 34 21 15 – TES Lighting
- C. SECTION 34 21 19 – TES Dc Switchgear.
- D. SECTION 34 21 25 – TES Dc Control Power
- E. SECTION 34 21 31 – TES Substation Automation System (SAS)
- F. SECTION 34 21 33 – TES Rail Voltage Monitoring and Grounding System
- G. SECTION 34 21 70 – VMF TES Control and APS
- H. SECTION 34 22 26 – TES Grounding and Bonding

1.3 REFERENCED STANDARDS

- A. Section incorporates by reference the latest revisions of the following documents:
- B. Institute of Electrical and Electronics Engineers (IEEE)
 - 1. IEEE 80, IEEE Guide for Safety in Ac Substation Grounding
 - 2. IEEE 81, Guide for Measuring Earth Resistivity, Ground Impedance, and Earth Surface Potentials of a Ground System
 - 3. IEEE 400, Guide for Field Testing and Evaluation of the Insulation of Shielded Power Cable Systems
 - 4. IEEE 1187, Recommended Practice for Installation Design and Installation of Valve-Regulated Lead-Acid Batteries for Stationary Applications

5. IEEE 1188 Recommended Practice for Maintenance, Testing, and Replacement of Valve-Regulated Lead-Acid (VRLA) Batteries for Stationary Applications
 6. IEEE C37.20.1, Standard for Metal-Enclosed Low-Voltage Power Circuit Breaker Switchgear
 7. IEEE C37.20.2, Standard for Metal-Clad Switchgear
 8. IEEE C37.41, Standard Design Tests for High-Voltage (> 1000 V) Fuses, Fuse and Disconnecting Cutouts, Distribution Enclosed Single-Pole Air Switches, Fuse Disconnecting Switches, and Accessories Used with These Devices
- C. InterNational Electrical Testing Association (NETA)
1. NETA ATS, Acceptance Testing Specifications for Electric Power Distribution Equipment and Systems
- D. National Electrical Manufacturers Association (NEMA)
1. NEMA PE 5, Utility-Type Battery Chargers

1.4 FAILURE OF TEST

- A. If any test fails, make corrections and retest at no additional cost to the Owner.
- B. If off-site test is witnessed by Engineer or his representatives and fails, Contractor shall pay for return trip to facility or test site(s) including air fare and lodging.
- C. In the event equipment is not ready for testing by Contractor upon agreed testing date and Engineer or his representatives arrive at test site, Contractor shall pay for return air fare and lodging of Engineer or his representatives.

1.5 SUBMITTALS

- A. Procedures: Section 01 33 00, Submittal Procedures.
- B. Test program plan: Submit within 120 Days after NTP and provide monthly updates.
- C. Test procedures:
 1. Submit a minimum of 60 Days before test is scheduled to be performed.
 2. Tests shall not be performed and test reports will not be considered valid until procedures are approved by Engineer.
- D. Test reports:
 1. Submit within 30 calendar days after completion of each test unless otherwise indicated.
 2. Factory Design Test Reports:
 - a. Submit existing test reports 90 calendar days before shipping equipment.
 - b. Equipment shall not be shipped until the report is approved by the Engineer.
 3. Factory Production Test Reports: For each test specified in this Section.

4. Submit Electrically Insulated Floor and Wall Test Report for each substation before installing substation equipment:
5. Wire and cable testing report: Cable insulation test for dc feeder cables.
6. TES Substation Factory Acceptance Test Report.
7. Submit TES Substation Ground Grid Test report before starting Field Acceptance Test.
8. TES Substation Field Acceptance Test Reports.
9. Pretest TES Substation Factory Acceptance Test Report.
10. Pretest TES Substation Field Acceptance Test Report.
11. Integrated Testing Test Reports:
 - a. Rail Voltage Monitoring and Grounding Devices Tests.
 - 1) Initial chart recording.
 - 2) Final record chart recording.
 - b. Short Circuit Test.
 - c. Train Start Tests.

1.6 REQUIREMENTS FOR TEST PROGRAM PLAN, TEST PROCEDURES, AND TEST REPORTS

- A. Test Program Plan:
 1. Identify each test by reference to the Section, Article, and Paragraph number of the appropriate Technical Section of these Specifications.
 2. Provide a detailed schedule showing the time and place of each test to be performed.
 3. Tests to be included:
 - a. Each test described in this Section and in other Contract Specification Sections, including a test for each substation equipment type or assembly.
 - b. Supplier and Subcontractor tests to be completed at the suppliers' or Subcontractors' plants.
 - c. Contractor's tests to be completed at its plant or approved independent testing lab prior to delivery.
 - d. Other tests conducted by Contractor in connection with its own Quality Assurance program.
- B. Test Procedures: Develop detailed test procedures for each test containing the following:
 1. Title of test.
 2. Contract Specifications Section, Article, and Paragraph number.
 3. Test location.

-
4. Name of the agency performing each test (Contractor, its supplier, or an independent testing company).
 5. Test objective.
 6. Equipment and instrumentation requirements including manufacturer's name, model number, and serial number.
 7. Personnel requirements.
 8. Attached copies of applicable portions of ANSI, IEEE, or NEMA standards. Obtain permission of copyright holder to reproduce the necessary portions of standards and pay copyright holder if required.
 9. Test methodology including test setup, with circuit diagrams and test sequence.
 10. A step-by-step procedure for performing the test, including all steps required for each device tested, even if devices are identical. For example, if there are four circuit breakers to test, provide a separate step-by-step procedure for each breaker.
 11. Forms for recording test data:
 - a. May be incorporated into step-by-step procedure.
 - b. Include space for test equipment calibration data.
 - c. Include a step-by-step format for data reduction and formulas used in deriving the format.
 - d. Include criteria for acceptability and justification for the criteria set forth, including procedures for evaluating data.
 - e. Include space for signatures of test witnesses.
 12. Expected test results.
 13. Test evaluation procedures.
 14. Proposed test report form.
- C. Test Reports:
1. Each test report shall have attached the related and approved test procedure.
 2. Each report shall document the test results obtained and shall include the following information:
 - a. Title of test.
 - b. Contract Specifications Section and Article number.
 - c. Test objectives.
 - d. Summary and conclusions including Pass/Fail or N/A.
 - e. Test location, date, and time.

- f. List of test equipment used, including the following for each piece of test equipment:
 - 1) Manufacturer's name.
 - 2) Model number.
 - 3) Serial number.
 - 4) Calibration certificate showing that equipment was calibrated by an independent agency within the previous 12 months.
- g. Conditions of test, including temperature and humidity.
- h. Raw test data from the approved test procedure forms.
- i. Summarized test data including tables, curves, photographs and any additional test data required to support the test results.
- j. Test results in a form that can easily be compared to these Specifications requirements.
- k. Descriptions of equipment and material failures, and reasons for the failure.
- l. Descriptions of all modifications to equipment or wiring performed during testing, reasons for modifications, and names of individuals approving such modifications.
- m. Abbreviations and references.
- n. Signatures of tester and test witnesses.

1.7 WITNESSING OF TESTS

- A. Engineer will, at his/her option, witness all tests.
- B. Testing Notification: At least 30 calendar days before each test, upon the approval of test procedure, notify Engineer in writing of the date, time, and location the test will be performed.
- C. Verify that test equipment bears a current calibration sticker before scheduling testing.
- D. If Engineer elects not to witness a test or tests, test reports shall nevertheless be submitted to Engineer for review and approval.
- E. Witnessing of test by Engineer shall not waive requirements in Specifications or relieve Contractor from its responsibility to produce test report in accordance with Specifications.

1.8 QUALITY ASSURANCE

- A. Comply with the requirements of the Project Quality Plan.
- B. Qualifications:
 - 1. Field testing of insulated power cables rated 2 kV and higher:
 - a. Shall be performed by a NETA certified technician working for an independent testing company under the direct supervision of Contractor.

- b. NETA technician shall have at least 5 years experience in construction acceptance testing.
 - c. Testing company shall be a NETA member and approved by Engineer.
 2. Field acceptance testing of each substation shall be performed under direct supervision of TES Substation Supervisor representing the manufacturer of the substation equipment, as specified in Section 34 21 05, Common Work Results for TES.
 3. Testing Company: Tests shall be performed by the manufacturer, or a company or agency employed by Contractor with all of the following qualifications:
 - a. Approved by Engineer: Once such a company or agency is approved they shall not be discharged or otherwise replaced by Contractor without written approval of Engineer.
 - b. Employees assigned to the project shall be personnel familiar with electrical testing procedures, electrical instrumentation, and general electrical networks.
 - c. Personnel must be capable of modifying the specified procedures to suit actual field conditions should such modifications become necessary.
 - C. Calibration of Testing Equipment:
 1. Testing equipment must be calibrated by an independent agency minimum every 12 months, or more frequently if recommended by the manufacturer.
 2. Calibration sticker shall be affixed to test equipment indicating last calibration date.
 - D. Quality of Test Data:
 1. Take a sufficient number of test readings to assure that random factors due to human error in reading the instruments and transient disturbances in electrical network have negligible influence on final results.
 2. Establish adequacy of the data as follows:
 - a. Examine data to verify that removal of either the highest or lowest value will not alter the arithmetic average of the group by more than 5 percent.
 - b. If the average would be altered by more than 5 percent, take one more set of data and combine results with the first set.
 - c. If the average of the combined data would still be altered by more than 5 percent if the highest or lowest value were removed, advise Engineer that an unstable condition might exist.

PART 2 - PRODUCTS

2.1 TESTING EQUIPMENT

- A. Electrical Megohmmeter for Insulation Testing:
 1. 1000 Vdc output voltage suitable for resistance measurement from 500 kilohm to 500,000 megohms. Use a megohmmeter with an internal bleeder resistor for discharge.

2. Approved Manufacturer: Hipotronics or approved equal.
- B. High-Potential Test Set:
1. Portable high-potential dc test set, 0 to 130 kVdc, 10 mA with regulated output.
 2. Internal shorting solenoid and discharge resistor.
 3. Full-scale accuracy: 2 percent.
 4. Capable of measuring cable insulation resistance up to 5,000,000 megohms.
 5. Approved Manufacturer: Hipotronics or approved equal.

2.2 FACTORY DESIGN TESTS

- A. General Requirements:
1. Tests shall be conducted by or under supervision of the equipment manufacturer.
 2. Demonstrate compliance with specified design requirements.
 3. Perform on production components, assemblies, subsystems and substations on the highest level of assembly that will allow demonstration of design compliance.
 4. Perform on the first production unit and perform in accordance with these Specifications.
- B. Perform Factory Design Tests as specified in each 34 21 xx and 34 22 xx section, under the Part 2 article titled "Source Quality Control."
- C. Existing Test Reports:
1. Unless otherwise specified, if design tests have already been performed by the manufacturer of equipment, existing test reports may be submitted to Engineer, who will determine whether the new design test may be waived.
 2. Existing test reports need not meet the format requirements specified in this Section, but content of reports shall include all relevant information.

2.3 FACTORY PRODUCTION TESTS

- A. General Requirements:
1. Tests shall be conducted by or under the supervision of the equipment manufacturer.
 2. Demonstrate that each unit to be delivered operates within specified limits and is in compliance with design requirements and industry standards.
 3. Test requirements may vary from an inspection and functional demonstration for a simple component to a full system functional demonstration of an assembly.
- B. Perform Factory Production Tests as specified in each 34 21 xx and 34 22 xx section, under the Part 2 article titled "Source Quality Control."
- C. Tests in this Section are in addition to those specified in other 34 21 xx and 34 22 xx sections.

- D. Electrically Insulated Floor and Wall Tests:
1. Perform hi-potential dielectric tests on the epoxy floor and wall insulation installed in each TES substation enclosure prior to the installation of substation equipment.
 2. Provide a hi-potential tester with a voltage range of 0-15,000 Vdc and a current range of 0-2000 microamperes dc to perform the tests.
 3. Floor: Perform a wet mop test as follows:
 - a. Provide a sponge mop with a non-metallic handle. Provide a copper plate behind the sponge with a wire terminal to attach the test lead.
 - b. Connect one lead from the tester to the copper disk and the other lead to the station ac ground bus.
 - c. Apply 2500 Vdc from the hi-potential tester, using precautions such as insulated boots and hot gloves to protect the test technician.
 - d. Saturate the mop with saline solution of 1/3 salt and 2/3 water (by volume).
 - e. Mop the entire insulated floor with the room darkened. Re-saturate the mop as necessary.
 - f. Visible arcing indicates inadequate dielectric strength of the epoxy coatings; apply additional layers of epoxy until the leakage current is lower than 50 microamperes.
 4. Walls: Perform a copper disk test as follows:
 - a. Provide a copper disc 4 inches in diameter and 1/4-inch thick. The disk shall have a non-conductive handle and wire terminal to attach the test lead.
 - b. Connect one lead from the tester to the copper disk and the other lead to the station ground bus.
 - c. Place the copper disc on the wall insulation at a minimum of 10 locations selected by Engineer where the laminate is fastened to the wall with mechanical fasteners.
 - d. Apply 2500 Vdc for 60 seconds and record the leakage current.
 - e. If leakage current is greater than 50 microamperes, epoxy insulation shall be applied to the fastener to increase the insulation and the fastener retested.

2.4 TES SUBSTATION FACTORY ACCEPTANCE TESTS

- A. General Requirements:
1. Perform test for each completely assembled substation at substation manufacturer's facility before shipping substation to site.
 2. Perform at ambient conditions unless a specific environmental or operating limit is necessary to demonstrate acceptable operation.
 3. Tests shall demonstrate that each substation is complete and ready for shipping to the site, both functionally and cosmetically.

- B. Pretest: Perform for each substation using an approved test procedure and submit a test report prior to performing the factory acceptance test for witnessing.
- C. Wire and Cable Testing:
1. Perform tests after factory wiring and terminations have been installed.
 2. Inspect wire and cable for physical damage and proper connections.
 3. Protect semiconductor devices against the test voltage by means of shorting jumpers or other methods accepted by Engineer, if they are not inherently protected by the circuit in which they are used.
 4. Continuity Tests: Check continuity from point to point and check for shorts to ground with an ohmmeter.
 5. Insulation Resistance Tests:
 - a. Measure insulation resistance with a 1000 Vdc megohmmeter.
 - b. Measure insulation resistance between conductor and ground.
 - c. Test cables after terminations are complete. Do not connect equipment to the cable system during tests.
 - d. Acceptance Criteria for 600 V wire and cable: 10 Megohms for 1,000 feet when measured at 25 C.
 - e. Test Failure: If insulation resistance values are unacceptable, correct deficiency and retest. If the test fails again, replace the entire wire or cable segment.
 6. High Potential Tests: In accordance with IEEE 400.
 - a. Passing Criteria: No insulation breakdown or excessive leakage current.
 - b. Failures: Locate and determine the trouble, replace defective wires, cables or components, make necessary corrections to installation, and retest without additional cost to the Owner.
 7. Control circuit wiring: Test for continuity and insulation after termination.
 8. Power and equipment branch circuits: Perform continuity test on conductors.
 9. Three-phase loads: Verify circuit phasing.
- D. Low-Voltage Panelboards and Enclosed Circuit Breakers:
1. Test circuits for connections in accordance with the wiring diagram.
 2. Test that insulation resistance to ground of nongrounded conductors is a minimum of 10 megohms.
 3. Test panelboard and load center enclosures for continuity to the grounding system.
 4. Test operation of circuits and controls. When testing, operate each control a minimum of 10 times and each circuit continuously for a minimum of 1/2 hour.
 5. Test that each panel has a balanced load.

-
- E. Ancillary Systems:
1. Perform operational and functional tests on auxiliary and ancillary systems including the following:
 - a. Auxiliary panelboards;
 - b. Auxiliary contacts;
 - c. Door interlocks;
 - d. Receptacles;
 - e. Interior, exterior, emergency, and cubicle lighting. Measure lighting levels and confirm that minimum lighting levels are met as required by Section 34 21 15, TES Lighting;
 - f. HVAC;
 - g. All systems provided in this Contract that are not specifically called out in this Section.
- F. General Substation Operation:
1. Perform a functional test of substation operation.
 2. Check the interlocks on the enclosure and panels for proper functioning alarm and operation of shutdown circuitry.
 3. Use strip chart recorders or oscillographs as required to provide a permanent record of the protective functions.
 4. Perform other tests as required by substation equipment manufacturer and Engineer to determine the acceptability of the installation and equipment.
- G. Medium-Voltage Ac Switchgear:
1. Perform on ac switchgear in accordance with IEEE C37.20.2:
 - a. Dielectric tests.
 - b. Mechanical operation tests.
 - c. Electrical operation and control wiring tests, except that the control wiring continuity shall be verified by actual electrical operation of control devices.
 - d. Grounding of instrument transformer cases.
- H. Ac Switchboard (VMF Only):
1. Verify that circuits are connected in accordance with the applicable wiring diagrams.
 2. Verify that circuits are continuous and free from short circuits.
 3. Verify that the insulation resistance to ground of non-grounded conductors is megger tested to not less than 10 megohms.

4. Verify that circuits are operable. Conduct tests to include operating each control not less than ten times and the continuous operation of each lighting and power circuit for not less than 1/2 hour.
- I. Dc Circuit Breaker: Perform on each dc circuit breaker after mounting in switchgear:
 1. Operation test.
 2. Position test: Disconnected, test, and connected positions.
 3. Alignment test of primary and secondary contacts.
 4. Interlocking test for all positions.
 - J. Dc Switchgear: Perform Production Tests as specified in IEEE C37.20.1:
 1. Dielectric tests.
 2. Mechanical operation tests.
 3. Grounding of instrument transformer case test.
 4. Electrical operation and control wiring tests: Verify by actual electrical operation of the component control devices.
 - K. Positive and Negative Disconnect Switches: Perform Production Tests as specified in IEEE C37.41.
 1. Perform standard production tests on all switches to check the quality and uniformity of workmanship and materials used, including the following:
 2. Check for gaps, using a feeler gage (or other approved method) at each contact and assembly point. Gaps are grounds for rejection.
 3. Test operation of all components.
 4. Perform power frequency dielectric withstand test.
 5. Test electric resistance of current path.
 - L. Dc Relays:
 1. Verify proper operation and setting of all relays including rate of rise, frame fault relay and rail-to-earth relay.
 2. Where applicable, settings to be in accordance with approved relay coordination curves.
 - M. Rectifier Transformer:
 1. Perform insulation tests between windings and between windings to ground and between the core to ground using a 2500 Vdc megohmmeter for 1 minute.
 2. Perform functional tests of temperature protective devices.
 - N. Rectifiers:
 1. Perform insulation tests between the diode strings and rectifier enclosure using a 2500 Vdc megohmmeter for one minute.

2. Perform insulation tests between the enclosure and ground using a 2500 Vdc ohmmeter for 1 minute.
 3. Perform a functional test of all temperature, protective, monitoring and alarm devices.
- O. Emergency trip stations (ETS): Perform functional test.
- P. Substation Automation System (SAS):
1. Simulate alarm and analog functions at each device on Alarm Points List in Section 34 21 31, TES Substation Automation System (SAS).
 - a. Simulation shall replicate actual field activation of functions to the extent possible.
 - b. Include method of simulation of functions in test procedure for approval by the Engineer.
 2. Demonstrate downloading of event log to flash drive or laptop.
- Q. SCADA: Simulate alarm functions at each device on Alarm Points List in Section 34 21 31, TES Substation Automation System (SAS).
- R. Transfer Trip: Simulate transfer trip and verify correct outputs at PLC for transfer trip.
- S. Frame Fault (Device 64HS & GS) Tests:
1. Connection: As shown in the one-line diagram.
 2. Test: Simulate a 750 Vdc to frame fault by passing low dc current levels through the relays.
 3. Criteria: Maximum total clearing time including operation of the 64HS & GS relay, the substation lock-out relay, and the tripping of the main ac and dc feeder breakers shall not exceed 300 ms.
 4. At the time of testing, provide graphical outputs, including time characteristics, onsite for review and approval.
- T. Rail Voltage Monitoring and Grounding Devices Tests:
1. Test: Demonstrate proper function of the rail-to-earth relay and rail-to-earth grounding device.
 - a. Simulate rail-to-earth voltages and currents.
 - b. Show that the substation will alarm, trip, and short circuit rail to earth when the voltage and currents exceed the alarm, trip, and short circuit points specified in Section 34 21 33, TES Rail Voltage Monitoring and Grounding System.

PART 3 - EXECUTION

3.1 TES SUBSTATION GROUND GRID TESTS

- A. Pretest the substation ground grid before pouring slab to verify that the required maximum resistance can be achieved, in accordance with Section 34 22 26, TES Grounding and Bonding.

- B. Retest the ground at each substation before conducting Field Acceptance Tests.
- C. Perform testing using the fall of potential method in accordance with IEEE Standard 81.
- D. If a graph of readings does not show the characteristic shape, move current probe further out and repeat procedure.
- E. For each test, submit full fall of potential graph showing each reading.
- F. Passing ground resistance test: 5 ohms or less.

3.2 TES FIELD ACCEPTANCE TESTS

- A. General Requirements:
 - 1. Perform tests in accordance with NETA Acceptance Testing Specifications for Electrical Power Distribution Equipment and Systems.
 - 2. Perform after complete installation of each TES substation.
 - 3. No equipment shall be energized or placed in operating mode until completion of Field Acceptance Testing and permission of Engineer.
 - 4. Tests shall demonstrate that each substation, cable installation, or other equipment is ready for energization and revenue service, both functionally and cosmetically.
- B. Prior to Witnessed Testing:
 - 1. Verify that all equipment is properly installed in accordance with approved drawings and in operable condition.
 - 2. Verify that all open inspection items and NCRs have been corrected.
 - 3. Pretest TES substation to ensure that all necessary troubleshooting has been completed prior to witness testing.

3.3 TES SUBSTATION FIELD ACCEPTANCE TESTS

- A. Wire and Cable Testing:
 - 1. Retest wire and cable after delivery of substation in accordance with Paragraph above titled Factory Acceptance Test.
- B. Electrically Insulated Floor and Wall Tests:
 - 1. Repeat factory tests on wall and floor areas not covered by installed switchgear.
 - 2. Verify that insulated floor and walls have not been damaged in shipping.
- C. General Substation Operation:
 - 1. Perform a functional test of substation operation before energizing the substation. Energize only circuits 600V or less for functional test.
 - 2. Include steps specified above in Part 2 under Paragraph titled "Factory Acceptance Test" and Sub-paragraph titled "General Substation Operation."

- D. Dc Switchgear:
1. High-potential tests:
 - a. Disconnect high-resistance ground relay, Device 64, for this test.
 - b. Perform test between the ac and dc switchgear, including fasteners and the isolation laminate, at 2500V dc. Leakage current shall be less than 50 microamperes.
 - c. Perform test from dc switchgear enclosure to ground at 2500 Vdc. Leakage current shall be less than 50 microamperes.
 - d. Perform continuity tests on all interconnecting cables and buses.
 - e. Perform insulation test on all interconnecting feeder cables using a 2500 Vdc megohmmeter for 1 minute.
 - f. Test positive and negative feeder buses to ground using a 2500 Vdc megohmmeter for 1 minute.
 - g. Verify load measuring and reclosing functions.
 2. Verify proper operation of all interlocks and Kirk key schemes.
- E. Dc Relays:
1. Verify proper operation and setting of all relays including rate of rise, frame fault relay and rail to earth relay.
 2. Where applicable, settings to be in accordance with approved relay coordination curves.
- F. Rectifier Transformer:
1. Perform insulation tests between windings and between windings to ground and between the core to ground using a 2500 Vdc megohmmeter for 1 minute.
 - a. Pass/fail criteria: Test is passed if megohmmeter is able to hold the specified voltage for 1 minute.
 2. Perform functional tests of temperature protective devices.
- G. Rectifiers:
1. Perform insulation tests between the diode strings and rectifier enclosure using a 2500 Vdc megohmmeter for one minute.
 - a. Pass/fail criteria: Test is passed if megohmmeter is able to hold the specified voltage for 1 minute.
 2. Perform insulation tests between the enclosure and ground using a 2500 Vdc ohmmeter for 1 minute.
 - a. Pass/fail criteria: Test is passed if megohmmeter is able to hold the specified voltage for 1 minute.
 3. Perform a functional test of all temperature, protective, monitoring and alarm devices.

-
- H. Emergency trip stations (ETS): Perform functional test.
- I. Substation Automation System:
1. Repeat tests specified above in Part 2 under Paragraph titled "Factory Acceptance Test."
 2. Demonstrate with actual field activation of functions to the extent possible.
- J. SCADA: Repeat tests specified above in Part 2 under Paragraph titled "Factory Acceptance Test."
- K. Transfer Trip: Perform complete functional test of transfer trip, verifying transfer tripping at adjacent substations in accordance with the requirements in Section 34 21 19, TES Dc Switchgear.
- L. Frame Fault (Device 64HS & GS) Tests:
1. Connection: As shown in the one-line diagram.
 2. Test: Simulate a 750 Vdc to frame fault by passing low dc current levels through the relays.
 3. Criteria: Maximum total clearing time including operation of the 64HS & GS relay, the substation lock-out relay, and the tripping of the main ac and dc feeder breakers shall not exceed 300 ms.
 4. At the time of testing, provide graphical outputs, including time characteristics, onsite for review and approval.
 5. In the event that certain test conditions do not conform to the test procedure, make necessary field adjustments, perform necessary calculations to demonstrate successful test completion, present the calculation method to Engineer for review, and include with the test report.
- M. Rail Voltage Monitoring and Grounding Devices Tests:
1. Test: Demonstrate proper function of the rail-to-earth relay and rail-to-earth grounding device.
 - a. Simulate rail-to-earth voltages and currents.
 - b. Show that the substation will alarm, trip, and short circuit rail to earth when the voltage and currents exceed the alarm, trip, and short circuit points specified in Section 34 21 33, TES Rail Voltage Monitoring and Grounding System.
- N. Battery:
1. Perform after substation equipment has been installed onsite.
 2. Acceptance tests: Perform in accordance with IEEE 1188.
 3. Terminal connection resistance: Test with a micro ohmmeter. Values shall not exceed those specified in IEEE 1187.
 4. Capacity test: Perform in accordance with IEEE 1188.

5. Perform load test demonstrating that batteries comply with the requirements in Section 34 21 25, TES Dc Control Power, by duplicating the conditions stated under Battery Duty Cycle section.
- O. Battery Charger:
1. Perform after substation equipment has been installed onsite.
 2. Perform acceptance tests in accordance with NEMA PE 5.
- P. Ancillary Systems:
1. Repeat tests specified in Part 2, above under the Paragraph titled "TES Substation Factory Acceptance Test."
- Q. Power Meter:
1. Testing shall be performed by a qualified testing agency using calibrated reference standard devices.
 - a. The test instruments shall be calibrated and traceable to the National Institute of Standards and Technology (NIST).
 - b. Calibrate analog instruments no more than 6 months prior to testing.
 - c. Calibrate digital instruments no more than 12 months prior to the test.
 - d. Provide certificates of calibration for the reference standard devices.
 2. Test for accuracy of the following:
 - a. Four-quadrant energy measurement accuracy: kWh imported, kWh exported, kWh net, kVARh imported, kVARh exported, kVARh net, kVAh imported, kVAh exported, kVAh net.
 - b. Power measurement accuracy including active, reactive and apparent (kW, kVAR and kVA).
 - c. Demand Accuracy.
 - d. L-L and L-N voltage measurement accuracy of every phase.
 - e. Current measurement accuracy of every phase.
 - f. Power Factor.
 - g. Frequency.
 - h. CT accuracy test (10 percent, 20 percent, 30 percent, 40 percent, 50 percent through rated current, including ratio test), CT phase error test, PT accuracy test (including ratio test), burden test of CT circuit.
 3. Verify metering transformer configuration and wiring match the power meter configuration, CT/PT polarities are correct and CT/PT ratios are correct.

3.4 DC FEEDER CABLE FIELD TESTING AND INSPECTION

- A. Before connecting cables to rails or OCS, perform dc insulation-resistance test in accordance with NETA ATS Section 7.3.3, Cables, Medium- and High-Voltage, using a dc high-potential test set.

- B. Perform visual and mechanical inspection of cable in accordance with NETA ATS Section 7.3.3.

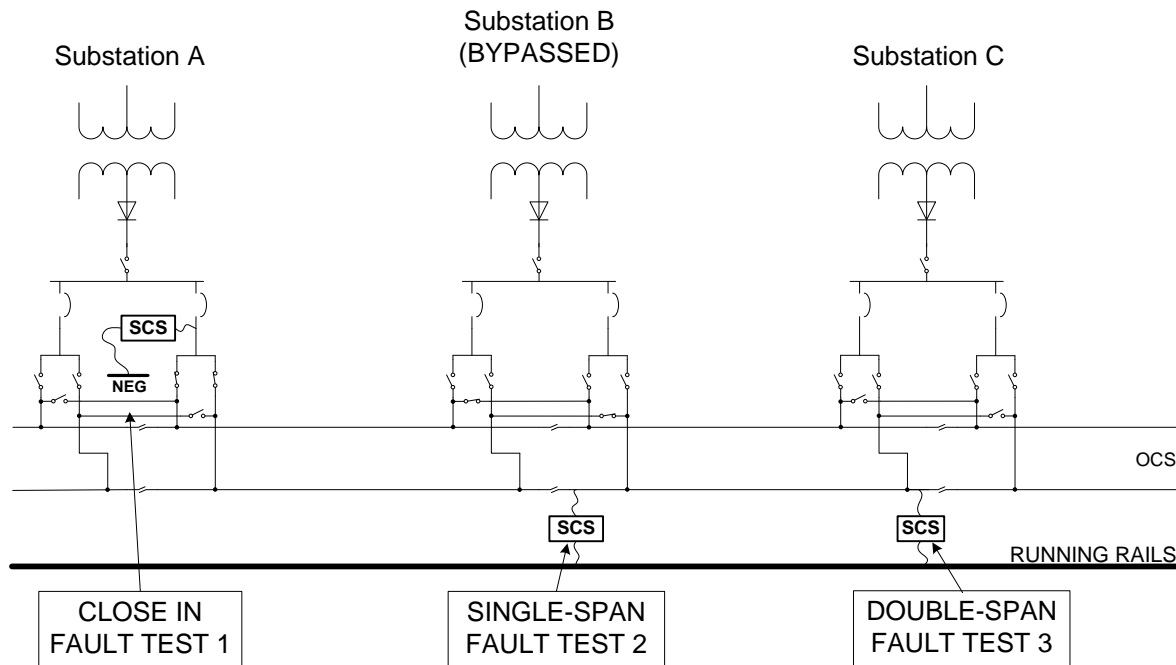

3.5 TES SUBSTATION ENERGIZATION

- A. Obtain permission from Engineer before energizing substation.
- B. Rectifier Transformers: Adjust transformer taps for optimum dc output voltage based on ac service voltage at each location.

3.6 INTEGRATED TES TESTING

- A. General Requirements:
 - 1. Perform in cooperation with other disciplines to demonstrate the proper function of the TES.
 - 2. Tests shall demonstrate that all interfaces are correct and operable.
 - 3. Provide test procedure and test report unless stated otherwise.
- B. Short Circuit Test:
 - 1. Location: Perform the test using the area encompassed by three consecutive substations, as selected by the Engineer (see Figure 1, below).
 - 2. Disconnect Switch Configuration: Perform this test with dc disconnect switches at the center substation (Substation B) in bypass mode, to effectively remove from the circuit the OCS section insulators associated with that substation.
 - 3. Disable the automatic tripping elements of the dc breakers during testing in order to obtain data of actual fault current levels.
 - 4. Energize only Substation A for each test. The substations on both sides of Substation A and Substation C must all be de-energized.

Figure 1 - Diagram for Close-in, Single-Span and Double-Span Fault Tests

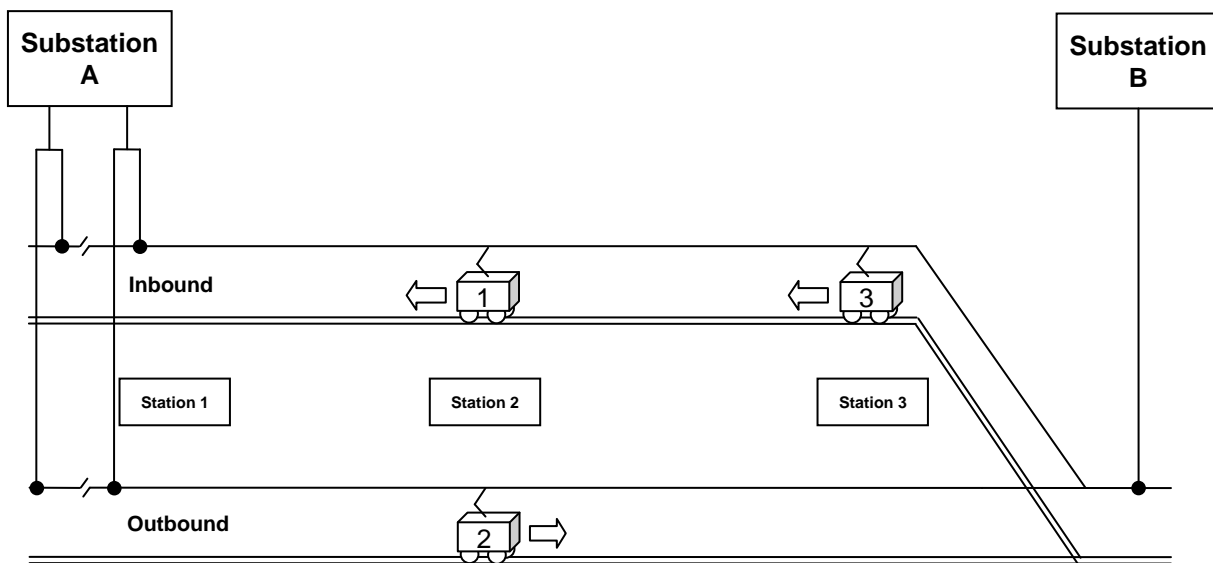

5. Close-in Fault Test 1:
 - a. Purpose: To determine system I_{max} and adjust protection relay settings.
 - b. Preparation: Place a jumper across line and load terminals of the feeder breaker and move to the connected position.
 - c. Test: Using a short circuit switch (SCS) apply a bolted fault from line side of the dc feeder breaker to the negative bus.
 - d. After Test: Verify that the dc breaker trips according to protection coordination study.

6. Single-Span Fault Test 2:
 - a. Purpose: To capture the upper limit of the di/dt range on dc protective relays.
 - b. Test: Using a short circuit switch (SCS) apply a bolted fault from messenger wire to rail at Substation B.
 - c. After Test: Verify and apply new protective settings if necessary.
 - d. Re-test: Repeat Single-Span Fault Test with new settings to verify that the breaker trips according to new protection setting.

-
7. Double-Span Fault Test 3:
 - a. Purpose: To capture the lower limit of the di/dt range on dc protective relays.
 - b. Test: Using a short circuit switch (SCS) apply a bolted fault from messenger to rail at the location furthest from the feed point of the substation under test.
 - c. After Test: Verify that the dc breaker trips according to protection coordination study.
 - C. Rail Voltage Monitoring and Grounding Devices Tests:
 1. Initial Chart Recording:
 - a. For each substation, provide a 48-hour chart recording of the rail-to-earth voltages and currents measured at the terminals of the negative cubicle during simulated revenue service.
 - b. Set horizontal and vertical scale such that both time duration and magnitude of rail-to-earth voltages are clearly readable.
 - c. Resolution shall be no less than 100 ms for time and 2 V for voltage
 2. Adjustment: Iteratively adjust the annunciation and trip setpoints until optimum settings have been determined to the satisfaction of Engineer. This process may require several weeks or more of monitoring and adjusting settings. Submit settings to Engineer after the following conditions are met:
 - a. The substation remains on line for 14 days without a nuisance trip (tripping under normal operation without apparent reason) including times when adjacent substations are removed from service for at least 1 hour.
 - b. The recommended settings conform to IEEE 80 for safe touch and step potential.
 3. Final Record Chart Recording:
 - a. For each substation, after the rail voltage monitoring and grounding devices have been set and the settings accepted by Engineer, provide a 48-hour chart recording of rail-to-earth voltages and currents measured at terminals of dc switchgear.
 - b. Set horizontal scale so that both time duration and magnitude of rail-to-earth voltages are clearly readable.
 - c. Make recording on a weekday, during actual or simulated revenue service and make a part of the as-built record documentation.
 - D. Train Start Test:
 1. Engineer will provide the test procedure and will conduct the test. Provide support as requested by the Engineer and submit test report.
 2. Location: Test will be performed using the area encompassed by two consecutive substations, as selected by the Engineer (see Figure 2, below).

- 3. Purpose:
 - a. Verify that TES substations will allow multiple trains to start under full load.
 - b. Adjust protection relay settings.
- 4. Testing Instruments: Provide two chart recorders to monitor di/dt.
- 5. Personnel: Provide a technician for two days.
- 6. Test Support: Connect chart recorders in the two substations under test. Adjust protection relay settings if necessary, as determined by test results.

Figure 2 - Diagram for Train Start Test

- E. VMF APS and ETS Test:
 - 1. Test APS with the streetcar vehicle. Verify the operation as described in Section 34 21 70, VMF TES Control and APS.
 - 2. Test must include verification and proper operation of the following equipment:
 - a. APS control cabinet.
 - b. APS disconnect switch.
 - c. VMF Ac MCC.
 - d. VMF ETS pushbuttons.
 - e. Shop TPSS S1 ac and dc switchgear.

PART 4 - MEASUREMENT AND PAYMENT**4.1 MEASUREMENT**

A. The quantities of accepted work will be measured in the following units. All measurements will be plan measure except for authorized changes.

1. Description: Lump Sum

4.2 PAYMENT

A. Payment will be made at the respective unit or lump-sum price listed in the proposal and shall be full compensation for all labor, materials, and equipment necessary to complete the respective unit in place. There will be no separate measurement or payment for any item of work not specifically identified and listed in the proposal, and all such work shall be considered a subsidiary item with all costs pertaining thereto included in the prices for other items listed in the proposal. At the Engineer's option, partial payment may be made for any lump sum item listed in the proposal, providing that the Contractor is diligently and satisfactorily pursuing full completion of such partially complete item in accordance with the approved job progress schedule.

END OF SECTION

THIS PAGE INTENTIONALLY LEFT BLANK

SECTION 34 21 95**TES OPERATION AND MAINTENANCE DATA****PART 1 - GENERAL****1.1 SUMMARY**

- A. This Section includes Operation and Maintenance (O&M) Manual for TES Work.

1.2 RELATED SECTIONS

- A. SECTION 34 21 96 – TES Project Record Documents
B. SECTION 34 21 97 – TES Demonstration and Training

1.3 SUBMITTALS

- A. Procedures: Section 01 33 00, Submittal Procedures.
- B. Quality Assurance:
1. Submit names, qualifications, and a sample of similar work for each person who will be involved in producing the O&M Manual, within 90 days after NTP.
 2. Submit O&M Manual outline minimum 30 days before starting work on O&M Manual.
 3. Submit specified Quality Control checklist at the same time as the O&M Manual signed by the quality checker.
- C. O&M Manual:
1. Submit minimum of 120 days before scheduled energization of first substation. Ensure that O&M Manual is approved prior to starting training of Owner's maintenance and operations personnel as required by Section 34 21 97, TES Demonstration and Training.
 2. Submit an electronic version in PDF format for review.
 - a. Include a page and PDF bookmark for each tab that will be inserted in the hard copy final version.
 - b. If the initial submittal does not include the required Quality Control Checklist and the specified O&M Manual formatting, organization, and content it will not be reviewed in detail.
 3. After final approval of submitted O&M Manual submit 10 hard copy sets and 5 electronic copies on CD.
- D. Renewal Parts Catalog:
1. Submit sample within 90 days of NTP.
 2. Submit minimum of 90 days before scheduled energization of first substation.
 3. Submit an electronic version in pdf format for review.

4. After final approval of submitted Renewal Parts Catalog submit 10 hard copy sets and 5 electronic copies on CD.

1.4 QUALITY ASSURANCE

- A. Comply with the requirements of the Project Quality Plan.
- B. Qualifications:
 1. The O&M Manual must be laid out and assembled by a person with the following competence:
 - a. Skilled in organization with experience producing manuals or other large documents of this kind.
 - b. Competent at using the word processing program used, including the ability to create a template for headings to be used throughout the document and produce an automatic table of contents.
 - c. Competent at using Adobe Acrobat and producing hierarchical bookmarks
 2. Each written portion of the O&M Manual must be produced or edited by a person or persons with the following competence:
 - a. Skilled in writing in English with proper paragraph construction, sentence construction, grammar, spelling, and punctuation.
 - b. An ability to write clearly and concisely.
 - c. An ability to organize the written material in such a way that it is easy to navigate.
 - d. Familiar with operation, troubleshooting, and maintenance of the equipment included in the manual.
 3. Submit the names and qualifications of the persons who will be involved in production of the manual, describe the role of each person, and provide a sample of comparable work produced by each person.
- C. Quality Control:
 1. Prepare an O&M Manual outline including headings and two levels of subheadings for submittal. Verify that the approved outline is used to assemble the O&M Manual.
 2. Prepare an O&M Manual Quality Checklist including the following and verify that each item has been included before submittal:
 - a. Each requirement listed in the paragraph below titled "Format."
 - b. Each piece of equipment that will be included in the O&M Manual.
 - c. Each type of content required by the Specifications.

PART 2 - PRODUCTS**2.1 OPERATION AND MAINTENANCE MANUAL****A. Format:**

1. If the Manual has multiple volumes, include the following in each volume, specific to that volume of the manual:
 - a. Frontispiece: Preceding and facing the title page, showing a recognizable illustration of the equipment described.
 - b. Title Page: Include the name and function of the equipment, manufacturer's identification number(s), and the Contract Specifications number(s) and title(s).
 - c. Table of Contents: List the sections and subsection titles with the page on which each starts and a list of included drawings for each section or subsection.
2. Consecutively number each page, restarting the numbering for each volume, with the volume number included in the page number. For example, Page 2-36 would be the page number of the 36th page in Volume 2.
3. Present content in a logical hierarchy with headings and subheadings in a consistent format that make it easy to navigate the manual.
4. PDF Format:
 - a. Create a hierarchy of bookmarks, with each major section as a top-level bookmark, and subsections as bookmark subheadings.
 - b. The bookmarks must match the structure of the table of contents and include the headings and subheadings in the same hierarchical structure.
5. Hard Copy Format:
 - a. Dividers: Insert dividers with identifying tabs to separate sections of the manual.
 - b. Pages: 8-1/2 inches by 11 inches in size or folded to that size.
 - c. Binders: Heavy duty, D-ring, locking, three-ring binders not filled to more than 2/3 of their capacity.
 - d. Paper: 47 pound bond.

B. General Requirements for Content:

1. Information shall cover the exact equipment provided and shall not consist of marked up general catalog data.
2. Delete information on material or equipment not used.
3. Include drawings and diagrams for major assemblies and subassemblies.

4. Include descriptive brochures providing physical and functional description of the equipment.
 - a. Brochures shall be original, printed materials or high quality color prints from electronic media.
 - b. Brochures shall not be photocopies.
 5. Do not include as-built drawings in the O&M Manual. Submit separately in accordance with Section 34 21 96, TES Project Record Documents.
- C. Organization of Content:
1. Provide major headings and subheadings corresponding to major topics and subtopics that present the information in a logical, easy to access format.
 2. Include only major headings and subheadings in the Table of Contents.
 3. Provide a tab for each major heading and subheading.
 4. Within the manual, at the beginning of each subtopic include a detailed list of the individual items included in that subtopic, with page numbers.
 5. Manufacturer's publications must be organized in one of two ways:
 - a. Placed in the same section as Contractor-written content by system, such as "Dc switchgear," or
 - b. Separate from Contractor-written content, but organized by system using the same structure used to organize the Contractor-written content. Contractor written content must include references to manufacturer's publications including the following:
 - 1) Subsection name and number.
 - 2) O&M Manual sequential page number.
 - 3) Manufacturer name and model number.
 - 4) Title of publication.
 6. Titles of headings and subheadings must be generic, such as "HVAC System," not names of manufacturers or part numbers.
- D. Content: Provide maintenance and operating instructions for all equipment and systems installed, including the following:
1. Installation:
 - a. Pre-installation inspection.
 - b. Installation verification checklist.
 - c. Torque: Include manufacturer's recommended torque information for each type of bolted connection used.
 - d. Calibration.
 - e. Preparation for operation for initial installation.

2. Operation:
 - a. Performance specifications.
 - b. Operating limitations.
 - c. Include step-by-step procedures for
 - 1) Starting: Provide start-up checklist.
 - 2) Restarting.
 - 3) Operating.
 - 4) Shutdown.
 - 5) Emergency requirements.
3. Preventative Maintenance:
 - a. Include step-by-step procedures for
 - 1) Inspection.
 - 2) Operation checks.
 - 3) Cleaning.
 - 4) Lubrication.
 - 5) Adjustments.
 - b. Indicate required tools
 - c. Indicate annual maintenance schedule
4. Corrective Maintenance:
 - a. Include step-by-step procedures for
 - 1) Repair.
 - 2) Disassembly.
 - 3) Reassembly of the equipment for proper operation.
 - b. Indicate required tools
5. Overhaul:
 - a. Parameters that indicate an overhaul is required.
 - b. Disassembly.
 - c. Parts to replace.
 - d. Adjustment, cleaning, etc. for parts not replaced.
 - e. Reassembly of the equipment for proper operation.
 - f. Preparation for operation after overhaul.

- E. Appendices: Include the following in a separate volume, each in its own tabbed appendix. Do not include this information in the body of the manual:
1. Glossary, abbreviations, symbols.
 2. Bill of Materials:
 - a. Organize by system and subsystem.
 - b. Provide complete with all necessary information, including part numbers and catalog item numbers if applicable, for identifying parts.
 - c. Identify parts or assemblies obtained from another manufacturer by the name of that manufacturer and the manufacturer's identifying part number.
 - d. Supply the size, capacity, or other characteristics of the part if required for identification.
 3. Torque table for all types of bolts used in bolted connections.
 4. Spare Parts and Special Tools:
 - a. Provide a list of contractual and recommended spare parts
 - b. Provide a list of special tools required for maintenance.
 5. Safety: Safety precautions.
 6. Testing: Copies of Field Acceptance Testing procedures.
 7. Warranty information.
 8. Other appendices as needed.

2.2 RENEWAL PARTS CATALOG

- A. Organize by system and subsystem.
- B. Enumerate and describe every component with its related parts, including supplier's number, Contractor's number, Drawings Apparatus Reference number, and provision for entry of the Owner's part number.
- C. Use cut-away and exploded drawings to aid identification of parts not readily identified by description.
- D. Parts common to different components, such as bolts and nuts, shall bear the same Contractor's number with a reference to other components in which they are found.
- E. For each part or component, list all the assemblies of which it is a component.
- F. Standard parts:
 1. Identify commercially available items such as common standard fastenings, fuses, lamps, galvanized pipe, nuts and bolts, etc., by standard hardware nomenclature besides Contractor's number.
 2. Furnish a separate list of these items in the catalog with adequate information to order these items through commercial channels.

- G. Furnish a complete itemization of servicing materials (oils, paints, special compounds, greases, etc.) required and component requiring its use.
- H. Furnish ordering and procurement information required for components and subassemblies to the lowest level replaceable component. Ensure that the Owner will not need to request information from Contractor at a future date.
- I. Submit lists in the form of reproducible Bills of Materials suitable for loose-leaf binding adequately cross-referenced to related drawings and Bills of Material.

PART 3 - EXECUTION

3.1 REVISIONS

- A. If subsequent modifications to the equipment require revised operation and maintenance procedures:
 - 1. Revise the O&M Manuals to show the equipment as installed.
 - 2. Revise by issue of replacement pages to the final O&M Manuals, or by reissue of the O&M Manuals, at the Engineer's option.
 - 3. Submit the revisions to the O&M Manuals not later than 30 Days following revision of the equipment.

3.2 SPECIAL SUBMITTAL PROCEDURES

- A. Work with Engineer to review O&M Manuals together in a meeting environment, if requested
- B. Revise manuals in accordance with directions and comments from both meeting inputs and formal mark-ups (by reviewers)
- C. Resubmit as required in accordance with Section 01 33 00, Submittal Procedures.

PART 4 - MEASUREMENT AND PAYMENT

4.1 MEASUREMENT

- A. The quantities of accepted work will be measured in the following units. All measurements will be plan measure except for authorized changes.
 - 1. Description: Lump Sum

4.2 PAYMENT

- A. Payment will be made at the respective unit or lump-sum price listed in the proposal and shall be full compensation for all labor, materials, and equipment necessary to complete the respective unit in place. There will be no separate measurement or payment for any item of work not specifically identified and listed in the proposal, and all such work shall be considered a subsidiary item with all costs pertaining thereto included in the prices for other items listed in the proposal. At the Engineer's option, partial payment may be made for any lump sum item listed in the proposal, providing that the Contractor is diligently and satisfactorily pursuing full completion of such partially complete item in accordance with the approved job progress schedule.

END OF SECTION

THIS PAGE INTENTIONALLY LEFT BLANK

SECTION 34 21 96**TES PROJECT RECORD DOCUMENTS****PART 1 - GENERAL****1.1 SUMMARY**

- A. This Section includes requirements for TES as-built drawings.

1.2 SUBMITTALS

- A. Procedures: Section 01 33 00, Submittal Procedures.
- B. Incremental Submission of As-Built Drawings
1. Upon request from the Engineer, make available copies of selected as-built drawings in color.
 2. Incremental as-built drawings requested by the Engineer shall be stamped "As-Built", signed, and dated by Contractor.
- C. Final Submission of As-Built Drawings:
1. At completion of Work, and before requesting Final Acceptance of Work, deliver Final as-built drawings to the Engineer.
 2. Stamp drawings "As-Built Record."
 3. Submit five hard copies and three electronic copies on CD or DVD in AutoCAD (latest version) and in PDF formats.
 4. Submit as-built drawings and include the following information:
 - a. Date of submission.
 - b. Project title and number.
 - c. Contractor's name and address.
 - d. Certification that as-built drawings as submitted are complete and accurate.
 - e. Signature of Contractor or its authorized representative.

PART 2 - PRODUCTS

Not Used.

PART 3 - EXECUTION**3.1 MAINTENANCE OF AS-BUILT DRAWINGS**

- A. During factory wiring and testing of a TPSS, or other equipment, immediately update drawings or documents affected by a change in the circuits or equipment.

- B. During on-site installation and testing, maintain in each TPSS plan books of approved shop drawings, and immediately update drawings affected by a change in the circuits or equipment.
- C. Protect drawings from damage.
- D. Update as-built documents continuously during the course of construction.

PART 4 - MEASUREMENT AND PAYMENT

4.1 MEASUREMENT

- A. The quantities of accepted work will be measured in the following units. All measurements will be plan measure except for authorized changes.
 - 1. Description: Lump Sum

4.2 PAYMENT

- A. Payment will be made at the respective unit or lump-sum price listed in the proposal and shall be full compensation for all labor, materials, and equipment necessary to complete the respective unit in place. There will be no separate measurement or payment for any item of work not specifically identified and listed in the proposal, and all such work shall be considered a subsidiary item with all costs pertaining thereto included in the prices for other items listed in the proposal. At the Engineer's option, partial payment may be made for any lump sum item listed in the proposal, providing that the Contractor is diligently and satisfactorily pursuing full completion of such partially complete item in accordance with the approved job progress schedule.

END OF SECTION

SECTION 34 21 97**TES DEMONSTRATION AND TRAINING****PART 1 - GENERAL****1.1 SUMMARY**

- A. This Section includes the following:
 - 1. Requirements for instruction and training of Operations and Maintenance personnel in the management, operation, and maintenance of provided equipment and systems.
 - 2. Requirements for training materials.

1.2 SUBMITTALS

- A. Procedures: Section 01 33 00, Submittal Procedures.
- B. Submit the names and qualifications of the persons who will be involved in production of the manuals, describe the role of each person, and provide a sample of comparable work produced by each person.
- C. Submit resumes of proposed instructors.
- D. Submit an electronic version of the Instructor Guide three months before the start of training in PDF format for review.
- E. Submit an electronic version of the Training Manual 90 days before the start of training in PDF format for review.
- F. After final approval of submitted Instructor Guide submit 3 hard copies.
- G. After final approval of submitted Training Manual submit 10 hard copies.
- H. Training shall not commence until the Training Program Plan and Instructor Guides are approved by the Engineer.
- I. Submit videos before the start of training if videos are used in training. Submit on DVD in MPEG-4 format.
- J. Submit Training Reports not later than 1 week after completion of course.

1.3 QUALITY ASSURANCE

- A. Comply with the requirements of the Project Quality Plan.
- B. Qualifications:
 - 1. The Instructor Guide and Training Manual must The O&M Manual must be laid out and assembled by a person with the following competence:
 - a. Skilled in organization with experience producing manuals of this kind.

- b. Competent at using the word processing program used, including the ability to create a template for headings to be used throughout the document and produce an automatic table of contents.
- c. Competent at using Adobe Acrobat and producing hierarchical bookmarks
2. Each written portion of the Instructor Guide and Training Manual must be produced or edited by a person or persons with the following competence:
 - a. Skilled in writing in English with proper paragraph construction, sentence construction, grammar, spelling, and punctuation.
 - b. An ability to write clearly and concisely.
 - c. An ability to organize a training program in a logical way so that each lesson builds on the previous lessons and trainees are able to achieve the specified goals.
 - d. Familiar with operation, troubleshooting, and maintenance of the equipment included in the manual.
3. Submit the names and qualifications of the persons who will be involved in production of these manuals, describe the role of each person, and provide a sample of comparable work produced by each person.
4. Qualifications of Instructors:
 - a. Must be fluent in English.
 - b. Must be experienced in the system for which they are conducting training.
 - c. Must have minimum two years experience conducting training.

PART 2 - PRODUCTS

2.1 TRAINING PROGRAM

- A. Design program to train the Owner's maintenance and operations personnel in details of furnished equipment and systems and enable them to operate, service, and maintain systems such that systems will perform and continue to perform in accordance with requirements of this Contract.
- B. Provide a logically related sequence of separate training sessions covering System Operation, Overall System Maintenance, and Equipment Operation and Maintenance.
- C. Ensure operations and maintenance personnel are fully trained prior to start of passenger service.
- D. Operations and Maintenance Personnel Qualifications:
 1. Assume personnel to be trained have only basic skills pertinent to their craft.
 2. Assume Operations and Maintenance personnel to be trained have no knowledge of features of specific equipment or systems to be taught.

2.2 TRAINING COURSE

- A. Course requirements:
1. Include classroom, hands-on, and/or field instruction, as appropriate, and models, mockups, documentation, and aids to carry out the program.
 2. Class Sizes: Unless otherwise specified elsewhere in these Specifications, the Owner will be able to send up to 10 participants to the training course specified.
 3. Duration: Maximum 8 hours per day.
 4. Training Location and Classrooms: Conduct training sessions in facilities provided by the Owner. The facilities will be equipped with tables, chairs, and one cabinet with lock hasp.
 5. Provide video players and projectors as required.
 6. Provide literature and equipment necessary to train personnel.
 7. Training on actual system equipment and spare equipment will be permitted; however, such use shall not interfere with pre-revenue tests and system demonstrations.
- B. Equipment Operations and Maintenance Training:
1. Provide training in the operation and maintenance of equipment systems provided.
 2. Provide hardware training including, but not limited to:
 - a. Equipment operation.
 - b. Troubleshooting procedures, including field diagnostics and test equipment.
 - c. Interface with other equipment.
 - d. Preventative maintenance procedures.
 3. Provide Operations and Maintenance personnel with a thorough knowledge of the equipment and its operation, its interface with other equipment, and the capabilities and use of test equipment.
 4. Provide participants with theoretical background and hands-on experience in troubleshooting, repair procedures, and preventive maintenance procedures.
 5. Enable Operations and Maintenance personnel to develop a self sufficient hardware maintenance team for the equipment.
 6. Include a page by page review and explanation of approved O&M Manuals.
- C. Supplemental Training:
1. Provide extended, duplicate, or additional training for the systems provided, as deemed necessary by the Engineer, due to modification of systems and equipment configuration made after completion of the scheduled training course.

- D. Training Materials:
1. Use approved O&M Manuals and as-built drawings as part of training materials, but do not duplicate this information or incorporate it into the training materials specified in this Section.
 2. Provide each course participant with a copy of the Training Manual and other pertinent material, including O&M Manual and As-Built Drawings, prior to commencement of course.
 3. Upon completion of the course, instructor's manuals, training manuals, and training aids become the property of the Owner unless such items are specifically exempted by the Engineer.
 4. The Owner reserves the right to copy training materials and aids for use in Owner-conducted training courses.
 5. Provide special tools, equipment, training aids, and other materials required to train course participants. Provide sufficient quantity of special tools and other training equipment for the number of participants attending the course.
 6. Use actual hardware and photographs taken during the manufacturing process wherever possible. Actual hardware used for training must pass re-inspection and acceptance testing prior to being placed in service.
 7. Videos:
 - a. Do not use videos as a replacement for a classroom instructor, or as the primary training vehicle.
 - b. Use prerecorded lectures only as supplementary training material.
 - c. The Owner shall have the right to take video recordings of training courses presented by the Contractor. The Owner shall also have the right to use these videos to train personnel in the future.

2.3 INSTRUCTOR GUIDE

- A. Provide Owner-specific materials prepared specifically for training Owner's personnel.
- B. The Instructor Guide may not be combined with the Training Manual, and must include the following:
1. A one-page training program summary including a list of each training session with a brief description and the estimated time required for the session.
 2. A table of contents.
 3. An introduction explaining the overall format for training.
 4. A separate section for each training session.
 5. A disk containing a separate Microsoft PowerPoint file for each training session. Name each file with its respective training session number.
 6. Other materials used in support of the lesson.
 7. One complete student handout package.
 8. One copy of material referenced in the lesson.

- C. Electronic Format for Review:
1. Create a bookmark for the one page summary, the table of contents, the introduction, and one for each training session.
 2. Include a PDF version of the PowerPoint slides for each training session.
 3. Other materials used in the lesson. Materials that have already been submitted separately, such as O&M Manuals, do not need to be submitted with the Instructor Guide.
- D. Final Hard Copy Format:
1. Pages: 8-1/2 inches by 11 inches in size or folded to that size.
 2. Binders: Heavy duty, D-ring, locking, three-ring binders not filled to more than 2/3 of their capacity.
 3. Paper: 47 pound bond.
 4. Include a heavy-duty plastic CD holder sized to fit in the three-ring binder and include one Power Point disk with each Instructor Guide.
- E. Each section of the Instructor Guide, representing one training session, must include the following information in the order listed below:
1. A short summary section including the following:
 - a. Training session number.
 - b. Lesson name: Concise but descriptive of what is included.
 - c. Estimated time to teach: This is an approximate period that may vary due to student number and knowledge level. It should correspond to the time listed in the training program summary at the beginning of the Instructor Guide.
 - d. Objectives: One or more performance-based objectives each of which specifies a measurable minimum level of performance considered acceptable.
 - e. Training session location, such as classroom, substation, or Shop facility.
 - f. Instructor materials needed for the training section, such as the following:
 - 1) Laptop and video projector
 - 2) PowerPoint Presentation
 - 3) Equipment, such as tools parts for disassembly
 - g. Trainee reference materials needed for that particular training session, in addition to the Training Manual, such as the following:
 - 1) O&M Manual
 - 2) As-Built Drawings
 - 3) Test equipment

2. A presentation section, including the following:
 - a. A short paragraph introducing the subject covered by the session.
 - b. A brief description of the lesson objectives.
 - c. A descriptive outline of all the topics to be included in the session, including the point at which to show each PowerPoint slide (reference slide number), certain sections of the O&M Manual (reference section and page number), certain drawings from the as-built drawings (reference drawing number), or other training materials.
 3. A closing section including any evaluations, tests, or quizzes given in conjunction with this lesson
- F. The Instructor Guide must be detailed enough to accomplish the following:
1. Serve as a written record of the specific facts and information.
 2. Allow another instructor with knowledge of the area to teach the class.
 3. Ensure that the subject delivery is consistent each time the lesson is given.
 4. Allow replication of all evaluations, tests, and quizzes given in conjunction with this lesson.

2.4 TRAINING MANUAL FOR TRAINEE'S USE

- A. The Training Manual will be furnished to each trainee, and must include the following:
1. The one-page training program summary from the Instructor's Manual.
 2. A table of contents.
 3. The introduction explaining the overall format for training from the Instructor's Manual.
 4. A separate section for each training session, similar to the Instructor's Manual but with the differences noted:
 - a. The summary section of the Instructor's Manual without the list of Instructor Materials.
 - b. The presentation section of the Instructor's Manual, but with full page power point slides added for each section at the end of the section.
- B. Electronic Format for Review:
1. Create a bookmark for the one page summary, the table of contents, the introduction, and one for each training session.
 2. Include a PDF version of the PowerPoint slides for each training session.
 3. Other materials used in the lesson. Materials that have already been submitted separately, such as O&M Manuals, do not need to be submitted with the Instructor Guide.
- C. Final Hard Copy Format:
1. Pages: 8-1/2 inches by 11 inches in size or folded to that size.

2. Binders: Heavy duty, D-ring, locking, three-ring binders not filled to more than 2/3 of their capacity.
3. Paper: 47 pound bond.

PART 3 - EXECUTION

3.1 TRAINING REPORTS

- A. Grading system: Establish to report progress of each trainee during the course and identify requirements for further training for each participant.
- B. Training Reports:
 1. Include graded tests (without names) with raw scores.
 2. Include a summary of the results of monitoring and evaluating.
 3. Include records of student attendance and performance.

PART 4 - MEASUREMENT AND PAYMENT

4.1 MEASUREMENT

- A. The quantities of accepted work will be measured in the following units. All measurements will be plan measure except for authorized changes.
 1. Description: Lump Sum

4.2 PAYMENT

- A. Payment will be made at the respective unit or lump-sum price listed in the proposal and shall be full compensation for all labor, materials, and equipment necessary to complete the respective unit in place. There will be no separate measurement or payment for any item of work not specifically identified and listed in the proposal, and all such work shall be considered a subsidiary item with all costs pertaining thereto included in the prices for other items listed in the proposal. At the Engineer's option, partial payment may be made for any lump sum item listed in the proposal, providing that the Contractor is diligently and satisfactorily pursuing full completion of such partially complete item in accordance with the approved job progress schedule.

END OF SECTION

THIS PAGE INTENTIONALLY LEFT BLANK

SECTION 34 22 05**TES COMMON WORK RESULTS FOR CONDUCTORS AND CABLE****PART 1 - GENERAL****1.1 SUMMARY**

- A. This Section includes the following:
 - 1. Products used with TES conductors and cable.
 - 2. Wire and cable type requirements.
 - 3. Requirements for circuit separation.
 - 4. Requirements for installation of TES conductors and cable for electrical power and traction power.
- B. This Section does not apply to the installation of OCS conductors.

1.2 RELATED SECTIONS

- A. SECTION 34 21 05 – Common Work Results for TES
- B. SECTION 34 21 90 – TES Testing
- C. SECTION 34 21 96 – TES Project Record Documents
- D. SECTION 34 22 29 – TES Raceway and Equipment Hangers and Supports

1.3 DEFINITIONS

- A. Low-voltage cable: A single or multi-conductor insulated cable rated 2000 V or less.

1.4 REFERENCED STANDARDS

- A. Section incorporates by reference the latest revisions of the following documents:
- B. Institute of Electrical and Electronics Engineers (IEEE)
 - 1. IEEE 1210, Standard Tests for Determining Compatibility of Cable-Pulling Lubricants With Wire and Cable
- C. National Electrical Contractors Association (NECA)
 - 1. NECA 1, Standard Practice of Good Workmanship in Electrical Contracting
- D. National Fire Protection Association (NFPA)
 - 1. NFPA 70, National Electrical Code
- E. Underwriters Laboratories (UL)
 - 1. UL 224, Extruded Insulating Tubing

1.5 SUBMITTALS

- A. Procedures: Section 01 33 00, Submittal Procedures.
- B. Submit Product Data on the following items:
 - 1. Cable pulling equipment, including tension measuring device with calibration certificate.
 - 2. Cable racks.
- C. Cable Pulling Calculations:
 - 1. Submit cable pulling calculations for approval no later than 30 working days before scheduled installation. Include the following information:
 - a. Circuit identification
 - b. Manufacturer and type of cable
 - c. Cable dimensions
 - d. Unit weight of cable
 - e. Maximum permissible pulling tension
 - f. Maximum permissible side-wall pressure
 - g. Pulling lubricant used and assumed friction coefficient.
 - h. Estimated length of pull
 - i. Recommended direction of pull
 - j. Total degrees of conduit bend
 - k. Inside radius and position in run of conduit bends
 - l. Conduit size
 - m. Calculated jam ratio
 - n. Calculated peak pulling tension
 - o. Calculated peak side-wall pressure
- D. Cable Pulling Report:
 - 1. Submit final report for each cable installation within 30 working days of installation and include the following information:
 - a. Information originally provided with Cable Pulling Calculations (see above)
 - b. Date of installation and name of Engineer's witness
 - c. Actual length of pull
 - d. Actual direction of pull
 - e. Actual maximum pulling tension

- f. Calculated maximum sidewall pressure at worst-case conduit ell and pulling sheave.
- E. As-built Drawings:
 - 1. Submit as specified in Section 34 21 96, TES Project Record Documents.
 - 2. Show splices in cable on as-built drawings.

1.6 NOTIFICATION

- A. Notify Engineer 48 hours before cable pulling operations where cable pulling calculations were required.
- B. Adjust schedule as necessary to permit observation.

1.7 DELIVERY, STORAGE, AND HANDLING

- A. Ship each unit securely wrapped, packaged, and labeled for safe handling in shipment and to avoid damage.
- B. Deliver wires and cables to the site in unbroken standard coils or reels with attached tag bearing manufacturer's name, wire trade name, and listing information.
- C. Store wire and cable in secure and dry storage facility, in accordance with NECA 1.

PART 2 - PRODUCTS

2.1 CONDUIT MANDREL AND BRUSH

- A. Mandrel: Flexible non-metallic segmented type.
 - 1. Size no smaller than 1/4 inch less than the size of conduit.
 - 2. Approved Manufacturer: Greenlee, or approved equal.
- B. Brush: Wire brush type, sized for conduit.

2.2 CABLE PULLING LUBRICANT

- A. Commercially-available non-petroleum-based product that will not damage cable sheathing or insulation or cause corrosion to metal boxes or fittings of the raceway system.
 - 1. Product shall be approved by the cable manufacturer.
 - 2. Product shall meet the requirements of IEEE 1210.
- B. Provide special-formulation pulling lubricant where required due to low ambient temperature or where a lower coefficient of friction is required to meet pulling tension and sidewall pressure limits.
- C. Acceptable Manufacturer/Product:
 - 1. Polywater J, or Polywater WJ for low ambient temperature, or approved equal.

2.3 CABLE RACKS

- A. UL listed, heavy duty, glass-reinforced nylon, suitable for the support of low voltage insulated cables without additional insulators, with sufficient load capacity to support the installed and future cables.
- B. Size: Racks shall be of adequate length to support the number of cables indicated without stacking, with space for 25 percent additional cables.

2.4 CABLE PROTECTORS

- A. Nylon, flanged, split tube to insert in duct end to protect cable from damage.
- B. Approved Manufacturers/Products:
 - 1. Greenlee 488-2 or 488-3;
 - 2. Condux 08042301 or 08042300; or approved equal.

2.5 INSULATED CABLE CLAMPS

- A. Thermoplastic elastomer, high-dielectric split-sleeve cable bushing and two-piece, galvanized or stainless-steel clamp assembly for installation on hot-dip galvanized framing channel.
- B. See Section 34 22 29, TES Raceway and Equipment Hangers and Supports, for framing channel requirements.
- C. Approved Manufacturer/Product: B-Line, Insulclamp, or approved equal.

2.6 CABLE SUPPORTS

- A. Designed to support cable in vertical conduit and provide a watertight seal.
- B. Malleable or ductile iron with hot-dip galvanized finish, threaded for rigid conduit.
- C. Approved Manufacturer/Product: OZ Gedney Cable Support, Type C Compound, or approved equal.

2.7 CABLE TIES (TIE WRAPS)

- A. Self-extinguishing nylon with a temperature range of minus 40 degrees F to 185 degrees F.
- B. Cable ties shall have a locking hub or head with a stainless steel locking barb on one end and a taper on the other end.
- C. Width:
 - 1. Dc feeder cables: Minimum 1/2 inch.
 - 2. Other applications: Adequate to prevent damage to wire or cable insulation.
- D. Strength: Minimum 250 pounds for dc feeder cables.
- E. Outdoor use: Ultraviolet-resistant material.

2.8 SPLICE AND TERMINAL CONNECTORS

- A. Fittings shall be tool-applied, compression, compatible with conductors on which they are used, and listed for use with provided cable.

- B. No. 10 AWG and smaller conductors:
 - 1. Wire terminations: Heavy duty, ring type, nylon insulated.
 - 2. Splices: Self-insulating or provided with an insulating cap or heat-shrink insulating sleeve.
- C. No. 8 AWG to No. 4 AWG: Provide double-bolted NEMA two-hole terminals where rotation of a single-bolted terminal would result in contact or unacceptable clearance with other conductors or the enclosure.
- D. No. 2 AWG to No. 3/0 AWG: Provide terminals with two NEMA-standard bolt holes in tongue unless otherwise indicated.
- E. No. 4/0 AWG and larger conductors: Provide long-barrel, double-compression type, with two NEMA standard bolt holes in tongue unless otherwise indicated.
- F. Compression Tools:
 - 1. Shall apply a hexagonal compression using mechanical, electrical, or hydraulic power mechanism that ensures a complete compression cycle.
 - 2. Shall permanently imprint die information on the completed connection.

2.9 INSULATING MATERIAL FOR SPLICES AND TERMINATIONS

- A. Provide insulating material for terminations of type accepted by Engineer for the particular use, location, and voltage. Mark each tape package to indicate shelf-life expiration date.
- B. Electrical insulating tape for general use: Vinyl plastic with rubber based pressure sensitive adhesive, pliable from temperatures of minus 18 degrees C to 105 degrees C. Verify tape has the following minimum properties when tested in accordance with ASTM D3005:
 - 1. Thickness: 7 mils.
 - 2. Breaking Strength: 15 pounds per inch.
 - 3. Elongation: 200 percent.
 - 4. Dielectric Strength: 10 kV/mil.
 - 5. Insulation Resistance (Direct method of electrolytic corrosion): 10 megohms.
- C. Rubber electrical insulating tape for protective overwrapping: Silicone rubber with a silicone pressure-sensitive adhesive. Verify tape has the following minimum properties when tested in accordance with ASTM D1000:
 - 1. Elongation: 525 percent.
 - 2. Dielectric Strength: 13 kV.
 - 3. Insulation Resistance (Indirect Method of Electrolytic Corrosion): 10 megohms.
- D. Heat shrink tubing: Product meeting the electrical and environmental requirements of the application.

2.10 FIREPROOFING TAPE

- A. Fire and arc proof tape, self extinguishing, and compatible with conductor insulation and jacket.
- B. Tape shall not deteriorate when subjected to water, salt water, gases or sewage.
- C. Approved Manufacturer/Product: 3M, Type 77, or approved equal.

2.11 IDENTIFICATION

- A. Wire Sleeves: Non-fading, heat-shrink polyolefin, machine-printed sleeve labels.
 - 1. Approved Manufacturer/Product: Brady PermaSleeve.
 - 2. Material: Polyolefin heat shrinkable tubing.
 - 3. Standards: UL 224.
 - 4. Color: White with black printing, unless specified or indicated otherwise.
- B. Cable Tags: Non-fading, polyethylene, slide in, printed cable tags with holes for attachment to cable with plastic cable ties.
 - 1. Numbers shall be 1-inch high.
 - 2. Approved Manufacturer/Product: Almetek Industries, Inc., E-Z Tags, or approved equal.

PART 3 - EXECUTION**3.1 WIRE AND CABLE TYPE REQUIREMENTS**

- A. Substation power circuits, ac and dc: 600 V single conductor cable.
- B. Within switchgear, where not exposed to medium voltage: 600 V switchboard wire.
- C. Within ac switchgear: 600 V switchboard wire.
- D. Within dc switchgear and rectifier: 2 kV switchboard wire.
- E. Dc feeders: 2 kV single-conductor dc feeder cable.
- F. Conductors installed in the same raceway or vault as 2 kV feeder cables (e.g. blue light conductors): 2 kV control wire.
- G. Control wiring to dc disconnect switches: 2 kV control wire.
- H. Cable sizes up to 4/0 AWG in cable tray: Multi-conductor cable.
- I. Surge arresters: Extra-flexible cable.
- J. Use bare conductor for ground wire only.

3.2 CIRCUIT SEPARATION

- A. Physically separate conductors and cables on circuits of different voltages or systems to reduce the possibility of unsafe conditions, interference, or equipment damage.

- B. The following major circuit groups shall not be harnessed or bundled together, shall not run in the same conduit and shall be physically separated and secured in vaults, enclosures, and cable trays.
1. Low-voltage ac circuits.
 2. Low-voltage dc circuits: 600 V rated.
 3. Low-voltage dc circuits: 2 kV rated.
 4. Dc control circuits.
 5. Dc traction power positive feeders.
 6. Dc traction power negative feeders.
- C. Where these circuit groups share vaults, enclosures, or cable trays, physically separate and secure such that there is a minimum separation of 6 inches.
- D. Where dc traction power positive and negative feeders share the same vault, rack them on opposite sides of the vault.

3.3 MANDRELLING RACEWAYS

- A. Mandrel and brush raceways before installing cable.

3.4 INSTALLING CABLE IN RACEWAY

- A. General Requirements:
1. Notify the Engineer 48 hours before installing cables.
 2. Inspect wire and cable for damage before installation. Damaged cable shall not be installed.
 3. Cable shall not exceed fill limits of NFPA 70.
 4. Install all cables to be placed in one duct simultaneously.
 5. Install conductors and cables in accordance with NECA 1 and as recommended by the manufacturer.
 6. Use extreme care in installing cables so as to avoid twisting, kinking, or injuring cable or its sheath.
 7. Apply generous amounts of approved cable pulling lubricant.
 8. Use an approved wire cable grip extending not less than 18 inches back from the end of the cable.
 9. Do not bend cables during installation, either permanently or temporarily, to radii less than 12 times the outer diameters, except where conditions make the specified radius impractical and shorter radii are permitted by the manufacturer.
 10. Immediately seal ends of cable until cable is terminated and protected in manholes.

- B. Cable Pulling Calculations:
1. Perform and submit cable pulling calculations before installing cable in raceways. Refer to Submittals Article, above, for documentation requirements.
 2. Perform calculations using industry-accepted pulling software such as PolyWater's 'Pull-Planner.'
 3. Calculate Jam Ratio, maximum pulling tension, and maximum side-wall pressure to ensure cable installation will meet manufacturer's requirements.
 4. If cable pulling calculations indicate that manufacturer-recommended installation tension or sidewall pressure may be exceeded, recalculate after making one or more of the following changes, as needed, until calculated tension and sidewall pressure are acceptable:
 - a. Modify pulling method.
 - b. Reverse pulling direction.
 - c. Provide special pulling lubricant.
 - d. Modify raceway components.
 - e. Add vaults or pull-boxes so that installation will be acceptable.
 5. If Jam Ratio indicates a tendency for cables to jam, provide factory- or field-installed cable-wrap or binding before installation or provide factory-multiplexed cables so that jamming will not occur.
 6. Revisions to raceway system, cables, or pulling method shall be made at no cost to Owner.
- C. Pulling Tension:
1. Do not exceed manufacturer's recommended pulling tension and sidewall pressure for cable installed.
 2. Tensiometer: Provide a calibrated tensiometer that indicates pulling force in pounds at the pulling end under the following circumstances:
 - a. Conduit runs with over 180 degrees of bend, whether pulled by hand or with a cable puller.
 - b. All cable installations where a cable puller is used, whether powered or unpowered.
 3. During cable installation, record the highest cable tension.
 4. Using measured cable tension, calculate the highest resulting sidewall pressure, both within conduit run and at pulling sheaves.
 5. Exceeding manufacturer's recommendations for either parameter will require replacement of cables at no cost to the Owner.
- D. Installation with power winches:
1. Power winches shall not be used for pulling conductors smaller than 2 AWG in raceways.

2. Provide suitable installation equipment to prevent cutting and abrasion of conduits and wire.
 3. If used, sheaves and pulleys must limit cable sidewall pressure and bend radius to acceptable values.
 4. Use lubricant and installation procedures as recommended by the cable manufacturer and suitable for expected ambient temperatures.
 5. Where conductors are pulled using more than three persons at the pulling end, meet requirements for installation with power winches.
- E. Installation in Manholes and Pullboxes:
1. Pump water out of manholes, hand holes, and pull chambers before installing cable and maintain manholes, hand holes, and pull chambers in a dry condition while cables are being pulled.
 2. Brush or swab dry and mandrel each conduit before installing cable.
 3. Install cables in the lowest available duct.
 4. Route cables along the manhole or handhole walls providing the longest possible slack or in accordance with approved installation drawings. Form cables closely parallel to the walls.
 5. Prevent cable interference with duct entrances.
 6. Provide cable racks spaced at a maximum of 4 feet and secure cable to racks using cable ties.
 7. Existing manholes and handholes: Where new ducts are to be terminated or where new cables are to be installed, modify the existing locations of cables, cable supports, and grounding as required to provide a properly arranged and supported installation.
- F. Cable Pulling Report: After cable installation, prepare and submit for approval a Cable Pulling Report documenting conditions during cable installation. Refer to Submittals Article, above, for documentation requirements.
- G. Bundle cable and conductors neatly and securely with nylon cable ties in branch circuit panelboards, cabinets and control boards. Bundle power cables separately from control cables.

3.5 INSTALLING SPLICES AND TERMINATIONS

- A. Use continuous lengths of wire and cable between power source and equipment. Splices are subject to approval by Engineer.
- B. Install splices and terminations in accordance with the cable and terminator manufacturers' instructions.
- C. Where splices are required and approved by Engineer, make them only in approved outlet, junction or pull boxes, or in equipment cabinets.
- D. Splice multi-conductor cables in accordance with the cable and splice-kit manufacturers' recommendations.

- E. Tools:
1. Use compression splice and terminator installation tools and installation techniques recommended by the manufacturer and as specified above.
 2. Conductor sizes through No. 6 AWG: Mechanical hand tools may be used, with dies for each conductor size as recommended by the manufacturer.
 3. Conductor sizes larger than No. 6 AWG: Use hydraulic tools with hexagonal or circumferential dies as recommended by the manufacturer.
 4. Insulate splices to a level equal to that of the cable.
 5. Fixture Wire: Make splices in lighting circuits with insulated crimp-type connectors.
 6. Control and Switchboard Wires: Terminate each wire held with screw-type terminals using an insulated sleeve (nylon), ring-tongue-type or locking spade-type, crimp-on lugs.
- F. Torque bolted connections with a calibrated torque wrench to values specified in Section 34 21 05, Common Work Results for TES.

3.6 FIREPROOFING DC FEEDERS

- A. Provide fireproofing tape in manholes, handholes, cable vaults, switchgear, and where exposed in other locations.
- B. Tape each conductor individually.
- C. Conductors that make up a single circuit may be taped as a group in intermediate vaults only when all three of the following conditions are satisfied:
1. The cables have twisted during installation such that it is impossible to tape each individual conductor.
 2. The cables are not spliced in the vault in question
 3. The Engineer agrees that it is impossible to tape each individual conductor at that location.
- D. Under no conditions shall conductors from different circuits be taped together as a group.

3.7 IDENTIFICATION

- A. Identify conductors cables at all terminal points and duct entrances at junction boxes, switches, circuit breakers, and pullboxes with tags as specified.
- B. Engineer will furnish cable numbering system.
- C. Wire sleeves: Print cable destination and number of conductors in cable as described in Contract Drawings.
- D. Wire and Cable tags: Attach with plastic tie wraps.

3.8 FIELD QUALITY CONTROL

- A. Cable Pulling Report: For installations where cable pulling calculations were required, provide cable tension measuring equipment and record the highest cable tension experienced during the installation. Submit Cable Pulling Report for approval.

- B. Wire and Cable Field Testing: Perform in compliance with Section 34 21 90, TES Testing.

PART 4 - MEASUREMENT AND PAYMENT

4.1 MEASUREMENT

- A. The quantities of accepted work will be measured in the following units. All measurements will be plan measure except for authorized changes.
1. Description: Lump Sum

4.2 PAYMENT

- A. Payment will be made at the respective unit or lump-sum price listed in the proposal and shall be full compensation for all labor, materials, and equipment necessary to complete the respective unit in place. There will be no separate measurement or payment for any item of work not specifically identified and listed in the proposal, and all such work shall be considered a subsidiary item with all costs pertaining thereto included in the prices for other items listed in the proposal. At the Engineer's option, partial payment may be made for any lump sum item listed in the proposal, providing that the Contractor is diligently and satisfactorily pursuing full completion of such partially complete item in accordance with the approved job progress schedule.

END OF SECTION

THIS PAGE INTENTIONALLY LEFT BLANK

SECTION 34 22 10**TES LOW-VOLTAGE CONDUCTORS AND CABLE****PART 1 - GENERAL****1.1 SUMMARY**

- A. This Section includes the following:
 - 1. Low-voltage wire and cable
 - 2. Dc traction power cable
 - 3. Extra-flexible cable, bare and insulated
 - 4. Wiring connections, splices, and terminations

1.2 RELATED SECTIONS

- A. SECTION 34 21 90 – TES Testing
- B. SECTION 34 21 96 – TES Project Record Documents
- C. SECTION 34 22 05 – TES Common Work Results for Conductors and Cable

1.3 DEFINITIONS

- A. Low-voltage cable: A single or multi-conductor insulated cable rated 2000 V or less.

1.4 REFERENCED STANDARDS

- A. Section incorporates by reference the latest revisions of the following documents:
- B. ASTM International (ASTM)
 - 1. ASTM B3, Specification for Soft or Annealed Copper Wire
 - 2. ASTM B8, Standard Specification for Concentric-Lay-Stranded Copper Conductors, Hard, Medium-Hard, or Soft
 - 3. ASTM B33, Standard Specification for Tinned Soft or Annealed Copper Wire for Electrical Purposes
 - 4. ASTM B172, Standard Specification for Rope-Lay-Stranded Copper Conductors Having Bunch-Stranded Members, for Electrical Conductors
 - 5. ASTM B496, Standard Specification for Compact Round Concentric-Lay-Stranded Copper Conductors
 - 6. ASTM D747, Standard Test Method for Apparent Bending Modulus of Plastics by Means of a Cantilever Beam
 - 7. ASTM D1000, Test Methods for Pressure-Sensitive Adhesive-Coated Tapes Used for Electrical and Electronic Applications
 - 8. ASTM D3005, Specification for Low-Temperature Resistant Vinyl Chloride Plastic Pressure-Sensitive Electrical Insulating Tape

- C. Insulated Cable Engineering Association (ICEA)
 - 1. ICEA S-73-532/NEMA WC57, Standard for Control, Thermocouple Extension, and Instrumentation Cables
 - 2. ICEA S-95-658/NEMA WC 70, Power Cables Rated 2000 Volts or Less for the Distribution of Electrical Energy
- D. Institute of Electrical and Electronics Engineers (IEEE)
 - 1. IEEE 1202, Standard for Flame-Propagation Testing of Wire and Cable
- E. InterNational Electrical Testing Association, (NETA)
 - 1. ANSI/NETA ATS, Standard for Acceptance Testing Specifications for Electrical Power Equipment and Systems
- F. International Organization for Standardization (ISO)
 - 1. ISO 9001, Quality Management Systems - Requirements
- G. National Electrical Contractors Association
 - 1. NECA 1, Standard Practices for Good Workmanship in Electrical Contracting
- H. National Fire Protection Association
 - 1. NFPA 70, National Electrical Code
- I. Underwriter's Laboratories (UL)
 - 1. UL 44, Thermoset-Insulated Wires and Cables
 - 2. UL 1277, Electrical Power and Control Tray Cables with Optional Optical-Fiber Member
 - 3. UL 1581, Reference Standard for Electrical Wires, Cables, and Flexible Cords

1.5 SUBMITTALS

- A. Procedures: Section 01 33 00, Submittal Procedures.
- B. Submit Product Data on the following items:
 - 1. Wire and cable of each type.
 - 2. Splicing and terminating materials.
- C. Product information for each type and size of wire and cable shall include the following:
 - 1. Manufacturer of wire and cable, and certificate of compliance.
 - 2. Number and size of strands composing each conductor.
 - 3. Conductor insulation composition and thickness.
 - 4. Average overall diameter of finished wire and cable.
 - 5. Storage instructions.
 - 6. Minimum training radius, in inches.

7. Minimum insulation resistance in megohms per 1000 feet at 30 degrees C ambient.
 8. Jacket composition and thickness in mils.
 9. Total number of conductors per cable.
 10. Shield material (if any) and thickness.
 11. Conductor resistance and reactance in ohms per 1000 feet at 25 degrees C ambient.
 12. Conductor ampacity at 30 degrees C ambient for 600 V wire and cable.
- D. Submit Test Procedures and Test Reports:
1. Certified test reports for Design Tests, Production Tests, and Flame Tests.
 2. Test procedures, including details of proposed test equipment.
 3. Field Test Report, including the following:
 - a. Continuity test.
 - b. Phase test for three-phase circuits.
 - c. Insulation resistance test.
- E. As-built Drawings:
1. Submit as specified in Section 34 21 96, TES Project Record Documents.
 2. Show splices in low-voltage cable, where permitted by Engineer, on as-built drawings.

1.6 QUALITY ASSURANCE

- A. Comply with the requirements of the Project Quality Plan.
- B. Qualifications: Cable manufacturer shall have a minimum of five years experience successfully manufacturing the type of cable to be supplied by that manufacturer.

1.7 DELIVERY, STORAGE, AND HANDLING

- A. See Section 34 22 05, TES Common Work Results for Conductors and Cable.

PART 2 - PRODUCTS

2.1 GENERAL REQUIREMENTS

- A. Wire and Cable Marking: Verify that wire and cable markings comply with applicable NEMA and NFPA 70 requirements.

2.2 600 V SINGLE CONDUCTOR WIRE AND CABLE

- A. Conductor Material: ICEA stranded or solid copper meeting requirements of ASTM B3, soft drawn.

- B. Conductor Type:
 - 1. Size 12 AWG and Smaller: Solid conductor.
 - 2. Size 10 AWG and Larger: Class B stranded.
- C. Insulation:
 - 1. Size No. 14 to 1/0 AWG: Type XHHW-2, cross-linked polyethylene insulated in accordance with ICEA S-95-658/NEMA WC 70.
 - 2. Size 2/0 AWG and Larger: Type XHHW-2, cross-linked polyethylene insulated in accordance with ICEA S-95-658/NEMA WC 70 or type RHH/RHW, ethylene-propylene-rubber-insulated in accordance with ICEA S-95-658/NEMA WC 70.
 - 3. Voltage Rating: 600 V.
 - 4. Temperature Rating: Insulation temperature rating not less than 90 degrees C in wet or dry locations.

2.3 600 V SWITCHBOARD WIRE

- A. Conductor: Stranded, tinned, annealed copper per ASTM B33.
- B. Insulation: Thermoset, chemically cross-linked polyethylene, UL Type SIS, 90 degrees C. Flame rated per UL 1581, Vertical Flame (VW-1).

2.4 2 KV SWITCHBOARD WIRE

- A. Conductor: Annealed, tinned copper per ASTM B33, flexible-stranded per ASTM B172.
- B. Insulation: Flame-retardant, crosslinked polyolefin, rated 2000 V, 110 C, 45 mil minimum thickness.
- C. Acceptable Manufacturer/Product: Rockbestos Exane-1068A, or approved equal.

2.5 2 KV CONTROL WIRE

- A. Conductor: Stranded, tinned, annealed copper per ASTM B33.
- B. Insulation: Thermoset, cross-linked polyethylene or ethylene propylene meeting the requirements of ICEA S-73-532/NEMA WC57, rated 2000 V, 90 degrees C wet or dry, single- or multi-conductor, suitable for installation in raceway.

2.6 2 KV SINGLE-CONDUCTOR DC FEEDER CABLE

- A. General:
 - 1. Type RHW-2, 90 degrees C, unshielded, size as indicated.
 - 2. Insulation and jacket system shall be rated for application up to 2 kV.
 - 3. Cable shall be suitable for use on service and feeders, indoors or outdoors, in wet or dry locations, or in raceway/duct. Cable shall be sunlight resistant and suitable for installation at 0 degrees C and in cable tray.
 - 4. Cables shall meet or exceed the requirements of ICEA S-95-658/NEMA WC 70, UL 44, and UL 1581.

5. Cable shall be manufactured and tested under the control of a Quality Assurance program that meets the requirements of ISO 9001.
- B. Conductors: Annealed, uncoated copper, round or compact, concentric-lay stranded per ASTM B496.
 - C. Insulation: Ethylene-propylene rubber (EPR) meeting electrical and physical requirements of ICEA S-95-658/NEMA WC 70.
 1. No polyethylene shall be allowed as a component of the insulation and EPR insulation shall be compounded by the cable manufacturer.
 2. For flexibility, the insulation compound shall have an Apparent Bending Modulus of 2600 psi or less in accordance with Standard Test Method ASTM D747.
 - D. Overall Sheath Jacket: Thermosetting chlorinated polyethylene unless noted otherwise.
 - E. Approved Manufacturer/Product: The Okonite Company, Okoguard-Okolon TS-CPE, or approved equal.

2.7 EXTRA-FLEXIBLE CABLE

- A. Conductor: Copper; Class I stranding, or as indicated; ASTM B3, ASTM B172; bare or insulated.
- B. Insulation:
 1. Type RHW-2, 90 degrees C, unshielded, rated 2 kV, size as indicated.
 2. Ethylene-propylene rubber (EPR) as specified above under 2 kV single-conductor cable.

2.8 MULTI-CONDUCTOR, LOW-VOLTAGE CABLE

- A. Provide multi-conductor cable conforming to ICEA S-95-658/NEMA WC 70, approved for use in cable tray, with the following additional requirements:
 1. Conductors: Bare, soft annealed copper per ASTM B33, Class B stranded in accordance with ASTM B8. Quantity of conductors as indicated.
 2. Insulation: As specified above for single conductor cable.
 3. Overall Covering: Cable shall be provided with sunlight-resistant jacket over the insulation meeting the flame-spread requirements of UL 1277.
 4. Multiple conductors for control wire shall be minimum of 14 AWG stranded copper.
 5. Insulation Rating: 600 V.
- B. Multi-conductor cable shall be made by assembling individual or twisted pairs of insulated conductors into a tight cylindrical form using fillers that are compatible with other materials in the cable. The jacket used shall fit tightly to form a firm assembly.

2.9 FIXTURE WIRE

- A. Provide fixture wire conforming to the following requirements:
 1. Type: SF-2 silicone rubber insulated.
 2. Conductor: Stranded copper conductor 16 AWG or larger as indicated.

2.10 BARE CONDUCTOR

- A. ASTM B3, Class B stranded, annealed soft-drawn copper conductor unless otherwise indicated. Size as indicated.

2.11 COLOR CODING OF CONDUCTORS (600 V)

- A. Identify individual conductors of multi-conductor cables by means of solid colors, stripes, or printing, unless otherwise approved by Engineer.
- B. Jacket Printing: Mark conductors in compliance with NFPA 70, and with the following additional information:
 - 1. Number of conductors (for multi-conductor cables).
 - 2. Date of manufacture.
- C. Footage Marker: Provide the following cable types with footage printing on the jacket or a footage marker tape under the jacket.
 - 1. Multi-conductor cables.
- D. Ac Power Cables: Conform to the following color coding for power cables:

Conductor	480Y/277 V	208Y/120 V
Phase A	Brown	Black
Phase B	Orange	Red
Phase C	Yellow	Blue
Neutral	White	White
Ground	Green	Green

- E. Use solid color insulation or solid color coating for branch circuit phase conductors No. 10 AWG and smaller and neutral and equipment ground conductors.
- F. Use a background color other than white or green for phase conductors with colored tracers.

2.12 FACTORY ASSEMBLY

- A. Wire and cable type requirements: See Section 34 22 05, TES Common Work Results for Conductors and Cable.
- B. Circuit Separation: See Section 34 22 05, TES Common Work Results for Conductors and Cable.
- C. Install wires and cables in accordance with manufacturer's recommendations and restrictions.
- D. Do not bend cables during installation, either permanently or temporarily, to radii less than 12 times the outer diameters, except where conditions make the specified radius impractical and shorter radii are permitted by the manufacturer.
- E. Bundle cable and conductors neatly and securely with cable ties in branch circuit panelboards, cabinets and control boards. Bundle power cables separately from control cables.
- F. Install wire and cable in conduit as indicated and in accordance with NECA 1.

- G. Terminations:
1. Use continuous lengths of wire and cable between power source and equipment. Splices are not permitted.
 2. Tools:
 - a. Use terminator installation tools and installation techniques recommended by the manufacturer.
 - b. Conductor sizes through No. 6 AWG: Mechanical hand tools may be used, with dies for each conductor size as recommended by the manufacturer.
 - c. Conductor sizes larger than No. 6 AWG: Use hydraulic tools with hexagonal or circumferential dies as recommended by the manufacturer.
 - d. Use compression tools that permanently imprint die information on the completed connection.
 3. Control and Switchboard Wires: Terminate each wire held with screw-type terminals using an insulated sleeve (nylon), ring-tongue-type or locking spade-type, crimp-on lugs.
- H. Wiring Within Enclosures:
1. Requirements below apply to all electrical equipment enclosures, including junction boxes.
 2. General:
 - a. Install wire as continuous lengths inside substations, without splices between terminations.
 - b. Wiring entering a removable enclosure shall be harnessed and secured to facilitate removal.
 - c. Wires from different wire runs shall not be harnessed together or with internal wiring.
 3. Wire support:
 - a. Attach wiring within enclosures to conductor supports rigidly fastened to the enclosure structure.
 - b. Wiring supports shall be free from edges, bolt heads, or similar areas and shall not interfere with nor contact enclosure covers.
 - c. Secure wiring such that there is no strain on wire terminals, multi-pin connector pins, or other wire termination hardware.
 - d. Use of adhesive wire supports is not permitted.
 4. Wire dress:
 - a. Allow sufficient slack at terminals to accommodate vibration, equipment shifting, cover removal, and component replacement.

- b. Provide additional wire length for re-termination of wires without excess tension or splicing as follows:
 - 1) No. 10 and smaller: Three re-terminations.
 - 2) No. 8 and larger: Two re-terminations.
- 5. Terminal blocks: Provide with insulated covers.
- 6. Cubicle doors: Protect wires at hinges.

2.13 SOURCE QUALITY CONTROL

A. Design Tests:

- 1. 2 kV Single-Conductor Dc Feeder Cable:
 - a. Cable shall meet the requirements of the following flame test procedures:
 - 1) UL 44 vertical tray flame test.
 - 2) IEEE 1202 for 1/0 AWG & larger.
- 2. Multi-Conductor 600 V Type TC Control Cable:
 - a. Flame Test: Completed cable shall pass the UL 1581 vertical tray flame test for cable assemblies.

B. Production Tests:

- 1. 2 kV single-conductor dc feeder cable: Perform on each reel of 2 kV single conductor dc feeder cable.
 - a. High voltage ac withstand test: Perform at the potential indicated in the table below after six hours immersion in water and while still submerged. Hold voltage for 5 minutes.

Conductor Size (AWG/kcmil)	Wall Thickness (min average)		Withstand Voltage (kVac)
	EPR	TS-CPE	
8-2	55	30	7.0
1-4/0	65	45	8.0
250-500	75	65	9.5
550-1000	90	65	11.5

- b. Insulation Resistance Test: The insulation resistance constant shall not be less than 15,000 megohms per1000 feet at 15.6 degrees C.
- 2. Submit certified test reports documenting production testing.

PART 3 - EXECUTION

3.1 WIRE AND CABLE TYPE REQUIREMENTS

- A. See Section 34 22 05, TES Common Work Results for Conductors and Cable.

3.2 FIELD INSTALLATION

- A. See Section 34 22 05, TES Common Work Results for Conductors and Cable.

3.3 FIELD QUALITY CONTROL

- A. See Section 34 21 90, TES Testing, for field testing for wire and cable.

PART 4 - MEASUREMENT AND PAYMENT**4.1 MEASUREMENT**

- A. The quantities of accepted work will be measured in the following units. All measurements will be plan measure except for authorized changes.
1. Description: Lump Sum

4.2 PAYMENT

- A. Payment will be made at the respective unit or lump-sum price listed in the proposal and shall be full compensation for all labor, materials, and equipment necessary to complete the respective unit in place. There will be no separate measurement or payment for any item of work not specifically identified and listed in the proposal, and all such work shall be considered a subsidiary item with all costs pertaining thereto included in the prices for other items listed in the proposal. At the Engineer's option, partial payment may be made for any lump sum item listed in the proposal, providing that the Contractor is diligently and satisfactorily pursuing full completion of such partially complete item in accordance with the approved job progress schedule.

SECTION 34 22 15

TES FIBER OPTIC CABLE

PART 1 - GENERAL

1.1 SUMMARY

- A. This Section includes the following:
 - 1. Outside plant single mode fiber optic cable for transfer trip between TES substations.
 - 2. Patch panel for fiber optic cable.

1.2 RELATED SECTIONS

- A. SECTION 26 05 43 – Systemwide Electrical Underground Ductbanks and Raceways for Systems
- B. SECTION 34 21 06 – TES Common Work Results for Metals
- C. SECTION 34 21 31 – TES Substation Automation System
- D. SECTION 34 21 90 – TES Testing
- E. SECTION 34 22 05 – TES Common Work Results for Conductors and Cable
- F. SECTION 34 22 33 – TES Raceway and Boxes

1.3 DEFINITIONS

- A. See RUS Bulletin 1753F-601a.

1.4 REFERENCED STANDARDS

- A. Section incorporates by reference the latest revisions of the following documents:
- B. ASTM International (ASTM)
 - 1. ASTM D1248, Standard Specification for Polyethylene Plastics Extrusion Materials for Wire and Cable
- C. U.S. Department of Agriculture, Rural Utilities Service (RUS)
 - 1. RUS Bulletin 1753F-601a (PE-90a), Minimum Performance Specification for Fiber Optic Cables
- D. National Fire Protection Association (NFPA)
 - 1. NFPA 70, National Electrical Code (NEC)
- E. National Electrical Contractors Association (NECA)
 - 1. NECA 301, Installing and Testing Fiber Optics

- F. International Organization of Standardization (ISO)
 - 1. ISO 9001 Standard Quality Management Systems
- G. Telecordia
 - 1. GR-326, Generic Requirements for Single-Mode Optical Connectors and Jumper Assemblies
- H. Telecommunications Industry Association (TIA)
 - 1. TIA-598, Optical Fiber Cabling Coding

1.5 SUBMITTALS

- A. Procedures: Section 01 33 00, Submittal Procedures.
- B. Product Data:
 - 1. Fiber optic cable.
 - 2. Connectors.
 - 3. Splice kits.
- C. Certificates of compliance with specified standards.
- D. Cable identification schedule.
- E. Qualifications:
 - 1. Manufacturer.
 - 2. Foreman for fiber optic cable installation.
 - 3. Splicing technicians.
- F. Installation:
 - 1. Installation plan.
 - 2. Manufacturer's cable installation requirements, including maximum pulling tension, minimum bend radius under tension, minimum final bend radius, and recommended installation methods.
 - 3. Pulling calculations, if cable is pulled.
 - 4. Cable pulling report, if cable is pulled.
 - 5. Manufacturer's installation instructions:
 - a. Connectors.
 - b. Splice kits.
- G. Testing:
 - 1. Test procedure complying with Section 34 21 90, TES Testing.
 - 2. Test report complying with Section 34 21 90, TES Testing, for each segment tested.

1.6 QUALITY ASSURANCE

- A. Comply with the requirements of the Project Quality Plan.
- B. Qualifications:
 - 1. Manufacturer:
 - a. Minimum 5 years of demonstrated experience manufacturing fiber optic cable and minimum 2,000,000 feet of fiber optic cable supplied and successfully installed.
 - b. Quality Assurance Program in place conforming to requirements of ISO 9001.
 - 2. Foreman of fiber installation crew: Minimum 2 years experience installing fiber optic cables in duct systems.
 - 3. Splicing technicians:
 - a. Minimum 2 years prior experience installing, splicing, and testing single-mode fiber optic cable
 - b. Certified fusion splicing technicians with a demonstrated knowledge of industry standards, fiber optic splicing and fiber optic testing equipment.

1.7 DELIVERY, STORAGE, AND HANDLING

- A. Packing:
 - 1. Ship cable on non-returnable wooden reels.
 - 2. Drum Diameter: Minimum 20 times the diameter of cable.
 - 3. Reels: Substantial enough to withstand reasonable handling, designed with inner end of accessible but protected from injury.
 - 4. Cable Ends: Sealed to prevent entrance of moisture and securely fastened to prevent ends from becoming loose during transit.
- B. Ship each run of cable on a separate reel.
- C. Clearly identify each cable reel on the outside flange with the following information:
 - 1. Manufacturer's name.
 - 2. Contract name and number.
 - 3. Cable identification number.
 - 4. Cable length.
 - 5. Date of manufacture.
 - 6. Name, address, and phone number of consignee.
- D. Delivery:
 - 1. Inspect cables at time of delivery at construction site to assure no damage was done during shipping.

2. Inspect every reel for physical damage.
- E. Storage:
1. Store cables on solid surfaces designed to support cable reels which drain adequately and do not allow accumulation of liquids, oils, or chemicals.
 2. Align and protect cable reels so as not to allow reel flanges to damage other reels.
 3. Reseal cable ends promptly when a length is cut from reel.
- F. Handling:
1. Handle cable reels using a sling and spreader attached to a shaft through the reel hubs, or by cradling both flanges between lift truck forks.
 2. Do not lift reels by top reel flange or drop from any height.
 3. Ensure lift truck forks do not touch cable surfaces on reel.
 4. Roll reels in the direction opposite the cable wind on reel.
 5. Do not lay reels flat.

PART 2 - PRODUCTS

2.1 OUTSIDE PLANT FIBER OPTIC CABLE

- A. General:
1. The life expectancy of the cable shall be 25 years for service in a railroad and transit environment.
 2. The cable shall be designed for installation in underground conduit, wet or dry environments, including alternating wet and dry conditions.
- B. Cable Description:
1. Single mode, 12 fiber, all-dielectric, complying with requirements of RUS Bulletin 1753F-601a.
 2. Tensile strength: Minimum 600 pounds, sufficient for the intended installation method and the length of each run.
- C. Fiber: Optimized for wavelength and attenuation per equipment requirements, colored with ultraviolet curable inks complying with color coding of RUS Bulletin 1753F-601a.
- D. Cable Construction:
1. Gel-Filled Loose Tube Buffer:
 - a. Gel: Non-hygroscopic, anti-fungal, non-conductive, homogenous, free from dirt and foreign matter, and readily removable with conventional nontoxic solvents.
 - b. Buffer tube color coding shall comply with TIA-598.
 2. Central Strength Member: Dielectric, overcoated with thermoplastic.

3. Overall strength member: Aramid yarn.
4. Inner Jacket: Black polyethylene, separated from outer jacket by water blocking yarns for mechanical protection.
5. Outer Jacket:
 - a. Suitable for wet and dry locations, dust resistant, and gas tight.
 - b. Extruded low-density, high molecular weight polyethylene, black, complying with ASTM D1248, Type I, Category 5, Class C, Grade E5.
 - c. Permanently marked in accordance with RUS Bulletin 1753F-601a.
- E. Connectors: Comply with Telcordia GR-326.
- F. Cable Management Hardware: Specifically manufactured for cable management of fiber optic cable.
- G. Identification:
 1. Wire sleeves: Comply with requirements in Section 34 22 05 Common Work Results for Conductors and Cable.
 2. Cable tags: Weatherproof, polyolefin, machine printed, white with black lettering, for securing with cable ties. Lettering minimum 1/8-inch high.

2.2 FIBER PATCH PANEL

- A. Type: Rack mounted, unloaded.
- B. Configuration: Minimum 12 ports with connector bulkhead, space for storing 6 meters of each fiber optic cable, tie point for securing fiber cable central member, and effective management of fiber terminations.
- C. Identification: Labeling provisions that correspond to each fiber port location. Labeling shall be viewable from front of panel.
- D. Cable entrance: Provide grommet and cable clamp strain relief.

2.3 FIBER PATCH CORDS

- A. Patch Cord Cable Construction:
 1. Factory-fabricated, flexible fiber optic cable assembly with SC compatible connectors, from manufacturer's standard products lines.
 2. Shall contain a dielectric strength member and a protective outer jacket and allow for small bend radius for installation in space-constrained areas.
 3. Type: Single-Mode Duplex Zip cord.
 4. Acceptable Manufacturer: ADC Krone or approved equal.
- B. Jacket Color: Yellow for single mode.
- C. Connectors:
 1. SC UPC (blue) for patch panel ports.

2. Connector ends for field equipment shall match equipment optical port configuration.
- D. Fiber: Meet the same characteristic requirements of the patch-panel-terminated cable to which it mates.

PART 3 - EXECUTION

3.1 PRIOR TO INSTALLATION OF CABLE

- A. Submit installation plan indicating proposed installation method to Engineer for approval.
1. Installation by Blowing: Verify that conduit intended for use is properly installed for the intended blowing pressure.
 2. Installation by Pulling:
 - a. Submit pulling calculations for each segment in accordance with Section 34 22 05, TES Common Work Results for Conductors and Cable.
 - b. Verify that tensile strength of cable is greater than the calculated pulling tension.

3.2 INSTALLATION OF CABLE

- A. Raceway:
 1. Install cabling in raceway complying with Section 34 22 33, TES Raceway and Boxes, and 26 05 43, Systemwide Electrical Underground Ductbanks and Raceways for Systems. No exposed cabling will be allowed.
 2. Prime and paint exposed raceways in accordance with Section 34 21 06, TES Common Work Results for Metals, to match the color of the structure.
- B. Comply with cable installation requirements in NECA 301.
- C. Provide 50 feet of slack cable in the manhole closest to each substation.

3.3 AFTER INSTALLATION OF CABLE

- A. If cable was pulled, submit cable pulling report for each segment in accordance with Section 34 22 05, TES Common Work Results for Conductors and Cable.
- B. Identification:
 1. Submit a cable identification schedule to the Engineer for approval before applying cable labels.
 2. Identify interior cable and patch cords on both ends less than 3 inches from the termination using wire sleeves.
 3. Identify each cable using cable tags where it enters and leaves each manhole, handhole, or pull box through which it passes.
- C. Connector Installation: Comply with manufacturer's instructions.

3.4 WITHIN SUBSTATION

- A. Install patch panel in substation communications rack.

- B. Terminate outside plant fiber optic cable in patch panel.
- C. Provide fiber patch cords as required for the following applications:
 - 1. From port to port within same patch panel, for fiber cross-connection patching.
 - 2. From patch panel to SAS switch (see Section 34 21 31, TES Substation Automation System).
- D. Patch cords installed within ladder tray and at conduit to equipment transitions shall be installed in flexible corrugated innerduct for protection.

3.5 CABLE MANAGEMENT

- A. Provide horizontal and vertical cable management hardware for cables in manholes, racks, cable trays, and in switchgear.
- B. Perform the following using cable management:
 - 1. Organize cable, arranging it neatly and securely.
 - 2. Arrange cable such that it does not interfere with the future use of or access to unused conduit.
 - 3. Segregate different classes of cable, such as ac power, dc power, ground, and data.
 - 4. Make ports and designation strips visible.
 - 5. Provide permanent circuit identification for cables supported or terminated.

3.6 SPLICING AND TERMINATION

- A. Fiber splicing shall be performed by the fusion splicing method only and placed only in communication equipment enclosures in the substation.
- B. Fiber optic cable shall not be spliced in manholes or handholes unless specifically authorized.
- C. Splices and terminations shall be connectorized and supported in a cabinet or splice enclosure.

3.7 FIELD QUALITY CONTROL

- A. Inspect for the following:
 - 1. Conformance to workmanship standards and practices.
 - 2. Conformance to Contract Documents
 - 3. Correct and secure cabling terminations and connections.
 - 4. Correct and complete labeling and tagging.
- B. Field Testing:
 - 1. Submit test procedures complying with the requirements of Section 34 21 90, TES Testing.

2. Verify that test equipment bears a current calibration sticker, in accordance with Section 34 21 90, TES Testing, before scheduling testing.
 3. Test the following in each substation:
 - a. Power output of fiber optic transmitters
 - b. Sensitivity of fiber optic receivers
 4. Perform the following testing in accordance with NECA 301 after installing cable and installing identification in accordance with this Section:
 - a. Continuity testing.
 5. Perform the following in accordance with NECA 301 on each fiber after splicing is complete and cable is secured in its final position:
 - a. End-to-end insertion loss using an OLTS power meter and source.
 - b. OTDR test.
 6. Perform the following additional tests:
 - a. Bit error ratio: Must be minimum 10^{-13}
 - b. Transmission speed of each circuit.
 - c. Link failure transfer and restoration time
 7. Compare OLTS insertion loss to the loss estimated in the calculated loss budget and include in test report.
- C. Test transfer trip system in accordance with Section 34 21 90, TES Testing, as part of Field Acceptance Testing.

PART 4 - MEASUREMENT AND PAYMENT

4.1 MEASUREMENT

- A. The quantities of accepted work will be measured in the following units. All measurements will be plan measure except for authorized changes.
1. Description: Lump Sum

4.2 PAYMENT

- A. Payment will be made at the respective unit or lump-sum price listed in the proposal and shall be full compensation for all labor, materials, and equipment necessary to complete the respective unit in place. There will be no separate measurement or payment for any item of work not specifically identified and listed in the proposal, and all such work shall be considered a subsidiary item with all costs pertaining thereto included in the prices for other items listed in the proposal. At the Engineer's option, partial payment may be made for any lump sum item listed in the proposal, providing that the Contractor is diligently and satisfactorily pursuing full completion of such partially complete item in accordance with the approved job progress schedule.

END OF SECTION

SECTION 34 22 20

TES RAIL BONDING

PART 1 - GENERAL

1.1 SUMMARY

- A. This Section includes power bonding, cross bonding, and rail connections for traction electrification system.

1.2 REFERENCED STANDARDS

- A. Section incorporates by reference the latest revisions of the following documents:
- B. International Organization for Standardization (ISO)
 - 1. ISO 9001, Quality Management Systems - Requirements
- C. Underwriter's Laboratories (UL)
 - 1. UL 467, Grounding and Bonding Equipment

1.3 SUBMITTALS

- A. Procedures: Section 01 33 00, Submittal Procedures.
- B. Product Data: Description and catalog cut of proposed components and hardware items to be provided including the following:
 - 1. Proposed stub-end bonds for each size cable to be used identifying part number, wire size, stranding, and terminations.
 - 2. Weld material.
 - 3. Exothermic weld molds for each type of application.
- C. Testing Documents:
 - 1. Submit rail bonding testing documents under this Section.

1.4 QUALITY ASSURANCE

- A. Comply with the requirements of the Project Quality Plan.
- B. Engineer will inspect bonds for conformance to these Specifications.
- C. Remove bonds rejected by Engineer that have been deemed poor quality by Engineer and replace with a new bond at Contractor's expense.
- D. Qualifications: Manufacturer of exothermic welding system shall be ISO 9001 certified.

PART 2 - PRODUCTS**2.1 EXOTHERMIC WELDING SYSTEM**

- A. Welding mixture: Copper based exothermic mixture designed for permanent grounding or bonding connections, approved for outdoor use, and meeting UL 467.
- B. Molds: Specifically designed for exothermic welding of cable to web of rail.
- C. Stub-End Bond: Pre-formed, extra-flexible stranded copper cable, designed to assist exothermic weld process to a rail web, sized for each cable type.
- D. Approved Manufacturers/Products:
 - 1. Erico, Cadweld;
 - 2. Continental Industries, Thermoweld; or approved equal.

PART 3 - EXECUTION**3.1 INSTALLATION**

- A. Connect negative returns to rail and provide crossbonding at locations shown on Contract Drawings.
- B. Install rail connections and bonding in accordance with approved procedures, installation drawings, and in accordance with manufacturer's recommendations.
- C. Maintain running rail electrical isolation from ground.

3.2 RAIL CONNECTIONS

- A. Heat rail to remove trapped moisture.
- B. Clean surfaces of rails with a vitrified grinding wheel before welding.
- C. Clean rails with "Inhibisol" or other approved nontoxic solvent to remove traces of dirt and debris from grinding operations.
- D. Exothermically weld stub-end bond to rail.
- E. Stagger at intervals of not less than 8 inches on centerline.
- F. Center bonds: Weld to web of rail within plus or minus 1/4 inch of neutral axis.
- G. Rail-weld inspection and test:
 - 1. Visually inspect each weld in accordance with manufacturer's manual on installation.
 - 2. Test each weld to rail by striking sharply with a 2-pound hammer.
 - 3. Test bond resistance: Maximum of (Bond Length (ft) x 0.000011 (ohms/ft)) + 0.00016 (ohms).
- H. Remove defective bonds.
- I. Repeat or broken welds due to misfires, poor fusion, or other causes shall be relocated a minimum of 4 inches on centerline from their original weld locations.

3.3 EXOTHERMIC SPLICE

- A. Exothermically weld rail connection stub-end bond to power cable.
- B. Do not connect splice until rail connection has passed visual inspection, hammer test, and resistance test.
- C. Provide sufficient slack to accommodate rail movement due to expansion and contraction.

PART 4 - MEASUREMENT AND PAYMENT**4.1 MEASUREMENT**

- A. The quantities of accepted work will be measured in the following units. All measurements will be plan measure except for authorized changes.
 - 1. Description: Lump Sum

4.2 PAYMENT

- A. Payment will be made at the respective unit or lump-sum price listed in the proposal and shall be full compensation for all labor, materials, and equipment necessary to complete the respective unit in place. There will be no separate measurement or payment for any item of work not specifically identified and listed in the proposal, and all such work shall be considered a subsidiary item with all costs pertaining thereto included in the prices for other items listed in the proposal. At the Engineer's option, partial payment may be made for any lump sum item listed in the proposal, providing that the Contractor is diligently and satisfactorily pursuing full completion of such partially complete item in accordance with the approved job progress schedule.

END OF SECTION

SECTION 34 22 26

TES GROUNDING AND BONDING

PART 1 - GENERAL

1.1 SUMMARY

- A. This Section includes the following:
 - 1. TES substation ground grid.
 - 2. TES substation power system grounding, electrical equipment grounding, and raceway grounding.
 - 3. TES substation interior ground bus.

1.2 RELATED SECTIONS

- A. SECTION 34 21 16 – TES Substation Enclosures
- B. SECTION 34 21 90 – TES Testing
- C. SECTION 34 22 29 – TES Raceway and Equipment Hangers and Supports

1.3 REFERENCED STANDARDS

- A. Section incorporates by reference the latest revisions of the following documents:
- B. ASTM International (ASTM)
 - 1. ASTM B3, Specification for Soft or Annealed Copper Wire
 - 2. ASTM B187, Specification for Copper Bar, Bus Bar, Rod and Shapes
- C. Institute of Electrical and Electronics Engineers (IEEE)
 - 1. IEEE 837, Standard for Qualifying Permanent Connections Used in Substation Grounding
- D. National Fire Protection Association (NFPA)
 - 1. NFPA 70, National Electrical Code

1.4 SUBMITTALS

- A. Procedures: Section 01 33 00, Submittal Procedures.
- B. Product Data: Specified materials.
- C. Substation interior perimeter ground bus drawings:
 - 1. Provide plan view showing perimeter ground bus, equipment, and ground connections.
 - 2. Provide elevations of each wall showing height of perimeter ground bus and connections to equipment.

1.5 QUALITY ASSURANCE

- A. Comply with the requirements of the Project Quality Plan.
- B. Regulatory Requirements:
 - 1. Unless otherwise specified, electrical equipment and material shall be listed and labeled for the purpose for which it is used, by the Underwriters Laboratories, Inc. (UL).
 - 2. Installations shall be in accordance with NFPA 70.
- C. Qualifications: Persons installing exothermic welds shall be trained in their installation.

1.6 DELIVERY, STORAGE, AND HANDLING

- A. Ship each item of equipment and materials securely wrapped, packaged, and labeled for safe handling in shipment and to avoid damage.
- B. Store equipment and materials in secure and dry storage facility.

PART 2 - PRODUCTS**2.1 EQUIPMENT AND MATERIALS**

- A. Ground Rods:
 - 1. Copper-clad steel, non-rusting, sectional type.
 - 2. Size: Minimum 10 feet long and 3/4-inch diameter.
 - 3. Acceptable Manufacturer: Erico, or approved equal.
- B. Substation Ground bus:
 - 1. ASTM B187, 98 percent conductivity copper, silver plated.
 - 2. Size: 1/4-inch thick. Width depends on specific application (see Part 3, below).
- C. Stranded Bare Conductors: ASTM B3, Class B stranded, annealed copper conductor, unless otherwise indicated; size as indicated.
- D. Insulated Conductors: ASTM B3, Class B stranded, annealed copper conductor, type XHHW-2 unless otherwise indicated, green colored, size as stated or indicated.
- E. Terminal Lugs: Exothermically-welded or compression-type approved for the application.
- F. Jumpers: Tin-plated copper, braided, flexible jumper.
- G. Compression Connections: Connectors and compression tools of a single manufacturer. Connectors shall have an inspection port for use in checking proper conductor insertion.
- H. Compression Tools: For field quality control, compression tools shall not release before completion of the compression cycle and shall emboss the die index number into the connector as the crimp is completed.
- I. Bolted connectors: Burndy, or approved equal.
- J. Bolts for attachment of lug to equipment: Bronze.

- K. Exothermic Welding System:
 - 1. Provide dual-component exothermic welds with molds and accessories of a single manufacturer.
 - 2. Approved Manufacturers:
 - a. Erico;
 - b. Thermoweld; or approved equal.

2.2 FACTORY ASSEMBLY

- A. Raceway Ground:
 - 1. Assemble metallic conduits to provide a continuous ground path.
 - a. Bond metallic conduits using insulated grounding bushings.
 - b. Connect grounding bushings to the grounding system using conductors sized to comply with NFPA 70.
 - 2. Equipment Ground: In metallic and nonmetallic conduits where conductors are installed, provide a separate equipment grounding conductor, sized to comply with NFPA 70, Article 250, and installed in accordance with these Specifications.
- B. Equipment and Enclosure Grounds:
 - 1. Connect electrical and distribution equipment to the grounding system. Size cables or bus as specified.
 - 2. Connect non-electrical equipment with metallic enclosures to the grounding system.
 - 3. Bond boxes to the raceway or conduit system with a copper jumper solidly bolted to the box, sized to comply with NFPA 70.
- C. Equipment Grounding Requirements:
 - 1. Install a copper equipment grounding conductor in each raceway and bond to metallic raceways and boxes at access and pull points.
 - 2. Size equipment grounding conductors in accordance with NFPA 70 to provide adequate conduction path for ground faults. Increase size as required to allow for circuit voltage drop.
 - 3. Ground metallic raceways, boxes, cabinets, exposed expansion joints, lighting fixtures, motors, transformers and receptacles. Provide grounding bushings or compression connectors attached with machine screws for bonding.
- D. Substation Interior Perimeter Ground Bus:
 - 1. Provide 2-inch wide ground bus around entire perimeter of substation interior.
 - a. Mount on steel framing channel. See Section 34 22 29, TES Raceway and Equipment Hangers and Supports, for framing channel requirements.
 - b. Install at 18 inches above finished floor where there are no obstructions, and up to 8 feet above finished floor to avoid equipment or doorways.

2. Provide 1-inch wide ground bus from ac switchgear, ac surge arresters, panelboards, and other electrical equipment to perimeter ground bus.
3. Connect interior perimeter ground bus to four substation enclosure exterior grounding pads specified in Section 34 21 16, TES Substation Enclosures.

PART 3 - EXECUTION

3.1 FIELD INSTALLATION

- A. Requirements of Article titled "Factory Assembly" apply to field installation.
- B. Buried or embedded connections:
 1. Exothermically welded or compression-type terminal lugs using materials qualified in accordance with IEEE 837.
 2. Bolted connections shall not be buried or embedded.
- C. Above-ground connections:
 1. Exothermically welded or compression-type terminal lugs using materials qualified in accordance with IEEE 837.
 2. Bolted connections are permitted only in secured locations not accessible to the public.
- D. Connections shall be made in accordance with the manufacturer's requirements.
- E. Clean ferrous structures and piping and coat with minimum 6 mils thick zinc-rich primer for a distance of 6 inches from the grounding attachment point.
- F. Do not bond buried metallic piping systems or structures to grounding electrode systems unless specifically directed.
- G. Provide continuous ground conductor or splice using connections qualified in accordance with IEEE 837.
- H. Provide waterstops on stranded, ground conductors where they enter a structure.

3.2 TES SUBSTATION GROUND GRID

- A. At the site for each TES substation, provide a ground grid as shown on Contract Drawings.
- B. Pre-test ground grid in accordance with Section 34 21 90, TES Testing, before pouring substation slab. If resistance is greater than 5 ohms, add additional ground rods until a resistance of 5 ohms or less is achieved.
- C. After delivery of each prefabricated substation, connect ground pigtailed from ground grid to substation-enclosure grounding pads at each of the four corners of the substation enclosure interior.
- D. Ground connections: Compression-type terminal lugs. Make connections in accordance with substation manufacturer's instructions.

3.3 RACEWAY GROUND

- A. Metallic and nonmetallic conduit: Provide a separate ground wire sized in accordance with NFPA 70, 250.122, Size of Equipment Grounding Conductors.

- B. Equipment grounds shall not be installed in a raceway with dc positive feeders or dc negative returns.

3.4 TES SUBSTATION INTERIOR PERIMETER GROUND BUS (BUILT-IN-PLACE SUBSTATION)

- A. Provide substation interior ground bus in built-in-place substation as specified above in Part 2 Article titled "Factory Assembly."
- B. Connect perimeter ground bus to building ground system.

3.5 FIELD TESTING

- A. Test grounds in accordance with Section 34 21 90, Traction Electrification System Testing.
- B. Grounds shall not exceed the following maximum resistance:
 - 1. TES substation enclosure or building ground: 5 ohms.
 - 2. Surge arrester grounds: 5 ohms.

PART 4 - MEASUREMENT AND PAYMENT

4.1 MEASUREMENT

- A. The quantities of accepted work will be measured in the following units. All measurements will be plan measure except for authorized changes.
 - 1. Description: Lump Sum

4.2 PAYMENT

- A. Payment will be made at the respective unit or lump-sum price listed in the proposal and shall be full compensation for all labor, materials, and equipment necessary to complete the respective unit in place. There will be no separate measurement or payment for any item of work not specifically identified and listed in the proposal, and all such work shall be considered a subsidiary item with all costs pertaining thereto included in the prices for other items listed in the proposal. At the Engineer's option, partial payment may be made for any lump sum item listed in the proposal, providing that the Contractor is diligently and satisfactorily pursuing full completion of such partially complete item in accordance with the approved job progress schedule.

END OF SECTION

THIS PAGE INTENTIONALLY LEFT BLANK

SECTION 34 22 29**TES RACEWAY AND EQUIPMENT HANGERS AND SUPPORTS****PART 1 - GENERAL****1.1 SUMMARY**

- A. This Section includes supports for raceway and equipment .

1.2 RELATED SECTIONS

- A. SECTION 34 21 06 – TES Common Work Results for Metals
B. SECTION 34 22 33 – TES Raceways and Boxes

1.3 REFERENCED STANDARDS

- A. Section incorporates by reference the latest revisions of the following documents:
B. ASTM International (ASTM)
1. ASTM A123/A123M, Zinc (Hot-Dip Galvanized) Coatings on Iron and Steel Products
2. ASTM F2329, Standard Specification for Zinc Coating, Hot-Dip, Requirements for Application to Carbon and Alloy Steel Bolts, Screws, Washers, Nuts, and Special Threaded Fasteners

1.4 SUBMITTALS

- A. Procedures: Section 01 33 00, Submittal Procedures.
B. Product Data:
1. Submit for each type of specified material proposed for use.
2. Indicate the name of manufacturer, brand name, and catalog number for each type of material.

PART 2 - PRODUCTS**2.1 RACEWAY SUPPORTS**

- A. Conduit clamps for individual conduit supports: One-hole, galvanized, heavy-gage steel, or galvanized malleable iron with clamp back.
B. Channels, fittings and conduit racks: As specified in this Section.
C. Straps and clamps: Listed for the task.

2.2 METALLIC FRAMING CHANNEL AND FITTINGS

- A. Framing channel and channel fittings, clamps and accessories shall be hot-dip galvanized, or electro-galvanized and zinc chromate coated steel.

- B. Framing channel: 14-gage minimum, 13/16 inch or 1-5/8 inch-deep by minimum 1-5/8 inch-wide.
- C. Where heavy-duty racks are called out, framing channel shall be 12-gage, single or double 1-5/8 inch deep by 1-5/8 inch wide.
- D. Hanger rods: Galvanized steel or electro-galvanized and zinc chromate coated steel, 3/8-inch minimum.
- E. Prohibited: Aluminum, or light gage or strength metals or materials shall not be used.
- F. Acceptable Manufacturers:
 - 1. Unistrut;
 - 2. Powerstrut;
 - 3. Beeline; or approved equal.

2.3 NON-METALLIC FRAMING CHANNEL AND FITTINGS

- A. Framing channel and channel fittings: Heavy-duty vinyl ester fiberglass.
- B. Clamps, accessories, and hardware: Heavy-duty vinyl ester fiberglass or stainless steel.
- C. Acceptable Manufacturers:
 - 1. Unistrut;
 - 2. Powerstrut;
 - 3. Beeline; or approved equal.

2.4 ANCHORS

- A. Anchor Rating: Sufficient strength to support four times the load.
- B. For metal, use machine screws, bolts, or welded studs with nuts and lockwashers.
- C. Prohibited: Powder driven anchors or studs shall not be used.

2.5 FASTENERS AND HARDWARE

- A. Fasteners and hardware shall be suitable for the use and environment intended.
 - 1. Fasteners shall be corrosion resistant.
 - 2. Plated steel fasteners: Use only indoors, in dry locations.
 - 3. Prohibited: Unplated steel shall not be used.
- B. Stainless steel fasteners shall be used in splice boxes where exposed to weather, or in damp or wet locations.
- C. Bolted connections shall be made using lock washers.

2.6 CORROSION CONTROL

- A. Material and equipment shall be designed to ensure satisfactory operation and life in the environmental conditions that exist where the material or equipment is installed.

- B. Wherever "galvanized" or "hot-dip galvanized" is called out in this Section of the Specification, the material shall be coated in accordance with ASTM A123/A123M.
- C. For sheet steel, galvanized finish complying with Section 34 21 06, TES Common Work Results for Metals is an acceptable alternative to hot-dip galvanizing if cut edges are protected from corrosion.
- D. Galvanized Steel Field Coating: Organic cold galvanizing coating as specified in Section 34 21 06, TES Common Work Results for Metals.

2.7 FACTORY ASSEMBLY

- A. Conduit Supports and Racks:
 - 1. Load Rating: Conduit supports shall be capable of supporting a load equal to the sum of the weights of the conduit, wire, and the hanger itself, plus 200 pounds.
 - 2. Spare capacity: Minimum 25 percent.
 - 3. Multiple runs of exposed conduit: Group and support on conduit racks constructed from steel channels, conduit clamps and fittings.
 - 4. Vertical conduit racks: Provide supplementary bolted stop-blocks below each conduit clamp in a vertical strut to assure that clamps cannot slide down the channel.
 - 5. Multiple Conduits 2-inch or Larger: Support with heavy-duty channel, clamps and accessories.
 - 6. Individual Horizontal Conduits 2-inch or Larger: Support with individual hangers.
 - 7. Conduits 1-1/2 inch or smaller: Support with one-hole conduit straps with back spacers or individual conduit racks.
 - 8. Insulated: When conduit is within 18 inches above rectifier and dc switchgear, support with insulated materials.
 - 9. Make fittings up tight to prohibit movement, unless longitudinal movement is required due to conduit expansion.
- B. Cable Tray Supports:
 - 1. Support in accordance with Section 34 22 33, TES Raceways and Boxes, using steel channels, threaded rods and hardware.
 - 2. Insulate cable tray supports where cable tray runs over rectifiers and dc switchgear and supports are within 18 inches of rectifier or dc switchgear.
- C. Fasteners and Hardware:
 - 1. The material, coating and finish of fasteners and hardware shall be suitable for the environment and use intended.
 - 2. If fasteners or hardware exhibit corrosion, replace with a suitable type as directed by Engineer at no additional cost to the Owner.
- D. Damage Touch Up:
 - 1. Apply to galvanized surfaces where required due to cutting of hanger rods or channel, or construction damage.

2. Brush on a thick coat of cold galvanizing coating to cut ends. Coating may be sprayed on if at least three coats are applied.

PART 3 - EXECUTION

3.1 INSTALLATION

- A. Requirements of Article titled "Factory Assembly" apply to field installation.

PART 4 - MEASUREMENT AND PAYMENT

4.1 MEASUREMENT

- A. The quantities of accepted work will be measured in the following units. All measurements will be plan measure except for authorized changes.
 1. Description: Lump Sum

4.2 PAYMENT

- A. Payment will be made at the respective unit or lump-sum price listed in the proposal and shall be full compensation for all labor, materials, and equipment necessary to complete the respective unit in place. There will be no separate measurement or payment for any item of work not specifically identified and listed in the proposal, and all such work shall be considered a subsidiary item with all costs pertaining thereto included in the prices for other items listed in the proposal. At the Engineer's option, partial payment may be made for any lump sum item listed in the proposal, providing that the Contractor is diligently and satisfactorily pursuing full completion of such partially complete item in accordance with the approved job progress schedule.

END OF SECTION

SECTION 34 22 33
TES RACEWAY AND BOXES

PART 1 - GENERAL

1.1 SUMMARY

- A. This Section includes the following:
 - 1. Electrical conduit and ducts
 - 2. Cable tray
 - 3. Outlet, junction, and pull boxes
 - 4. Electrical distribution cabinets

1.2 RELATED SECTIONS

- A. SECTION 34 21 05 – Common Work Results for TES
- B. SECTION 34 21 06 – TES Common Work Results for Metals
- C. SECTION 34 22 26 – TES Grounding and Bonding
- D. SECTION 34 22 29 – TES Raceway and Equipment Hangers and Supports
- E. SECTION 26 05 43 – Systemwide Electrical Underground Ductbanks and Raceways for Systems

1.3 DEFINITIONS

- A. Raceway: As defined in NFPA 70, and products specified in this Section.

1.4 REFERENCED STANDARDS

- A. Section incorporates by reference the latest revisions of the following documents:
- B. American National Standards Institute (ANSI)
 - 1. ANSI C80.1, Standard for Electrical Rigid Steel Conduit (ERSC)
- C. National Electrical Contractor's Association (NECA)
 - 1. NECA 1, Standard Practice of Good Workmanship in Electrical Contracting
- D. National Electrical Manufacturers Association (NEMA)
 - 1. NEMA 250, Enclosures for Electrical Equipment (1000 Volts Maximum)
 - 2. NEMA FG 1, Fiberglass Cable Tray Systems
 - 3. NEMA ICS 2, Industrial Control and Systems Controller, Contactors, and Overload Relays 600 V
 - 4. NEMA RN 1, Polyvinyl-Chloride (PVC) Externally Coated Galvanized Rigid Steel Conduit and Intermediate Metal Conduit

5. NEMA TC 2, Electrical Polyvinyl Chloride (PVC) Conduit
 6. NEMA TC 3, Polyvinyl Chloride (PVC) Fittings for Use with Rigid PVC Conduit and Tubing
 7. NEMA TC 14, Reinforced Thermosetting Resin Conduit (RTRC) and Fittings
- E. National Fire Protection Association (NFPA)
1. NFPA 70, National Electrical Code
 2. NFPA 130, Fixed Guideway Transit and Passenger Rail Systems
- F. Underwriters Laboratories (UL)
1. UL 2024, Signaling, Optical Fiber and Communications Raceways and Cable Routing Assemblies

1.5 SUBMITTALS

- A. Procedures: Section 01 33 00, Submittal Procedures.
- B. List of Materials:
1. Submit a list of materials proposed for use.
 2. Give name of manufacturer, brand name, and catalog number of each item.
 3. Submit list complete at one time, with items arranged and identified in numerical sequence by Specification Section and Article number.
- C. Compliance with Applicable Standards:
1. Where equipment or materials are specified to conform to standards of organizations such as ANSI, ASTM, and NEMA, submit evidence of conformance. The label or listing of specified agency will be acceptable evidence.
 2. Instead of the label or listing, Contractor may submit a written certificate from an approved, nationally recognized testing organization, stating that items have been tested and units conform to specified standard.
- D. Shop Drawings:
1. Submit shop drawings showing exact location and arrangement of conduits, cabinets, and pullboxes installed under this Contract.
 2. Submit drawings with ample time to prevent delays in Work.

1.6 QUALITY ASSURANCE

- A. Comply with the requirements of the Project Quality Plan.
- B. Qualifications: Raceway installers shall be electricians licensed by the State.

PART 2 - PRODUCTS**2.1 CONDUIT AND FITTINGS**

- A. Galvanized Rigid Steel (GRS) Conduit and Accessories: ANSI C80.1; hot-dip galvanized inside and out after threading; ensure each length bears UL label.
- B. GRS Fittings and Accessories:
 - 1. Bushings: Nylon-insulated, metallic.
 - 2. Grounding bushings: Nylon-insulated, metallic, with lay-in lugs.
 - 3. Sealing Bushings:
 - a. Galvanized malleable or ductile iron bushings with Bakelite sealing and pressure discs and individual neoprene cable rings.
 - b. Bushings shall seal ends of GRS conduit against the entrance of water, air or dust around emerging cables.
 - c. Approved Manufacturer/Product: O-Z/Gedney, type KR, or approved equal.
 - 4. Conduit straps, clamps, and clamp backs: Galvanized malleable iron.
 - 5. Vertical-Conduit Cable Supports:
 - a. Malleable or ductile iron body with hot-dip galvanized finish.
 - b. Non-metallic tapered wedging plug that supports cable without damaging insulation.
 - c. Weatherproof, ventilating type.
 - d. Acceptable Manufacturer/Product: O-Z/Gedney, type CMT, R-style, or approved equal.
- C. PVC-Coated GRS Conduit (PVC/GRS or PGRS): NEMA RN 1, with corrosion resistant internal coating.
- D. Reinforced Thermosetting Resin Conduit (RTRC): NEMA TC 14; standard or heavy-wall, UL listed.
 - 1. Conduit joints and fittings: Tapered or untapered; all of one type.
- E. PVC Electrical Conduit and Fittings:
 - 1. Conduit: NEMA TC 2, EPC-40-PVC or EPC-80-PVC; heavy wall, high impact strength, rigid PVC.
 - 2. Fittings: NEMA TC 3, EPC-40-PVC.
- F. Liquidtight Flexible Metallic Conduit and Fittings.
 - 1. Core: Flexible galvanized steel with a continuous copper bonding conductor spiral wound between the convolutions.

2. Jacket: Extruded liquid-tight plastic or neoprene; moisture- and oil-proof, capable of conforming to the minimum radius bends of flexible conduit without cracking; self-extinguishing with low halogen containing material.
3. Fittings: Zinc-coated.

2.2 OXIDE INHIBITING JOINT COMPOUNDS

- A. Petroleum-based compound with evenly suspended zinc particles.
- B. Approved Manufacturer/Product: Burndy, Penetrox A, or approved equal.

2.3 CABLE TRAY

- A. Type: Fiberglass, ladder or solid-bottom type with solid covers and other accessories, NEMA FG 1.
- B. Minimum Dimensions:
 1. Width: Minimum 6 inches.
 2. Loading depth: Minimum 3 inches.
 3. Inside nominal depth: Minimum 5 inches.
 4. Radius of curved fittings: Minimum 24 inches unless otherwise approved by Engineer.
- C. Performance Requirements:
 1. 30 inch width or less: Capable of supporting a total cable load of 55 pounds per linear foot on a maximum span of 8 feet, including a 200-pound static load as specified below.
 2. Over 30-inch width: Capable of supporting a total cable load of 88 pounds per linear foot on a maximum span of 8 feet including a 200-pound static load as specified below.
 3. Requirements shall be independent of type of splice plates or type of span, when tested in accordance with load test procedure specified in NEMA standards.
 4. Safety factor: 2, based on destructive load.
 5. 200 pound static load: Straight sections and fittings shall not permanently deform under a 200 pound static concentrated load applied vertically along a 4-inch length for both of the following conditions:
 - a. Load applied to center of one tray section having specified cable load and support spacing.
 - b. Load shall be applied at midpoint between supports over a splice connection.
 - c. Load applied to one rung of empty tray section having specified support spacing. Load shall be located at midpoint between side rails and supports.

2.4 CONDUIT HANGERS AND SUPPORTS

- A. Refer to Section 34 22 29, TES Raceway and Equipment Hangers and Supports.

2.5 OUTLET, JUNCTION, AND PULL BOXES

- A. Sheet metal outlet boxes: Steel, galvanized.
- B. Sheet metal junction and pull boxes: Galvanized or stainless steel, hinged or screw-cover with stainless steel screws.
- C. Cast metal boxes: Hot-dip galvanized inside and out.
1. Blank covers: Same thickness as boxes and secured with No. 10-24 stainless steel machine screws.
 2. Device covers: See Section 34 21 17, TES Substation Design and Installation.
 3. Neoprene gaskets: 1/8-inch thick.
- D. Nonmetallic boxes: Heavy duty, phenolic, surface-mounted, with threaded nonmetallic conduit hubs, type FD, single- or double-gang as required. Provide non-metallic device covers.
1. Acceptable Manufacturer/Product: Thomas & Betts, Carlon FSC-34, or approved equal.

2.6 ELECTRICAL CABINETS

- A. NEMA 1, 12, 4X, or as indicated.
- B. Galvanized or stainless steel, size as noted on Contract Drawings.
1. Fronts: Steel.
 2. Mounting: Surface or recessed type as required for the application.
 3. Hinges: Continuous, stainless steel.
 4. Locks: Provide flush locks from a single manufacturer with standard key blank; field-keyable.
 5. Finish: Powder coat, as specified in Section 34 21 06, TES Common Work Results for Metals.
 6. Cabinet back panel: white, galvanized steel interior mounting panel suitable for mounting terminal blocks and relays.
- C. Fiberglass composite:
1. Covers: Fiberglass.
 2. Hinges: Continuous, stainless steel.
 3. Surface: Smooth, no color variations, swirls, color pockets, or voids.

2.7 FACTORY ASSEMBLY

- A. See Part 3, below, for type requirements.
- B. Conduit:
 - 1. General:
 - a. Install electrical raceway, boxes and accessories in locations as indicated, in accordance with NFPA 70, NECA 1, local codes and ordinances, and as indicated to provide a complete and operable system.
 - b. Where a conduit type indicated on Contract Drawings is in conflict with this Section, refer discrepancy to Engineer.
 - 2. Conduit threading:
 - a. Clean threads with a solvent recommended by coating manufacturer to remove oil.
 - b. Coat threads with organic cold galvanizing coating, in accordance with manufacturer's instructions.
 - c. If spray application is used, provide at least three coats.
 - 3. Metal-to-metal threaded joints:
 - a. Coat threads with oxide inhibiting compound.
 - b. Take care that compound is not present on interior of conduit after installation.
 - 4. Conduit caps:
 - a. Provide threaded cap or similar closure designed for the purpose on conduits that are not terminated immediately.
 - b. Prohibited: Tape is not acceptable for temporary cap.
 - 5. Conduit sealing:
 - a. Conduit exposed to different temperatures: Seal conduit to prevent condensation and passage of air from one area to the other.
 - b. Where waterproofing is required, seal conduits with watertight duct sealing system.
 - 6. Liquid tight flexible metal conduit:
 - a. Install so that liquids tend to run off surface and do not drain toward fittings.
 - b. Provide sufficient slack to reduce the effects of vibration.
- C. Conduit Grounding and Bonding:
 - 1. Install metallic conduits to be electrically and mechanically continuous and connected to ground by bonding to the grounding system.
 - 2. See Section 34 22 26, TES Grounding and Bonding, for additional requirements.

- D. Conduit terminations:
1. Dry areas:
 - a. Provide two locknuts, one inside and one outside of box or enclosure, for rigid conduit terminating at steel box, panelboard, cabinet, or similar enclosure.
 - b. Provide insulating bushing or grounding bushing on conduit end.
 2. Exposed, damp and wet locations: Provide threaded, water-tight hubs with sealing o-rings for cabinet connections or threaded connections to tapered threaded hubs for cast boxes and fittings.
 3. Terminate the conduit in appropriate boxes at motors, switches, outlets, and junction points.
- E. Cable Tray:
1. General:
 - a. Install cable trays using approved fittings and adequately support the complete system. See Section 34 22 29, TES Raceway and Equipment Hangers and Supports.
 - b. Install cable trays parallel to each other and the building and plumb and level.
 - c. Support cable trays with wall brackets or ceiling-mounted supports from the prefabricated building structure, with anti-sway brackets or braces where necessary.
 - d. Trays shall be located no closer than 2-1/2 inches from the nearest wall, unless otherwise approved.
 2. Supports:
 - a. Finish: Hot-dip galvanized after fabrication.
 - b. Ceiling supports: See Section 34 22 29, TES Raceway and Equipment Hangers and Supports.
 - c. End supports: Support terminating sections of cable tray not more than 12 inches from end of tray.
 - d. Wall supports: Capable of sustaining an end-load of 1,600 pounds.
 - e. Spacing:
 - 1) Supports: Space at maximum distance of 5 feet to provide rigidity and adequate strength to support weight of trays and cables.
 - 2) Splices: Each tray splice shall have a support between 6 inches and 24 inches from the splice.
 3. Seismic bracing: Provide bracing for cable tray system complying with sealed seismic calculations required in Section 34 21 05, Common Work Results for TES.

-
4. Fasteners:
 - a. Solidly bolt trays to supporting channels using countersunk machine screws, 1/4 inch by 20 threads per inch, minimum.
 - b. After installation of fasteners, tray shall be free from burrs or sharp edges.
 5. Separators: Provide separators to isolate cables of different voltages.
- F. Boxes:
1. General:
 - a. Provide electrical boxes and cabinets of the material, finish, type, and size indicated and as required for the location, kind of service, number of wires, and function.
 - b. Ensure boxes and support fittings are of suitable and compatible materials that will not corrode when subjected to moisture or standing water.
 - c. Provide brackets, supports, hangers, fittings, bonding jumpers, and other installation accessories as required. Refer to Section 34 22 29, TES Raceway and Equipment Hangers and Supports.
 - d. Securely attach outlet, junction, and pull boxes to the structure. Do not use conduits entering the box as supports for the box.
 2. Covers:
 - a. Provide boxes complete with accessible covers designed for quick removal and suitable for the purpose for which they will be used.
 - b. Provide flat or raised blank covers for boxes without devices or fixtures.
 - c. Provide neoprene gaskets for boxes subjected to weather.
 3. Installation:
 - a. Mount outlet, junction, and pull boxes so as to prevent moisture from entering or accumulating within the boxes.
 - b. Junction and Pull Boxes: Install so that covers are readily accessible after completion of the installation.
 4. Grounding: Ground/bond each box and cabinet as specified in Section 34 22 26, TES Grounding and Bonding.
 5. Dc equipment: For areas within 6 feet of dc rectifier and dc circuit breaker enclosures provide nonmetallic pull-boxes, junction boxes, device boxes, and covers.

PART 3 - EXECUTION**3.1 RACEWAY TYPE REQUIREMENTS**

- A. Permitted Conduit Types:
1. Underground - General:
 - a. PVC/GRS conduit.
 - b. PVC Schedule 40 or standard-wall fiberglass conduit encased in concrete structures or ductbanks.
 - c. Heavy-wall fiberglass conduit.
 2. Underground - Exceptions:
 - a. KCP&L services: In accordance with KCP&L standards or as directed by KCP&L engineer.
 3. Transition between embedded conduit and above-ground metallic conduit: PVC/GRS.
 - a. Ensure that above-ground PVC/GRS extends minimum 1 foot above ground or to conduit termination, whichever is less.
 4. Conduits in TES substations:
 - a. GRS or RTRC.
 - b. Within 6 feet of dc rectifier or distribution breaker enclosures: RTRC.
 5. Liquid-tight flexible metal conduit:
 - a. Permitted only where required for flexibility such as connections to vibrating equipment and across joints subject to differential movement.
 - b. Not acceptable as a substitute for other conduit types in areas with complicated bending requirements.
 6. Conduit or raceway types not specifically called out in these Specifications or Contract Drawings shall not be used.
- B. Permitted Cable Tray Type: Fiberglass with insulating support hardware.
- C. Prohibited Raceway Types:
1. Wiring gutters or wireways.
 2. Electrical Metallic Tubing (EMT).
 3. Intermediate Metal Conduit (IMC).
 4. Flexible metal conduit.
 5. Conduit running thread.

3.2 RACEWAY MINIMUM SIZES:

- A. GRS: 3/4-inch.
- B. RTRC: 3/4-inch.
- C. Liquid-tight Flexible Metallic Conduit: 1/2-inch.

3.3 RACEWAY BENDS

- A. Minimum Bend Radius (above grade): In accordance with NFPA 70 Chapter 9 Table 2, "Other Bends" column.
- B. Refer to Section 26 05 43, Systemwide Electrical Underground Ductbanks and Raceways for Systems, for bending requirements for underground ducts.

3.4 BOX AND CABINET TYPE REQUIREMENTS

- A. Dry locations:
 - 1. Outlet boxes: Sheet metal outlet boxes.
 - 2. Junction or pull boxes with volume less than 100 inches: Sheet metal junction or pull box.
 - 3. Cabinets: Galvanized steel, NEMA 250 Type 1.
- B. Damp locations:
 - 1. Outlet, junction, and pull boxes: Cast metal boxes.
 - 2. Cabinets: NEMA 250 Type 4X stainless steel unless otherwise approved.
- C. Within 6 feet of dc switchgear:
 - 1. Cabinets: Fiberglass composite.

3.5 INSTALLATION

- A. Requirements of Article titled "Factory Assembly" apply to field installation.

PART 4 - MEASUREMENT AND PAYMENT**4.1 MEASUREMENT**

A. The quantities of accepted work will be measured in the following units. All measurements will be plan measure except for authorized changes.

1. Description: Lump Sum

4.2 PAYMENT

A. Payment will be made at the respective unit or lump-sum price listed in the proposal and shall be full compensation for all labor, materials, and equipment necessary to complete the respective unit in place. There will be no separate measurement or payment for any item of work not specifically identified and listed in the proposal, and all such work shall be considered a subsidiary item with all costs pertaining thereto included in the prices for other items listed in the proposal. At the Engineer's option, partial payment may be made for any lump sum item listed in the proposal, providing that the Contractor is diligently and satisfactorily pursuing full completion of such partially complete item in accordance with the approved job progress schedule.

END OF SECTION

THIS PAGE INTENTIONALLY LEFT BLANK

SECTION 34 23 10**OCS DESCRIPTION AND GENERAL REQUIREMENTS****PART 1 - GENERAL****1.1 SUMMARY**

- A. The Traction Electrification Distribution System referred to hereafter as the Overhead Contact System (OCS) consists of all equipment needed to provide that part of the electrical circuit between the termination of the Traction Power Substation positive feeders at pole top or shop disconnect switches, and the contact wire interface with the vehicle pantograph, for the complete streetcar route, storage yard, and shop.
- B. For general Systems guidelines, refer to the Division 1 Specifications.
- C. Unless otherwise noted, the term "Owner" shall refer to the Kansas City Streetcar Authority throughout these Specifications.
- D. Unless otherwise noted, the term "Engineer" shall refer to the City Engineer or Owner's Designated Representative, as defined in General Provisions 3.1, City Engineer's Authority/Owner's Designated Representative.
- E. Unless otherwise noted, the term "Work" shall represent the entire scope of the construction of the Kansas City Streetcar project.
- F. The Contractor shall be responsible for coordinating all aspects of the Work, including but not limited to procurement, staging locations, traffic control, and all other tasks required to complete the Work.
- G. The route for revenue service is primarily double track along Main St. with a single track loop in the River Market area.
- H. Typically the selected streets have two way traffic operations, with the streetcar occupying two of the lanes, which is generally shared with vehicles travelling in the same direction.
- I. The storage yard and vehicle maintenance facility is located off the northeast corner of the River Market loop. It includes inbound and outbound tracks, storage tracks, and shop tracks, all of which are fully wired.
- J. Work under this contract includes the provision of OCS door attachment assemblies at the doors of the maintenance shop. The contractor shall coordinate the design of the selected attachment with the design of the building, taking full account of the form, fit, and function of the assembly and the selected door operating mechanism.
- K. Work under this Contract includes OCS design completion, materials procurement, installation, testing, and the provision of project records, operating and maintenance manuals, training, special tools, and spare parts in accordance with OCS Contract Drawings and Specifications.
- L. The OCS Contract Drawings and Specifications provide information regarding the Work and criteria for the Contractor to complete the OCS design, and install and test the Contractor's products. The Contractor shall provide all necessary engineering to ensure that the installed OCS meets the requirements of this Specification and referenced documents and drawings.

- M. The Contractor shall prepare a Contractor's OCS Design Completion Package (see Section 34 23 10 Part 2) with all information required for the OCS installation. The Contractor shall prepare designs that detail the use of the Contractor's products to achieve the required OCS installation.
- N. The equipment to be installed may include but is not limited to: poles, pole foundations, cantilevers, headspans, cross-spans, conductors, feeder jumpers, terminations, sectioning equipment, disconnect switches, surge arresters, contact wire bridges, and all other OCS associated components.
- O. The provision and installation of pole foundations are specified in the Missouri Department of Transportation Governing Specifications and Special Provisions.
- P. All OCS equipment is to be energized at a nominal 750 DC, and shall be double insulated.
- Q. All OCS Components shall be designed such that all fastenings and adjustments are accomplished with the same dimensional standards or tools. Metric standards or American standards (not both) shall be used throughout the OCS design.
- R. The Contractor shall coordinate with the Owner, Missouri DOT, and all other interested agencies regarding the Work.
- S. Double Insulation
1. A minimum of two levels of electrical insulation separated by a minimum dimension of four feet shall be provided between the contact wire and an OCS pole or other grounded structure.
 2. At support structures one level of insulation shall be at the contact wire supports, and the second level shall be adjacent to the structure. Physical locations of insulation shall be consistent with State of California Public Utilities Commission General Order No. 95, Section VII.
 3. At contact wire dead ends, two strain insulators shall be provided, separated by a minimum distance of 10 feet. Each level of insulation shall be rated to be compatible with the system insulation class.

- X. Specifications for Traffic Signal Attachments on OCS Poles shall be in accordance with Missouri Department of Transportation Governing Specifications and Special Provisions, in conjunction with Approval from the Engineer.

1.3 REFERENCED STANDARDS

- A. The pertinent provisions of the latest revisions of the codes and standards of the applicable NEMA, IEEE, ASTM, AWS, NEC, and ANSI shall apply to the Work of this Section.
- B. If other types of materials are proposed, the Contractor shall, along with the product description, include the relevant standards and information on that material in his submittal.
 - 1. AISC S302 Code of Standard Practice for Steel Buildings and Bridges
 - 2. AISC S326 Design, Fabrication and Erection of Structural Steel

1.4 SUBMITTALS

- A. Submittals shall be in accordance with the requirements of SECTION 01 33 00 – Submittal Procedures, except as modified herein.
- B. Submit a Contractor's OCS Detailed Design Completion Package as listed below and defined in SECTION 34 23 10 Part 2.
- C. General Design Information Submittals containing:
 1. Shop drawings
 2. Framing attachment height and dimension methodology and sample calculations
 3. Pole rake methodology and sample calculations
 4. OCS wire schedules
 5. Bills of materials

1.5 QUALITY ASSURANCE/QUALITY CONTROL

- A. Quality Control/Quality Assurance shall be in accordance with SECTION 01 43 00 – Systems Quality Assurance except where modified within this Specification Section.

1.6 OVERHEAD CONTACT SYSTEM STYLES

- A. Single Contact Wire Fixed Terminated Style
1. The wiring shall be supported and registered by means of cantilevers, or various styles of head span assemblies. At sharp curves and corners, wire pulloff or steady span assemblies may be used for registration. The contact wire shall be staggered.
 2. Wire terminations shall be fixed at both ends, each with capability for maintenance adjustment.

1.7 OCS POLES

- A. Tubular Poles
1. There will be 5 general configurations of OCS poles on the project; sole use OCS poles, OCS poles with street lighting, OCS feeder poles, Ornamental OCS poles, and OCS poles with traffic signal accessories. In some cases there will be combinations of these configurations. OCS pole finish may vary on the project, possibly utilizing both galvanized and painted finishes. The Contractor shall verify OCS pole types and finishes with the Engineer prior to procurement. See SECTIONS 34 23 37 – OCS Tubular Steel Poles, 34 23 37.11 – OCS Pole Ornamentation, 34 23 35.99 – OCS Pole Painting, and the Missouri Department of Transportation Governing Specifications and Special Provisions for related Specifications. OCS poles shall be procured based on these Specifications and Contract Drawings, in conjunction with Approval from the Engineer.

1.8 OCS TERMINATION WIRE ATTACHMENTS TO BUILDINGS

- A. OCS anchors will be required at the maintenance facility to reduce the tension in the shop contact wire, as well as to terminate the contact wire inside the building. The installation of this connection shall be subject to Inspection and Approval by the Engineer. After the attachment is approved by the Engineer, the Contractor shall be permitted to install and terminate the contact wire. Refer to the Contract Drawings (OCS Drawings and Vehicle Maintenance Facility Structural Drawings) for building attachment locations, anchor bolt details, and contact wire tension information.

1.9 OCS CONTRACT DRAWINGS

- A. OCS Basic Design Contract Drawings are standard drawings showing typical OCS design features for use at site-specific locations as detailed in OCS Wiring Layouts and Schedules.
1. General Drawings: General Drawings provide standard OCS abbreviations, drawing symbology, general electrical clearance data, and sample OCS plan and schedule drawings.
 2. Technical Sheets: The Technical Sheets provide information regarding design data, parameters, conductor characteristics, conductor tensions, temperature conditions, maximum wiring spans on tangent and curved track, wind blow off data, maximum mid span offset, pantograph security, and pantograph clearance.
 3. General Arrangement Drawings: General Arrangement Drawings show the layout and dimensions for poles and wiring at overlaps, crossovers, and terminations.

4. Typical Structure Drawings: Typical Structure Drawings provide typical arrangement views for various common functions of OCS structures. These drawings provide required dimensions, and identify assembly drawings showing typical equipment suitable for the structure's function.
5. Assembly Drawings: Assembly Drawings are pre-shop drawings which show the arrangement of several generic components assembled as cantilevers, headspans, cross-spans, pull-offs, and other OCS equipment.
6. OCS Layout Drawings:
 - a. The OCS Layout Drawings show structures and OCS wiring. Tables for each track indicate structure number, contact wire height, conductor termination heights, contact wire stagger and direction, and pole types. Additional information includes span lengths, location of section insulators, disconnect switches, jumpers and feeders, backbone/pull off arrangements, and other relevant information.
 - b. Electronic copies of the OCS Layout Drawings in the Contract Drawings will be made available to the Contractor within 30 days of Notice To Proceed.
7. Foundation Schedules: Foundation Schedules are tables that include stationing, grounding types, and measurements to accurately locate and install the OCS foundations.
8. Master Overlap Charts: Provides information regarding OCS tension lengths, pertinent road crossings, passenger stations, and other general information in the scope of installation.

1.10 AMBIENT AND CONDUCTOR TEMPERATURES

- A. The normal conductor temperature for computing erection conditions is 60 degrees Fahrenheit. The maximum conductor temperature is 120 degrees Fahrenheit. The minimum conductor temperature is minus 20 degrees Fahrenheit.

1.11 ICE LOADING

- A. For structural design calculations, a radial thickness of 1/2 inch ice on the contact wire shall be used. A radial thickness of 1/2 inch shall be used on all solid-type structures and structural members (pole brackets, cantilevers, etc.).

1.12 WIND LOADING

- A. A maximum wind speed of 90 mph or maximum wind speed given by local codes shall be applied to poles and rigidly attached brackets.
- B. A maximum wind speed of 55 mph shall be used when there is radial ice.
- C. Maximum windspeed for streetcar operations is 40 mph, applied to conductors with no ice loading.

1.13 LEVELS AND PLACEMENT OF INSULATION

- A. A minimum of two levels of electrical insulation shall be provided. Each level of insulation shall be rated to be compatible with the system insulation class.
- B. The first level of insulation shall be installed at the contact wire support.

- C. Physical locations of insulation shall be as shown in the Contract Drawings, and in conjunction with GO-95. At contact wire dead ends, two strain insulators shall be provided, separated by a minimum distance of 10 feet. The first level of insulation shall be installed so as to be 4 feet minimum and 5 feet maximum horizontally from superelevated track centerline.

1.14 CONTACT WIRE HEIGHTS

- A. The normal contact wire height at supports shall be 19 feet 6 inches.
- B. Minimum contact wire heights in streets or road crossings shall be 18 feet 0 inches after allowance for conductor sags due to temperature variations, ice loading, and conductor installation tolerances. The heights shall take into account the tolerances for track maintenance and construction.
- C. Minimum contact wire height under bridges shall be 15'-4".
- D. Clearances between the OCS and various overhead utilities shall be in accordance with the National Electrical Safety Code, and these Contract Drawings and Specifications.

1.15 CONTACT WIRE GRADIENTS

- A. The maximum rate at which the contact wire shall change its elevation relative to the track elevation shall be as follows:

Constant Gradient	2%
Gradient Change	1%

- B. The maximum line speed limit shall be 35 mph for OCS purposes.

1.16 PANTOGRAPH SECURITY

- A. The minimum allowable pantograph security shall be 6 inches.

1.17 CONTACT WIRE RADIAL LOADS

- A. The contact wire deviation at any single contact wire swivel clamp shall not exceed 7 degrees.
- B. Under maximum non-operating conditions where the contact wire registration loads exceed 850 lbs, two steady arms shall be used.
- C. Steady arm shape and heel settings shall be designed and installed in accordance with Contract Drawings.
- D. The heel point of the steady arm shall be outside of the limits of the pantograph envelope under both static and uplifted conditions.

1.18 FACTORS OF SAFETY

- A. The OCS shall be designed with the following minimum factors of safety under the temperature, wind, and ice loadings specified:

Equipment	Minimum Safety Factor
Conductors:	
Operating	2.0
Non-Operating	1.6

Hardware, assemblies, fittings, components, and non-electrical wires:

Operating against breakage	2.5
Operating against slippage	2.5
Non-Operating against breakage	2.0
Non-Operating against slippage	2.0

Structures designed per AISC (LRFD or ASD)

- B. The permitted wear of the contact wire shall be 30% of its original cross-sectional area. The safety factors stated above shall apply to the contact wire when worn.

1.19 PANTOGRAPH CLEARANCE ENVELOPE

- A. The installed OCS, including the steady arm in the uplifted position, shall not intrude into the pantograph clearance envelope for the applicable contact wire height. For the pantograph envelope and related clearance requirements under various conditions, see OCS Technical Sheets.
- B. For test purposes, the contact wire shall be lifted with the test pantograph by 3 inches from the free hanging condition, to verify clearance with uplift. In addition, 0.5 inches of pantograph carbon wear will be allowed from a new carbon outline on the test pantograph.

1.20 ELECTRICAL CLEARANCES

- A. The following electrical clearances shall be maintained:

1. Normal Minimum Static	6 inches
2. Normal Minimum Passing	4 inches
3. Absolute Minimum Static	5 Inches
4. Absolute Minimum Passing	3 inches
- B. All erected poles, brackets, switch operating handles, and other Contractor-installed equipment shall comply with the electrical clearances given in the OCS Drawings.
- C. Minimum electrical clearances shall apply after all applicable design allowances and construction tolerances have been accounted for.
- D. Refer to SECTION 34 23 11.01 – OCS Glossary of Standard Terms for definitions of static and passing conditions.

1.21 MECHANICAL CLEARANCES

- A. All erected poles, brackets, switch operating handles and other Contractor-installed equipment shall comply with the Streetcar clearance requirements of the current issue of the Design Criteria document.

1.22 TOLERANCES

- A. Unless otherwise specified in the Missouri Department of Transportation Governing Specifications and Special Provisions, pole foundations constructed shall have the following dimensional erection tolerances applied relative to the Contract Drawings:

1. Foundation offset from track centerline:	2 inches
2. Stationing along track Centerline adjacent to special trackwork:	2 feet

3. Stationing along track centerline at street intersections: 1 foot
4. Stationing along track centerline on open track: 5 feet
5. Span length change between adjacent pole foundations 5 feet

1.23 RETURN CIRCUIT

- A. See Traction Power Specifications for Return Circuit information.

PART 2 - PRODUCTS

2.1 CONTRACTORS OCS DESIGN COMPLETION PACKAGE

- A. Electronic copies of the OCS Drawings in the Contract Drawings will be provided to the Contractor.
- B. The Contractor's OCS Design Completion Package shall consist of the following:
 1. Shop Drawings.
 - a. Shop drawings for each OCS Assembly shall be produced and submitted for approval. Each Assembly drawing shall show the arrangement of OCS fittings and the pantograph clearance envelope for the designed contact wire height where applicable. Drawings shall also show minimum track offset, superelevation, and any other pertinent information where the assemblies will be installed.
 - b. Shop drawings relating to Cantilever Assemblies shall include the following:
 - 1) All cantilevers shall have double insulation. One level shall be at the conductors, and one level at the connection to the pole brackets.
 - 2) The reach of any cantilever shall not be more than three times the dimension between its support brackets on the pole, unless verified through calculation or modeling to verify structural adequacy.
 - 3) Drop-tube of cantilevers shall be checked during cantilever design to ensure minimum 1 inch running clearance to the pantograph clearance envelope.
 - c. Shop drawings relating to headspan, cross-span, or pull-off assemblies shall include the following:
 - 1) All headspans, cross-spans, and pull-off assemblies shall be double insulated.
 - 2) Cross-span insulation shall be provided in headspan wires, cross-span wires, span guys, and pull-offs in accordance with the requirements as shown in the Contract Drawings and Specifications.
 - 3) Headspans shall be designed with geometry as shown on the Contract Drawings.
 - 4) The minimum headspan attachment height at a pole shall be calculated based on the site specific headspan geometry.

- 5) Attachment heights for the (upper) headspan wires shall be a minimum of 6 inches below the tops of poles, or, where relevant, streetlight attachment points.
 - 6) Pull off assemblies shall only be used where total radial loadings on the steady arm at the opposite end of the assembly from the support exceed 200 lb at any temperature or wind condition. Where this condition cannot be met, steady span (double ended pull-off) assemblies shall be installed.
 - 7) Wiring dimensions for all head span, cross-span, pull-off and backbone assemblies.
- d. Shop drawings of assemblies and products shall be produced such that they demonstrate that the required OCS functions and configurations are achieved.
 - e. Each shop drawing shall be given an Assembly Reference that shall match the equivalent Contract Assembly Drawing and shall carry the same title.
 - f. Each shop drawing shall have a bill of materials listing all components, and include their part or catalog number, descriptive text, quantity required, and unit of measure.
 - g. Each shop drawing shall show details of all components including electrical characteristics, materials, dimensions, load ratings, and weights.
 - 1) Shop drawings for any single site specific assemblies or components that are not included in the Contract Drawings. Site measurement records, and design calculations for any such sites shall also be submitted.
 - 2) Calculation and documentation of cantilever, headspan, cross-span, pull off, and backbone assemblies shall provide loads, geometry, maximum and minimum dimensional limits, and application rules. This documentation shall be produced for the maximum loadings for each type of assembly.
 - 3) Methodology and calculations used to determine pole rake and orientation shall be submitted.
 - 4) OCS wire schedules shall be produced for all conductors to be installed.
 - 5) Projectwide Bill of Materials identifying all OCS components and component quantities used in the OCS installation shall be submitted. The Contractor shall furnish this information in tables as described below:
 - a) OCS components listed in alphabetical order.
 - b) OCS components listed in order of catalog number.
 - 6) Contractor's OCS Layout Plan design update drawings shall show the final installation including:
 - a) Assembly references for cantilevers, headspans, pull-offs and registration types attached to each structure.
 - b) Pole rake values and orientation dimensions.

- c) Design changes due to Contractor's equipment selection.
- d) Design changes affecting material selection and/or OCS structure location or offset.

2.2 DRAFTING STANDARDS

- A. The Contractor's Drawings submitted in electronic form should be drafted in accordance with Drafting Standards approved by the Engineer.

PART 3 - EXECUTION

3.1 DESCRIPTION OF WORK

The Contractor shall design, furnish, and install the OCS for the Project as described and referenced in the following.

- A. Perform Design Completion, as described in these Specifications, including but not limited to the following.
 - 1. Performing and submitting calculations to verify assembly and component adequacy.
 - 2. Producing and submitting shop drawings of all assemblies and components.
 - 3. Producing assembly and component test reports and certificates of compliance as described in these Specifications.
 - 4. Producing and submitting installation plans, test plans, and all other pertinent OCS design and installation documentation as described in these Specifications.
- B. Supply and install OCS conductors, OCS poles, OCS foundations, cantilevers, cross-spans, headspans, pull-offs, section insulators, any special pole or wiring anchors, and all other OCS components in accordance with the Contract Drawings and these Specifications.
- C. Perform and submit the required OCS system testing and documentation as required in these Specifications.
- D. Perform as-built measurements and drawing updates to be submitted as required in these Specifications.

PART 4 - MEASUREMENT AND PAYMENT

4.1 MEASUREMENT

- A. The quantities of accepted work will be measured in the following units. All measurements will be plan measure except for authorized changes.
 - 1. Description: Lump Sum

4.2 PAYMENT

- A. Payment will be made at the respective unit or lump-sum price listed in the proposal and shall be full compensation for all labor, materials, and equipment necessary to complete the respective unit in place. There will be no separate measurement or payment for any item of work not specifically identified and listed in the proposal, and all such work shall be considered a subsidiary item with all costs pertaining thereto included in the prices for other items listed in the proposal. At the Engineer's option, partial payment may be made for any lump sum item listed in the proposal, providing that the Contractor is diligently and satisfactorily pursuing full completion of such partially complete item in accordance with the approved job progress schedule.

END OF SECTION

SECTION 34 23 11.01**OCS GLOSSARY OF STANDARD TERMS****PART 1 - GENERAL****1.1 SUMMARY**

- A. This Section contains a glossary of Overhead Contact System (OCS) terms that define words and terms used in the Contract OCS Drawings and Specifications. The Systems Contractor shall ensure that supplied shop drawings, Test Certificates, OCS records and other OCS documentation required by the OCS Specifications use the preferred terms given in this Specification.

1.2 RELATED DOCUMENTS

- A. For general electrical terms, see "IEEE Standard Dictionary of Electrical and Electronic Terms", IEEE Standard 100 - Latest Edition
- B. For insulated cables, the definitions of terms shall be in strict accordance with applicable publications of ICEA for the cable provided.

1.3 GLOSSARY OF TERMS FOR OVERHEAD CONTACT SYSTEMS

- A. The purpose of this glossary is to provide uniform terminology and definitions for technical terms used in design of the Overhead Contact System. These terms will form the basis for assembly descriptions used in material allocation and control. The glossary does not include standard transit and electrical engineering terms, but is intended to define terms for which industry standard definitions have not been universally adopted, especially those related to Overhead Contact Systems.

Terms marked with an asterisk (*) are not preferred. Use preferred terms.	
Anchor –	
anchor bolt	A bolt inserted into a concrete foundation to form an attachment for a pole or support bracket.
Anchor base pole*	See "bolted-base pole".
Arrangement Drawing (OCS)	A group of structures in a specific configuration providing the wiring of a typical short section of OCS; e.g., overlap, crossover.
Assembly Drawing (OCS)	A configuration of components used repetitively in the OCS, and identified in combination as a group for ease of reference.
Assembly Reference	An alpha numeric code assigned to a discrete group of components of discrete design and discrete number that comprise a discrete assembly.
AWG	American Wire Gauge
Backbone	A span guy or wire between structural supports used primarily to register contact wires around a curve by means of a set of registrations attached along the backbone.
Backguy*	See "Guy".
BIL	Basic Impulse Level
Blow-off	Lateral displacement of the contact wire due to wind.
Body span wire	The center span wire of a three-wire Headspan.

Terms marked with an asterisk (*) are not preferred. Use preferred terms.	
Bolted – base pole	A pole for use on a foundation with anchor bolts (as opposed to plain pole which is embedded in earth or concrete).
Bond –	An electrical connection between metal hardware to eliminate voltage difference.
impedance bond	An inductive device bridging an insulated rail joint used for allowing passage of DC traction return current while preventing passage of high-frequency current used for signaling.
rail bond	Electrical connection between adjacent lengths of rail.
structure bond	An electrical connection between structure and rail or impedance bond.
Bracket or gain*	A connection to a pole by means of which the cantilever or bracket arm assembly is attached to the pole.
Bracket arm or Mast arm*	The frame assembly supporting a direct suspension single contact wire system from a pole (A bracket arm which is hinged to pole has the preferred term “cantilever”).
Bridge*	See “Overpass” or “Underpass”.
Break*	See “Section break”.
Bridle	A span guy or wire between structural supports used primarily to provide vertical support to a cross-span wire attached approximately midway along the bridle.
Bull ring	A steel ring usually 2-4 inches in diameter into which two or more span guys are connected.
Bypass switch	A disconnect switch at a non-feeder sectionalization point in the OCS.
Cable outlet	A short pipe installed through the wall of a tubular pole, through which a feeder cable exits the pole.
Carbon collector*	See “contact strip”.
Cantilever	The support frame and registration assembly supporting the catenary from a pole, and attached to the pole via hinge fittings.
Catenary –	The combination of conductors, hangers and in-span hardware of the overhead contact system used in LRT operation, not including supports and cantilevers.
dictionary meaning	The curve assumed by a perfectly flexible weighted cord of uniform density and cross-section hanging freely between two fixed points.
simple catenary	Comprising a contact wire supported from a messenger wire by hangers.
compound catenary	Comprising a contact wire, an auxiliary wire and a messenger wire, with associated hangers.
stitched catenary	A catenary system to which a stitch wire has been added at the supports to improve catenary dynamics.
tramway equipment* or single contact wire	Comprising a contact wire only.
Chording of curves	On curved route the propensity of the contact wire to “cut the curve” between registrations.

Terms marked with an asterisk (*) are not preferred. Use preferred terms.	
Circular mil	One thousandth part the area of a circle one inch in diameter.
Clamp –	
contact swivel clamp	The fitting on the end of the steady arm or registration pipe which attaches to the contact wire.
parallel groove clamp	A piece of hardware used to clamp two parallel wires together.
pipe clamp	A piece of hardware used to attach various types of components to a pipe.
strain clamp	A piece of hardware used for deadending a wire or conductor under high mechanical tension.
suspension clamp	A piece of hardware used to support a tensioned conductor or cable in a hanging arrangement, the greater part of the applied load being due to gravity.
Clipping in	The process of sagging an overhead wire to correct tension and clamping it at the support and fixing the hangers.
Commutation	The act of picking up electrical power from an overhead contact wire by pantograph.
Component	An item of hardware as commonly supplied complete by a manufacturer.
Contact bridge	A rigid bar, fixed closely above and attached to the in-running contact wire forming a slot for a second contact wire to pass through, thereby preventing differential uplift of crossing contact wires. Also called a “wire cross”.
Contact Strip	The replaceable wearing part of the pantograph collector head assembly which interfaces with the overhead contact wire for collecting current.
Contact wire or Trolley Wire*	The wire of an OCS with which the pantograph of a Streetcar makes contact for current collection. Normally made of copper or bronze, the wire is a single conductor with a groove to which hangers and clamps may be fitted.
Contact wire height –	The height of the underside of the contact wire above rail level when not uplifted by the pantograph.
minimum contact wire height	The minimum allowable contact wire height, usually at midspan or under bridges, which takes due account of vehicle clearance envelope, vehicle bounce and track tolerances, catenary temperature effects and electrical clearances. May also take future track raising into account if so required.
maximum contact wire height	The maximum allowable contact wire height within the operating range of the vehicle current collector.
Copperweld conductor	A wire with a steel center and a layer of copper fused around it or a number of such wires stranded together.
CR	Conduit Riser
Creep	The on-going permanent stretch of copper wires under mechanical tension for long periods of time.
Crossarm*	See “Cantilever”, “bracket arm”.
Cross level	The plane through the tops of the rails of a track in the transverse direction.
Cross level tolerance	See “Track tolerances”.

Terms marked with an asterisk (*) are not preferred. Use preferred terms.	
Cross-span	An installation of wires that crosses the track or roadway at approximately contact wire level; more specifically a single or double wire fastened to poles on either side of the route and supporting one or more contact wire(s).
Current collector	The rubbing strip at the top of a pantograph which rides along under the contact wire.
Curve Supports –	
inside curve	An arrangement for an OCS where the poles are on the inside of the curve, relative to the track.
outside curve	Poles are on the outside of the curve, relative to the track.
CW	Contact Wire
DGA	Down Guy Assembly
Direct Suspension Overhead Trolley Contact System	Wherein the trolley contact wire is attached by suitable devices directly to the main supporting system.
Double insulation	Insulation function provided by two physically separated insulators, installed at a nominal minimum and maximum spacing.
Droop	Fall of a conductor from its position at normal temperature, due to temperature change and/or ice coating.
Dropper*	See “Hanger”.
Drop bracket	An assembly fixed to the underside of a registration pipe that carries the steady arm.
DSW	Disconnect Switch
Dynamics or catenary dynamics	The interactive relationship between pantographs and contact wires at operating speeds; commutation performance.
Elastic system	A term applied to an overhead system where the contact wires are free to uplift under the pressure of the current collectors at the supports. Usually pendulums comprising one hanger or two articulating parallel hangers.
Electrical clearance –	
passing	The dimensional mechanical clearance between live part of either the vehicle (such as uplifted pantograph) or catenary and grounded parts of the fixed structures, due to the dynamics of the passage of a moving or stationary vehicle. See AREMA Standards Chapter 33.
static	The dimensional mechanical clearance between live parts of the OCS and grounded parts of fixed structures, in the absence of pantographs.
Embedded poles	Poles without base plates, directly inserted into socket-type or open foundations and fixed by grout or compacted backfill such as sand.
Encumbrance*	See “pole encumbrance” and “system height”
Envelope –	
vehicle static envelope	The maximum envelope of a static vehicle
vehicle dynamic envelope	The maximum envelope of a moving vehicle when it is free to lurch and sway.

Terms marked with an asterisk (*) are not preferred. Use preferred terms.	
combined vehicle envelope	The vehicle dynamic envelope plus the effects of maximum track alignment and cross-level tolerances.
structure clearance envelope	The combined vehicle envelope plus a safety clearance allowance typically 6 inches all round.
pantograph clearance envelope	The combined clearance envelope of the pantograph plus a lateral allowance for safety and vertical allowance above static contact wire level. Only steady arms and registration arms are permitted within this envelope.
Equation*	See Station Equation.
Equivalent span or ruling span*	A mathematically weighted average span of a given tension length of conductors used in sag-tension calculations.
Exclusive right-of-way	Right-of-way only accessible to Owner's own vehicles and maintenance personnel.
Eye bolt	A bolt embedded in the face of a building or other structure with an "eye" or "ring" at the exposed end, for attachment of span guys.
Face of pole	The absolute nearest part of a pole from the track but excluding the base plate unless this is located significantly above the level of the rails and intrudes into the clearance envelope.
Facing turnout	A track turnout oriented to be directly entered in the normal direction of travel (see also Trailing turnout).
Feeders	Conductors which supply power to or augment the power-carrying capacity of the conductors in an overhead contact system.
Feeder spout* or feeder outlet*	See "Cable Outlet".
Finial*	See "Pole Cap".
Fittings	Small components used in assembly of cantilever pipes and catenaries
Fixed-terminated (FT) equipment	OCS with dead-ended conductors at both ends.
FTA	Fixed Termination Anchor
Frog (Track)	A rail component used at the intersection of two running rails to provide support for wheels and passages for their flanges, thus permitting wheels on either rail to cross the other.
Gain*	See "bracket".
Galv.	Galvanized
Gauge –	
load gauge	The envelope around the track within which all loaded track vehicles are specified to remain while static or in motion.
track gauge	The distance between the inside running edges of the track.
electrical umbrella*	The electrical clearance envelope for the pantograph in the swayed position over its operating height range. See also "pantograph clearance envelope".
pole gauge	The thickness of steel in a tubular pole.

Terms marked with an asterisk (*) are not preferred. Use preferred terms.	
Grade crossing	A crossing of a highway, railroad track, other fixed guideway, or pedestrian walk or combination of these at the same level.
Grade separation	A vertically separated crossing of a highway or walkway from a rail track by the provision of a bridge or underpass.
Gradient (contact wire)	The average slope of the contact wire between two adjacent catenary supports measured relative to the track.
Ground wire	The conductor installed for the purpose of providing electrical continuity between the supporting structure of the overhead contact system and the common return or grounding system.
GRS	Galvanized Rigid Steel
Guy –	A steadying or positioning wire.
down guy or back guy*	A wire attached high on a pole and coming down at an angle to an anchor in the ground.
head guy or span guy	A wire between two points but not anchored to ground.
sidewalk down guy	A down guy which is diverted to a vertical position for anchorage to the ground, by use of a horizontal strut braced against the pole at a high level. Used where the normal down guy anchorage would obstruct a sidewalk or other pathway.
guard	A (yellow) plastic strip which fits around the lower end of a down guy for increased visibility. Required to extend 8 feet minimum above ground.
HD	Hard Drawn
Hand hole	An access hole in a pole for cable installation or inspection.
Hanger	A wire assembly by means of which the contact wire is suspended from the messenger wire at regular intervals (typically every 15-30 feet).
Headspan	An installation of two or more wires that crosses the tracks and supports a simple catenaries, or several single contact wires in multi-track area.
Heel of steady arm	The pivoted end of a steady arm opposite to the end with the contact wire clamp.
Heel Setting	The dimensioned height of the pin at the heel of a steady arm or registration pipe above the plane of the contact wire.
Horns	The curved or angled downwards ends of the pantograph head which ensure movement of out-of-running wires onto the contact strip.
ID	Identification or Internal Diameter
I&M	Installation and Maintenance
Impedance bond	See “bond”.
In-running catenary	The catenary in multiple catenary sections (such as overlaps) providing the passage for the pantograph.
Insulator –	Any body or substance provided and designed for the purpose of surrounding, supporting or interrupting an electrical conductor so as to restrict the flow of electricity to a desired path.
bell or disc	A bell shaped insulator of glass or porcelain used singly or in strings.
Johnny ball*	A type of strain insulator used primarily for guy or span wire insulation.

Terms marked with an asterisk (*) are not preferred. Use preferred terms.	
no-bo	The brand name for a type of section insulator without skirts.
section	See "section insulator".
standoff	A solid core insulator with bending strength.
strain	An insulator or a string of disc insulators used in line with a tensioned conductor.
strut	A standoff insulator used in compression members of cantilevers.
suspension	An insulator or string of disc insulators which are suspended in vertical position.
synthetic	An insulator made from fiberglass, plastic or epoxy resin.
Insert	A mechanical screw socket-type fixing for direct embedment into concrete usually placed before concreting.
Insulated overlap	A sectionalization point in an OCS formed by cutting insulation into the out-of-running sections of the two overlapping catenaries.
Jumper –	Generally an internal electrical connection in the overhead contact system; a short conductor assembly installed to provide electrical continuity.
continuity or full current	A jumper capable of carrying full line current from one catenary to another longitudinally at tensioning overlaps and track turnouts.
equalizing	A light internal jumper in the OCS, connecting the messenger to the contact wire for electrical continuity. Generally once in each span.
kcmil	One thousand circular mils
LF	Linear foot/feet
LS	Lump sum
Lightning Arrester*	See "Surge Arrester".
Line guard	A bunch of short (12 inch) wires with preformed twist that self lock around a conductor and used to prevent abrasion of the conductor.
Live –	
live load (structural)	A load or force that is temporary in nature such as wind, ice, and the dynamic uplift force of a passing pantograph.
live wire (electrical)	A conductor carrying a voltage for power supply.
Load gauge	See "gauge".
Lug –	
crimped	An attachment to the end of a wire for an electrical connection made using a compression or crimping tool.
terminal	A crimped, bolted or a soldered piece with a hole, used to terminate a wire for electrical connection.
Mast*	See "pole".
Mast arm*	See "bracket arm" or "cantilever".
Maximum sag	The sag of conductors either at maximum conductor temperature or under a given radial ice loading, whichever is greater.

Terms marked with an asterisk (*) are not preferred. Use preferred terms.	
Maximum operating wind speed	The maximum wind speed in which vehicles will continue to be operated at their normal speed. The wind speed selected for pantograph security calculations. Typically 55 mph for LRT Systems.
Messenger	The uppermost conductor in a catenary system. The conductor which hangs in the approximate shape of a catenary from which the contact wire is suspended by hangers.
MH	Manhole
Middle ordinate*	See “stringline”.
Midpoint anchor	The point approximately midway between two balance weights of a tension length of auto-tensioned equipment where the catenary is anchored against along-track movement.
Midpoint guy or tie wire*	The span guy that provides the midpoint restraint in auto-tensioned equipment.
Midpoint guy pole	The pole, normally with a down guy, that takes the load from the midspan guy.
Midspan offset (MSO)	The deviation of the static contact wire from the superelevated centerline of track at midspan.
MOW	Maintenance of Way Division of Owner
MPA	Midpoint Anchor assembly
NEC	National Electrical Code
NEMA	National Electrical Manufacturers Association
NESC	National Electrical Safety Code
No-load tension or unloaded tension*	The tension to be applied to a messenger alone so that, once the contact wire is suspended from the messenger, the messenger assumes its desired final sag and tension.
Non-riding*	See “out-of-running”.
OCS	Overhead Contact System
O&M	operations and maintenance
Offset –	
contact wire offset	The deviation of the static contact wire from the normal center – line of the track.
Pole offset	The dimension of the centerline of the pole from the centerline of the track.
Out-of-running (OOR) catenary	The portion of catenary in multiple catenary spans that does not provide for passage for the pantograph because it is higher than, or offset from, the in-running catenary.
Overhead Contact System (OCS)	That part of the traction power system comprising the catenary (or single contact wire), aerial feeders, catenary supports, foundations, balance weights and other equipment and assemblies, that delivers electric power from the traction substation to rail vehicles.
Overlap	That portion of the overhead contact system where the contact and messenger wires of two adjoining tension lengths overlap before terminating.

Terms marked with an asterisk (*) are not preferred. Use preferred terms.	
Overlap poles	The structures which position the two contact wires in parallel within an overlap section.
Overlap span	That portion of the Overhead Contact System between two structures, where the contact and messenger wires of two adjoining tension lengths overlap, thus allowing pantographs to transition from one tension length to the next under power.
Overpass or overbridge*	Where a street, Pedestrian walkway or railway crosses above the LRT tracks.
Pan*	An alternative name for the Collector Head of a pantograph.
Pantograph	A current collection device fitted on top of an electrically powered rail vehicle, hinged to vary in height as it rubs along the underside of the contact wire.
Pantograph clearance envelope	See "Envelope, pantograph clearance envelope"
Pantograph head	The uppermost part of the pantograph which is fitted with the current collector.
Pantograph Security	The analysis of the lateral relationship between pantograph and contact wire that makes due allowance for vehicle and pantograph sway, track tolerances, superelevation, erection tolerances, windage on wires and poles.
Pantograph sway	Lateral displacement of the pantograph induced by vehicle roll and lateral shock loads. Typical maximum value is 1 1/2 inch each way
Pantograph up-lift	The distance the contact wire is lifted as a pantograph passes.
Pantograph pressure or Pantograph up-thrust*	The nominal upward force exerted by the pantograph on the contact wire. Typically 18 to 22 pounds.
Parallel running (length)	The design length where the two parallel contact wires in an overlap are suspended at the same height.
PCD	Pitch Circle Diameter
Pendulum support	A type of support using two parallel hinges typically 12-24 inches long to support the contact wire keeping the contact wire vertical as it lifts freely.
Pole or mast*	An independent slender vertical structure with or without guy, used to support some part of the OCS.
Pole cap	The attachment over the top of a pole to prevent intrusion of rain water. Ornate designs may be called "Finials".
Pole encumbrance	The across-track outside dimension of a pole and its attachments at vehicle level.
Pole face	<ol style="list-style-type: none"> 1. The side of the pole to which the cantilever or bracket arm is attached. 2. The side of the pole facing the track.
Portal	A frame support structure consisting of vertical columns supporting each end of a horizontal beam.
Pre-emption device	A switch operated automatically by LRV's in city streets, which controls traffic signals to their favor.
Preformed End Fitting	A trade name for a wrap-around type of dead end or guy grip.

Terms marked with an asterisk (*) are not preferred. Use preferred terms.	
Presag	The static difference between the average contact wire height at the end hangers in a span and the height at midspan. Typically span/1000 in value.
Prestress (of conductors)	The erection tension applied to conductor at a higher tension than normal to reduce the short-term wire creep.
Profile (overhead)	The vertical alignment of the OCS conductors relative to the track.
Pulley	A pulley block used in messenger support and catenary termination systems.
Pull off/push off	The registration towards or away from centerline of track in relation to the pole.
Rail bond	See "bond".
Radial load	The horizontal load on a structure applied by conductors due to deviation of the contact wire at registrations.
Rake	Lean of the pole from vertical.
Registration	Lateral support of conductors to maintain a fixed horizontal location relative to the track.
Rigid trolley system	An overhead contact system using an un-tensioned contact wire, relying on structural support at close spacing to supply the necessary rigidity.
Riser	A vertical cable supplying power upward from an underground feeder system to the OCS.
ROW	Right-of-way
RMS	Root-mean-square
R,S & I	Rules, Standards and Instructions
Rubbing strip*	See "Contact Strip"
Ruling span	See "equivalent span".
Running edges	The inside faces of the rail heads of a track.
SA	Surge Arrester
Saddle	The fitting that supports a hanger on the messenger wire, sometimes fitted with an insulated lining to prevent current entering the hanger.
Sag	The difference between the average heights of the conductor at adjacent supports and its height at the lowest point in the span.
Sagging	The act of installing messengers and other conductors to the correct tension by measuring conductor sag.
Sag-tension charts	Charts referred to during wire stringing that give conductor tensions related to conductor temperature during the sagging operation.
SCW	Single Contact Wire (System)
Sectionalizing or sectioning*	The division of an electrical distribution system or network into electrical sections.
Section break	An electrical break in the overhead contact system permitting isolation of a sections of catenary electrically.
Section insulator or section isolator*	A device for dividing a contact wire (and messenger wire) into two electrical sections while maintaining mechanical continuity and a continuous path for the pantographs.

Terms marked with an asterisk (*) are not preferred. Use preferred terms.	
Shop door bridge	A device in doorways of maintenance shops that bridges the gap in the contact wire which is needed to allow the overhead doors to close.
Sidewalk guy	See “guy”.
Single wire system*	See “catenary – single contact wire”.
SL	Stringline
Sleeve –	
pipe sleeve	A short length of smaller diameter pipe fitted into a larger diameter pipe to reduce the internal diameter of the larger pipe.
sleeve foundation	A custom designed circular concrete tube placed in a drilled hole to provide a foundation for an embedded pole.
chaffing sleeve	A sleeve around a conductor to reduce damage from abrasion.
reinforcing sleeve	A steel sleeve placed around a steel pole at ground line to protect against corrosion damage.
repair sleeve	A sleeve around a conductor to repair local electrical damage.
Small Part Steelwork (SPS)	Steel brackets, frames, links and yokes, etc, which are cut from stock steel sections for attachment of catenary assemblies, but not constituting part of a principal support structure.
Single wire system	See “catenary”.
Soffit	The underside of a tunnel roof or bridge deck.
Span or Actual Span Length	The horizontal length of contact wire between two adjacent support points (not necessarily the distance or difference in stationing between the support structures).
Span guy	See “Guy, Span Guy”
Span length	The distance along track between structures determined by difference in stationing.
Span width	The distance across track or roadway (may be skewed) between the columns of a portal, headspan, or cross-span.
Spiral	The transition from tangent to curve track along which superelevation increases from zero to the selected value for the curve, and vice versa.
Spout	See “cable outlet”.
Square mil	One thousandth part of the area of a one inch sided square.
STA	Station (for survey or location purposes)
Stagger	The offset of the contact wire from the superelevated track centerline by registration at each support, that causes the contact wire to sweep side to side over the pantograph head during vehicle operation.
Stand-off insulator	See “insulator”.
Station Equation	Typically the mathematical adjustment at a point along an alignment where the normal stationing is interrupted or restarted.
Steady span	A cross span guy for contact wires, usually the lower of two horizontal span guys.

Terms marked with an asterisk (*) are not preferred. Use preferred terms.	
Steady arm or registration arm*	The lateral restrainer on the contact wire at a structure.
Step and touch potentials	The potential difference between points of contact – if between hand and feet it is called “touch”, if between feet, “step” potential. (See IEEE Dictionary)
Stringing	Installation of overhead wires under tension.
Stringline	The distance between the track arc and its chord between catenary support structures, measured at midspan.
Structure	A principal support for the OCS conductors, normally including foundation, pole(s), and cantilever(s)/bracket arm(s) or headspan/cross-span; or eyebolts and cross-span.
Subassembly	A configuration of components forming part of a larger assembly.
Superelevation effect	Displacement from the vertical track centerline due to track superelevation.
Surge Arrester or Lightning Arrester*	A device typically mounted on OCS poles and connected to the OCS, designed to protect the OCS and adjacent equipment, e.g. traction power substations and feeder cables, against lightning. Surge arresters typically provide a path to ground through variable resistance elements.
Synthetic guy strand	A synthetic rope material used in cross-span guying.
System depth* or System height	The vertical distance between messenger and contact wires, at the support structure.
Tensioning	A method of controlling sag in an OCS by tension or by weight.
Tension length or Tension section*	A length of OCS between two corresponding terminations with automatic tensioning or fixed terminations.
TES	Traction Electrification System comprising the Traction Power System (TPS) and the Overhead Contact Systems (OCS).
TOR	Top of rail (as a vertical datum)
TPFS	Traction Power Feeder System
TPS	Traction Power System, comprising the Traction Power Substations (TPSS) and the Traction Power Feeder System (TPFS) (i.e. ductbanks and traction power feeder and return cables).
TPSS	Traction Power Sub-Station
Track raising allowance	An allowance of vertical clearance specified when determining minimum contact wire heights, to cater for future lifting of tracks.
Track tolerances –	Variations from design dimensions of track.
cross level	Allowable variation between the levels of the two rails (or the designated difference in levels on superelevated track).
lateral	Allowable variation in the track alignment.
track gauge	Allowable variation from 4 feet - 8 1/2 inch.
vertical	Allowable variation in track height.
Travelers	Sheaves used in pulling wires during stringing preferably with one “cheek” that can be opened for inserting wires and pull lines.

Terms marked with an asterisk (*) are not preferred. Use preferred terms.	
Trailing turnout	A turnout oriented to junction two tracks converging from behind in the normal direction of travel.
Trolley wire *	See Contact wire.
Tunnel support	A catenary, feeder, or return wire support for use in tunnels and normally mounted in the tunnel soffit.
Turnout	The arrangement of a track switch and a frog with closure rails by which vehicles can be diverted from one track to another.
UL	Underwriters Laboratory
Underpass or Underbridge*	Where a road or river crosses beneath the LRT tracks.
Underbridge supports	OCS supports used beneath overpasses and normally attached to their soffits.
Uplift –	The difference in height of contact wire when at rest and when subjected to an upward force due to current collectors passing.:

SECTION 34 23 35.99**OCS POLE PAINTING****PART 1 - GENERAL****1.1 SUMMARY**

- A. The Work specified in this Section covers the manufacture, supply, and application of all materials and methods used for factory painting of OCS poles.
- B. At various locations on the streetcar system, hot-dipped zinc galvanized coated poles shall be painted with an exterior three-coat paint application over the galvanizing. A general description of the required finish required on pole types throughout the system is given below. The contractor shall verify these with the Engineer prior to procurement.
 - 1. All poles located on Main Street south of Truman Road shall be hot-dipped galvanized only, unless otherwise directed by the Engineer.
 - 2. All poles located on Main Street between Truman Road and 7th Street shall be painted black only, unless otherwise directed by the Engineer.
 - 3. All poles located on Main Street north of 7th Street shall be painted black only, unless otherwise directed by the Engineer.
 - 4. All poles located on Delaware Street, 3rd Street, 5th Street, Grand Boulevard, Oak Street, and the non-revenue alignment shall be painted black only, unless otherwise directed by the Engineer.

1.2 RELATED SECTIONS

- A. The Contractor shall familiarize himself with the contents of the following Sections of these Specifications:
 - 1. SECTION 01 33 00 – Submittal Procedures
 - 2. SECTION 34 23 37 – OCS Tubular Steel Poles
 - 3. SECTION 34 23 37.11 – OCS Pole Ornamentation

1.3 SYSTEM DESCRIPTION

- A. Painted OCS poles shall be supplied from the manufacturer in a finished condition. Any paint damage requiring field touch-up painting shall conform to these Specifications.
- B. The Contractor shall be responsible for this Work in its entirety.

1.4 REFERENCES

- A. The following standard shall apply and are made a part of this Specification:
 - 1. American National Standards Institute (ANSI)

1.5 SUBMITTALS

- A. All submittals shall be made in accordance with SECTION 01 33 00 – Submittal Procedures, except as modified herein.
- B. Color samples shall be submitted to the Engineer for Approval prior to application to poles.

- C. Paint data, preparation, and application procedures as specified shall be submitted to the Engineer for Approval prior to painting.

1.6 DELIVERY, STORAGE AND HANDLING

- A. All painted poles shall be handled and stored by the Contractor so as to not damage the paint or coatings.
- B. The storage of paint and its associated mixes shall be in accordance with the paint manufacturer's written instructions and shall not alter the composition of the paint such that the qualities are altered or otherwise lost.
- C. The Contractor shall insure that the storage of all flammable paints and solvents is in accordance with all Federal, State, and Local requirements.

1.7 WARRANTY

- A. The finished coating shall be guaranteed to last a minimum of 5 years, with no visible paint peeling, blistering, cracking, fading, or surface corrosion evident or occurring within that period.

PART 2 - PRODUCTS

2.1 MATERIALS

- A. The term Paint, as used herein, includes coatings, emulsions, enamels, varnishes, paints and other protective sealers, whether used as a prime, intermediate or finish coat.
- B. The types of paint approved for use on OCS poles are as follows:
 - 1. Primer paint to be a rust-inhibitive, high build epoxy coating, quick dry-recoatable, applied over a finished hot-dipped galvanized base component system having 1.5 mil thick (minimum) paint dry-film coat; equivalent to Sherwin Williams Industrial Recoatable Epoxy Prime (B67 Series).
 - 2. Intermediate and Top Coating - To be acrylic polyurethane resin coating resistant to weather, abrasion and salt solutions, fast-dry product having a wide selection of available colors, semi-gloss, two-coat system, each coating to be 1.5 mil dry-film thickness, equivalent to Sherwin Williams Industrial Hi-Solids Polyurethane Resin (B65 Series).
- C. All paint products and coatings shall be selected, purchased, and used on the basis of a normal exterior exposure in an urban area with low humidity, intense sunlight, and temperatures ranging from -20 degrees to 120 degrees Fahrenheit. All paint products and coatings must be designed for this environment, having excellent resistance to corrosion, weathering, and demonstrating superior color retention.
- D. Paints intended for use in the field shall be stored in sealed containers that legibly show the designated name, formula, batch number, color, quantity, date of manufacture, manufacturer's number and directions including storage, special precautions, and warnings.
- E. The Contractor shall provide the following information for all paint used:
 - 1. The paint manufacturer and product key number
 - 2. Manufacture batch lot number
 - 3. Color

4. Directions and instructions for storage and field touch-up application
- F. Contractor shall supply five gallons of primer and five gallons of each color of paint to the Owner for later use.

2.2 PAINTING PROCESS

- A. Painted surfaces shall have a minimum three-coat application. The coating shall consist of a primer, intermediate, and finish layer, each with a minimum dry 1.5 mil thickness. The total paint thickness shall not be less than 5 mils dry (excluding galvanizing) and shall be in accordance with the paint manufacturer's instructions.

PART 3 - EXECUTION

3.1 INSPECTION

- A. All paint and its application shall be subject to inspection by the Engineer.

3.2 INSTALLATION

- A. Painted surfaces shall receive a minimum of three coats.
- B. Unless otherwise recommended by the paint manufacturer, all paint applications shall be performed when the ambient temperature is between 45 degrees Fahrenheit and 95 degrees Fahrenheit. All paints shall be applied only to surfaces that are completely dry, clean, and free of surface moisture, dirt, dust, oil, mill scale, and detrimental coatings which will cause the paint to lose its bonding properties. The Contractor shall follow all requirements and suggestions provided by the paint manufacturer. Solvent clean all surfaces prior to the application of the prime coat. After 1 week, spot test the paint adhesion to the galvanizing to insure a permanent bond. Brush blast clean the entire galvanized surface if paint test proves unacceptable, in accordance with the paint manufacturer's recommendations.
- C. Items not to be painted, which are in contact with or adjacent to surfaces scheduled for painting, shall be removed or protected prior to surface preparation and painting operations. All masking and protective tapes shall be totally removed, without leaving residue, upon completion of the painting operations. Paint shall not be applied to any insulators, cable insulation, or other OCS components that are not specifically required to be painted.
- D. Prime Coat
 1. Primers shall be capable of remaining in satisfactory condition for 6 months without the protection of a finish coat, for all field painting applications.
 2. Primers shall have sufficient penetrating and wetting properties to insure good coating regardless of the presence of light scale, or light rust on the surface to be painted.
- E. Intermediate Coat
 1. The intermediate coat shall be of a composition similar to the final finish coat, as recommended by the paint manufacturer.
- F. Finish Coat
 1. The finish coat shall be a coating suitable for protecting the surfaces to which it is applied. It shall completely hide the primer and intermediate coats and shall have no visible streaks, blisters, large runs, or obvious color or surface imperfections.

2. Drying time to a tack free condition shall not be more than 24 hours.

3.3 APPLICATION

- A. Paint shall be factory applied by dip, spray, or electro-coating except as herein specified. Field touch-up painting shall be by clean, dry brush or roller application, in accordance with paint manufacturer's instructions. At the time of application, all paint mixes shall show no signs of deterioration and be thoroughly mixed prior to applying. Powder coating over hot-dipped galvanizing shall be considered acceptable, pending demonstration of its in-service performance and application and shall be approved by the Engineer prior to manufacture.
- B. Paints of different manufacturers shall not be mixed together. Thinning is acceptable prior to application where necessary to suit conditions of surface, temperature, weather and method of application with not more than one pint of approved thinner per gallon of paint or as per the paint manufacturer's instructions.
- C. Paint shall be applied so the final finished surfaces shall be free of visible runs, drops, blisters, brush marks, and variation of color, texture, and finish.
- D. Each coat shall be applied as a film of uniform thickness, not less than 1.5 mils dry. Special attention shall be given to insure that all surfaces including edges, corners, crevices, welds, voids, and base plates receive a film thickness equivalent to that of adjacent painted surfaces.
- E. Sufficient time shall elapse between successive coats to permit proper drying. The application of another coat shall not cause the lifting or loss of adhesion of the undercoat.

3.4 FIELD QUALITY CONTROL

- A. All painting activities shall be in accordance with these Specifications, and are subject to inspection at any time by the Engineer.
- B. All paint which is unacceptable as applied, shall be removed or repaired in accordance with the paint manufacturer's instructions, and inspected for Approval by the Engineer at the Contractor's expense.

PART 1 - MEASUREMENT AND PAYMENT

1.1 MEASUREMENT

- A. The quantities of accepted work will be measured in the following units. All measurements will be plan measure except for authorized changes.
 1. Description: Lump Sum

1.2 PAYMENT

- A. Payment will be made at the respective unit or lump-sum price listed in the proposal and shall be full compensation for all labor, materials, and equipment necessary to complete the respective unit in place. There will be no separate measurement or payment for any item of work not specifically identified and listed in the proposal, and all such work shall be considered a subsidiary item with all costs pertaining thereto included in the prices for other items listed in the proposal. At the Engineer's option, partial payment may be made for any lump sum item listed in the proposal, providing that the Contractor is diligently and satisfactorily pursuing full completion of such partially complete item in accordance with the approved job progress schedule.

END OF SECTION

SECTION 34 23 37**OCS TUBULAR STEEL POLES****PART 1 - GENERAL****1.1 SUMMARY**

- A. This Section covers furnishing, fabrication, hot-dip galvanizing, hard marking, labeling, and delivery of new tapered tubular steel poles and accessory parts, for use as part of the Overhead Contact System (OCS) as shown on the Contract Drawings.
- B. The Contractor shall fabricate all OCS tapered tubular steel poles per the Contract Drawings.
- C. There will be 5 general configurations of OCS poles on the project; sole use OCS poles, OCS poles with street lighting, OCS feeder poles, Ornamental OCS poles, and OCS poles with traffic signal accessories. In some cases there will be combinations of these configurations. OCS pole finish may vary on the project, possibly utilizing both galvanized and painted finishes. The Contractor shall verify OCS pole types and finishes with the Engineer prior to procurement. See SECTIONS 34 23 37 – OCS Tubular Steel Poles, 34 23 37.11 – OCS Pole Ornamentation, 34 23 35.99 – OCS Pole Painting, and the Missouri Department of Transportation Governing Specifications and Special Provisions for related Specifications. OCS poles shall be procured based on these Specifications and Contract Drawings, in conjunction with Approval from the Engineer.
- D. A summary of the possible pole combinations is provided below.
 - 1. Regular (Non-Feeder) OCS poles may be ornamental or simple tapered tubular. They may also be combined with lighting and/or traffic accessories.
 - 2. OCS Feeder poles shall be simple tapered tubular poles with spouts. Feeder poles will not be ornamental poles. Feeder poles shall not be combined with lighting or traffic accessories.
- E. A summary of the pole types based on location is provided below.
 - 1. All poles located on Main Street south of Truman Road shall be simple tapered tubular poles only, unless otherwise directed by the Engineer.
 - 2. All poles located on Main Street between Truman Road and 7th Street shall be ornamental, unless otherwise directed by the Engineer.
 - 3. All poles located on Main Street north of 7th Street shall be simple tapered tubular poles only, unless otherwise directed by the Engineer.
 - 4. All poles located on Delaware Street, 3rd Street, 5th Street, Grand Boulevard, Oak Street, and the non-revenue alignment shall be simple tapered tubular poles only, unless otherwise directed by the Engineer.

1.2 RELATED SECTIONS

- A. SECTION 01 33 00 – Submittal Procedures
- B. SECTION 01 43 00 – Systems Quality Assurance
- C. SECTION 34 23 35.99 – OCS Pole Painting

- D. SECTION 34 23 37.11 – OCS Pole Ornamentation
- E. Specifications for Street Lighting Attachments can be found in the Street Lighting Specifications.
- F. Specifications for Traffic Signal Attachments can be found in the Traffic Signal Specifications.

1.3 REFERENCE STANDARDS

- A. The latest edition of the following reference specifications shall also govern the Work covered by this Section unless otherwise noted.
 1. ASTM A36 Structural Steel
 2. ASTM A53 Pipe, Steel, Black and Hot-dipped, Zinc Coated, Welded and Seamless
 3. ASTM A123 Zinc Coating (Hot-Dip Galvanized) on Iron and Steel Products
 4. ASTM A153 Zinc Coating (Hot-Dip) on Iron and Steel Hardware
 5. ASTM A325 High Strength Bolts for Structural Steel Joints.
 6. ASTM A370 Mechanical Testing of Steel Products
 7. ASTM A449 Specification for Quenched and Tempered Steel Bolts and Nuts
 8. ASTM A500 Specification for Circular cross-section Tubular Pole (Fy = 42 ksi)
 9. ASTM A563 Carbon and Alloy Steel Nuts
 10. ASTM A572 High Strength Low-alloy Columbium- Vanadium Steels of Structural Quality
 11. ASTM A595 Steel Tubes, Low Carbon, Tapered for Structural Use
 12. ASTM A633 Standard Specification for Normalized High-Strength Low-Allow Structural Steel Plates
 13. ASTM E269 Standard Definitions of Terms Relating to Magnetic Particle Examination
 14. ASTM E709 Standard Recommended Practice for Magnetic Particle Examination
 15. ASTM F436 Hardened Steel Washers
 16. ASTM F593 Stainless Steel Bolts, Hex Cap Screws and Studs
 17. AISC --- Code of Standard Practice for Buildings and Bridges
 18. AISC --- Manual of Steel Construction
 19. AWS D1.1 Structural Welding Code - Steel
 20. ASNT SNT-TC-1A Personnel Qualifications and Certification in Nondestructive Testing

- | | | |
|-----|---------------------|---|
| 21. | MILSPEC DOD-P-21035 | Paint, High Zinc Dust Content Galvanizing Repair |
| 22. | FED SPEC FF-T-79166 | Type 1 Form 1 Hot-Dip Galvanized Drop Forged Steel Quenched and Tempered Hardware |

1.4 SUBMITTALS

- A. Submittals shall be made in accordance with the requirements of SECTION 01 33 00 – Submittal Procedures, except as modified herein:
1. The Contractor shall submit the specifications for welding procedures and processes, certificates of qualifications of welders, welding operators, tackers, and welding inspectors for acceptance.
 2. The Contractor shall submit for review shop drawings of all pole types and capacities required. The shop drawings shall be to scale, giving complete information necessary for the fabrication of the poles. The drawings shall also indicate all fittings, holes, and accessories. The locations, sizes and types of all welds shall also be included on the drawings.
 3. The Contractor shall submit for review, prior to commencing fabrication, the manufacturer's certificates of compliance, or certified laboratory test reports. The reports shall demonstrate the compliance of all raw materials and fabrication products. Included shall be a listing of all standards designated by the manufacturer, as indicated.
 4. The Contractor shall furnish copies of test reports of all factory tests as required by these specifications and referenced standards.

1.5 QUALITY CONTROL/QUALITY ASSURANCE

- A. Quality control activity shall be in accordance with SECTION 01 43 00 – Systems Quality Assurance except where varied herein:
- B. Qualifications for welding work
1. Quality of welding processes and welding operations shall be in accordance with current AWS D1.1.
 2. Provide certifications that welders employed have satisfactorily passed AWS qualification per current AWS requirements.
- C. Source Quality Control: Material and fabrication procedures are subject to inspections and tests in the mill, shop, and field. These inspections and tests shall not relieve the Contractor of the responsibility for providing materials and fabrication procedures that are in compliance with the requirements.
- D. Shop Assembly: Preassemble components in the shop to the maximum extent possible. In order to simplify field assembly of units, clearly mark components for easy assembly at the site of installation.
- E. Material Testing: The chemical compositions and appropriate mechanical properties shall be determined for all materials used, either by obtaining manufacturer's certificates of compliance or by laboratory testing at a facility which is acceptable to the Engineer.

- F. Weld Testing
1. The services of an AWS Certified Welding Inspector shall be provided by the Fabricator to perform specified fabrication and verification inspection of welding procedures and personnel, and to perform weld tests as specified herein. Approval of the Welding Inspector shall be obtained from the Engineer.
 2. A visual inspection of all welds shall be performed in conformance with the AWS code.
 3. Weld testing shall be performed on a sample number of poles selected at random by the Engineer, comprising 20% of the total number of poles.
 4. Equipment, procedures, personnel for weld testing, and test reports shall conform to the requirements of AWS D1.1, Section 6 - Inspection.
 5. Weld testing shall consist of:
 - a. Ultrasonic testing conforming to the requirements of AWS D1.1, section 6
 - b. Magnetic particle testing conforming to the requirements of ASTM E709
 6. The poles selected for testing shall be tested by the ultrasonic and magnetic particle methods.
 7. Ultrasonic testing shall be performed on the complete penetration welds between the pole shaft and pole base, and on any circumferential welds in the pole shaft, for each pole being tested. Magnetic particle testing shall be performed on all other welds including longitudinal seam welds, welds at handholes, etc.
 8. For each tested pole that is found to be deemed unacceptable, weld testing shall be performed on another sample pole selected at random by the Engineer.
 9. Results of weld testing shall be deemed acceptable or unacceptable in accordance with AWS D1.1, sections 8, 9 or 10.
 10. Welds found to be unacceptable shall be repaired as specified, and retested at the Contractor's expense.
- G. Impact Testing: Structural steel materials for base plates and pole shafts shall be tested for impact toughness in accordance with the Charpy V-notch test as specified in ASTM A370. The minimum energy value shall be 15 ft-lbs at 0°F.

1.6 DELIVERY, STORAGE, AND HANDLING

- A. During fabrication and delivery, steel products shall be handled and transported in a manner that will prevent damage occurring to the structural steel, galvanizing, and surface coatings.
- B. Material shall not be stored in contact with the ground. It shall be stored in a manner and location that will not cause deterioration of the material.
- C. Any damage to the material and equipment shall be the Contractor's responsibility and all repairs shall be accomplished by the Contractor in accordance with the manufacturer's instructions, at the Contractor's expense.

PART 2 - PRODUCTS**2.1 MATERIALS**

- A. OCS Tapered Tubular Steel Poles
1. Tapered tubular steel poles shall be furnished complete with base plate, pole shaft, stiffeners, handholes, feeder spouts, and fittings.
 2. Poles shall be single ply.
 3. Poles shall be fabricated with the pole shaft having multiple faceted or circular cross sections.
 4. Pole shafts shall be fabricated from one structural steel material type conforming to the following ASTM Specification:
 - a. Multiple Faceted or Circular cross section Tapered Tubular Pole including Joint Use Poles - A595, Grade A steel
 - b. Multiple Faceted Tapered Tubular Pole including Joint Use – A572, Grade 55 steel
 5. Base Plates: Base plates shall be fabricated from structural steel conforming to one of the following Specifications:
 - a. ASTM - A572, Grade 50 steel
 - b. ASTM – A633, Grade 50 steel
 6. Poles shall have no spliced joints.
 7. Pole Attachments
 - a. Pole and handhole reinforcements shall be fabricated from steel of the same type and grade as specified for the pole shafts.
 - b. Feeder spouts (outlets) shall be standard steel pipe conforming to ASTM A53, Type S, Grade B.
 - c. Pole caps shall be fabricated from steel compatible with the pole shaft, and fitted with three stainless steel set screws.
 - d. Handhole cover screws shall be stainless steel hex head set screws.
 - e. Lighting attachments will require holes through the pole shaft to accommodate wiring.
 8. Weld filler shall be selected in compliance with the welding procedures of AWS D1.1. and shall be capable of producing satisfactory designed strength.
 9. All steel shall be handled carefully to keep it clean, and it is to be treated with the care and concern that should be to any product whose finished surfaces are to remain as prepared in the shop. The steel shall be kept free and clean of all foreign matter that may affect the natural oxidation of the steel. The Contractor shall immediately remove any foreign matter found on the steel.
 10. Hot-dip galvanizing shall be in accordance with ASTM A123 for fabricated pole assemblies and ASTM A153 for hardware.
 11. Miscellaneous structural steel shall conform to ASTM A36.

2.2 FABRICATION

- A. General: Poles, base plates, and fittings, including handholes, grounding lugs, "J" hooks and base partition accessories shall be fabricated to the dimensions indicated on the Contract Drawings or the Contractor's OCS Pole design shop drawing, as approved by the Engineer.
- B. Methods: Poles, fittings, accessories, and base plates shall be fabricated by methods conforming to AISC Specifications, except as specified herein.
- C. Welding Procedures: Welding procedures, welders, welding operations, and tackers shall conform to the provisions of the current AWS D1.1, Section 2, Design of welded connections; Section 3, Workmanship; Section 4, Techniques; and Section 8, 9 or 10.
- D. Preheat: Preheat base plate immediately prior to welding pole shaft to base plate.
- E. Weld Repair: Welds found to be unacceptable shall be repaired in accordance with the provisions of AWS D1.1, Section 3, Workmanship.
- F. The connections shall be welded in accordance with the Contract drawings and shall be fabricated in the shop, using E70xx electrodes in compliance with the welding procedures of AWS D1.1. Contractor shall design weld size and configurations based on load ratings given in drawings and AWS guidelines.
- G. Allowable Tolerances are as follows:
1. Tapered Tubular pole diameter shall be within 1/16 inch of the design diameter, and shall be within 1/16 inch of perfect round.
 2. Pole wall thickness shall be within plus 10%, but no less than the design thickness.
 3. Pole straightness shall be within 1/8 inch per 5 feet of pole length.
 4. Tolerances for base plates shall be as follows:
 - a. Bolt Circle Diameter: + 1/16 inch, -0 inch
 - b. Hole Diameter: + 1/16 inch, -0 inch
 - c. Location of Holes: + 1/16 inch in each direction
- H. Pole Type Identification Number is used to identify the pole type which shall be stamped in 1-inch high letters by a minimum 1/16 inch deep in the vertical edge of the base plate before galvanizing. Pole Type Identification Number shall be applied to the opposite side from the handhole. Pole Type Identification Numbers shall be clearly readable after galvanizing.
1. Pole Type Identification Numbers shall match the designations on the pole assembly drawings.
- I. For ornamental bases, cladding, globe arms, accessories and connections see SECTION 34 23 37.11 – OCS Pole Ornamentation.
- J. Street Lighting Attachments on OCS Poles shall be in accordance with Missouri Department of Transportation Governing Specifications and Special Provisions, in conjunction with Approval from the Engineer.
- K. Traffic Signal Attachments on OCS Poles shall be in accordance with Missouri Department of Transportation Governing Specifications and Special Provisions, in conjunction with Approval from the Engineer

2.3 FACTORY TESTING

- A. Poles shall be factory tested according to the provisions in SECTION 34 23 80 – OCS Testing.

PART 3 - EXECUTION

Not Used

PART 4 - MEASUREMENT AND PAYMENT**4.1 MEASUREMENT**

- A. The quantities of accepted work will be measured in the following units. All measurements will be plan measure except for authorized changes.
 - 1. Description: Lump Sum

4.2 PAYMENT

- A. Payment will be made at the respective unit or lump-sum price listed in the proposal and shall be full compensation for all labor, materials, and equipment necessary to complete the respective unit in place. There will be no separate measurement or payment for any item of work not specifically identified and listed in the proposal, and all such work shall be considered a subsidiary item with all costs pertaining thereto included in the prices for other items listed in the proposal. At the Engineer's option, partial payment may be made for any lump sum item listed in the proposal, providing that the Contractor is diligently and satisfactorily pursuing full completion of such partially complete item in accordance with the approved job progress schedule.

SECTION 34 23 40

OCS WIRE AND CABLE

PART 1 - GENERAL

1.1 SUMMARY

- A. This Section covers procurement and installation of wire and cable for OCS use within the streetcar system as described in SECTION 34 23 10 – OCS Description and General Requirements.
- B. Work under this Section includes the procurement of wire conductors and insulated cable for use as part of the installation of OCS equipment in accordance with OCS Wiring Layout Drawings, OCS Wiring Schedules, Traction Electrification Sectionalizing Diagrams, and Standard OCS System Drawings contained in the Contract Drawings.
- C. The wire to be procured and installed includes bare wire conductors used as OCS contact wire, bare feeder wires, bare jumper wires, feeder cables, jumper cables, terminations, ground wires, and all other OCS associated components
- D. The cable to be procured and installed includes insulated conductors used as feeders, or jumpers electrically connecting and passing current, either directly or indirectly from the outgoing terminal of pole mounted switches to the operational contact wire of the OCS.

1.2 RELATED SECTIONS

- A. DIVISION 01 – General Requirements
- B. SECTION 01 33 00 – Submittal Procedures
- C. SECTION 01 43 00 – Systems Quality Assurance
- D. SECTION 26 – Traction Power Specifications
- E. SECTION 34 23 10 – OCS System Description and General Requirements
- F. SECTION 34 23 50 – OCS Assemblies, Components and Fittings
- G. SECTION 34 23 70 – OCS Installation
- H. SECTION 34 23 80 – OCS Testing

1.3 REFERENCED STANDARDS

- | | | | |
|----|------|----------------|--|
| A. | ASTM | A368-95a | Standard Specification for Stainless Wire Strand |
| B. | ASTM | A475-03 | Standard Specification for Zinc-Coated Steel Wire Strand |
| C. | ASTM | A492-95 | Standard Specification for Stainless Steel Wire Rope |
| D. | ASTM | A555/ A555M-05 | Standard Specification for General Requirements for Stainless Steel Wire and Wire Rods |
| E. | ASTM | A580/A580M-06 | Standard Specification for Stainless Steel Wire |
| F. | ASTM | B1 | Standard Specification for Hard-Drawn Copper Wire |

-
- | | | | |
|----|------|-----|--|
| G. | ASTM | B3 | Standard Specification for Soft or Annealed Copper Wire |
| H. | ASTM | B8 | Standard Specification for Concentric-Lay-Stranded Copper Conductors, Hard, Medium-Hard, or Soft |
| I. | ASTM | B47 | Standard Specification for Copper Trolley Wire |

1.4 SUBMITTALS

- A. Submittals shall be made in accordance with the requirements of SECTION 01 33 00 – Submittal Procedures of the Contract Documents, except as modified herein.
- B. Technical information required
1. Submit the following information for all wires and cables:
 - a. Size
 - b. Type
 - c. Material
 - d. Number of and diameter of individual wires
 - e. Overall diameter
 - f. Cross-section area
 - g. Weight per foot
 - h. Rated breaking load
 - i. Electrical characteristics
- C. Contact Wire
1. Submit certification verifying that the Contact wire has been designed, manufactured, inspected, and tested in accordance with the referenced standards and these specifications.
 2. Submit complete manufacturer's data.
- D. Jumper Wire
1. Submit certification verifying that the Jumper wire has been designed, manufactured, inspected, and tested in accordance with the referenced standards and these specifications.
 2. Submit complete manufacturer's data.
- E. Feeder and Feeder Jumper Cable
1. Submit certification verifying that the Feeder Cable and Feeder Jumper Cable has been designed, manufactured, inspected, and tested in accordance with the referenced standards and these specifications.
 2. Submit complete manufacturer's data.

- F. Stainless Steel Wire Rope
 - 1. Submit certification verifying that the stainless steel wire and wire rope have been designed, manufactured, inspected, and tested in accordance with the referenced standards and these specifications.
 - 2. Submit complete manufacturer's data.
- G. Galvanized Steel Wires
 - 1. Submit reports for each type of wire to be used containing the physical and mechanical properties of all components described in this Section. The conformance of components with these Specifications and Contract Drawings in the form of a manufacturer's certification shall be shown.
 - 2. Submit a certification that the galvanized steel wire and wire rope have been designed, fabricated, rated, and tested in compliance with the applicable provisions of the standards referenced in these Specifications.
 - 3. Submit complete manufacturer's data.
- H. Samples
 - 1. Submit three 12-inch long samples of each conductor or cable to the City Engineer.
 - 2. Cables shall have ends secured from fraying.
 - 3. All samples shall have rough edges at ends filed down.
 - 4. All samples shall be labeled with wire tape and intended use clearly identified.

1.5 QUALITY ASSURANCE/QUALITY CONTROL

- A. Quality Control/Quality Assurance shall be in accordance with SECTION 01 43 00 – Systems Quality Assurance except where modified within this Specification Section.

1.6 DELIVERY, STORAGE AND HANDLING

- A. Assembly, component, and fitting materials shall be packaged, stored, handled, and transported in a manner that will prevent damage occurring to the material and any surface coatings.
- B. Wire and cable materials shall be carefully wound onto drum built suitably for that wire or cable. Where wire or cables being supplied may form part of the Owner's maintenance stocks, cable drums shall be manufactured from steel.
- C. Materials shall not be stored in contact with the ground. It shall be stored in a manner and location that will not cause deterioration of the material. It shall be labeled clearly and numbered to match the Contractor's approved design drawings.
- D. Any damage to the materials and equipment shall be the Contractor's responsibility, and all repairs shall be accomplished by the Contractor in accordance with the manufacturer's instructions, at the Contractor's expense.

PART 2 - PRODUCTS**2.1 CONTACT WIRE**

- A. The contact wire shall be solid grooved hard drawn copper. The contact wire shall conform to or exceed the requirements of ASTM B47. The contact wire size shall be 350kcmil.
- B. The contact wire shall be wound on reels, with its vertical axis normal to the barrel of the reel. The wire shall be wound evenly, tightly, and with no kinks. The diameter of the reel spindle shall be large enough to prevent excessive wire twist when running the wire out of the reel. A minimum diameter of 36 inches is permitted.

2.2 JUMPERS

- A. Full current and potential equalizing jumpers shall be 350 kcmil stranded, annealed copper cable conforming to ASTM B3 and B8 Class G or H, bare. The connections to the conductors shall be of copper or bronze.

2.3 INSULATED FEEDER CABLE AND FEEDER JUMPERS

- A. Feeder cables and feeder jumpers shall be 250 kcmil 2000 V "flex type" insulated copper cable.
- B. The size of feeder wire to be installed at each location shall be as shown on the sectionalizing schematic drawings in the Contract.
- C. Insulation shall be rated for XHHW or approved equal.

2.4 GROUND CABLES

- A. OCS Pole and Surge Arrester Ground cable sizes shall be as shown in the Drawings, unless otherwise specified.
- B. OCS Pole and Surge Arrester Ground methods shall be in accordance with the Contract Drawings, these Specifications, and the National Electric Code (NEC).
- C. Grounding Conductor
 - 1. Extra-flexible bare cable: Copper, 2/0 AWG, Class I stranding, ASTM B3, ASTM B172.
 - 2. Insulated cable: Copper, 2/0 AWG, 2 kV rated insulation.
 - 3. Splice: C-type compression connector, Burndy Hyground or approved equal.
 - 4. Exothermic weld

2.5 WIRE AND CABLE

- A. Galvanized Steel Wire and Wire Rope
 - 1. Galvanized steel wire and wire rope shall not be used on the Project unless specifically approved for each application by the Engineer.
 - 2. The physical properties of the zinc coated stranded wire shall conform to the description in Table 1 of ASTM A475.
 - 3. The weight of coating for zinc coated steel wire shall not be less than that specified in Table 4, under Class C of ASTM A475.

4. The materials shall be protected against damage during shipping and shall be wound on suitable reels. Each reel shall have a strong weatherproof tag attached which shall show the physical and mechanical properties, the steel type and ASTM designation and the name and mark of the manufacturers.
- B. Stainless Steel Wire and Wire Rope
1. Stainless steel wire rope shall be extra flexible.
 2. Stainless steel wire strand shall be manufactured and tested in accordance with the requirements of ASTM standards A368, A555, and A580.
 3. Stainless steel wire rope shall be manufactured and tested in accordance with the requirements of ASTM standards A368, A492, A555, and A580.

PART 3 - EXECUTION

3.1 INSTALLATION

- A. Installation of wires shall be per the Contract Drawings and SECTION 34 23 70 – OCS Installation, of these Specifications.

PART 4 - MEASUREMENT AND PAYMENT

4.1 MEASUREMENT

- A. The quantities of accepted work will be measured in the following units. All measurements will be plan measure except for authorized changes.
1. Description: Lump Sum

4.2 PAYMENT

- A. Payment will be made at the respective unit or lump-sum price listed in the proposal and shall be full compensation for all labor, materials, and equipment necessary to complete the respective unit in place. There will be no separate measurement or payment for any item of work not specifically identified and listed in the proposal, and all such work shall be considered a subsidiary item with all costs pertaining thereto included in the prices for other items listed in the proposal. At the Engineer's option, partial payment may be made for any lump sum item listed in the proposal, providing that the Contractor is diligently and satisfactorily pursuing full completion of such partially complete item in accordance with the approved job progress schedule.

END OF SECTION

THIS PAGE INTENTIONALLY LEFT BLANK

SECTION 34 23 50**OCS ASSEMBLIES, COMPONENTS, AND FITTINGS****PART 1 - GENERAL****1.1 SUMMARY**

- A. This Section covers the provision of assemblies, components, and fittings that make up the OCS for the streetcar system, as described in SECTION 34 23 10 – OCS Description and General Requirements.
- B. Work under this Section includes the provision of OCS equipment in accordance with the OCS Wiring Layout Drawings, Assembly Drawings, Pole and Foundation Schedules, and other related Drawings contained in the Contract Drawings.
- C. The equipment to be provided includes items associated with cantilevers, headspans, cross-spans, conductor support assemblies, feeder and jumper components, terminations, sectioning equipment, disconnect switches, surge arresters, and other components required for the complete installation of the OCS for the route and maintenance shop.
- D. All OCS equipment is energized at a nominal 750 V DC, and shall be double insulated. A minimum of two levels of electrical insulation shall be provided between the contact wire and a line pole or other grounded structure
- E. All OCS assemblies, components, and fittings shall be designed and manufactured in accordance with SECTION 01 43 00 – Systems Quality Assurance except where modified within this Specification Section.
- F. All OCS assemblies, components, and fittings shall be submitted to the Engineer for Approval, in accordance with SECTION 01 33 00 – Submittal Procedures.
- G. Installation of Assemblies, components, and fittings shall be per SECTION 34 23 70 – OCS Installation.

1.2 RELATED SECTIONS

- A. DIVISION 01 – General Requirements
- B. SECTION 01 33 00 – Submittal Procedures
- C. SECTION 01 43 00 – Systems Quality Assurance
- D. SECTION 26 – Traction Power Specifications
- E. SECTION 34 23 10 – OCS Description and General Requirements
- F. SECTION 34 23 40 – OCS Wire and Cable
- G. SECTION 34 23 70 – OCS Installation
- H. SECTION 34 23 77 – OCS Surge Arrester Installation
- I. SECTION 34 21 78 – OCS Disconnect Switch Installation
- J. SECTION 34 23 80 – OCS Testing

1.3 REFERENCED STANDARDS

- A. The pertinent provisions of the latest revisions of the codes and standards of the applicable NEMA, IEEE, ASTM, AISC, AWS, NEMA, NFPA, Federal Standard 595 and ANSI shall apply to the Work of this Section.

1.4 SUBMITTALS

- A. Submittals shall be in accordance with the requirements of SECTION 01 33 00 – Submittal Procedures, except as modified herein.
- B. The Contractor shall submit for review and approval by the Engineer, complete details for all assemblies, equipment, and components specified on the OCS Drawings provided.
- C. The Contractor shall furnish suitable illustrated catalog sheets, sufficient for the identification of all components not bearing individual identification, for all equipment and components not specified in this Section. All components for the OCS shall be submitted as shop drawings or catalog sheets, without exception. The Engineer may request submission of sample components if required for clarification.
- D. All design data, calculations, and design results shall be bound with a Table of Contents and the full volume shall bear the seal of a registered Professional Engineer qualified by experience, who personally supervised the preparation of the design.
- E. The Contractor shall submit test reports from Factory Design Tests and Factory Production Tests specified in SECTION 34 23 80 – OCS Testing.
- F. Disconnect Switches
 - 1. Submit complete manufacturer's descriptions, catalog data, and information including model numbers or serial numbers.
 - 2. Submit manufacturer's general and detail arrangement drawings, and installation instructions.
 - 3. Submit operation and maintenance manuals with a list of recommended spare parts.
 - 4. Submit installation and adjustment procedures.
- G. Wiring Assemblies, Fittings, and Components
 - 1. Submit Shop Drawings for all assemblies, fittings, and components for approval prior to manufacture. Shop drawings shall show details, dimensions, designations of the materials comprising the various components, and shall include technical, mechanical, and electrical characteristics as Specified.
 - 2. Submit samples of certain components as required by the Engineer.
- H. Insulators
 - 1. Submit Shop Drawings prior to insulator manufacture, showing details and dimension of the insulating and metal parts, describing the material composing the various parts, together with technical, mechanical, and electrical characteristics.
 - 2. Submit Certificates of compliance as applicable for the following:
 - a. Steel analysis
 - b. Analysis of other copper, bronze, and aluminum materials

- c. Hot-dip galvanizing
 - d. Adhesive materials
 - e. Insulator materials
 - f. In-service record of proposed insulators
 - g. Certified Quality Control Procedures used in the manufacturing process
3. Submit the follow data prior to insulator manufacture:
 - a. A complete set of assembly, component, and detail Drawings showing dimensions and weights
 - b. Storage and handling instructions
 - c. Test Procedures and Reports as Specified in SECTION 34 23 80 – OCS Testing
 - d. Installation procedures
- I. Brackets and Hinges
1. Submit Shop Drawings for all components for approval prior to manufacture, showing details and dimensions, and giving designations of the materials comprising the various components together with technical and mechanical, characteristics as Specified.
 2. Submit samples of certain components as required by the Engineer.
 3. Submit installation and adjustment procedures.
- J. Surge Arresters
1. Submit Shop Drawings for all components for approval prior to manufacture, showing details and dimensions, and giving designations of the materials comprising the various components together with technical, mechanical, and electrical characteristics as Specified.
 2. Submit samples of certain components as required by the Engineer.
 3. Submit installation and adjustment procedures.
- K. Fixed Terminations
1. Submit Shop Drawings for all components for approval prior to manufacture, showing details and dimensions, and giving designations of the materials comprising the various components together with technical, mechanical, and electrical characteristics as Specified.
 2. Submit samples of certain components as required by the Engineer.
- L. Warning Signs, I.D. Numbers, and Information Markers
1. Submit Shop Drawings for all components for approval prior to manufacture, showing details and dimensions, and giving designations of the materials comprising the various components together with technical, mechanical characteristics as appropriate.
 2. Submit samples of certain components as required by the Engineer.

M. Section Insulators

1. Submit Shop Drawings prior to section insulator manufacture, showing details and dimension of the insulating and metal parts, describing the material composing the various parts, together with technical, mechanical, and electrical characteristics.
2. Submit Certificates of compliance for the following:
 - a. Steel analysis
 - b. Analysis of other copper, bronze, and aluminum materials
 - c. Hot-dip galvanizing
 - d. Adhesive materials
 - e. Insulator materials
 - f. In-service record of proposed insulators
 - g. Certified Quality Control Procedures used in the manufacturing process
3. Submit the follow data prior to insulator installation:
 - a. A complete set of assembly, component, and detail Drawings showing dimensions and weights
 - b. Storage and handling instructions
 - c. Test Procedures and Reports as Specified in SECTION 34 23 80 – OCS Testing
 - d. Installation procedure
4. Submit details of any specifications for materials included in the section insulator assembly which are not covered in this specification.

1.5 QUALITY ASSURANCE/QUALITY CONTROL

- A. Quality Control/Quality Assurance shall be in accordance with SECTION 01 43 00 – Systems Quality Assurance except where modified within this Specification Section.

1.6 DELIVERY, STORAGE, AND HANDLING

- A. Assembly, component, and fitting materials shall be packaged, stored, handled, and transported in a manner that will prevent damage occurring to the material and any surface coatings.
- B. Materials shall not be stored in contact with the ground. It shall be stored in an enclosed place, in a manner and location that will not cause deterioration of the material. It shall be labeled clearly and numbered to match the Contractor's approved design drawings.
- C. Any damage to the materials and equipment shall be the Contractor's responsibility and all repairs shall be accomplished by the Contractor in accordance with the manufacturer's instructions, at the Contractor's expense.

1.7 SAMPLES

- A. Provide samples of the following proposed items, along with a description of its intended use.

1. All conductor clamps to be used including contact wire clamps.
2. Insulators
3. All other assemblies, fittings, and components as requested by the Engineer

PART 2 - PRODUCTS

2.1 GENERAL REQUIREMENTS

- A. OCS assemblies, fittings, and components shall be standard products of manufacturers regularly engaged in the production of such materials and equipment, and shall be the manufacturers' latest proven design.
- B. Contractor shall size all components to meet all site specific loading requirements, in combination with required factors of safety as Specified in SECTION 34 23 10 – OCS Description and General Requirements.
- C. Contractor shall provide components capable of withstanding the project environment without degradation or loss of function.
- D. Products to be purchased shall be identified by the Contractors and quantified in the Bill of Materials Schedule. The Contractor shall make allowances for waste and breakages.
- E. Materials and equipment shall be delivered to the job site in unbroken packages, reels, or other forms of containers.
- F. Materials and equipment shall be stored in a manner that will prevent damage or degradation. Any materials deemed by the Engineer to be damaged shall be replaced at the cost of the Contractor.

2.2 BRACKETS AND HINGES

- A. Brackets, pole wraps, and pole bands with hinges as shown on the Contract Drawings shall be used to attach bracket arms, cross-spans, headspans, cantilevers, pull-offs, and terminations.
- B. The maximum breaking strength, or maximum working strength with corresponding factor of safety of all brackets, pole wraps, and pole bands with hinges shall be shown in shop drawings and catalog cuts.
- C. Contractor shall size all brackets, hinges, and related components as required by loading and Specified component factor of safety, as given in SECTION 34 23 10 – OCS Description and General Requirements.
- D. Specific bracket sizes shall correspond to specific tapered tubular pole sizes.
- E. Brackets that are simple and small, but have the required strength are desirable.

2.3 WIRE PULL-OFF AND BACKBONE ASSEMBLIES

- A. Direct pull-offs shall be suitable for single and multiple track operations.
- B. Pull off and backbone assemblies shall be used to hold the OCS system in its correct alignment on curves.
- C. The Contractor shall design and specify tensions and attachment heights of overhead guying and backbones including bridles and pull offs where required. Contractor shall size all wire, clamps, and components as required by loading and Specified component factor of safety, as given in SECTION 34 23 10 – OCS Description and General Requirements.

- D. Suitable bull-rings may be used in backbone systems to achieve correct tension distribution and accommodate the angles required. If bull-rings are not used, the fittings utilized shall not cause kinking or detrimental stresses in the backbone wire.
- E. Pull-off and Backbone assemblies shall not infringe upon the pantograph envelope.
- F. Stainless Steel wire shall be used for pull off and backbone assemblies.
- G. The pull offs shall be designed to accommodate the loads at each location, and shall maintain a minimum load of 200lb in all locations along the pull off wire at any temperature or condition.

2.4 HEADSPANS

- A. Headspans shall consist of two or more steel span wires with double insulation. The span wires shall include insulators, where required, and turnbuckles with a minimum of 6 inches of adjustment capability, in each direction, after installation.
- B. Contractor shall size all wire, clamps, and components as required by loading and Specified component factor of safety, as given in SECTION 34 23 10 – OCS Description and General Requirements.
- C. Headspan assemblies shall not infringe upon the pantograph envelope.
- D. Headspan geometry shall be in accordance with SECTION 34 23 10 – OCS Description and General Requirements.
- E. Stainless Steel wire shall be used for headspans.

2.5 CROSS-SPANS AND SPAN GUYS

- A. Cross-spans shall consist of a single steel wire with double insulation. Cross-spans and span guys shall be designed for single and multi-track arrangements. The cross-span and span guy wires shall be easily adjustable with turnbuckles to facilitate installation, adjustment, and future maintenance, and shall have at least 6 inches of adjustment in each direction, after installation.
- B. Contractor shall size all wire, clamps, and components as required by loading and Specified component factor of safety, as given in SECTION 34 23 10 – OCS Description and General Requirements.
- C. Cross-span and span guy assemblies shall not infringe upon the pantograph envelope.
- D. Cross-span geometry shall be in accordance with SECTION 34 23 10 – OCS Description and General Requirements.
- E. Stainless Steel Wire shall be used for Crossspans.

2.6 WIRE TERMINATION FITTINGS

- A. Strain type termination assemblies shall be of a straight line design or of other design of aesthetically pleasing appearance.
- B. Wire wrap, cone, or wedge type designs are acceptable, and turnbuckles with a minimum of 6 inches of adjustment capability in each direction after installation shall be included. Slip strength of the assembly shall meet 100% of the breaking strength of the terminating conductor.

2.7 PIPE

- A. Application
1. Pipe is generally used for constructing support assemblies, and can be made from various materials, as Approved by the Engineer.
 2. The cut ends of pipe shall be painted, plugged or capped for protection and appearance.
- B. Standard Sizes
1. ASTM A53 Grade B steel pipes are standard. The following types are commonly used, however the Contractor is responsible for determining appropriate size and schedule of pipe, based on all site specific loadings and structural Specifications provided in SECTION 34 23 10 – OCS Description and General Requirements.
 - a. Steady arms are generally made of ¾ inch diameter schedule 40 or schedule 80 pipes.
 - b. Cantilever frames are generally made of 2 inch diameter schedule 40 or schedule 80 pipes.

2.8 SECTION INSULATORS

- A. Bridging type section insulators shall permit continuous current collection during the passage of a vehicle pantograph, and be suitable for mainline train operations.
1. Bridging section insulators supplied by the contractor shall be Arthur Flury AG type or approved equal.
 2. Section insulators shall be installed in accordance with manufacturer's instructions.
 3. Section insulators shall provide smooth passage of the vehicle pantograph with minimum current interruption by pantographs at running speeds up to 35 mph.
- B. Non-Bridging type section insulators shall ensure that adjacent sections of the OCS will remain electrically isolated from each other during all phases of the passage of a vehicle pantograph.
1. Section insulators shall be installed in accordance with manufacturer's instructions.
 2. Non-bridging section insulators shall provide smooth passage of the vehicle pantograph with minimum current interruption by pantographs at running speeds up to 20 mph.
 3. The non-bridging gap between adjacent electrical sections shall be 18 inches minimum.
- C. All section insulators shall meet or exceed the following design requirements:
1. All Section Insulators will be submitted to the Engineer for Approval.
 2. Test Procedures and Reports, as Specified in SECTION 34 23 80 – OCS Testing, shall be submitted for all Section Insulators.
 3. Section Insulators shall meet the load requirements given in the Contract Drawings with the appropriate factors of safety as Specified in SECTION 34 23 10 – OCS Description and General Requirements.

4. Section Insulators shall meet the electrical requirements Specified for Insulators, in Section 2.12 below.
5. The design shall be suitable for use by new pantograph carbons and by carbons with 1 inch of uneven wear.
6. The design shall ensure that electrical isolation between adjacent electrical sections is maintained at all times.
7. The section insulator shall be designed to remain stable dynamically and structurally, under train operating conditions as specified.
8. The section insulator shall be designed to withstand crosswinds of up to 90 mph without failure or permanent deformation.
9. The design shall ensure that the moving pantograph is continuously in contact with the section insulator.
10. Pantographs drawing current while traversing the section insulator shall not cause excessive arcing or damage to the section insulator or pantograph.
11. The design shall allow for torsional forces resulting from the passage of pantographs at rated speed combined with lateral wind loads.
12. Contact wire skids or runners shall be copper or copper alloy and shall provide a smooth transition from one section to another.

2.9 SURGE ARRESTERS

- A. DC surge arresters shall be outdoor style, intermediate class, and shall be designed, constructed and tested in accordance with the general requirements of ANSI C62.1.1. The arresters shall be rated to withstand normal operating line transients of up to 5000 V DC of either polarity to ground. They shall conduct surges due to lightning strikes, and shall block follow-through current from the substation rectifiers.
- B. Surge arresters shall be submitted to the Engineer for Approval.
- C. Surge arresters shall be of the metal oxide varistor type. Each surge arrester shall have an energy discharge capability of 2.2 kj/kV for currents of 300A or less.
- D. Each surge arrester shall incorporate an individual grounding system which may be connected to a ground rod or ground mat by means of 4/0 AWG copper wire with a 2000 volt rated insulation.
- E. Each surge arrester shall be suitable for mounting directly to OCS poles, and shall be supplied with the required accessories.
- F. Surge arresters shall be installed as shown in the Contract Drawings, in conjunction with these Specifications.
- G. Surge arresters shall be installed at:
 1. Feeder cable termination points at the OCS
 2. Bypass disconnect switch cable terminations at the OCS, on both sides of switch
 3. At locations where the track passes beneath overhead structures

4. At any other locations shown in the sectionalizing diagrams in the Contract Drawings
5. At OCS feed points at the vehicle maintenance facilities

2.10 DISCONNECT SWITCHES

- A. Disconnect switches shall be single or twin, two position, single throw, non-load break, non-grounding, non-fusible air switches with arcing horns.
- B. The disconnect switches shall be capable of breaking load currents under emergency conditions. The switches for the mainline shall be of the exposed type and have a minimum continuous rating of 1500 V DC and 2000 amperes.
- C. The disconnect switch blades and contact surfaces shall be silver-coated copper or copper alloy. The line and load side disconnect terminals shall have silver-plated copper buses complying with ASTM B187, to accommodate the number and size of feeder cables as indicated on the Contract Drawings. The switch terminals shall have provisions for NEMA drilled (2 or 4 hole) cable terminal lugs.
- D. Separate insulated cable strain posts shall be provided for the termination of cables, designed to prevent cable movements from affecting the adjustment of each switch.
- E. Each disconnect switch shall be operated using operating handle near ground level. The operating handle will be included with each disconnect switch.
- F. Disconnect switches shall be suitable for mounting on tapered tubular, ornamental joint use poles.
- G. Disconnect switches shall require approval from the Engineer.

2.11 OCS DOORBRIDGE ASSEMBLY

- A. A special OCS doorbridge assembly is required at each doorway where a roll-up door is installed in a maintenance shop. The roll-up door is typically stored above the lintel of the door, inside the shop.
- B. In order for a roll-up door to close, it is necessary for a short section of the OCS to be retracted out of the path of the door when it closes. The doorbridge provides the means to retract this section of OCS and subsequently, after the door is reopened, to replace the same short section of OCS so the streetcars can enter the shop under their own power with their pantographs raised.
- C. Door bridge assembly includes section insulator for electrical isolation of shop.

2.12 INSULATORS

- A. The Contractor shall prepare detailed designs for each of the required insulators shown on the Contract Drawings. The designs shall be based on the performance requirements, working loads, required factors of safety as Specified in SECTION 34 23 10 – OCS Description and General Requirements, and basic dimensions. The design shall be submitted for review and Approval by the Engineer.
- B. Insulators shall be suitable for the various assemblies including cantilevers, cross-spans, headspans, registration assemblies, terminations, section insulators. and any other strain insulator applications. Insulators shall be furnished complete with integral hardware suitable for connection to supports or OCS hardware.
- C. The insulators metal parts shall be made of malleable iron, ductile iron, or forged steel and shall be galvanized, prior to integration to the body in accordance with ASTM A153.

- D. All adhesives shall be sealed to the fittings to prevent the ingress of moisture.
- E. All insulators shall have a smooth, void free surface. Unless otherwise directed by the Engineer, color shall match Federal Standard 595A color number 36293 (lusterless medium gray). Color shall be submitted to Engineer for Approval. The insulator shall be capable of withstanding service in the climate described in SECTION 34 23 10 – OCS Description and General Requirements
- F. The design of the insulators shall be such that cyclical stresses due to temperature variation, or other loads including torsion due to contact wire roll, shall not lead to insulation deterioration or mechanical failure.
- G. Insulators shall be porcelain or synthetic, as described below.
- H. Porcelain insulators shall be as follows:
 - 1. The insulator shall be made of the best commercial-grade wet process porcelain in accordance with ASTM D116.
 - 2. The insulator surface shall be free of imperfections. Pieces with imperfections in the glaze repaired by recoating and refiring, as well as pieces repaired by re-touching with paint, will be rejected.
- I. Synthetic insulators may be fabricated from any of the following materials or combinations thereof, depending on type or application:
 - 1. Molded ethylene propylene copolymer with hydrated alumina filler
 - 2. Fiberglass-reinforced epoxy solid rod
 - 3. Composite type with molded ethylene propylene copolymer jacket or skirts formed over a fiberglass-reinforced epoxy core
- J. All insulators shall have the following ratings:

Nominal System Voltage	600 V DC
Insulation Level	3.7 kV AC RMS
Creepage Distance	1.88 inch (min)
60 Hz Withstand Voltage, Dry	35 kV
60 Hz Withstand Voltage, Wet	18 kV
- K. Each insulator shall also bear the manufacturer's name or trademark and year of manufacture, clearly and permanently imprinted, without affecting the appearance or function of the insulator.

2.13 OCS FITTINGS AND HARDWARE

- A. OCS fittings and hardware includes the following items which, combined with other major items, completes the total OCS.
 - 1. Clevis fittings
 - 2. Parallel wire and cable clamps
 - 3. Nuts, bolts, and cotter pins
 - 4. Wire terminations

5. Cross-contact assembly
 6. Dead ends
 7. Turnbuckles
 8. Wire splices and connectors
 9. Knuckle assemblies
 10. Links and eyebolts
 11. Thimbles and wire sleeves
- B. All fittings and hardware used for the various OCS assemblies shall be selected and manufactured such that they can be reused after removal.
 - C. All fittings and hardware shall be designed to allow an easy interface with the other components of the OCS system.
 - D. All fittings and hardware shall be designed and installed in a manner which will provide a homogenous OCS hardware and assembly arrangement.
 - E. All components shall be designed such that all fastenings and adjustments are accomplished with the same dimensional standards and tools.
 - F. Clevis fittings, nuts, bolts (excluding bolts securing ground cables), turnbuckles, links, thimbles, and wire sleeves shall be hot dipped galvanized, or stainless steel.
 - G. Cotter pins shall be stainless steel.
 - H. Parallel wire clamps, cable clamps, bolts securing ground cables, wire terminations, dead ends, wire splices, and wire connectors shall be bronze or other copper alloys. Overall OCS design shall ensure the prevention of galvanic corrosion.
 - I. Cross-contact assemblies shall be copper.
 - J. Jumpers shall be double clamped at each end.

2.14 WARNING SIGNS, AND I.D. NUMBERS

- A. Warning signs and pole I.D. numbers shall be supplied and installed by the Contractor.
- B. All signs, and I.D. numbers shall be manufactured for outdoor use. The lettering shall show no appreciable discoloration, cracking, blistering or dimensional changes or loss of adhesion for a period of ten years.
- C. Pole ID Numbers shall be installed on all poles.

PART 3 - EXECUTION

Not Used

PART 4 - MEASUREMENT AND PAYMENT**4.1 MEASUREMENT**

A. The quantities of accepted work will be measured in the following units. All measurements will be plan measure except for authorized changes.

1. Description: Lump Sum

4.2 PAYMENT

A. Payment will be made at the respective unit or lump-sum price listed in the proposal and shall be full compensation for all labor, materials, and equipment necessary to complete the respective unit in place. There will be no separate measurement or payment for any item of work not specifically identified and listed in the proposal, and all such work shall be considered a subsidiary item with all costs pertaining thereto included in the prices for other items listed in the proposal. At the Engineer's option, partial payment may be made for any lump sum item listed in the proposal, providing that the Contractor is diligently and satisfactorily pursuing full completion of such partially complete item in accordance with the approved job progress schedule.

END OF SECTION

SECTION 34 23 64**OCS SPECIAL TOOLS****PART 1 - GENERAL****1.1 SUMMARY**

- A. This Section covers furnishing of all special tools required for the OCS work, including but not limited to, jumpers, assembly-specific slings, hoists, special jig and fabrication tools, compression dies, and any other special tools required for working on the Overhead Contact System.
- B. All special tools specified herein and required by the agency shall be purchased as new for this project in coordination with Engineer. The tools may be used by the Contractor and shall remain his property throughout the construction period of the Overhead Contact System, and during its subsequent testing. All special tools shall become the property of the Owner, and shall be delivered to the Owner in good working condition, as directed and Approved by the Engineer.

1.2 RELATED SECTIONS

- A. DIVISION 01 – General Requirements
- B. SECTION 01 33 00 – Submittal Procedures
- C. SECTION 34 23 66 – OCS Spare Parts
- D. SECTION 34 23 70 – OCS Installation

1.3 SUBMITTALS

- A. Submittals shall be made in accordance with the requirements of SECTION 01 33 00 – Submittal Procedures, except as modified herein.
- B. Shop drawings and manufacturer catalog cuts shall be submitted showing details and dimensions of all special tools, together with complete specifications of materials proposed for components. The Contractor shall verify the capacity of the tools specified to suit the construction and maintenance needs, and submit their proposal for complete list of tools and tackle for this project for Approval of the Engineer, before procurement.

PART 2 - PRODUCTS**2.1 MATERIALS**

- A. All special tools proposed for use shall meet the applicable performance requirements, and shall be non-corroding and durable.

2.2 MANUFACTURED ITEMS

- A. The Contractor shall furnish the following general types of OCS special tools, and manufactured items to the agency, prior to procurement:
 - 1. Manufacturer specific tools (installation, adjustment, maintenance) – two each
 - 2. Shop fabrication jigs (jumpers, and cross contact bridges) – two each
 - 3. Cable thimble, compression and crimp dies and tools – three each

4. Special fastener keys and sockets – three each
 5. Safety tools provided with equipment from manufacturers – two each
 6. Go/No-Go gauges supplied by manufacturers – two each
 7. Optical Stagger Gauges – two each
 8. Other specialized OCS tools required to install, align, test and commission the catenary and/or components and assemblies – two each
- B. The above special tools are the typical style/purpose tools to be furnished to the Owner. The Contractor shall provide any other special tools required for the installation and maintenance of any other specialized OCS components.
- C. This requirement shall not restrict the Contractor from selecting and providing all necessary tools and equipment to be used by his own crews for the OCS construction.

PART 3 - EXECUTION

3.1 GENERAL REQUIREMENTS

- A. The OCS Contractor shall deliver all special tools and products to a location designated by the Engineer, complete and ready for use, subject to the inspection of the Engineer, in sufficient time for all required OCS adjustment purposes.
- B. The OCS Contractor shall be responsible for and protect all products from damage during the duration of the project and shall deliver all special tool items in good working condition to the Owner at the completion of the project. All special tools and equipment required by this Specification that are damaged and rendered useless for this intended purpose, or lost or stolen during the execution of this Contract, shall be replaced by the Contractor at the Contractor's expense.

PART 4 - MEASUREMENT AND PAYMENT

4.1 MEASUREMENT

- A. The quantities of accepted work will be measured in the following units. All measurements will be plan measure except for authorized changes.
1. Description: Lump Sum

4.2 PAYMENT

- A. Payment will be made at the respective unit or lump-sum price listed in the proposal and shall be full compensation for all labor, materials, and equipment necessary to complete the respective unit in place. There will be no separate measurement or payment for any item of work not specifically identified and listed in the proposal, and all such work shall be considered a subsidiary item with all costs pertaining thereto included in the prices for other items listed in the proposal. At the Engineer's option, partial payment may be made for any lump sum item listed in the proposal, providing that the Contractor is diligently and satisfactorily pursuing full completion of such partially complete item in accordance with the approved job progress schedule.

END OF SECTION

SECTION 34 23 66**OCS SPARE PARTS****PART 1 - GENERAL****1.1 SUMMARY**

- A. This Section includes the requirements for OCS mandatory spare parts for the KCMO Streetcar project.
- B. Owner may elect to purchase additional spares separately.

1.2 RELATED SECTIONS

- A. SECTION 01 33 00 – Submittal Procedures
- B. SECTION 01 43 00 – Systems Quality Assurance

1.3 QUALITY ASSURANCE

- A. OCS spare parts shall comply with the requirements of all applicable OCS Specification Sections and shall be in accordance with SECTION 01 43 00 – Systems Quality Assurance except where modified within this Specification section.

1.4 SUBMITTALS

- A. Unless otherwise specified, all submittals shall be in accordance with SECTION 01 33 00 – Submittal Procedures.
- B. Submit a detailed Mandatory Spare Parts list with part numbers, manufacturer, and cost for the Approval of the Engineer as part of the Project Shop Drawing and Submittals procedures.
- C. Submit detailed Recommended Spare Parts list with part numbers, manufacturer, and cost for the approval of the Engineer as part of the project shop drawing and submittal procedures.

PART 2 - PRODUCTS**2.1 GENERAL**

- A. Provide the following items to be bid as part of this Contract.
 - 1. All provisioning items shall be identical to the project approved/installed items and shall meet all requirements of the appropriate Sections of these Specifications. Parts availability from the approved supplier to the agency shall be for a period of not less than 7 years after the end of this Contract.
 - 2. All items shall be complete and ready for installation, except for wire or cable and that necessary for connections.

2.2 SPARE PARTS

A. The following mandatory spare parts shall be furnished as part of the OCS Contract:

1	Cantilever Assemblies (complete assemblies)	
	Push-Off – direct suspension light load	1 Each
	Pull-Off – direct suspension light load	1 Each
	Push-Off – heavy load	1 Each
	Pull-Off – heavy load	1 Each
2.	Cantilever Components	
	Steady Arms – light load	2 Each
	Steady Arms – heavy load	2 Each
3	Section Insulator (bridging)	1 Each
4	Section Insulator (non-bridging)	1 Each
5	Surge Arresters (with mounting hardware)	5 Each
6	Pole mounted disconnect switch (assembly)	2 Each
7	In-Span Contact Wire Insulators and Fittings	4 Each Type
8	Termination Turnbuckles	2 Each
9	Pole Bracket Assemblies	2 Each Type
10	Contact Wire Bridge Assemblies	2 Each
11	Poles	4 (Type and length to be determined by the Engineer)
12	Ornamental Poles	4 (Type and length to be determined by the Engineer)
13	Contact Wire	1 Drum (5000 feet minimum)
14	Cable (structural)	500 feet of each type of cable used to support OCS
15	Cable (feeder)	500 feet of each type used to electrically feed OCS

B. Special Tools and Equipment – Provide special tools and equipment as needed for installation, adjustment and testing as specified in SECTION 34 23 64 – OCS Special Tools.

PART 3 - EXECUTION**3.1 DELIVERY**

- A. Deliver all spare parts to a location directed by the Engineer. Pack all material for warehouse storage and clearly mark with manufacturer's part and/or style number.
- B. Unload and store all items neatly in the Owner's storage facility as directed by the Engineer.
- C. Complete delivery and storage for all spare parts prior to OCS commissioning.

3.2 WARRANTY USE

- A. In the event that any initial provisioning spare part items must be used in the course of satisfying the OCS Contract warranty procedures, the Contractor shall replace such items at the Contractor's expense.

PART 4 - MEASUREMENT AND PAYMENT**4.1 MEASUREMENT**

- A. The quantities of accepted work will be measured in the following units. All measurements will be plan measure except for authorized changes.
 - 1. Description: Lump Sum

4.2 PAYMENT

- A. Payment will be made at the respective unit or lump-sum price listed in the proposal and shall be full compensation for all labor, materials, and equipment necessary to complete the respective unit in place. There will be no separate measurement or payment for any item of work not specifically identified and listed in the proposal, and all such work shall be considered a subsidiary item with all costs pertaining thereto included in the prices for other items listed in the proposal. At the Engineer's option, partial payment may be made for any lump sum item listed in the proposal, providing that the Contractor is diligently and satisfactorily pursuing full completion of such partially complete item in accordance with the approved job progress schedule.

END OF SECTION

THIS PAGE INTENTIONALLY LEFT BLANK

SECTION 34 23 70

OCS INSTALLATION

PART 1 - GENERAL

1.1 SUMMARY

- A. This Section covers installation of the OCS as described in SECTION 34 23 10 – OCS Description and General Requirements.
- B. Work under this Section includes the assembly and installation of OCS wiring equipment and fittings in accordance with the OCS Wiring Layout Drawings, OCS Assembly Drawings, and related drawings contained in the Contract Drawings, and Specifications.
- C. The equipment to be installed includes OCS supports, conductors, feeder jumpers, terminations, sectioning equipment, and all other OCS associated components to create an OCS suitable for streetcar operations in public streets.
- D. All OCS equipment is energized at a nominal 750 V DC, and shall be double insulated. A minimum of two levels of electrical insulation separated by a minimum distance of 4 feet shall be provided between the contact wire and an OCS pole or other grounded structure.
- E. Installation of OCS material shall be part of the coordinated work plan for the complete project. The Contractor shall be required to submit Procedures and Plans for all stages of work for Approval by the Engineer. Approval shall not relieve the Contractor from liability for damages incurred during installation of the OCS.

1.2 RELATED SECTIONS

- A. DIVISION 01 – General Requirements
- B. SECTION 01 33 00 – Submittal Procedures
- C. SECTION 01 43 00 – Systems Quality Assurance
- D. SECTION 26 – Traction Power Specifications
- E. SECTION 34 23 10 – OCS Description and General Requirements
- F. SECTION 34 23 35.99 – OCS Pole Painting
- G. SECTION 34 23 37 – OCS Tubular Steel Poles
- H. SECTION 34 23 37.11 – OCS Pole Ornamentation
- I. SECTION 34 23 40 – OCS Wire and Cable
- J. SECTION 34 23 50 – OCS Assemblies, Components, and Fittings
- K. SECTION 34 23 77 – OCS Surge Arrester Installation
- L. SECTION 34 23 78 – OCS Disconnect Switch Installation
- M. SECTION 34 23 80 – OCS Testing

1.3 SUBMITTALS

- A. Submittals shall be made in accordance with the requirements of SECTION 01 33 00 – Submittal Procedures of the Contract Documents, except as modified herein.
- B. OCS installation procedures:
 - 1. Submit procedures for all stages of OCS installation, including pole installation, cantilever framing and installation, headspan installation, bridle and pulloff installation, conductor stringing (including pre-tensioning and final tensioning methods), insulation cut-in, disconnect switch installation, and any other OCS installation activities. Procedures shall be Approved by the Engineer prior to commencement of the Work.
 - 2. Submit staging plans providing the sequence of the Work, including methods of securing the Work during periods of interruption. Staging plans shall be Approved by the Engineer prior to commencement of the Work.
 - 3. Submit manufacturers data and usage procedures for tools used to grip contact wire during stringing and where held under tension. The Contractor shall use a grip method that does not produce a kink in the Contact Wire. Contact Wire kinks will not be accepted, without exception. The method of gripping shall be submitted to the Engineer for Approval, however Approval will not release the Contractor from liability if the method produces kinks in the Contact Wire.
 - 4. Submit a schedule of OCS fabrication and installation activities to the Engineer on a weekly basis. Deviation from the schedule shall be reported to the Engineer on a daily basis.
 - 5. Submit the updated conductor erection spreadsheet within five (5) days of the installation of each conductor length. Information on the spreadsheet shall include wire run number, length, pre-tension load, pre-tension temperature, duration of pre-tensioning, final tension load, final tension temperature, and notes describing any unusual circumstances.
 - 6. Submit a schedule of pole stationing labels showing pole identification (ID) numbers, and warning signs for pre-approval before proceeding with their procurement or installation.

1.4 QUALITY ASSURANCE/QUALITY CONTROL

- A. Quality Control/Quality Assurance shall be in accordance with SECTION 01 43 00 – Systems Quality Assurance except where modified within this specification section.

1.5 SAFETY REQUIREMENTS

- A. The health and safety of workers and the public shall be in accordance with applicable state and federal regulations, in conjunction with the project Specifications.

1.6 HANDLING

- A. OCS assembly, component, and fittings materials shall be packaged, handled, and transported to site in a manner that will prevent damage occurring to the material and any surface coatings.
- B. OCS Material shall not be stored in contact with the ground. It shall be stored in a manner and location that will not cause deterioration of the material.
- C. Materials delivered to site shall only be stockpiled in areas specified in the Construction Plan and Approved by the Engineer.

- D. Any damage to the materials and equipment shall be the Contractor's responsibility and all repairs shall be accomplished by the Contractor in accordance with the manufacturer's instructions, at the Contractor's expense.

1.7 LICENSING AND CERTIFICATION REQUIREMENTS

- A. All Work specified in this Section shall be performed by workers skilled and experienced in the installation of OCS systems.
- B. Superintendent Qualifications
 - 1. The OCS superintendent shall demonstrate previous superintendent experience in successfully performing Work of this type on a project of similar size and complexity. Experience shall include the supervision and training of OCS installation crew, as well as interpretation of OCS specifications, design drawings, OCS equipment manuals, and OCS manufacturer's design drawings.
- C. OCS Installation Crew Foreman Qualifications
 - 1. A foreman shall be appointed for each crew not exceeding six OCS installers, or where crews work independently. The foreman shall have demonstrated experience or training in the installation of OCS, and demonstrated experience as foreman of OCS installations or similar overhead line work.
- D. OCS Installer Qualifications
 - 1. OCS installers shall be qualified by experience and training to perform the specified work. A Journeyman Lineman shall have completed a federally approved Outside Line Construction and Maintenance apprenticeship program.

1.8 TOOLS

- A. Contact wire shall only be strung or held in tension by specifically designed grips that pull along the wire centerline without bending or kinking the wire.
- B. Tools that are deformed or otherwise damaged shall be discarded and replaced at the Contractor's expense.
- C. Fittings and equipment designed for permanent installation shall not be used as multiple use construction tools.

PART 2 - PRODUCTS

2.1 OCS SHOP DRAWINGS

- A. Shop drawings shall be submitted in accordance with SECTION 01 33 00 – Submittal Procedures and all related OCS Specifications.
- B. Shop drawings shall be prepared by the contractor to demonstrate the form, fit and function of each assembly reference given in the Contract Drawings, and be assigned the same assembly reference and assembly description.
- C. Shop drawings shall assign the full technical description of any pipe, wire or cable used in the detailed assembly.
- D. Shop drawings shall show the maximum rated strength and corresponding factor of safety of each assembly as appropriate.
- E. Shop drawings shall be specifically designed for use on this project and submitted for approval and approved by the Engineer prior to procurement of materials.

- F. Each shop drawing shall be supported by component drawings and/or catalog cuts as appropriate.
- G. Shop drawings shall be supported by appropriate index sheets of both assembly references and of components numbers.

2.2 CONTACT WIRE

- A. Contact wire shall be supplied in accordance with SECTION 34 23 40 – OCS Wire and Cable.

2.3 JUMPERS

- A. Insulated and bare jumpers shall be fitted with flexible jumper wire in accordance with SECTION 34 23 40 – OCS Wire and Cable, and configured as shown in OCS Contract Drawings.

PART 3 - EXECUTION

3.1 INSTALLATION

- A. The following describes the Work required for the installation of the assemblies, wiring, and fittings of the complete OCS system onto poles erected as specified in SECTION 34 23 72 – OCS Tubular Pole Installation.
- B. The Work shall also include design verification, stringing, tensioning, supporting, registering, and anchoring the conductors, installing jumpers, section insulators, disconnect switches, surge arresters, and other ancillary equipment and hardware, including contact wire bridges and other components, as required, to provide a complete and fully operational OCS.
- C. The Contractor shall be responsible for coordinating the OCS installation with other project civil, structural, systems, and electrical work.
- D. The Contractor shall submit, for review and approval by the Engineer, drawings for all temporary anchorages, guying, and electrical isolations.
- E. Fasteners shall include bolts, nuts, locknuts, washers, pins, turnbuckles, machine screws and other items that may be used to attach items together. Fasteners shall be installed in accordance with the manufacturer's recommendations. Bolts shall be of sufficient length to allow two full threads to extend beyond the nuts and locknuts; however, the end of the bolt must never extend more than 1.5 inches beyond the nut or locknut. Threads of all bolts, nuts and machine screws shall be lightly lubricated prior to assembly, and shall be torqued using a calibrated torque wrench in accordance with the manufacturer recommendations. Fittings, fasteners, or any other attachments that do not fit, are cracked, have sustained galvanizing damage during installation, or are found to be defective in any way, shall be rejected and replaced at the Contractor's expense. Contractor shall install hardware such that the orientation of nuts, bolts, and pins is consistent to the extent possible.
- F. Drilling, cutting, or reaming of components will not be permitted without prior Approval of the Engineer.
- G. Turnbuckles, where used, shall be installed in a manner that will provide 50% of the available take-up and release, to remain for future adjustment.
- H. At all stages of work, Contact Wire is to be handled with special care to prevent bending, kinking, twisting or other forms of damage. Wire grips and other installation equipment shall be designed and used so as not to damage or bend the wire. Kinks in the Contact Wire will not be accepted under any circumstances.

3.2 INSTALLATION TOLERANCES

- A. The installed OCS shall conform to the dimensional requirements shown on the Contract Drawings and shop drawings, within the following tolerances:
1. Pole rake at pole top (after loading at 60 degrees Fahrenheit) – 1 inch off vertical
 2. Contact wire height:
 - a. At support 1 inch
 - b. At a bridge 0.5 inch
 3. Contact wire stagger at registration 1 inch
 4. Wire tension 50 lb

3.3 OCS ASSEMBLIES

- A. OCS support and termination assemblies, and all other defined and described OCS assemblies shall be constructed in accordance with approved shop drawings to the dimensions shown in the Contract Drawings.
- B. All OCS dimensioning shall be to the centerline of the track rails in the plane of the rail surfaces or as shown in the Contract Drawings.
- C. Prior to conductor stringing all installed supports and termination assemblies shall be restrained against movement by the wind and weather. In particular, cantilevers shall not be allowed to swing in the wind. Any materials damaged by inclement weather shall be discarded and replaced at the Contractor's expense.

3.4 CONTACT WIRE STRINGING

- A. Contact wire shall be installed in accordance with the Contractor's procedure, as approved by the Engineer. Allowance shall be made for conductor creep.
- B. In order to reduce creep, the Contractor shall pre-stress the contact wires while in temporary rollers or travelers for a minimum period of 48 hours prior to any clamping or clipping in at supports.
- C. Contractor shall submit the pre-stressing procedure to the Engineer for Approval, prior to commencement of stringing. The procedure shall describe the proposed method including:
1. The pre-stress tension and pre-stress time period to be applied to the contact wire before being reduced to normal tension and adjusted to its final position, and clipped in
 2. The Contractor's check of the adequacy of the OCS structures and supports to ensure that they can safely carry any proposed loading in excess of the design values

- D. During final stringing, actual conductor temperature, as measured by contact thermometers, shall be used in conjunction with the conductor erection tables provided in the Contract documents to ascertain the various stringing parameters. The actual erection tension shall be based on conductor temperature and equivalent span. The climatic and span data shall be entered on a conductor erection spreadsheet developed by the Contractor, and shall be used to ensure conformity to the actual wire data before contact wire stringing is started. The conductor erection spreadsheet developed by the Contractor shall be updated and submitted to the Engineer within 5 days of the installation of each contact wire.
- E. The contact wire shall be attached to the anchor and strung out, being held in its approximate lateral position in relation to the track centerline by the use of temporary rollers at supports to prevent kinking. Rollers used by the Contractor shall not create kinks in the Contact Wire. The contact wire shall be strung under a tension adequate to keep the contact wire from touching the ground during stringing. After stringing, the contact wire shall be pre-stressed as described above before it is reduced to the contact wire tension for the ambient temperature, and the steady arms or other registrations attached, removing any twists in the contact wire by working from one anchor to the other. Wire pull-offs shall then be installed and tensioned.
- F. After final tensioning has been completed, cross-spans, cantilevers, and pull-offs shall be set normal to the track, and the contact wire heights and staggers adjusted as required to obtain the values given in the wiring layout drawings and wire schedule drawings.

3.5 CONDUCTOR SPLICES

- A. Splices shall not be installed in the in-running contact wires, without exception. At locations where the Contact Wire is out of running, splices may only be used with approval from the Engineer. Splices shall be positioned so as not to interfere with the operation of other wires, fittings or equipment under all climatic and operating conditions.

3.6 JUMPERS

- A. Continuity jumpers and feeder jumpers shall be erected where shown on the OCS layout drawings and shall be installed in accordance with the manufacturer's recommendations. The Contractor shall determine the lengths of the jumpers, based on actual field measurements, and the jumpers shall be installed, secured and shaped to avoid conflicts with the uplifted pantographs and so as to not restrict minor movement of adjacent cantilevers. Jumper wire shall have cut and tied ends that shall not project more than 1 inch through the connection clamps.
- B. Connection clamps shall be installed as in accordance with manufacturer's recommendations. Before fitting the connector clamps, the conductors shall be cleaned and wire-brushed to ensure a good electrical connection beneath the clamp, and shall be lubricated with a conductive grease as recommended by the manufacturer. The connector bolts shall be torqued to the manufacturer's recommendations using a calibrated torque wrench.
- C. Feeder cables shall be double clamped.
- D. Feeder jumpers shall be connected to the cantilever pipes and cross-spans by means of insulated clamps or clips

3.7 CONTACT WIRE BRIDGES

- A. Contact wire bridges shall be used for crossing of contact wires in crossovers and other areas where in running contact wires cross each other as shown on the layout drawings.
- B. Contact wire bridges shall be double clamped at each end.

- C. Contact wire bridges shall be installed at crossed contact wire locations shown on the layout drawings.
- D. The contact wire bridges shall allow some free movement of the contact wires over the operating temperature range. A minimum contact wire bridge length of 2 feet shall be used. The upper contact wire shall be adjusted to float through the contact bridge assembly under normal conditions with no pantograph uplift.

3.8 SECTION INSULATORS

- A. Section insulators shall not be cut into a contact wire until the adjustments of Section 3.4 have been completed and the contact wire is ready for final tensioning.
- B. Section insulators shall be located as shown on the contract drawings and only installed after the Engineer has given his approval to each site-specific location in the field.
- C. Section insulators shall be installed in accordance with the manufacturer's recommendations.
- D. Each section insulator shall be installed and adjusted to provide a smooth passage for the pantograph without causing rocking or arcing. The section insulator shall be free to move without twisting or becoming misaligned.
- E. Section insulators shall be installed in straight running contact wire, without deviation at the Section Insulator.
- F. All electrical connectors and clamps shall be prepared and protected externally and internally in accordance with the manufacturer's recommendations.
- G. Extreme care shall be taken during installation of section insulators and related components, to prevent the contact wire from being damaged. Any damage to the contact wire shall be repaired or replaced at the Contractor's expense.

3.9 SURGE ARRESTERS

- A. Install surge arresters per SECTION 34 23 77 – OCS Surge Arrester Installation, of these Specifications.

3.10 DISCONNECT SWITCHES

- A. Install disconnect switches per SECTION 34 23 78 – OCS Disconnect Switch Installation, of these Specifications.

3.11 WARNING SIGNS AND POLE IDENTIFICATION NUMBERS

- A. Warning signs shall be installed at the following locations:
 - 1. Method of attachment of signs shall be Approved by the Engineer. At locations where method proves inadequate the Contractor shall design a different method of attachment for Approval. Any signs needing a new method of attachment will be replaced at the Contractor's expense.
 - 2. "Danger High Voltage" – On each pole in station platform areas and on each pole to which a switch operating handle is installed.
 - 3. The Contractor shall prepare a schedule of locations for warning signs for approval by the Engineer.
 - 4. Warning signs shall be installed on all poles at a height and orientation site specifically agreed by the Engineer.

5. Pole I.D. numbers shall be installed on all OCS poles, with site specific exclusion being Approved by the Engineer.
6. The Contractor shall prepare a schedule of locations for pole I.D. numbers for approval by the Engineer.
7. Pole I.D. numbers shall be installed on all poles at a height and orientation site specifically agreed by the Engineer.

3.12 POLE GROUNDING

- A. Grounding and Bonding shall be performed in accordance with the Contract Drawings and Specifications, and the National Electric Code (NEC).
- B. On each pole where a surge arrester is installed, a 2/0 insulated ground wire from the surge arrester shall be exothermically welded to the top of the lightning arrester ground rod. The surge arrester cable shall be a single piece of wire, with no splices or interruptions. If multiple lightning arresters are required, they shall each have their own ground rod and ground wire. OCS Contractor shall coordinate this work with all other Project Work.
- C. On each pole without a surge arrester, a 2/0 insulated pole ground wire shall be exothermically welded to the top of the foundation ground rod. The final connection of the 2/0 ground wire shall be made with compression connectors bolted to a grounded stud or tag provided for that purpose inside the pole. OCS Contractor shall coordinate this work with all other Project Work.
- D. Where exothermic welds are to be made to a galvanized surface, galvanizing shall be removed using a grinding wheel to expose a clean surface. After welding, repair the galvanized coating on the steel surface using an Approved zinc rich cold galvanizing paint, ZRC Cold Galvanizing Compound, or an Approved equal. Surface preparation and application of the galvanizing repair shall be in accordance with the repair material manufacturer's recommendations.
- E. Exothermic welding cartridges and molds shall be for the type of weld shown on the Contract Drawings, and be performed in accordance with the manufacturer's recommendations. Worn and damaged molds shall be discarded and not used. Where directed by the Engineer, welds and molds shall be replaced.

3.13 REPAIRS

- A. Repairs to any part of the OCS shall only be made as approved by the Engineer. Damaged components shall be removed from site, or reported to the Engineer along with a proposed repair procedure. The Engineer shall determine if components shall be discarded and replaced at the Contractor's expense.
- B. Any insulator damaged or degraded in any way shall be replaced at the Contractor's expense, without exception.
- C. Vertical kinks in the contact wire shall be removed using a power operated tool or by hand using a leather or copper faced hammer to beat the contact wire against a flat smooth surface such as a hardwood block.
- D. Lateral kinks in the contact wire shall be removed if they affect the fit of any parts or are detrimental to pantograph operation. Twists in the contact wire shall be corrected.
- E. No contact wire kinks will be accepted in the final product, without exception.

- F. Damage to the galvanizing of poles, assemblies, components and hardware shall be repaired by the application of an Approved zinc-rich, cold galvanizing repair paint, ZRC Cold Galvanizing Compound, or an Approved equal. Surface preparation and application of the galvanizing repair shall be in accordance with the repair material manufacturer's recommendations.
- G. All Work associated with touch-up painting and grouting will be at the Contractor's expense.

PART 4 - MEASUREMENT AND PAYMENT

4.1 MEASUREMENT

- A. The quantities of accepted work will be measured in the following units. All measurements will be plan measure except for authorized changes.
 - 1. Description: Lump Sum

4.2 PAYMENT

- A. Payment will be made at the respective unit or lump-sum price listed in the proposal and shall be full compensation for all labor, materials, and equipment necessary to complete the respective unit in place. There will be no separate measurement or payment for any item of work not specifically identified and listed in the proposal, and all such work shall be considered a subsidiary item with all costs pertaining thereto included in the prices for other items listed in the proposal. At the Engineer's option, partial payment may be made for any lump sum item listed in the proposal, providing that the Contractor is diligently and satisfactorily pursuing full completion of such partially complete item in accordance with the approved job progress schedule.

END OF SECTION

SECTION 34 32 71**OCS POLE FOUNDATIONS****PART 1 - GENERAL****1.1 SUMMARY**

- A. The Work covered by this Specification shall include the furnishing of all labor, equipment, tools, services and materials for complete and proper installation of Overhead Contact System (OCS) pole foundations as indicated on the plans.
- B. The work to be performed under this specification shall include all surveying and field layouts necessary for the correct location of the pier foundations. This includes walkout survey of OCS pole placement by the OCS Contractor.
- C. Provide and install steel reinforcement, anchoring and grounding devices within the foundations.
- D. Excavate the foundations, furnish all cast-in-place concrete foundations.
- E. Clean up the work areas after completion of each foundation, including disposal of all refuse.

1.2 RELATED SECTIONS:

- A. DIVISION 01 – General Requirements

1.4 SUBMITTAL

- A. Submit the following for approval in accordance with SECTION 01 33 00 – Submittal Procedures under the General Requirements.
 - 1. Shop Drawings
 - 2. Certificates and Test Reports
 - 3. Written description of construction procedures, material used, Product Data and equipment for drilling the foundation

1.5 QUALITY ASSURANCE

- A. Contractor shall employ sufficient personnel skilled and experienced to properly perform the work of this section, and shall use adequate equipment.
- B. Contractor shall perform the following in accordance with the requirements of the Contractor's Quality Control Program as approved by the Engineer.
 - 1. Material qualification testing and mill certification for acceptance
 - 2. Job control testing of in-progress work in shops and continuous field inspection
- C. Installation of ground rods and other electrical material shall be by licensed Electricians, registered in the State of Missouri.

1.6 DELIVERY, STORAGE, AND HANDLING

- A. Materials shall be delivered to the site in undamaged condition and stored off the ground in a well drained location, protected from damage, and easily accessible for inspection and handling.

1.7 PROJECT CONDITIONS

- A. Comply with ACI 305 and 306 during hot and cold weather conditions.

PART 2 - PRODUCTS

2.1 MANUFACTURERS AND MATERIALS

- A. Temporary Casing Shell: Steel casing shall have an outside diameter equal to or greater than the specified diameter of the drilled shaft, and shall have sufficient strength to withstand handling stresses, concrete pressure, and surrounding earth or fluid pressures.

1. Concrete:
 - a. As specified in MISSOURI DEPARTMENT OF TRANSPORTATION GOVERNING SPECIFICATIONS AND SPECIAL PROVISIONS, AS LISTED IN KCMO STREETCAR PROJECT TECHNICAL SPECIFICATIONS except as modified herein.
 - b. Concrete shall have a minimum compressive strength of 3600 psi at twenty-eight days.
- B. Reinforcement:
 1. As specified in MISSOURI DEPARTMENT OF TRANSPORTATION GOVERNING SPECIFICATIONS AND SPECIAL PROVISIONS, AS LISTED IN KCMO STREETCAR PROJECT TECHNICAL SPECIFICATIONS except as modified herein.
- C. Anchor Bolts:
 1. As specified in MISSOURI DEPARTMENT OF TRANSPORTATION GOVERNING SPECIFICATIONS AND SPECIAL PROVISIONS, AS LISTED IN KCMO STREETCAR PROJECT TECHNICAL SPECIFICATIONS except as modified herein.
 - a. F1554 Anchor bolts, 55Ksi
- D. Concrete Formwork:
 1. Refer to MISSOURI DEPARTMENT OF TRANSPORTATION GOVERNING SPECIFICATIONS AND SPECIAL PROVISIONS, AS LISTED IN KCMO STREETCAR PROJECT TECHNICAL SPECIFICATIONS and as specified below.
 2. Forms used in constructing pier above ground level shall be of sufficient strength to withstand the pressure of concrete and shall provide concrete having smooth surface.
- E. OCS Pole Grounding
 1. OCS Foundations shall include pole grounding installation as shown in the Contract Drawings and described in the Specifications.
 2. OCS foundations at locations with surge arresters shall include surge arrester grounding installation as shown in the Contract Drawings and described in the Specifications.
 3. Grounding rods shall be in accordance with Systemwide Electrical Specification.

PART 3 - EXECUTION

3.1 PREPARATION

- A. Walkout Survey: After the Contractor has established the location of pole foundations, and prior to starting excavation, a walkout survey shall be conducted by representatives of Engineer and the Contractor, and any other parties affected by foundation locations, in order to resolve any problems resulting from pole placement in the indicated location.

3.2 EXCAVATION/ERECTION/APPLICATION

- A. Drill the pier shafts at locations and to the dimensions and depths as indicated on the plans and control them within the specified tolerances.

- B. Abandoned pipe, concrete, boulders and other obstructions, which extend into the pier shafts and prevent the proper formation of piers shall be removed. The permanent utility lines and piping which are interfered with by the pier shafts shall be brought to the Engineer's attention.
- C. Blasting shall not be permitted for use on OCS pole foundations.
- D. Excavated drilling materials that are surplus, or do not comply with the reusable materials as specified, shall be removed from job-site and disposed of as directed.
- E. Steel casing shells shall be used, where required by the Engineer to control ingress of water or prevent caving of the pier shaft.
- F. Reinforcing steel, anchor bolts shall be installed as follows:
 - 1. Place the reinforcement and install the anchor bolts, and grounding plates or rods in the foundations. Reinforcement shall not be spliced.
 - 2. The reinforcing cage shall be placed symmetrically about the axis of foundations, and shall be securely braced to maintain the minimum clearance of concrete cover as indicated. Maintain in clean condition until embedded in concrete.
 - 3. The anchor bolt assemblies, grounding plates and rods shall be located and oriented as indicated, with the specified tolerances.
 - 4. Prefabricated templates shall be used to hold the projecting portion of the anchor bolts in their proper positions.
- G. Remove all loose material from the bottom of the drilled shafts and dewater as required prior to and during placing of concrete.
- H. Immediately after approval of the reinforcement and anchor bolts installation by the Engineer begin the placement of the concrete. Concrete shall be placed in one continuous operation in each pier shaft.
- I. To prevent segregation of concrete, place concrete by tube or tremie method.
- J. Excavation, installation of reinforcement and anchor bolts, and concreting of the foundation shall be scheduled so that each drilled shaft is poured within twelve hours after excavation. The number of foundations left open at the end of a work day shall be kept to a minimum and shall be adequately covered and protected against possible hazards.
- K. Wherever steel casing shells are used, they shall be withdrawn as the concrete is placed. An adequate head of concrete shall be maintained above the bottom of the casing to resist the soil and water pressures.
- L. The anchor bolt template may be removed from a pier and reused elsewhere two days after the concrete has been placed.
- M. All exposed, rough concrete surface shall be steel troweled to produce a smooth, dense surface. Pier top shall be finished with 1% slope, as indicated on the Contract plans.
- N. OCS pole and surge arrester grounds shall be tested in accordance with SECTION 34 23 80 – OCS Testing.
- O. Conduit sleeves for feeder cables, lighting cables, lightning arrester cables, traffic signals, and any other amenities shall be verified and installed prior to pouring foundation concrete.

3.3 FIELD QUALITY CONTROL

A. Allowable Tolerances:

1. Allowable OCS foundation construction tolerances shall be in accordance with MISSOURI DEPARTMENT OF TRANSPORTATION GOVERNING SPECIFICATIONS AND SPECIAL PROVISIONS, AS LISTED IN KCMO STREETCAR PROJECT TECHNICAL SPECIFICATIONS, except as modified herein.
2. Each pier foundation shall be located within 2 inches of its offset dimension, as indicated on the foundation plans or as approved by the Engineer.
3. To avoid local obstructions the along-track positions of pier foundation indicated may be modified by up to ± 5 feet. Adjacent to special trackwork or curved track of a 500 foot radius or less, the along-track positions of the OCS pole foundation can only be modified by up to ± 2 feet. Such modifications are subject to prior approval by the Engineer.
4. Axis of the shaft shall not be out of plumb more than 1% of its excavated depth.
5. Each pier foundation shall not be less than the correct diameter and length indicated on the plans.
6. Each anchor bolt shall be located within 1/8 inch of its correct horizontal position and 1/2 degree of true vertical in its anchor bolt assembly, as indicated on the plans.
7. Anchor bolt assembly shall be located within 1-1/2 inches of its correct offset dimension and vertical position, as indicated in the plans. The anchor bolt positions shall be determined relative to the offset dimensions from the vertical and horizontal base lines, or track center line.
8. Each anchor bolt assembly shall be located within two degrees of its correct orientation, as indicated on the plans.
9. The top of concrete of each foundation shall be within 1/4 inch of its correct elevation, as indicated on the plans.

3.4 ADJUSTING AND CLEANING

- A. Notify the Engineer after installation of the reinforcement, anchor bolt assembly in each foundation that the installation is ready for inspection. Adjust the reinforcement, anchor bolts as required by the Engineer.
- B. At the conclusion of the foundation work, remove equipment used in the work, and remove all debris, surplus material, and excavated soil from the site.

3.5 PROTECTION

- A. Open pier shafts and incomplete construction shall be covered to prevent hazards.
- B. Protect projecting and exposed surfaces from injury during entire construction period.
- C. The anchor bolts shall be protected from damage and prevented from moving during placement and curing of the concrete. Anchor bolt threads shall be protected from concrete contamination.

PART 4 - MEASUREMENT AND PAYMENT**4.1 MEASUREMENT**

A. The quantities of accepted work will be measured in the following units. All measurements will be plan measure except for authorized changes.

1. Description: Lump Sum

4.2 PAYMENT

A. Payment will be made at the respective unit or lump-sum price listed in the proposal and shall be full compensation for all labor, materials, and equipment necessary to complete the respective unit in place. There will be no separate measurement or payment for any item of work not specifically identified and listed in the proposal, and all such work shall be considered a subsidiary item with all costs pertaining thereto included in the prices for other items listed in the proposal. At the Engineer's option, partial payment may be made for any lump sum item listed in the proposal, providing that the Contractor is diligently and satisfactorily pursuing full completion of such partially complete item in accordance with the approved job progress schedule.

END OF SECTION

SECTION 34 23 72**OCS TUBULAR POLE INSTALLATION****PART 1 - GENERAL****1.1 SUMMARY**

- A. This Section covers the delivery to site and installation of new tapered tubular steel poles and accessory parts, for use as part of the Overhead Contact System (OCS) as shown on the Contract Drawings.

1.2 RELATED SECTIONS

- A. SECTION 01 33 00 – Submittal Procedures
- B. SECTION 01 43 00 – Systems Quality Assurance
- C. SECTION 34 23 10 – OCS Description and General Requirements
- D. SECTION 34 23 35.99 – OCS Pole Painting
- E. SECTION 34 23 37 – OCS Tubular Steel Poles
- F. SECTION 34 23 37.11 – OCS Pole Ornamentation
- G. SECTION 34 23 70 – OCS Installation
- H. Specifications for Street Lighting Attachments on OCS Poles shall be in accordance with Missouri Department of Transportation Governing Specifications and Special Provisions, in conjunction with Approval from the Engineer.
- I. Specifications for Traffic Signal Attachments on OCS Poles shall be in accordance with Missouri Department of Transportation Governing Specifications and Special Provisions, in conjunction with Approval from the Engineer.

1.3 REFERENCE STANDARDS

- A. The latest edition of the following reference specifications shall also govern the Work covered by this Section unless otherwise noted.

Sponsor	Number	Subject
MILSPEC	DOD-P-21035	Paint, High Zinc Dust Content Galvanizing Repair

1.4 SUBMITTAL

- A. Submittals shall be made in accordance with the requirements of SECTION 01 33 00 – Submittal Procedures, except as modified herein.
- The Contractor shall submit pole rake calculations for each pole.
 - The Contractor shall submit pole installation procedures.

1.5 QUALITY CONTROL/QUALITY ASSURANCE

- A. Quality control shall be in accordance with SECTION 01 43 00 – Systems Quality Assurance, except where varied herein.

1.6 HANDLING AND STAGING

- A. Any damage to the material and equipment shall be the Contractor's responsibility and all repairs shall be accomplished by the Contractor in accordance with the manufacturer's instructions, at the Contractor's expense.
- B. Pole staging areas shall be coordinated and approved with the Engineer prior to installation.
- C. Material shall not be stored in contact with the ground. It shall be stored in a manner and location that will not cause deterioration of the material.

PART 2 - PRODUCTS

Not Used

PART 3 - EXECUTION**3.1 PREPARATION**

- A. Initially verify the suitability of installation of the pole on the foundation by applying a template to the pole base.
- B. Perform any preparatory work necessary to install the pole such as chipping off concrete on anchor bolts and cleaning threads.
- C. Straightening of bent anchor bolts or replacement of damaged ones shall be performed in accordance with a procedure approved by the Engineer, at the Contractor's expense.
- D. A pole location survey and walkthrough shall be performed prior to installation of pole foundations. The overhead contact system contractor who installs the poles shall be included in this survey and walkthrough to verify proper pole locations and field conditions.

3.2 ERECTION/INSTALLATION

- A. Poles shall not be installed on foundations until 14 days after concrete pour and concrete strength as measured by test cylinders has achieved at least 90% of the minimum compressive strength specified.
- B. Poles shall be installed on the foundations where shown on the Contract Drawings as approved by the Engineer. The Contractor shall remove the protection cap, PVC protection sleeves, and cap from anchor bolts, prior to setting the pole.
 - 1. Rake poles to provide a vertical pole, with tolerance not to exceed 1 inch, when loaded.
- C. Grounding and Bonding: All steel poles installed by the contractor shall be bonded to the foundation grounding rod, using the grounding studs or lugs, and attached to the pole as shown on the OCS Contract Drawings. For tubular poles, grounding and bonding equipment may need to be installed prior to pole erection.
- D. Poles shall be set with handhole oriented in the direction facing away from track and with the Pole Type Identification Number facing tracks or curbs. Poles between two tracks shall be set with the handhole oriented in the direction of increased stationing.

- E. Pole fittings: The contractor shall install all bolted and clamped fittings required for specific installation including, but not limited to, the following items:
 - 1. Feeder Spouts.
 - 2. Accessories required for Ornamental Poles
 - 3. Accessories required for Lighting Pole attachments
 - 4. Accessories required for Traffic Pole Accessories
 - 5. Pole Caps
- F. Feeder poles:
 - 1. Feeder poles shall be fitted with a cable support ("J") Hook and terminating bushings at the cable entrance hubs. The terminating bushings shall be weatherproof, of compression seal type. The pull wire at the top of the pole shall be terminated with 2 (two) feet of free end length.
 - 2. Feeder poles shall be installed with the spouts perpendicular to track, and on opposite face of pole relative to track.
- G. OCS poles with Street Lighting Attachments:
 - 1. Refer to lighting drawings and specifications for street lighting attachment requirements.
- H. OCS poles with Traffic Attachments:
 - 1. Refer to traffic signal drawings and specifications for traffic attachment requirements.
- I. After complete installation of the pole the following information shall be recorded by the Contractor and submitted to the Engineer in the structure record drawings:
 - 1. Pole stationing and referenced track
 - 2. Pole size
 - 3. Pole length
 - 4. Face of pole to track centerline dimension
 - 5. Pole Rake
 - 6. Details and dimensions of any Accessories installed on the pole
- J. Signs and Markers shall be installed as specified in accordance with SECTION 34 23 70 – OCS Installation.

3.3 REPAIR COATINGS

- A. Field repair of zinc coated surfaces or painted surfaces shall be in accordance with SECTION 34 23 35.99 OCS Pole Painting.

PART 4 - MEASUREMENT AND PAYMENT**4.1 MEASUREMENT**

A. The quantities of accepted work will be measured in the following units. All measurements will be plan measure except for authorized changes.

1. Description: Lump Sum

4.2 PAYMENT

A. Payment will be made at the respective unit or lump-sum price listed in the proposal and shall be full compensation for all labor, materials, and equipment necessary to complete the respective unit in place. There will be no separate measurement or payment for any item of work not specifically identified and listed in the proposal, and all such work shall be considered a subsidiary item with all costs pertaining thereto included in the prices for other items listed in the proposal. At the Engineer's option, partial payment may be made for any lump sum item listed in the proposal, providing that the Contractor is diligently and satisfactorily pursuing full completion of such partially complete item in accordance with the approved job progress schedule.

END OF SECTION

SECTION 34 23 77**OCS SURGE ARRESTER INSTALLATION****PART 1 - GENERAL****1.1 SUMMARY**

- A. This Section covers the installation of surge arresters for the Overhead Contact System (OCS), as shown on the Contract Drawings, and specified herein.
- B. The Contractor shall provide and install surge arrester assemblies as shown in the Contract Drawings, including:
 - 1. All OCS poles serving as positive feeder cable risers
 - 2. Selected OCS poles as shown in the Contract Drawings
 - 3. On all poles with bypass disconnect switches, on both sides of the switch
- C. The Contractor shall design, supply and install the necessary attachments for supporting the surge arrester at the top of the pole as shown in the Contract Drawings. The Contractor's designs and technical data for these assemblies shall be formally submitted and subject to Approval by the Engineer.

1.2 RELATED SECTIONS

- A. The Contractor shall familiarize himself with the contents of the following Divisions/Sections of these Specifications:
 - 1. DIVISION 01 – General Requirements
 - 2. SECTION 01 33 00 – Submittal Procedures
 - 3. SECTION 01 43 00 – Systems Quality Assurance
 - 4. SECTION 26 05 26.13 Systemwide Electrical Grounding for Systems
 - 5. SECTION 34 21 50 – DC Surge Arresters
 - 6. SECTION 34 23 40 – OCS Wire and Cable
 - 7. SECTION 34 23 50 – OCS Assemblies, Components, and Fittings
 - 8. SECTION 34 23 70 – OCS Installation
 - 9. SECTION 34 23 80 – OCS Testing

1.3 REFERENCED STANDARDS

- A. ASTM B3 Standard Specification for Soft or Annealed Copper Wire
- B. ASTM B172 Standard Specification for Rope-Lay-Stranded Copper Conductors Having Bunch-Stranded Members, for Electrical Conductors

1.4 SUBMITTALS

- A. Submittals shall be made in accordance with the requirements of SECTION 01 33 00 – Submittal Procedures, except as modified herein.
- B. The following submittals shall be made:
 - 1. Test Procedures and Reports in accordance with SECTION 34 23 80 – OCS Testing.

PART 2 - PRODUCTS**2.1 SURGE ARRESTER**

- A. Surge arrester assemblies shall be in accordance with SECTION 34 21 50 – DC Surge Arresters, in conjunction with these Specifications.
- B. Each surge arrester shall be supplied with all accessories required for OCS pole mounting.

2.2 GROUNDING CONDUCTOR

- A. Extra-flexible bare cable: Copper, 4/0 AWG, Class I stranding, ASTM B3, ASTM B172.
- B. Insulated cable: Copper, 4/0 AWG, 2 kV rated insulation.
- C. Splice: C-type compression connector, Burndy Hyground or approved equal.
- D. Exothermic weld

2.3 GROUNDING CONNECTIONS

- A. Refer to SECTION 26 05 26.13 Systemwide Electrical Grounding for Systems for general requirements on grounding and bonding connections.

PART 3 - EXECUTION**3.1 INSTALLATION REQUIREMENTS**

- A. Surge arresters shall be installed at locations shown on the Contract Drawings in accordance with the arrester manufacturer recommendations and as specified herein.
- B. Mount in a position such that catastrophic failure shall not permit a positive cable to contact a pole.
- C. Energized side of surge arrester: Provide insulated cable from surge arrester to contact wire or switch, as indicated on Contract Drawings.

3.2 GROUNDING REQUIREMENTS

- A. Pole shall be field drilled with a hole to accommodate the surge arrester ground cable and protective grommets. Field drilled hole shall be coated with touch-up paint in accordance with the Specifications and the pole manufacturer.
- B. Where grounding cables are attached to surge arresters, sufficient slack shall be installed.
- C. Bonding cable connections between the surge arresters and the OCS, and between the surge arresters and the grounding system shall be installed with a minimum number of bends and connections. Bends in the cables shall be no less than 8 inch radius.

- D. Bonding connections between the surge arresters and the grounding systems shall be of the exothermic weld type.
- E. Each grounding connection shall achieve a grounding resistance of 5 Ohms or less, or as specified by the surge arrester manufacturer for the type of unit supplied, if the recommended resistance is less than 5 Ohms.

3.3 FIELD QUALITY CONTROL

- A. Each individual surge arrester grounding connection and system shall be tested in accordance with the testing procedures specified in SECTION 34 23 80 – OCS Testing.

PART 4 - MEASUREMENT AND PAYMENT

4.1 MEASUREMENT

- A. The quantities of accepted work will be measured in the following units. All measurements will be plan measure except for authorized changes.
 - 1. Description: Lump Sum

4.2 PAYMENT

- A. Payment will be made at the respective unit or lump-sum price listed in the proposal and shall be full compensation for all labor, materials, and equipment necessary to complete the respective unit in place. There will be no separate measurement or payment for any item of work not specifically identified and listed in the proposal, and all such work shall be considered a subsidiary item with all costs pertaining thereto included in the prices for other items listed in the proposal. At the Engineer's option, partial payment may be made for any lump sum item listed in the proposal, providing that the Contractor is diligently and satisfactorily pursuing full completion of such partially complete item in accordance with the approved job progress schedule.

END OF SECTION

THIS PAGE INTENTIONALLY LEFT BLANK

SECTION 34 23 78**OCS DISCONNECT SWITCH INSTALLATION****PART 1 - GENERAL****1.1 SUMMARY**

- A. This Section covers installation of pole mounted DC disconnect switches on OCS poles and connection to the OCS conductors, as shown on the Contract Drawings and specified herein.
- B. The disconnect switch assembly is to be used as an in-line switch in the OCS. It provides a means to disconnect OCS line sections from one another to enable de-energization of one of them. Disconnect switch assemblies will not normally be operated under load conditions.

1.2 RELATED SECTIONS

- A. The Contractor/manufacturer shall familiarize himself with the contents of the following Divisions and Sections of the Contract Specifications:
 - 1. DIVISION 01 – General Requirements
 - 2. SECTION 01 33 00 – Submittal Procedures
 - 3. SECTION 34 21 40 – TES DC Disconnect Switches

1.3 DISCONNECT SWITCH ASSEMBLY TYPES

- A. Disconnect switches are procured under SECTION 34 21 40 – TES DC Disconnect Switches. Each disconnect switch shall be operated using a manual operating handle mounted within reach of personnel on the ground.

1.4 REFERENCE DRAWINGS

- A. The locations of poles on which to mount disconnect switch assemblies are shown on the Contract Drawings.

1.5 SUBMITTALS

- A. Submittals shall be made in accordance with the requirements of SECTION 01 33 00 – Submittal Procedures, except as modified herein.
- B. For each type of disconnect switch, the following submittals shall receive approval by the Engineer before installation in the OCS:
 - 1. Complete manufacturer's descriptions, shop drawings, catalog data, enclosure color, electrical performance ratings and information including model number.
 - 2. Manufacturer's general and detail arrangement and dimensional drawings (shop drawings)
 - 3. The shop drawing for each assembly shall be referenced with the assembly reference and shall represent in full the equivalent project assembly drawing.
 - 4. Each shop drawing shall provide a complete list of its component materials for that specific type of assembly, including the identification of materials to be supplied by others, such as pipes, brackets, bolts, cables, jumpers and cable connectors.

5. Manufacturer's recommended installation instructions, including checks/tests after installation
6. Operation and maintenance manual with list of recommended spare parts

PART 2 - PRODUCTS

2.1 GENERAL

- A. Each switch enclosure shall be mounted near the top of a taper tubular OCS pole or feeder pole equipped with feeder spouts, and provided with up to two surge arresters. The height and orientation of the disconnect switch enclosure shall be agreed by the Engineer.
- B. All exposed unit outdoor switches shall be capable of operation with a 1/4-inch thick covering of glazed ice on the external switch mechanism.
- C. Switch Enclosures
 1. Non-metallic fiberglass switch enclosures shall be of a ventilated, rain-tight, tamperproof design suitable for outdoor application. The enclosure shall have a gasketed, heavy duty hinged door with padlockable handle, catch, full length hinge (one sided) and hooded ventilation openings with screens.
 2. One specified outdoor type padlock shall be provided with each cabinet (enclosure), all keyed alike. A dead front operating handle and linkage shall be provided inside the box for each switch.
 3. The switch position shall be visually indicated by the handle alignment with "OPEN" and "CLOSED" plates.
 4. The enclosure shall be of sufficient size to accommodate the switch, internal linkages and operating gear, cabling and terminations without electrical shorting or damage due to chafing on the feeder cable insulation. All maintainable components shall be readily accessible through the door opening, and sufficient space shall be provided for the manipulation of required tools.
 5. The exterior face of the cabinet shall be equipped with a switch data/nameplate and a Danger - High Voltage warning label permanently attached to the cabinet.
 6. The enclosure shall be a minimum of 1/4-inch thick polyester, with a glass to resin ratio of 40 to 60 and shall be equipped with a drain hole in the base. Resin shall be fire retardant polyglass or equal as Approved by the Engineer. Enclosure color shall be subject to Approval of the Engineer.
- D. Padlocks
 1. Each pole mounted disconnect switch shall be provided with an outdoor type, heavy duty, keyed padlock keyed to the requirements of the Owner, having a minimum hasp diameter of 2-inches.
 2. All padlocks shall be keyed alike. Two keys shall be provided for each padlock.

PART 3 - EXECUTION**3.1 INSTALLATION**

- A. The Contractor shall submit shop drawings for the disconnect switch support bracket for Approval by the Engineer before any switch is installed.
- B. Disconnect switches shall be field installed at OCS pole locations as shown on the Contract Drawings.
- C. Disconnect switches shall be installed in accordance with the manufacturer's instructions.
- D. The Contractor shall check the adequacy of poles for supporting the disconnect switches and accessories.
- E. All wiring shall be provided as required. All necessary additional hardware such as bolts and support brackets, couplings, bushings, connectors, grounding conductors, and all basic electrical materials needed for the installation of disconnect switch assemblies shall be supplied and installed by the OCS Contractor.
- F. Prior to energization of the OCS, the Contractor shall verify correct operation of all disconnect switches installed under this Contract, and shall demonstrate to the satisfaction of the Engineer the intended operation. Final switch positions shall be verified prior to OCS energizing without exception.
- G. The installation shall conform to the National Electrical Code (NEC).

PART 4 - MEASUREMENT AND PAYMENT**4.1 MEASUREMENT**

- A. The quantities of accepted work will be measured in the following units. All measurements will be plan measure except for authorized changes.
 - 1. Description: Lump Sum

4.2 PAYMENT

- A. Payment will be made at the respective unit or lump-sum price listed in the proposal and shall be full compensation for all labor, materials, and equipment necessary to complete the respective unit in place. There will be no separate measurement or payment for any item of work not specifically identified and listed in the proposal, and all such work shall be considered a subsidiary item with all costs pertaining thereto included in the prices for other items listed in the proposal. At the Engineer's option, partial payment may be made for any lump sum item listed in the proposal, providing that the Contractor is diligently and satisfactorily pursuing full completion of such partially complete item in accordance with the approved job progress schedule.

END OF SECTION

THIS PAGE INTENTIONALLY LEFT BLANK

SECTION 34 23 80**OCS TESTING****PART 1 - GENERAL****1.1 SUMMARY**

- A. The Traction Electrification System and all its components shall be tested to verify compliance with all specified design, performance, reliability, and maintainability requirements.
- B. All tests described in this Section shall be performed as indicated unless specifically waived in writing by the Engineer. All tests shall be performed on production components without modification or special preparation.
- C. The tests specified herein are considered to be an absolute minimum by the Engineer. The Contractor shall be responsible for assuring that each design and performance requirement of this Specification is assigned to a specific test effort. The Contractor shall submit a comprehensive test program plan as specified. The Contractor and its subcontractors may perform additional testing, as they deem necessary.
- D. Material and other test requirements may also appear in other Sections. The Contractor shall integrate all of these tests into the Master Test Plan.
- E. After the Overhead Contact System (OCS) has been installed, and is to be made ready for operation, field acceptance testing shall be performed to verify physical and electrical integrity of the system, and to verify quality of workmanship.
- F. Following completion of all field acceptance testing, vehicle tests shall be performed to demonstrate clearances and commutation.
- G. This Section covers field-testing procedures, supply of test equipment and testing of the Overhead Contact System (OCS), visual inspections prior to energization, streetcar slow speed, commutation and pantograph clearance tests.

1.2 RELATED SECTIONS

K. SECTION 34 23 78 – OCS Disconnect Switch Installation

L. SECTION 34 23 90 – OCS Installation Records

1.3 REFERENCED STANDARDS

A. See Referenced Standards in SECTION 34 23 10 – OCS Description and General Requirements.

1.4 SUBMITTALS

A. Submittals will be in accordance with SECTION 01 33 00 – Submittal Procedures. Submit a Test Program Plan for approval within 60 days of the Notice to Proceed. The Test Plan shall be used as a controlling document for all tests and shall include test procedures and proposed test reports. The purpose of this plan is:

1. Ensure that the Contractor has considered all of the testing requirements contained in this and other Sections of the Specifications, and has made adequate provisions for testing in his overall program plans and schedules.
2. Achieve an early mutual understanding between the Contractor and the Engineer on the range, depth and other aspects of tests to be conducted.

B. The Test Program Plan shall contain as a minimum the following data:

1. Title of each test with reference to the respective article or Section number in the Specification
2. The name of the agency performing each test, a description as them being Contractor, his supplier, or an independent testing company
3. Test locations
4. Submittal date for each test procedure, test report, and/or certified test document
5. Scheduled starting date for each test
6. Scheduled completion date for each test
7. Test objectives
8. Test criteria
9. A list of test equipment to be available on site during OCS installation, including optical stagger gauge or laser equipment, insulated height stick, mechanical pantograph gauge suitable for use on embedded track, insulated tape measures, a 6ft hand level, and a pantograph profile with sway “ears”
10. Personnel requirements
11. Test input and expected output
12. Data to be recorded and form of data
13. Test evaluation procedures
14. Nature of required reports
15. A sample of each type of form proposed for use

16. A list of individual contact wire heights and staggers for every contact wire support or registration points for each step of the OCS configuration, on a stage-by-stage, step by step work schedule
 17. A list of acceptance measurements to be recorded upon completion of the OCS construction
- C. Prior to each test, the Contractor shall submit verification that the OCS meets the specifications to the Engineer.

1.5 QUALITY ASSURANCE/QUALITY CONTROL

- A. Quality Control/Quality Assurance shall be in accordance with SECTION 01 43 00 – Systems Quality Assurance except where modified within this Specification Section.

1.6 SAFETY REQUIREMENTS

- A. The health and safety of workers and the public shall be in accordance with all Federal, State, and Local regulations, as well as any requirements stipulated by the Owner or Engineer.

1.7 TEST PROCEDURES

- A. The Contractor shall develop detailed test procedures, which include test report format and forms for recording data for each test. The Contractor shall submit five copies, or at the Engineer's preference, a PDF file, of each test procedure. The test procedures shall include applicable procedures specified in, but not limited to, ANSI, IEEE, or NEMA standards. A set of test procedures shall be prepared for each assembly and component in this specification.
- B. Test procedures must be reviewed and approved by the Engineer prior to commencement of each test. Each test procedure shall contain a step-by-step procedure for performing the test and shall include but not be limited to the following:
1. Title of test
 2. Test objective
 3. Test location and time
 4. Required equipment and instrumentation
 5. Test criteria including data evaluation procedures
 6. Test methodology including test setup, with circuit diagrams and test sequence
 7. Test data requirements including forms and format for recording data
 8. Testing agency or company

1.8 TEST REPORTS

- A. The results of each test shall be recorded on approved test report forms. Each report shall document the test results obtained and shall include the following information:
1. Title of test
 2. Test objectives
 3. Summary and conclusions

4. Location and date of test
5. List of all test equipment used with calibration data
6. Conditions of test, including temperature and humidity
7. Raw test data
8. Reduced test data including tables, curves, photographs and any additional test data required to support the test results
9. Test results in a form which can easily be compared to the Specification requirements
10. Descriptions of all equipment and material failures, the reasons for the failure
11. Descriptions of all modifications to the equipment or wiring performed using the testing, and the reasons for the modifications, and the names of individuals approving such modifications
12. Abbreviations and references
13. Signatures of test witnesses

1.9 WITNESSING OF TESTS

- A. The Engineer will, at his option, witness all tests. At least 21 days prior to each test, the Contractor shall notify the Engineer in writing of the date, time, and location the test will be performed. If the Engineer decides not to witness a test or tests, test reports shall nevertheless be submitted to the Engineer for approval.
- B. The Witnessing of tests shall not be considered as acceptance of test results or test reports.

1.10 PERFORMANCE OF TESTING

- A. Factory design or production testing of individual components may be performed by the component manufacturer at the plant of manufacture or at an approved testing facility.
- B. Field testing shall be performed by the OCS installer under the direct supervision of the field service engineer representing the manufacturer of the OCS equipment and the Contractor.
- C. Field testing of insulated power cables rated 2 kV and higher shall be performed by a NETA certified technician working for an independent testing company under the direct supervision of the manufacturer of the substation equipment, and hired by the manufacturer of the substation equipment. The NETA technician shall have at least five years experience in construction acceptance testing. The testing company shall be a NETA member and shall be approved by the Engineer. After approval by the Engineer, the testing company shall not be discharged or otherwise replaced without his written approval.
- D. Streetcar testing of the complete OCS installation shall be performed by the OCS installer under direction of the field service engineer representing the manufacturer of the OCS equipment and the Contractor.

1.11 TEST CLASSIFICATIONS

- A. The required tests are categorized as follows:
1. Factory design tests shall be conducted by or under the supervision of the equipment manufacturer to demonstrate compliance with specified design requirements. These tests shall be performed on production components, assemblies, subsystems, and substations, and shall be performed on the highest level of assembly that will allow demonstration of design compliance. Design tests are limited to the number of units needed to demonstrate design compliance, typically one or two.
 2. Factory production tests shall be conducted by or under the supervision of the equipment manufacturer and include all efforts necessary to demonstrate that the unit to be delivered operates within specified limits and is in compliance with design requirements. Production test requirements may vary from an inspection and functional demonstration for a simple component to a full system functional demonstration of an assembly. Production tests shall be performed at the OCS manufacturer's facility prior to shipment of the OCS equipment to the field. These tests are routinely performed at the ambient conditions unless a specific environmental or operating limit is necessary to demonstrate acceptable operation.
 3. Field acceptance tests shall demonstrate that each installed OCS segment is ready for vehicle testing functionally and revenue service cosmetically. Field tests include Measurement, Mechanical, Clearance, Electrical, and Energization tests.
 4. Vehicle tests shall demonstrate clearances to pantograph and vehicle body, and operation at maximum permissible speed without loss of contact or physical interference with a pantograph by the OCS.

PART 2 - PRODUCTS

2.1 MATERIALS

- A. The Contractor shall supply all tools and equipment for performance of the tests.

PART 3 - EXECUTION

3.1 FACTORY DESIGN TESTS

Component design tests shall be run on each component specified in this Section, and submitted to The Engineer for approval. If the manufacturer of the equipment has already performed design tests, the existing test reports may be submitted to the Engineer for approval. Existing test reports will not be required to meet the format requirements specified in this Section; however the content of the reports shall include all relevant information. In the event the components have not been design tested, the tests shall be run on the first production units and performed in accordance with these Specifications.

- A. OCS Insulators

The following design tests shall be performed as described in ANSI C29.1 for one insulator of each type and rating supplied:

1. Power Frequency Withstand
2. Impulse Withstand
3. Thermal Capacity

4. Mechanical Strength

5. Resistance

B. OCS Section Insulators

The following design tests shall be performed for one section insulator of each type supplied:

1. Resistance to ultraviolet radiation and electrical tracking of the insulating material

2. Mechanical Strength

3. Electrical Tests per section 3.1.A

C. OCS Disconnect Switches

The following design tests shall be performed as described in ANSI C37.34 for one OCS disconnect switch of each type and rating supplied:

1. Insulation resistance and high potential tests

2. Temperature rise

3. Short time current

4. Interrupting current

D. Poles

1. The contractor shall demonstrate the deflection of each type of pole procured under this Contract to the engineer. The demonstration shall be in the form of a factory design test, performed in the place of the manufacturer. The testing shall be non-destructive and at a time and place agreed by the Engineer. The parameter to be demonstrated is the deflection at the top of the pole. The purpose of the test is to determine that the type of pole has deflection characteristics that match or are lower than predicted by theoretical considerations.

a. For each Pole Type to be tested, the maximum allowable moment that can be applied to the base of the pole shall be calculated based on the properties of the material specified and the dimensions shown on the drawings for that Pole Type. Calculation of the maximum allowable moment shall take into account the effects of local buckling, if appropriate. The magnitude of the load applied to the top of the pole to apply the maximum allowable moment to the base of the pole shall be calculated and the pole tested by application of this load in 1/3 increments. The deflection of the top of the pole shall be measured and recorded for each load increment. At release of the full test load, measure and record any permanent set (deflection past the neutral point) of the pole.

b. In the case of tapered tubular poles, the theoretical deflection for application of these load increments may be calculated in accordance with Deflection Equations for Tapered Tubular Cantilevered Beams of the "Standard Specifications for Structural Supports for Highway Signs, Luminaires and Traffic Signals" by the American Association of State Highway and Transportation Officials or other approved methods.

- c. The theoretical calculated deflections shall be compared with the values measured and the pole shall be determined to have passed the deflection test if none of the measured values are greater than the theoretical value plus 10%. Measured values less than the theoretical calculated values shall be considered as complying with these requirements. Permanent set of the pole shall not be greater than 5% of the deflection that occurred under the maximum load.
2. The Contractor shall submit to the Engineer, in writing a test procedure for approval, prior to testing of any poles. The test procedure shall include method of application of loads, recording devices, calibration of devices, method calculation of theoretical deflections and any information deemed pertinent by the Engineer. The test procedure shall comply with the following minimum requirements:
 - a. Test Arrangement - Poles will normally be placed in a horizontal position for testing although the vertical position is allowed. The pole shall be bolted to a rigid foundation that resists all translation and rotation about any axis. Provision shall be made to accurately measure the load applied to the pole, deflection at the top of the pole and to monitor the movement of the test foundation at the base of the pole to confirm its rigidity.
 - b. Test Equipment – The loads shall be applied at the top of the pole by a crane or other suitable pulling devices. Loads shall be measured by using calibrated scales or load cells located in the pulling lines. Loading and/or measurement through a system of blocks, tackles or pulleys shall not be allowed.
 - c. Dead Load Pick Up – The load required to compensate for the dead weight of the pole in its horizontal position shall be calculated and added to the test load increments.
 - d. Loading Procedure – The pole shall be loaded with the required Dead Load Pick Up load and reference established to measure deflection of the top of the pole from this point. The pole shall be loaded by 33, 66, and 100 percent of the load calculated to apply the maximum allowable moment at the base of the pole. Each load shall be applied in a steady uniform manner from the Dead Load Pick Up load to the value of the increment plus the Dead Load Pick Up value and held for 3 minutes. The deflection of the top of the pole shall be measured at the start and end of the hold period to confirm no creep is occurring. If creep is detected, continue hold until deflection readings stabilize. If creep is detected after 10 minutes of hold, the pole is considered to have failed the test. Confirm that the no movement has been detected in the test foundation at the base of the pole. If movement is detected, take necessary steps to eliminate the movement and retest the pole. After the deflection has been measured, decrease the load in a gradual uniform manner to zero.
 - e. Reapply the Dead Load Pick Up load and compare with previous reference point(s) and establish new reference point if required. Record permanent set, if any. Apply load to next increment value and repeat above procedure for each increment (plus Dead Load Pick Up) value.
 - f. Recorded values for deflections measured at each increment and permanent pole set, if any, shall be compared with the above requirements and the pole type shall be accepted as passed if the results are within the requirements listed.

3. If the requirements are not met, that particular individual pole shall be rejected for use on the project and another pole of the same Type tested. If the second pole of the same Type does not meet these requirements, that pole will be rejected for use on the project and two additional poles of that Type shall be tested as above. If both poles meet the above requirements, the Pole Type will be accepted for use on the Project. If either pole does not meet the requirements, all poles of the Type tested shall be tested by the above method for acceptance for use on the Project.
4. The cost of this testing, any required re-testing, and the issue of test reports shall be included in the bid price, and no additional compensation will be paid to the Contractor.

3.2 FACTORY PRODUCTION TESTS

Component Factory Production tests shall be run on each component specified in this Section, and submitted to the Engineer for approval.

A. Fittings, Hardware, and Cantilever Tubes

1. The following production tests shall be performed in accordance with ASTM standards:
 - a. Chemical Analysis Tests on each lot.
 - b. Sample galvanizing tests upon completion of fabrication.
 - c. Visual and dimensional tests upon completion of fabrication.
 - d. Tests to determine thread fittings of units, washers, and bolts.
2. A lot shall consist of all castings produced by one furnace melt.

B. Disconnect Switches

The following production tests shall be performed as described in ANSI C37.34 for each disconnect switch of each type and rating supplied:

1. Insulation resistance and hi-potential test.
2. Mechanical operation of all components.

C. Galvanized Steel Wires and Wire Rope

All grades of stranded steel wires used as support wires, guys, and pull offs shall be tested in accordance with ASTM A475.

D. Stainless Steel Wire and Wire Rope

1. Stainless steel wire and wire rope used as support wires and pull-offs shall be tested in accordance with ASTM A555, ASTM A368 and ASTM A492.
2. Test reports shall be submitted.

E. Section Insulators

1. The following tests shall be performed in accordance with the applicable ANSI/IEEE Standards:
 - a. Dry flashover tests
 - b. Wet flashover tests

- c. Low frequency dry withstand test
 - d. Low frequency wet withstand test
 - e. Impulse withstand test
2. The Contractor shall provide data to show that the insulator material is resistant to ultra-violet radiation and electrical tracking.
 3. The messenger insulators shall be proof tested in accordance with the applicable Section of the Specifications, and the contact wire insulator shall be tension-proof tested to applicable contact wire maximum tension plus design factors of safety.
 4. All test reports shall be provided.

F. Insulators

The following production tests shall be performed in accordance with ANSI C29.1.

1. Visual and Dimension Tests:
 - a. The entire surface shall be smooth and free from defects.
 - b. If adhesives are used, the insulator shall be inspected to see that the fillet of adhesive provides a complete seal between the coating and end fitting.
 - c. The insulator shall be inspected to verify that both end fittings are in line after being assembled on the rod.
 - d. The insulator shall be in accordance with the approved shop drawings and specifications.
2. Routine Flashover

A sampling of not less than 5% of each type of insulator shall be subject to a flashover test in accordance with ANSI C29.1.
3. Proof Test

All insulators shall be subject to a mechanical strength proof test. The insulators shall be tested at room temperature for 10 seconds to 120% of the designed tensile, compressive or bending load, failure shall constitute rejection.

G. Overhead Contact System Conductors

1. All conductors shall be subject to factory quality control tests as required in the applicable Standards. Tests shall be required on each reel of wire prior to shipment to site. A certified copy of the test report for each reel shall be submitted to the Engineer. A copy of the test report shall be packed with each reel.
2. The OCS contact wire shall be tested in accordance with ASTM Standard B47. In addition, the contact wire shall be subject to a twist test. The twist test shall be performed as specified for round wire, except that six twists shall be required. Contact wire not meeting the twist test shall be rejected.

H. Poles

1. Material Testing shall be in accordance with Reference Standards given in SECTION 34 23 37 – OCS Tubular Steel Poles.

2. Weld Testing shall be in accordance with AWS Specifications, as per SECTION 34 23 37 – OCS Tubular Steel Poles.
 3. Impact Testing shall be in accordance Reference Standards given in SECTION 34 23 37 – OCS Tubular Steel Poles.
 4. Galvanizing Testing shall be in accordance Reference Standards given in SECTION 34 23 37 – OCS Tubular Steel Poles.
- I. All galvanized items shall be inspected for conformance with the requirements of the following ASTM specifications, as applicable:
- a. Galvanizing Compliance: A123 or A153
 - b. Embrittlement: A143
 - c. Distortion: A384

J. Inspection

Provisions shall be made for inspection of the fabrication and testing by the Engineer or his authorized representative. Inspection by the Engineer at the point of manufacture shall not constitute acceptance of the Work as specified.

3.3 VERIFICATION PRIOR TO FIELD TESTS

Prior to conducting the field tests, the Contractor shall verify that the OCS equipment is installed according to the Contract Drawings and specifications, and is in operable condition.

- A. Verify the physical integrity and quality of workmanship of the system installation.
- B. Verify electrical clearances equal or exceed criteria.
- C. Verify clearance envelope for vehicles and pantograph are not infringed.
- D. Verify electrical integrity of the system.

3.4 MEASUREMENT TESTS

- A. Upon completion and acceptance by the Engineer of each segment of construction, the Contractor shall measure the contact wire height, stagger, and other required dimensions and record the readings on a Measurement Test Data Form, in the presence of the Engineer's representative.
- B. Tests shall be scheduled in advance with the Engineer.
- C. The Acceptance Measurement Data form provided shall be used to record test data. A typical blank Acceptance Measurement Data form for catenary equipment is shown in Table 3.1.
- D. Since the OCS is a single contact wire fixed terminated system, all references to the messenger wire, balance weights, along track movement and other non-occurring issues, shall be struck through.
- E. All columns on the test form will be completed using data from field measurements taken in the presence of the Engineer's representative, from existing records or from computed data as noted. Descriptions of the OCS Measurement Test Data form fields and the procedures used for the associated testing follow:
 1. Track – Designation shown on the Contract Drawing

2. Wire Run Number – Designation shown on the Contract Drawings
3. Drawing No. – Of the OCS Layout Schedule where structures are to be shown and labeled
4. Names – Of the persons responsible for the measurement and their respective organizations
5. Sheet No. – Number in the series of forms on which the wire run measurements are to be shown
6. Equipment Style – The style of catenary being measured
7. Conductor Temperature – Temperature (°F) of the conductors at the time of measurement. This measurement will be monitored by the use of a dial-type thermometer inserted into a hole bored lengthwise into a 10” length of contact wire. The thermometer contact wire assembly will be held under the same ambient conditions as those experienced by the installed OCS.
8. Weather and Air Temperature – Conditions at the time of measurement; temperature will be measured on-site
9. Date – Of the measurement
10. Station No. Identification – Support structure stationing as shown on the layout schedules
11. Structure Set out (Pole Face to centerline of track distance) – Measured distance from the pole to abutment face to track centerline, taken with tape measure
12. Foundation Height – Measured height from top of foundation to top of near rail, + above rail, - below rail
13. Crosslevel (Superelevation) – Difference between the elevators of the two rails measured at the structure location
14. Stagger – Distance from the contact wire to the super-elevated centerline of the track measured at the support location. This measurement will be taken using a catenary position measurement device. Stagger shall be recorded as L (left) or R (right) when viewed in the direction of increasing stationing. Record stagger to nearest ½ inch.
15. CW Height – Distance from the contact wire to a line defined by the top of both rails at the point of measurement (the inclined reference point)
16. System Height – height of messenger wire above the contact wire measured at the support. This value is computed from measurements of messenger wire and contact wire heights taken from track level. (Struck through for single contact wire.)
17. Midspan Offset – Same as “Stagger” above, except taken at midspan. Same sign convention applies
18. Midspan C.W. Height – Same as “CW. Height” above, except measured at midspan
19. Midspan Crosslevel – Same as “Crosslevel” above, except measured at midspan. Measurement will be taken using level and tape measure.
20. Sag – The computed average of “C.W. Height” for the previous and next structure minus Midspan C.W. Height between the structures

21. Gradient – Rate of change of contact wire height; computed as the difference between contact wire height at two adjacent supports divided by the distance between the supports
 22. Span Length – Along track distance between the two OCS supports
 23. Balance Weight Rise or Fall – Position of balance weight at ambient temperature relative to the computed 60°F position. (Struck through for Fixed Terminated Systems.)
 24. Position of Balance Weight Stops – Position of upper and lower balance weight top relative to foundation upper surface, taken from design calculations. (Struck through for Fixed Terminated Systems.)
 25. Mean Balance Weight Position at 60°F – Position of balance weight top relative to foundation upper surface; taken from design calculations. (Struck through for Fixed Terminated Systems.)
 26. In-Running Contact Wire Height – height of in-running contact wire at overlaps and turnouts
 27. Out-of-Running Contact Wire Height – height of out-of –running contact wire at overlaps and turnouts
 28. Bridge Clearance Approximate Station – Approximate station location of bridge clearance measurement, as measured from the nearest catenary pole location
 29. Bridge Face/Low/Mid- Designate whether the measurement is taken at a bridge face, the bridge midpoint, or at the estimated low point of the bridge lower surface
 30. Bridge Vertical Track Clearance – Vertical distance between the underside of the bridge and the superelevated centerline of the track
 31. Messenger Wire to Bridge Distance with 50 lbs. C.W. (Struck through for single contact wire.)
 32. Remarks – as necessary
- F. The Engineer will use the Acceptance Measurements to determine compliance with the designs and will inform the Contractor of necessary corrections to be performed.
- G. The Contractor shall execute corrections at no further cost to the Engineer, except for adjustments required by the Engineer which are changes beyond the requirements specified in the Contract Documents.
- H. After executions of corrections, the Contractor shall re-measure and record affected data and submit the results to the Engineer.
- I. The Work of this Section shall not be complete until corrections are complete and approved by the Engineer.
- J. Completed Acceptance Measurement Tables shall be submitted in accordance with SECTION 01 33 00 – Submittal Procedures.

3.5 MECHANICAL TESTS

- A. Upon completion of the OCS installation, the Contractor shall verify the physical integrity of the complete system.

- B. The Contractor shall check, by visual inspection from ground level, that all the OCS components are correctly installed:
1. Catenary poles are vertical.
 2. Steady arms are correctly positioned.
 3. Feeder disconnect switch operating mechanisms operate freely and correctly and switch-blade position corresponds to handle position.
- C. Following Measurement Tests, the Contractor accompanied by the Engineer's representative, shall carry out the following checks at contact wire level, and remedy any unsatisfactorily conditions detected:
1. Check fit and tightness of all components.
 2. Check that all split pins and locknuts are secure.
 3. Check that the contact wire is free of kinks, twists, nicks or damage.
 4. Check stranded wires are free of damage to strands.
 5. Check steady arm heel settings and fittings are correct.
 6. Check that jumpers are of the correct type, have adequate travel capability, are properly fitted, and are well formed to avoid fatigue failure.
 7. Check that the clearance of wires passing through a cantilever at the same potential is at least 3 inches under normal climatic conditions.
 8. Check for clearance and insulation between adjacent or crossing contact wires.
 9. Check installation for locations of possible interference with passage of pantographs, including spots where pantographs could tangle with wires or suspension assemblies.
 10. Check that orientation of bolts, nuts, and pins are consistent to the extent possible.
- D. From the ground, the Contractor shall make the following checks:
1. Check that all disconnect switch operating handles operate correctly and name plates are correctly positioned.
 2. Check that the disconnect switches operate easily and that the blades open and close smoothly without sticking.

3.6 CLEARANCE TESTING

- A. Overhead Contact System
1. The Contractor shall measure clearances between the conductors, OCS equipment that will be energized, and any fixed structure such as an overhead bridges. Corrections for temperature shall be made, for fixed terminated catenary, and for uplift of the conductors. Clearances shall be equal to or exceed the values given in these Specifications.
 2. The purpose of these tests is to verify the mechanical and electrical clearances of the vehicle pantograph on the system. Any section found to have insufficient clearance shall be adjusted to provide the required clearance.
- B. Pantograph Clearance Envelope

1. The Contractor shall perform pantograph clearance envelope inspections. The purpose of these inspections is to verify the mechanical and electrical clearances of the pantograph on the OCS. The inspections shall be conducted after all installations are complete. Any OCS assembly found to have insufficient clearance shall be adjusted to provide the required clearance.
 2. Inspections shall be performed with a rail mounted height and stagger gauge having the profile of the appropriate pantograph clearance envelope. This gauge shall be used to verify the mechanical clearances between the pantograph and OCS components such as the heels of steady arms and drop brackets, and the electrical clearance between the pantograph and civil structures, such as overbridges. For this purpose the contact wire shall be uplifted before clearance measurements are taken. All measurements shall be recorded.
- C. Vehicle Mechanical Clearances to OCS Supports (excluding Pantograph)
1. Vehicle Clearance Inspections shall be performed using a rail mounted sway gauge based upon the streetcar clearance diagram appropriate to the section of track being checked, and allowing for track curvature, superelevation and track tolerances. Equipment shall be clear of the sway gauge by a minimum of 3 inches.
 2. Alternatively, the clearance from face of the OCS structure to track centerline shall be measured at each structure and compared to the vehicle dynamic envelope dimension for the track curvature and superelevation. All parts of the OCS structure including pole, switch operating mechanism, cables and cable cleats, etc. which are lower than the streetcar roof line shall be clear of vehicle envelope by a minimum of 6 in. to allow for pole rake, track tolerances and mechanical running clearance.

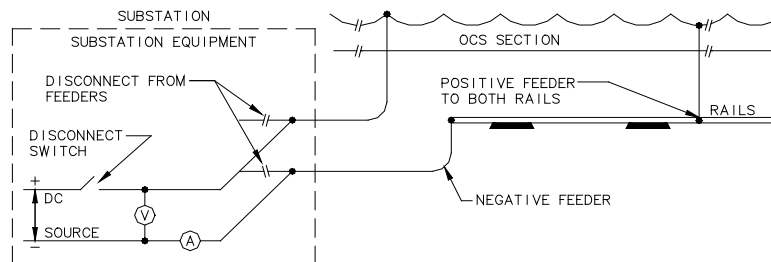

3.7 TESTS WITH A STREETCAR

- A. Upon completion of the Measurement, Mechanical and Clearance Tests, the Contractor will initiate a low speed de-energized streetcar test run to confirm acceptable pantograph performance. A visual inspection of the pantograph interface to the wire will be performed. The test will demonstrate that the pantograph passing electrical clearances are adequate, no physical interference with pantograph movement, and sufficient pantograph security. During these test, the Contractor shall have available plant, equipment and labor able to perform minor modifications to the OCS equipment.
- B. The Contractor shall conduct a survey of the installed contact wire with a streetcar and equipment. The test equipment shall include a chart recorder or similar equipment for continuous recording of voltage, current and contact interruptions, and a video tape camera and recorder to record the pantograph head tracking on the OCS. Tests shall be performed to verify no contact losses between the vehicle pantograph head and the contact wire up to the maximum permissible speeds under normal operating conditions, and to demonstrate adequate pantograph passing electrical clearances, no physical interference with pantograph movement, and sufficient pantograph security.

3.8 ELECTRICAL TESTS

- A. Electrical Tests
1. Continuity Tests
 - a. With the OCS section de-energized the Contractor shall make a series of continuity tests to prove the continuity of each section of catenary and track in the area.
 - b. Each OCS section shall be formed by shorting the OCS to the track with jumpers at one end of the test section. Refer to Figure 3.1.

- c. The Contractor shall provide a 12 V battery, a current measuring shunt, voltmeter, ammeter, and a switch to allow voltage and current measurements to be made.
- d. The Contractor shall record the results of the test and shall average the results of three loop resistance measurements using Table 3.3. A passing test shall constitute a nominal loop resistance not exceeding 0.1 ohm per mile of single track simple catenary style construction or 0.3 ohm per mile of single wire style construction. The cause of higher loop resistance values shall be investigated and addressed to the satisfaction of the Engineer.

CONNECTION FOR THE DC LOOP RESISTANCE TEST
(CONTINUITY TEST)

Figure 3.1

B. Dielectric Test

1. With the OCS de-energized, and with all surge arresters disconnected, the Contractor shall connect a 1000 volt megger between the catenary and the rail at one end of each test section as shown in Figure 3.2. The resistance in each test shall be noted on Table 3.4. A resistance value of greater than 5 M ohms is required to be obtained before continuing with the tests described in the Hi-Pot Insulation Testing Section.

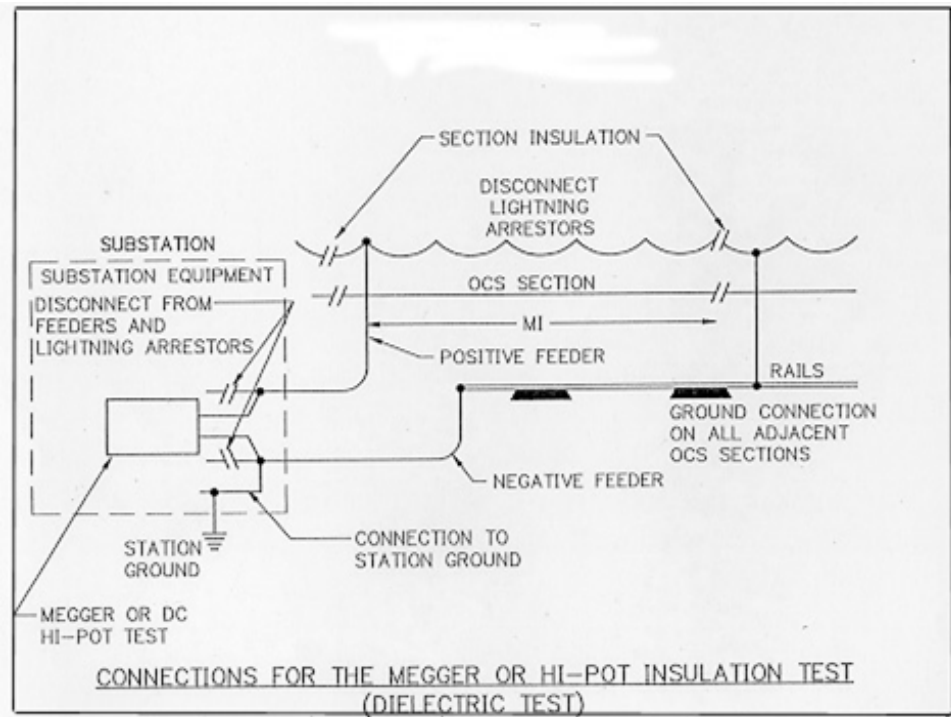

Figure 3.2

C. Hi-Pot Insulation Testing

1. General: The Contractor shall replace the 1000 volt megger with a DC hi-pot test set. DC Hi-pot test shall be performed on discrete sections 1 to 2 miles in length of the OCS. The Hi-pot tests serve the following purposes:
 - a. Components such as insulators and feeders are checked for leakage.
 - b. The electrical withstand of section insulators and disconnect switches are verified.
 - c. The test provides a means of periodically checking for any reduction in the insulation level of the OCS sections, by comparing voltage and leakage current with previously measured values.
 - d. A nominal Dc Hi-pot voltage of 2.5 kV shall be used for the test. Hi-pot tests shall be carried out on the OCS sections as soon as possible after the continuity tests have been completed, in order to ensure that all of the section being tested is electrically continuous and is subjected to the test voltage. Leakage currents between 0 and 5 mA can be expected for section lengths of 1-2 miles.

2. Precautions: The Hi-pot measurements require application of high voltage to the OCS. Proper regard must be paid to safety. Test zones shall be clearly identified. All safety requirements established in the Safety program concerning the public, work personnel and equipment shall be strictly enforced. Personnel not directly associated with the tests should be clear of the tracks. Sections of OCS and associated sections of the system, and all OCS sections adjacent to the section under test shall be grounded.
3. Procedure: Adjacent OCS sections which are electrically isolated from the section under test shall be grounded by connecting the OCS to the rails. The Contractor shall verify that a low resistance path exists for all the rails between all grounds and the test ground connections. All surge arrestors shall be disconnected from the section under test. A DC voltage shall be applied to the OCS section per figure 3.2 in 500 volt steps up to 2500 V. Before each measurement is read, the Contractor shall allow one minute to pass in order to stabilize the level of leakage current. Leakage current shall not exceed 5 mA per mile at 2500 V. The Contractor shall record the results in Table 3.4. The cause of leakage currents in excess of 5 mA per mile, or unstable current readings shall be investigated and addressed to the satisfaction of the Engineer. The test voltage shall be held for 30 seconds. The leakage current at each value shall be measured and recorded together with the weather conditions and temperature.

D. Ground Resistance Measurement for Surge Arresters

1. General: Prior to acceptance, the ground resistance of the ground connections for the surge arrestors shall be measured and recorded in accordance with the test procedure. Grounds for surge arrestors with a ground resistance measurement greater than 5 ohms shall be supplemented by adding ground rods until a grounding resistance of 5 ohms or less is achieved.
2. Procedure:
 - a. Connect the megger as shown in Figure 3.3. Note that the lead from P1C1 should be as short as possible and that the electrodes and the ground rod must be in a straight line. It is not essential for the electrodes to be parallel to the track, but this configuration will probably be the most convenient.
 - b. Position the electrodes at distances as shown in Table 3.2 test position 1, i.e. with $x = 66$ feet $y = 105$ feet. To ensure acceptance values of resistance, the ratio of distance (x/y) must be approximately 62 percent. Insert current and potential electrodes into the earth approximately 6 to 10 inches, for very dry soil pour water around the current electrode. Measure and record the resistance.
 - c. Keeping the x dimension the same as in step b, reposition the current electrode to $y + 6$ feet. Measure and record the resistance.
 - d. Compare the resistance values obtained in steps b and c. If the readings obtained are within 5 percent of each other, no further measurements are required and the average value should be used as the actual resistance. If the readings differ by more than 5 percent, increase x by ten feet and make y equal to $(x + 10) / 0.62$ approximately. Repeat steps b, c, and d as necessary.
 - e. Repeat this procedure for each surge arrester location.

- f. A measured ground resistance value of 5 ohm or less is considered acceptable.

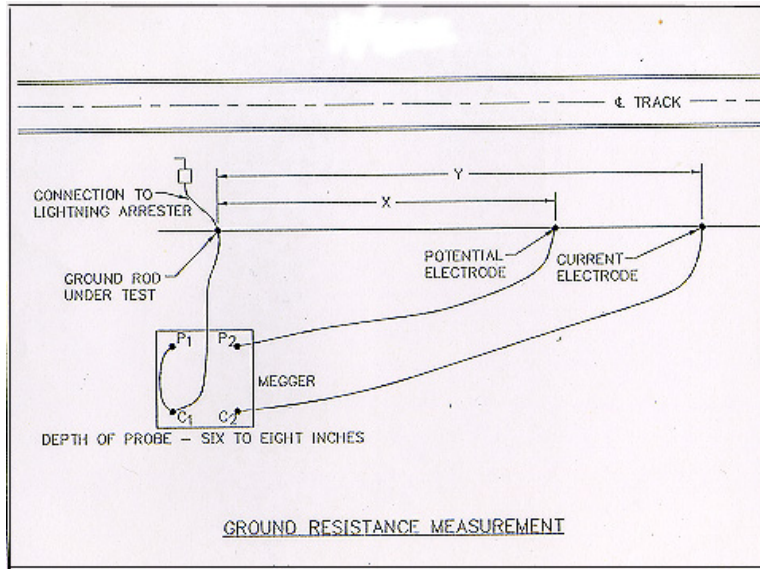

Figure 3.3

3.9 OCS ENERGIZATION TEST

- A. In conjunction with the Traction Power Substation testing each electrical section of the OCS shall be energized under the direction of the Engineer.

3.10 VEHICLE TESTS

- A. Arc and Spark
 - 1. Vehicle testing shall be performed on the OCS at low speeds and operating speeds to verify arc-free commutation.

PART 4 - MEASUREMENT AND PAYMENT**4.1 MEASUREMENT**

A. The quantities of accepted work will be measured in the following units. All measurements will be plan measure except for authorized changes.

1. Description: Lump Sum

4.2 PAYMENT

A. Payment will be made at the respective unit or lump-sum price listed in the proposal and shall be full compensation for all labor, materials, and equipment necessary to complete the respective unit in place. There will be no separate measurement or payment for any item of work not specifically identified and listed in the proposal, and all such work shall be considered a subsidiary item with all costs pertaining thereto included in the prices for other items listed in the proposal. At the Engineer's option, partial payment may be made for any lump sum item listed in the proposal, providing that the Contractor is diligently and satisfactorily pursuing full completion of such partially complete item in accordance with the approved job progress schedule.

THIS PAGE INTENTIONALLY LEFT BLANK

SECTION 34 23 90**OCS INSTALLATION RECORDS****PART 1 - GENERAL****1.1 SUMMARY**

- A. This Section covers the requirements for OCS installation records at site specific OCS support locations including As-built Structure Record Drawings, OCS Wiring Layout Redline Drawings, OCS Materials List, Assembly "Used-on" List, Conductor Stringing Records, Cantilever Cutting Dimension Sheets and Test Reports.
- B. All electronic media shall be developed with a software format agreed to by the Engineer.

1.2 RELATED SECTIONS

- A. SECTION 01 33 00 – Submittal Procedures
- B. SECTION 34 23 96 – OCS Installation and Maintenance Manuals

1.3 SUBMITTALS

- A. Submittals shall be made in accordance with the requirements of SECTION 01 33 00 – Submittal Procedures, except as modified herein.
- B. Samples of each type of OCS installation record shall be submitted to the Engineer within 60 days of Notice to Proceed.
- C. The first submittal of the As-built Structure Record Drawing shall be made in three drawing sets, clamped or bolted together, 11 x 17 inch size for review and comment by the Engineer.
- D. Final copies of the As-built Structure Record Drawing and Materials List shall be three copies 11 x 17 inch size in 7-ring binders or an Approved equal
- E. The final submittal of OCS Wiring Layout red-line "as-built" drawings shall be stamped "Project Record", signed and dated by the Contractor, and shall be delivered to the Project Manager prior to the final inspection.
- F. In addition to the requirements for hard copies of Contractor originated drawings, final copies of As-built Structure Record Drawings and Materials Lists shall be submitted in electronic format which shall include a matrix or document showing how the files are set up and how to access them. Include no extraneous files. Two CD ROMs shall be submitted.
- G. Two copies of Conductor Stringing Records and Cantilever Cutting Sheets shall be submitted to the Engineer.

PART 2 - PRODUCTS**2.1 AS-BUILT STRUCTURE RECORD DRAWINGS**

As-built Structure Record Drawings show the OCS as-built conditions at each location (stationing) where Work was performed by the Contractor.

- A. The Contractor shall provide an As-built Structure Record Drawing for each OCS pole.

- B. The Contractor originated drawings shall be developed in accordance with the Contract Drawings, and will show a photographic image of the final conditions at each location.
- C. The photographic image of the OCS poles shall depict the elevation taken from centerline of track, or thereabouts, facing in the direction of increasing stationing, and include the track rails and the complete structure and its constituent assemblies.
- D. Each structure photograph shall have an image that broadly fills the height of the available space on the As-built Structure Record Drawing.
- E. All photographs shall be taken at the highest quality and resolution level available on digital camera with at least 5.0 mega pixels capable of saving photographs on a non-glossy format like "TIFF".
- F. "Design" data (values and references) and "installed" data shall be shown in separate columns.
- G. Each column of data shall be for an individual wire run.
- H. The installed values for contact wire heights and staggers at supports shall be as measured by height and stagger gauge after remedial work has been completed.

2.2 OCS WIRING LAYOUT REDLINES

- A. The Engineer will furnish to the Contractor a complete set of OCS Wiring Layouts Drawings for redline purposes.
- B. The Contractor shall red-line the Wiring Layout Drawings to show any changes to the assembly references on a structure by structure basis. Wire heights and stagger values shall not be changed except at the direction of the Engineer.

2.3 OCS MATERIALS LIST

- A. The Contractor's proposed format of the computer generated Materials List and the "Used-on" List shall be forwarded to the Engineer prior to the submittal of the final documents.
- B. Assembly references given on Wiring Layout Drawings shall be totaled by computer and issued by the Contractor in tabular form as follows:

1. Materials List

By site specific OCS pole/OCS support location (stationing) showing every assembly required for complete installation of the support and of the span ahead

2. "Used-on" List

By assembly reference, showing every support location (stationing) where the specific assembly is used

2.4 OCS CONDUCTOR STRINGING RECORDS

- A. For each length of conductor installed, a detailed record shall be kept of:
 1. The reel number from which the conductor was taken
 2. The maximum prestressing tension applied
 3. The temperature at the time of tensioning

4. The time period that the prestressing was applied
5. Final installation tension and conductor temperature
6. Certifying signature of the Contractor's Superintendent/Engineer/Construction Manager

2.5 CANTILEVER CUTTING SHEETS

- A. For each cantilever, the dimensions of the pipes and other components shall be shown on Cantilever Cutting Sheets.

2.6 TEST REPORTS

- A. Test Reports initiated by the Contractor or by the Engineer and prepared by the Contractor shall be treated in accordance with SECTION 01 33 00 – Submittal Procedures.

PART 3 - EXECUTION

Not Used

PART 4 - MEASUREMENT AND PAYMENT

4.1 MEASUREMENT

- A. The quantities of accepted work will be measured in the following units. All measurements will be plan measure except for authorized changes.
 1. Description: Lump Sum

4.2 PAYMENT

- A. Payment will be made at the respective unit or lump-sum price listed in the proposal and shall be full compensation for all labor, materials, and equipment necessary to complete the respective unit in place. There will be no separate measurement or payment for any item of work not specifically identified and listed in the proposal, and all such work shall be considered a subsidiary item with all costs pertaining thereto included in the prices for other items listed in the proposal. At the Engineer's option, partial payment may be made for any lump sum item listed in the proposal, providing that the Contractor is diligently and satisfactorily pursuing full completion of such partially complete item in accordance with the approved job progress schedule.

END OF SECTION

THIS PAGE INTENTIONALLY LEFT BLANK

SECTION 34 23 96**OCS INSTALLATION AND MAINTENANCE MANUALS****PART 1 - GENERAL****1.1 SUMMARY**

- A. This Section describes the Work and format required to produce Overhead Contact System (OCS) Installation and Maintenance (I&M) Manuals.
 - 1. All OCS I&M manuals shall comprehensively address Overhead Contact System assembly configurations, assembly/component maximum loads, OCS installation precautions, conductor stringing, initial creep removal, final adjustments, preventive maintenance, servicing, repair and spare parts provisioning. Include information for routine OCS inspections and quantitative OCS measurements. Include OCS assembly replacement procedures with the OCS energized and de-energized.
 - 2. OCS I&M Manuals shall be prepared in separate sections addressing:
 - a. OCS wiring and poles
 - b. OCS shop drawings, assembly references, components and conductors
 - c. Spare parts catalogs
 - d. OCS disconnect switches

1.2 RELATED SECTIONS

- A. SECTION 01 33 00 – Submittal Procedures
- B. SECTION 34 23 97 – OCS Maintenance Staff Training

1.3 QUALITY ASSURANCE

- A. Provide qualified manual writers and developers who are thoroughly familiar with all subject material for each volume.

1.4 SUBMITTALS

- A. Submittals shall be made in accordance with the requirements of SECTION 01 33 00 – Submittal Procedures, except as modified herein.
- B. The Contractor shall submit the following:
 - 1. One complete photo-ready reproducible hard copy of each volume of the I&M Manual.
 - 2. One all-electronic media version of the complete manual on compact disc using MS Windows compatible files in a software format mutually agreed upon with the Engineer.
 - 3. Electronic media versions revised in accordance with hardcopy manual revisions, during the review period
 - 4. Submit five copies of I&M Manuals in final form.

1.5 SUBMITTAL SCHEDULE

- A. The Contractor, at a minimum, shall submit to the Engineer for Approval the following, in accordance with the following timetable:
1. OCS I&M Manual Outline – Submit two sets of manual outlines with a submittal schedule to the Engineer for Approval, at least 1 year before the start of the prescribed training courses specified in SECTION 34 23 97 – OCS Maintenance Staff Training.
 2. OCS I&M Manual, Draft - Submit two sets of the first draft of the proposed training materials 6 months before the start of the prescribed agency training course.
 3. OCS I&M Manual Training Draft - Submit ten sets of the training draft for use during the training class, 30 days before the start of the prescribed agency training course.
 4. OCS I&M Manual, Final - Submit final volumes of the I&M Manuals in the following quantities 30 days after the completion of training:
 - a. Three complete sets of manuals in reproducible hard copy format
 - b. One electronic copy in native format
 - c. One electronic copy in Adobe PDF format
 5. The final submittal of materials shall correct all errors that were found by the Contractor, during training or changes that were requested by the Engineer.
- B. All revision updates for all volumes of the OCS I&M Manual shall be provided to the Engineer by the end of the Warranty period or more frequently to reflect any changes made to the OCS during the Warranty period.

1.6 MANUAL CONTENT

- A. The I&M Manual shall cover, but not be limited to the following OCS topics:
1. Overhead Contact System description
 2. Section insulators
 3. Disconnect switches
 4. Poles
 5. Surge arresters
 6. Cantilever assemblies
 7. Headspan assemblies
 8. Single wire cross span assemblies
 9. All splice types
 10. Maintenance and inspection special tools
 11. Operations and Maintenance Procedures
 12. Safety Precautions

PART 2 - PRODUCTS**2.1 MANUAL FORMAT**

- A. Manuals shall consist of 8 1/2 x 11 inch sheets bound in loose-leaf 7-ring type binders. Binders shall not exceed 3 inches overall thickness. Several binders may be required.
 - 1. Foldout diagrams or illustrations may be employed with a maximum size of 11 x 17 inches. The title shall be visible when the sheet is folded.
 - 2. Covers shall be oil, grease, solvent and wear resistant.
 - 3. The paper and ink shall resist smearing, fading and deterioration from age.
- B. The organization of the manuals shall treat the OCS as a system and not as a grouping of disassociated parts. The manuals shall highlight the precautions to be taken by operating and service personnel to assure their safety while performing maintenance, and servicing functions.
- C. Manuals shall be written in English to be understood by a high school graduate with 2 years of experience in a related field but with minimal knowledge of railroad or transit operations. The writing shall be concise and free of ambiguities.
- D. Manufacturer's standard manuals and parts lists will be acceptable, subject to the approval of the Engineer, if they deviate only slightly from the requirements specified herein.
- E. Revisions to a manual shall be reflected in a revision index, which shall form an integral part of each manual and which shall be revised with each manual update.
- F. Diagrams and illustrations shall not be loose or in pockets. All printed material shall be clearly reproducible by copying machines, which precludes the use of halftone illustrations (line drawings are required).
- G. The material in the manuals including the spare parts catalogs shall be similarly organized and indexed, with a standard numbering system. The format of all data contained in the manuals shall be consistent section to section.

2.2 PURPOSE

- A. The OCS I&M Manual shall enable the maintenance staff to have, in convenient form, all information needed for preventive maintenance inspections, maintenance tasks, adjustment and installation, and on-site trouble diagnosis.
- B. It shall also contain a detailed description of each system component so that the maintenance staff can effectively service, inspect, maintain, adjust, troubleshoot, repair and replace it.
- C. An integrated set of OCS shop drawings shall be included as a separate section. All portions of the drawings shall be legible when printed on 8 1/2 x 11 inch paper.
- D. Include in the manual:
 - 1. General description
 - 2. Principles of operation
 - 3. Shop drawings to component level
 - 4. A conductor schedule listing installation details of every contact wire by wire run number

5. Preventive maintenance tasks and procedures highlighting critical areas requiring meticulous attention for inspection and maintenance standards including wear limits, settings and tolerances
6. Lubrication and cleaning, including frequency, methods, and trade identifications of recommended materials, component location and description
7. Summarized preventive maintenance schedules and recommended intervals
8. Repair procedures including dismantling, reassembly and testing procedures
9. Requirements of special tools, jigs, stagger and clearance gauges and their source of supply
10. Test equipment lists and their description
11. Spare parts requirements
12. Warning and safety procedures during maintenance actions
13. A description of OCS assemblies and assembly references
14. Standard installation procedures
15. Safety procedures
16. List of special tools that are required for any given installation
17. Any other information necessary to ensure proper installation and as required by the Engineer

2.3 SPARE PARTS CATALOG

- A. The spare parts volume of the I&M Manual shall catalog, enumerate, and describe every component with its related parts and necessary special tools, including the supplier's number and any commercial equivalents.
- B. Drawings shall identify all sub-assemblies and component parts. A component part is defined as the lowest level of component assembly that consists of a separate individually fabricated part.
- C. Parts common to different components (e.g. bolts and nuts) shall bear the same Contractor's number in all components with a reference to the other components in which they are used. Each part or other component shall be identified as being part of the next higher assembly.
- D. Commonly available material such as galvanized pipe, galvanized and stainless steel wires and rods, nuts and bolts, thimbles etc. shall be identified by standard hardware nomenclature and the Contractor's number. A separate list of these items shall be provided in the manuals with information sufficient to order these items through (local) commercial channels.
- E. The spare parts catalog shall have a complete itemization of all consumable parts and servicing materials (oils, paints, special compounds, grease, etc.) required for the component requiring its use.
- F. Federal Paint Registry Numbers shall be supplied in addition to paint descriptions as part of the itemization of consumables

- G. In addition to the normal cross-referencing noted in the preceding paragraphs, at least three supply sources shall be provided for all required consumables and servicing materials. Suppliers and materials shall be specified by trade name and type. Of the three required sources, at least two shall be located in the United States

PART 3 - EXECUTION

Not Used

PART 4 - MEASUREMENT AND PAYMENT

4.1 MEASUREMENT

- A. The quantities of accepted work will be measured in the following units. All measurements will be plan measure except for authorized changes.
1. Description: Lump Sum

4.2 PAYMENT

- A. Payment will be made at the respective unit or lump-sum price listed in the proposal and shall be full compensation for all labor, materials, and equipment necessary to complete the respective unit in place. There will be no separate measurement or payment for any item of work not specifically identified and listed in the proposal, and all such work shall be considered a subsidiary item with all costs pertaining thereto included in the prices for other items listed in the proposal. At the Engineer's option, partial payment may be made for any lump sum item listed in the proposal, providing that the Contractor is diligently and satisfactorily pursuing full completion of such partially complete item in accordance with the approved job progress schedule.

END OF SECTION

THIS PAGE INTENTIONALLY LEFT BLANK

SECTION 34 23 97**OCS MAINTENANCE STAFF TRAINING****PART 1 - GENERAL****1.1 SUMMARY**

- A. This Section includes Specifications for training materials, training programs and training schedules for the Overhead Contact System (OCS).
1. The Contractor shall complete all OCS training 30 days prior to the start of OCS Commissioning.
 2. Training classes shall be for OCS trainees between entry level and Journeyman.
 3. The Contractor shall furnish manuals, training literature and training aids for OCS training.
 4. Training and support materials shall be provided to enable the agency personnel to operate and maintain the complete OCS. The training program shall include detailed instructions, demonstrations and supervised hands-on training.
 5. Each OCS trainee class shall be given twice. The Contractor shall coordinate with the Engineer during the scheduling of the training classes so that the agency only has to provide 50% of the OCS maintenance/operations staff at any one given time. Depending on the agreed upon schedule, the duplication requirements for classes may require a periodic gap of time between classes.
 6. Each class shall be developed with the Engineer, with the objective of the agency being able to repeat training for OCS trainees at a later date.
 7. All training shall be given in English, unless otherwise requested/coordinated by the Owner.
 8. The agency shall retain the right to reproduce any of the training materials for its own use.

1.2 RELATED SECTIONS

- A. SECTION 01 33 00 – Submittal Procedures
- B. SECTION 34 23 90 – OCS Installation Records
- C. SECTION 34 23 96 – OCS Installation and Maintenance Manuals

1.3 DESCRIPTIONS

- A. Element – A Systems Element, i.e., OCS, Communications, Corrosion, Signals or Traction Power
- B. Topic – A subject area within OCS, for which instruction will be completed in less than 4 hours.
- C. Instructor – A Contractor's employee nominated to give training
- D. Trainee – An agency employee receiving training
- E. Agency OCS Trainers – An agency employee selected to teach trainees

- F. Student – A trainee or agency OCS Trainers attending a class of instruction
- G. OCS Training Materials – This describes the OCS documents used in support of the classroom and workshop instruction, and comprises:
 - 1. OCS Instructors Training Guide
 - 2. OCS Training Aids
 - 3. OCS Student Workbooks
 - 4. OCS Trainers Handbook
- H. OCS Support Materials – As-built documentation of the installed OCS, including updated Contract Drawings, acceptance measurements forms, cantilever cut sheets, Structure Record Drawings of every OCS support and the OCS I&M Manuals.
- I. OCS Instructors Training Guide – Used as a manual by OCS Instructors and the agency OCS trainers, this Guide includes a course outline, agendas, objectives, lesson plans, training aids, presentation guidelines, suggested questions for class discussion, and criteria for measuring student performance.
- J. OCS Training Aids include:
 - 1. Visual displays (overhead transparencies, Power Point files)
 - 2. OCS assemblies and components
 - 3. Scale models
 - 4. Mock ups
 - 5. Tools and equipment
- K. OCS Student Workbooks – These workbooks for trainees include a course agenda, a schedule of sessions, hard copies of presentations (e.g. transparencies, electronic presentation files), lecture outlines, and any additional printed material used during the course.
- L. OCS Trainers Handbook – This Handbook for OCS Trainers expands on the subject matter given in the Instructors Training Guide by showing additional examples, photographs, charts and tables. Answers to questions on aspects of OCS raised by the trainees in previous classes are included. The OCS Trainers Handbook also gives assistance in the use of training aids provided by the Contractor.
- M. OCS Installation and Maintenance Manual – typically comprising sections on pole and wiring installation, shop drawings, OCS spare parts and details on disconnect switches.

1.4 TRAINING

- A. Training shall be conducted at the agency facilities in Kansas City, Missouri and include classroom and hands-on instruction for agency personnel.
- B. The size of OCS trainee classes, time and location for the training shall be Approved in advance by the Engineer.
- C. Instructors shall conduct customized training classes on OCS topics.
- D. Instructors shall be capable of providing detailed explanations of the operation and maintenance of all aspects of OCS, including individual assemblies, and of answering any questions that may arise.

- E. The Contractor shall furnish experienced instructors who have direct knowledge of OCS.
- F. For each class, Instructor(s) shall have previously conducted classes of similar subject matter and scope, and shall be proficient in the use of the tools, equipment and training aids.
- G. The resumes and qualifications of OCS instructors shall be submitted to the agency for Approval.
- H. A list of the OCS topics to be taught by each instructor shall be submitted in advance to the Engineer.
- I. All instructors shall be fluent in English. Prior to the initiation of classroom instruction, all instructors nominated by the Contractor shall attend a 1-day orientation at the agency to become familiar with agency safety regulations and facilities, and to be advised of student qualifications and expectations.
- J. The Contractor shall furnish a description of the prerequisite knowledge trainees must have before starting OCS training classes.

1.5 SUBMITTAL QUANTITIES FOR FINAL OCS TRAINING MATERIALS

- A. The Contractor shall provide the following final training materials:
 - 1. One complete photo-ready reproducible set of OCS Instructor Training Guide, OCS Trainers Handbook, and Student Workbook
 - 2. All training materials that are produced for the Project shall be MS Windows compatible files, using a software format mutually agreed between the Engineer and the Contractor. The electronic media versions shall be revised in accordance with the hardcopy manual revisions.
 - 3. Two OCS Instructors Training Guides
 - 4. Two OCS Trainers Handbooks
 - 5. One complete set of training aids
 - 6. Ten student workbooks
- B. A schedule for delivery of training materials to all designated the agency personnel shall be approved in advance by the Engineer.

1.6 SUBMITTAL SCHEDULE

- A. The Contractor, at a minimum, shall submit to the Engineer for Approval, in accordance with SECTION 01 33 00 – Submittal Procedures, OCS Training Outline Proposals and OCS Training Materials, in accordance with the following timetable:
 - 1. OCS Training Outline Proposals – Submit two sets of training outlines/schedules. The outline/schedule shall be submitted to the Engineer for Approval, at least 1 year before the start of the prescribed agency training courses.
 - 2. OCS Training Materials, Draft - Submit two sets of the first draft of the proposed training materials 6 months before the start of the prescribed agency training course.
 - 3. OCS Training Materials, Training Draft - Submit ted sets of the training draft for use during the training class, 30 days before the start of the prescribed agency training course.

4. OCS Training Materials, Final - Submit final training materials in the following quantities 30 days after the completion of training:
 - a. Three complete sets of manuals in reproducible hard copy format
 - b. One electronic copy in native format
 - c. One electronic copy in Adobe PDF format
 5. The final submittal of training materials shall correct all errors that were found by the Contractor, found during training or changes that were requested by the Engineer.
- B. All revision updates for all the training materials shall be provided to the agency by the end of the Warranty period or more frequently to reflect any changes made to the OCS during the Warranty period.

1.7 INSTRUCTION REQUIREMENTS

- A. Trainees shall be exposed to the depth of detail that is necessary for the performance of preventive, corrective, overhaul and maintenance operations for all OCS equipment supplied under this Contract.
- B. Trainees shall be afforded the opportunity to perform the more complex maintenance functions in the field and in the shop, in addition to troubleshooting faults artificially introduced in the equipment.
- C. Instruction shall include, at a minimum, the following:
 1. Introduction to the equipment, including terminology, and the identification of OCS assemblies
 2. The OCS Wiring Layouts drawings showing the configuration of the OCS over the tracks
 3. Theory of design of an OCS.
 4. Routine care, including cleaning, lubrication schedules, adjustments and inspection criteria
 5. Problem symptoms, troubleshooting techniques and repair procedures
 6. Removal and replacement of components
 7. Disassembly and reassembly for the purpose of component familiarity and any special processes
 8. When methods of access, removal, dismantling, or application are not self-evident, the instruction shall cover these matters
 9. Instruction in the use and maintenance of all OCS special tools and gauges
 10. Safety instruction for all maintenance activities
 11. Overhaul procedures

1.8 TRAINING OUTLINES

- A. The Contractor shall develop and provide a training outline proposal for agency Approval 1 year in advance of the scheduled training.

- B. The Contractor training outline shall include:
1. A list of OCS training topics
 2. A detailed outline of each topic
 3. A description of the scope of instruction to be covered in each topic
 4. An overview of the hands-on experience to be included as a part of the OCS training course
 5. A list of the OCS equipment, tools and test equipment, manuals, and other materials to be utilized as trainee training aids
 6. Lesson plans that include the sequence of activities, an outline of the content, the learning strategies to be used (e.g., classroom presentation, hands-on practice, audio/video presentation, etc.), and include sample lessons
 7. An assessment of the classroom space, workshop space and power supplies needed for training
 8. A list of classroom equipment that agency might loan if requested
 9. The duration of the training, in hours, for each topic, broken down into classroom, workshop and fieldwork
 10. A proposed course schedule

1.9 OCS TRAINING MATERIALS

- A. Training materials shall be separate and distinct from the Contract As-built records and I&M Manuals. Training materials shall be setup to contain step-by-step introduction to the OCS training classes and shall describe those features and equipment peculiar to OCS.
- B. As training materials are being developed, the Contractor shall work closely with agency staff, to ensure the specified agency standards with respect to the course organization, content, and overall quality of all training materials are being met.
- C. The Contractor shall provide an adequate supply of high quality, professionally prepared training material on paper, and such other training aids as described in this Section, to impart the essential knowledge to the trainees involved and leave them with authoritative and up-to-date reference material.
- D. Training materials shall provide support to the training courses, and comprise the OCS Instructors Training Guide, OCS training aids, and OCS student workbook.

1.10 OCS INSTRUCTORS TRAINING GUIDE

- A. The Contractor shall provide Instructors Training Guides for Contractor's instructors and for agency OCS trainers, containing course outline, agendas, objectives, lesson plans, training aids, presentation guidelines, suggested discussion questions and criteria for measuring student performance by a series of tests.
- B. The information given in the Instructors Training Guide shall be coordinated with course information and course materials, and shall be grouped to correspond to course periods of not more than 4 hours.
- C. Written and practical tests shall be included, that are to be given at suitable points during training. These tests shall be designed to determine the extent to which students have learned and can apply the information presented.

1.11 TRAINING AIDS FOR OCS TRAINEE CLASSES

- A. The Contractor shall provide training aids for use by the OCS instructor, such as mock-ups, scale models, and electronic presentations (e.g. Microsoft Power Point files) etc. The following materials may be used as training aids:
1. Items that are ear-marked for spare parts may be used to facilitate hands-on-training in a workshop setting or out on the line.
 2. OCS assemblies such as section insulators, shop-door bridges, surge arresters, disconnect switches and pantographs, the functions of which can be displayed without dismantling.
 3. Electronic presentation files (software format to be approved by agency or videos shall be used for training aids. Electronic presentation files may be used to illustrate OCS assemblies showing components, and OCS wiring layouts.
 4. Lesson plans shall be updated as required during the course of instruction.
- B. All training aids shall be of durable construction and shall become the property of the agency. Any equipment or tools used during training are in good working condition both before and after training sessions.
- C. All training materials, such as training aids and lesson plans, shall become the property of the agency at the completion of the training program. The Contractor shall be responsible for the condition of these materials for the duration of the training program.
- D. Where videos are used for instruction, one copy of each instructional video shall be provided to the agency on a DVD.
- E. Course materials (e.g. manuals, class handouts, tools, equipment, videos, computer-based software) and training materials shall be provided for each class, and shall be reusable (where practical). The same training materials shall be used for each class so that each class is exposed to the same information and comments can be collected on training manuals. Comments from training manuals will be given to the Contractor for incorporation into the final manuals.

1.12 OCS STUDENT WORKBOOKS

- A. The Contractor shall provide student workbooks for OCS trainees that include:
1. Course objectives
 2. A course agenda
 3. Schedule of sessions
 4. Lecture outlines
 5. Instructions on use of course materials, tools, equipment and other instruction aids
 6. Notebook-size, 8 1/2 x 11 inch, copies of all visual displays used by an instructor, (e.g. electronic presentation files)
- B. The student workbook shall include prepared notes on:
1. Design and operation of the OCS
 2. The interaction between OCS and other System Elements, such as traction power, signals and corrosion

3. Civil trackwork, overhead bridges and underpasses impacting the design and maintenance of the OCS
 4. The relationship of the OCS wiring layouts and the assembly reference drawings/shop drawings
 5. Contract OCS as-built drawings and other installation records
 6. The content and use of the procedures in the OCS I&M Manuals
 7. OCS test equipment
 8. The calibration and regular checking of stagger gauges and clearance envelope carts
 9. Use and analysis of Acceptance measurements sheets
 10. Hook-up video equipment for OCS surveillance runs
- C. Student workbooks shall be retained by the trainees for future reference.
- D. Student workbooks shall be printed single sided and presented in 3-ring binders. This will allow room for students to use the blank sides of pages for notes.

1.13 OCS CONTRACT DRAWINGS

- A. OCS Contract Drawings include both basic design drawings and site-specific drawings. On completion of the installation these drawings are updated to an As-built or a Design Update condition.
1. For use in class (in the absence of screen projection) these drawings shall be reproduced in two sets: a BASIC DESIGN set and a SITE-SPECIFIC set at 11 x 17 inch size.
 2. For distribution to each trainee the two sets shall be reproduced at 8 1/2 x 11 inch and comb-bound.

1.14 OCS INSTALLATION AND MAINTENANCE MANUALS

- A. I&M Manuals, (also called Installation and Maintenance Manual), typically comprise the following volumes:
1. OCS wiring and poles
 2. OCS shop drawings, assembly references, components and conductors
 3. Spare parts catalogs
 4. OCS disconnect switches
- B. These volumes shall be available for training purposes, and such a set shall be made available to the training class. See SECTION 34 23 96 – OCS Installation and Maintenance Manuals.

1.15 AMOUNT OF REQUIRED TRAINING TIME FOR OCS TRAINEES

- A. The Contractor shall designate the total number of hours allocated for training of two classes with a class size of up to ten people.
- B. Based on this, the Contractor shall provided two classes at up to ten agency employees per class for OCS training at 40 hours for each class = 80 hours total for OCS training.

1.16 TRAINING SYLLABUS FOR THE TRAINEES COURSE

- A. The Contractor shall develop a course syllabus covering the following topics and allowing time for the trainees to interact with the Instructor during the instruction by asking questions and receiving input based on real life experiences. Where appropriate the instructor shall address typical misinterpretations by novices of criteria and of equipment factors of safety. Showing of Video/DVD recordings is encouraged. Field visits shall be included where practical. Time for short written tests during class time shall be allowed.
- B. The following shall provide a framework for the order of the topics to be taught and times shown are typical values and may be varied, but the sequence of the classes and their duration is at the Contractor's choice, but subject to the Engineer's Approval:
1. Introduction to OCS (class room)
 - a. Glossary of OCS Terms
 - b. Description of OCS styles
 2. OCS Design Basis (class room and field)
 - a. Agency Design Criteria (all Sections)
 - b. Streetcar Characteristics
 - 1) Vehicle envelopes
 - 2) Pantographs
 - 3) Pantograph clearance envelopes
 - c. Conductors and wires
 - 1) Types and uses
 - 2) Tensions and sags
 - d. Contact wire stagger design
 - 1) Track tolerances
 - 2) Vehicle and pantograph sway
 - 3) Wind effects
 - 4) Mid-span offset
 - e. Contact Wire Height
 - 1) In streets and segregated right-of-way (ROW) (NESC)
 - 2) Clearance at overpasses
 - 3) Track sags and hogs
 - 4) Contact wire gradients

-
- f. Clearance Criteria
 - 1) Electrical
 - 2) Physical (Code)
 3. As-built Records, as described in SECTION 34 23 90 – OCS Installation Records.
 - a. OCS Contract Design Update Drawings (class room)
 - 1) Drawing hierarchy
 - 2) Basic design drawings
 - 3) Site specific drawings
 - b. OCS Testing and Measurements Records (class room and field)
 - 1) OCS acceptance measurements
 - 2) Pole ground resistance measurements
 - 3) Pantograph clearance envelope checks
 - 4) Streetcar OCS videotapes
 - 5) Structure record drawings
 4. Installation and Maintenance Manuals (I&M), as described in SECTION 34 23 96 – OCS Installation and Maintenance Manuals (class room)
 - a. OCS wiring and poles
 - 1) Conductor stringing
 - 2) Preventive maintenance
 - b. OCS shop drawings, components and conductors
 - c. OCS parts catalog
 - d. OCS disconnect switch
 5. Shop Work
 - a. Cantilever manufacture
 - b. Pull-off assembly
 - c. Hanger manufacture
 - d. Other assemblies
 6. Periodic Inspections of the OCS
 - a. Quantitative Measurements (class room and field)
 - 1) Wire heights and staggers
 - 2) Track elevation and superelevation
 - 3) Analysis of height and stagger measurements

- b. Qualitative Inspections (class room and field)
 - 1) Eye-level inspections
 - 2) Ground-level inspections
 - 3) OCS surveillance by video
- 7. Reasons for OCS Line Failures (class room)
 - a. Dewirements
 - b. Lightning strikes
 - c. Vandalism
 - d. Faulty materials
- 8. Hi-Rail Vehicles (class room and field)
 - a. Use
 - b. Maintenance
- 9. OCS Tools, Equipment and Gauges (class room and field)
 - a. Stagger gauges
 - b. Pantograph clearance gauge
 - c. Video equipment
 - d. Tensiometers
 - e. De-kinking tools
 - f. Lifting equipment and slings
 - g. Work/worker safety
- 10. Agency Operations and Maintenance Procedures (class room)

1.17 SPECIAL EQUIPMENT FOR OCS TRAINING CLASSES

- A. The Contractor shall, at a minimum, supply one complete set of all special tools and test equipment necessary to service, repair, maintain, and overhaul each system shall have been delivered by the Contractor for use in the training program. At the completion of the training program these special tools, test equipment, and training aids shall be turned over to the Engineer, in proper working order, by the Contractor.

PART 2 - PRODUCTS

Not Used

PART 3 - EXECUTION

Not Used

PART 4 - MEASUREMENT AND PAYMENT**4.1 MEASUREMENT**

A. The quantities of accepted work will be measured in the following units. All measurements will be plan measure except for authorized changes.

1. Description: Lump Sum

4.2 PAYMENT

A. Payment will be made at the respective unit or lump-sum price listed in the proposal and shall be full compensation for all labor, materials, and equipment necessary to complete the respective unit in place. There will be no separate measurement or payment for any item of work not specifically identified and listed in the proposal, and all such work shall be considered a subsidiary item with all costs pertaining thereto included in the prices for other items listed in the proposal. At the Engineer's option, partial payment may be made for any lump sum item listed in the proposal, providing that the Contractor is diligently and satisfactorily pursuing full completion of such partially complete item in accordance with the approved job progress schedule.

END OF SECTION

THIS PAGE INTENTIONALLY LEFT BLANK

SECTION 34 42 10**SIGNALS GENERAL ENGINEERING AND DESIGN REQUIREMENTS****PART 1 - GENERAL****1.1 SUMMARY**

- A. This Section includes Specifications for general engineering and design requirements applicable to all portions of the Work unless otherwise specified. It also includes definitions, general requirements and Standards and Codes. This Section also details submittal requirements. The Contractor shall, in conformance with the Contract Documents
1. Design the Signal System
 2. Manufacture the Signal System
 3. Install, adjust and test the Signal System
 4. Provide spare parts, special tools and test equipment
 5. Furnish documentation and drawings necessary to support operation, maintenance and repair of the Signal System
 6. Provide technical support to verify the proper operation of the Signal System
 7. Train the Agency personnel in the operation and maintenance of the Signal System and provide training aids and materials for future use as described in the Contract Documents
 8. Provide technical support and replacement parts during the warranty period
- B. These documents are intended to establish and control both the specific and general design parameters for the design, fabrication, installation and testing of the Street Car Signal System for the use on the Project. The use of proven equipment and designs is required.

1.2 RELATED SECTIONS

- A. SECTION 01 33 00 – Submittal Procedures
- B. SECTION 01 43 00 – Systems Quality Assurance
- C. SECTION 34 42 16 – Signals Wire and Cable
- D. SECTION 34 42 29 – Signals Electrical and Electronic Components
- E. SECTION 34 42 76 – Signals Tests and Inspections

1.3 QUALITY ASSURANCE

- A. The Contractor shall comply with the requirements of Division 11.
- B. Failsafe equipment proposed for this Contract shall have been proven by in-service experience.

1.4 DEFINITIONS

- A. The Street Car signal portions of the Contract Documents use terms that are specific to the railroad signal industry. Whenever the following railroad signal terms appear in these Specification Sections they shall be interpreted as follows.
- B. AAR Terminals – Terminal blocks which conform to AREMA Communications and Signals Manual Part 14.1.8 (Recommended Design Criteria for Molded Binding Post Type Terminal Block, Details & Assemblies)
- C. Absolute Block – A block in which no train is permitted to enter while it is occupied by another train
- D. Approach Lighting – A method of lighting signals upon the approach of a train
- E. Approach Locking – Electric locking is effective while a train is approaching within a specified distance. Approach locking is arranged such that a signal displaying an aspect to proceed, and which prevents, until after the expiration of a predetermined time interval after such signal has been caused to display its most restrictive aspect, the movement of any interlocked or electrically locked switch, movable point frog, or derail in the route governed by the signal, and which prevents an aspect to proceed from being displayed for any conflicting route
- F. Aspect – The appearance of a fixed signal conveying an indication as viewed from the direction of an approaching train
- G. Automatic Block Signal System – A series of consecutive blocks governed by block signals. ABS system is actuated by a train, engine, or by certain conditions affecting the use of a block
- H. Block – A length of track of defined limits, the use of which trains and engines are governed by block signals, cab signals or both
- I. Conflicting Movements – Movements over conflicting routes
- J. Conflicting Routes – Two or more routes opposing, converging or intersecting, over which movements cannot be made simultaneously without possibility of collision
- K. Current of Traffic – The direction specified by the operating rules in which trains may move on a designated track
- L. Detector Locking – A method of locking which is effective when the detector track circuit (OS) is occupied. Detector Locking prevents the operation of any power operated switch, moveable point frog, or derail and the display of any signal indication more favorable than Proceed at Restricted Speed within the limits of the detector track circuit. Detector Locking is also referred to as Section Locking
- M. Electric Locking – The combination of one or more electric locks and controlling circuits by means of which levers of an interlocking machine are locked, or the equivalent using circuits only, so that switches, signals, or other units operated in connection with signaling and interlocking, are secured against operation under certain conditions.
- N. Failure – An improper condition resulting from a device not performing its intended function
- O. Failure Rate – The frequency of failure, expressed as failures per hour, failures per mile, etc. Failure rate is the mathematical reciprocal of Mean Time Between Failures (MTBF)
- P. In Advance of Signal – A term used in defining the territory beyond a signal as seen from an approaching train

- Q. In Approach to a Signal – A term used in defining the territory to which a signal indication is conveyed
- R. Indication – The information conveyed by the aspect of a signal
- S. Indication Locking – Electric locking which prevents manipulation of levers that would result in an unsafe condition for a train movement if a signal, switch or other operative unit fails to make a movement corresponding to that of its controlling lever, or which directly prevents the operation of a signal, switch or other operative unit, in case another unit which should operate first fails to make the required movement
- T. Interface – The points where two or more systems, subsystems or structures meet, transfer energy or transfer information
- U. Interlocked Switch – A track switch within the interlocking limits, the control of which is interlocked with other functions of the interlocking
- V. Interlocking – An arrangement of signals and signal appliances so interconnected that their movements must succeed each other in proper sequence and for which interlocking rules are in effect. It may be operated manually or automatically
- W. Mean Time Between Failures (MTBF) – The mean operating time between independent failures
- X. Non-vital Circuit – Any circuit the function of which does not affect the safety of train operation
- Y. Reliability – The probability of performing a specified function without failure and within design parameters for the period of time intended under actual operating conditions
- Z. Route – The course or way to be traveled
- AA. Route Locking – Electric locking, effective when a train passes a signal displaying an aspect for it to proceed, which prevents the movement of any switch, movable point frog, or derail in advance of the train within the route entered. It may be so arranged that as a train clears a track section of the route, the locking affecting that section is released
- BB. Safe – The condition in which passengers, crew, or repair personnel are secure from threat, danger, harm, or loss arising from improper design, manufacture, assembly, malfunction or failure of the signal system or any of its components or subsystems
- CC. Speed, Schedule – The average speed of a vehicle or train, from terminal to terminal obtained by dividing the distance between these points by the time taken to make the trip including time for intermediate station stops
- DD. Switch Machine – A device, the complete operation of which performs the three functions of unlocking, operating and locking a switch
- EE. Tight (used as a suffix) – Apparatus is designated as watertight, dust tight, etc., when so constructed that the enclosing case excludes the specified material
- FF. Train – One or more cars coupled together and operating as a unit
- GG. Vital Circuit – Any circuit and its elements, the function of which affects the safety of train operations

1.5 GENERAL REQUIREMENTS

- A. The intent of the Project is to procure a signal system based on components and designs, which have a proven performance history. This Section provides information considered pertinent to the understanding of the Street Car environment. The Signal System shall include:
1. General Streetcar operations
 - a. Exiting Non-Revenue tracks and Entering into Revenue Service
 - 1) All street car vehicle operations entering or leaving the mainline will need to be coordinated by operations dispatch. Contractor to coordinate streetcar signals design with traffic signal design.
 - 2) A streetcar exiting the on the Shop Track towards the mainline Northbound Track on Grand Boulevard for revenue service operation will position itself over the L2 Train-to-Wayside (TWC) loop located adjacent to the S2 bar signal at the intersection of Grand Boulevard and West 3rd Street. The streetcar operator will look to see if there is a streetcar on Grand Ave. If there is a street car approaching on Grand, the Non-Revenue street car will wait to make a call until the revenue street car passes. Once the street car passes the streetcar operator will then initiate an S2 route request by using the TWC carborne unit to dial in the train ID number and correct route number. The carborne unit will then transmit the message to the TWC wayside interrogator unit located in signal case RC1, which will in turn transmit the message serially to the streetcar signaling microprocessor. The microprocessor will then transmit a preemption request to the traffic signal control system.
 - 3) The preemption request will then activate a sequence that will place the 3rd Street traffic signal to stop for all directions for vehicular traffic. Once this has been accomplished the traffic signal control system will then transmit an indication to the streetcar signaling microprocessor indicating that it is now safe to clear the S2 signal for a straight-through route exiting at signal S6. Once the proper aspect is displayed, the streetcar operator will then accept the signal and proceed over track 1T and Switch 1 (trailing point move) and will position the vehicle over TWC loop L6, which is located adjacent to signal S6.
 - 4) Once the streetcar is properly positioned over the L6 TWC loop the operator will key down the south end of the vehicle and will then proceed to the opposite end of the vehicle and key up the north end. The operator will then initiate a route request for a move from S6 to the 3rd St. station on the revenue southbound track. This will initiate a preemption sequence that will place the Grand Boulevard/3rd Street traffic signal to stop in all four directions. Once the signaling microprocessor receives the indication that it is safe to clear signal S6, the streetcar will be routed over Switch 1 onto the Southbound Track, exiting at bar signal S4. The operator will then accept the signal and will position the vehicle into the 3rd St. Station and begin revenue service.
 - b. Returning to Vehicle Maintenance Facility
 - 1) A streetcar exiting the mainline heading towards the shop on the Northbound Track will position itself over the L6 TWC loop. The vehicle operator will then initiate an S6-to-S2 route request. This will initiate a preemption sequence that will place the Grand Boulevard/3rd Street traffic signal to stop in all four directions. Once the signaling microprocessor receives the indication that it is safe to clear signal S6, the operator will proceed onto the non-revenue tracks and head towards the shop area once the signaling system safely clears the signal and properly positions Switch 1 for the requested move.

- 2) Streetcar traffic entering and leaving the non-revenue tracks will need to be coordinated by dispatch to effectively control the flow of vehicles from the vehicle maintenance facility into revenue service and vice versa.
- c. Union Station
- 1) Once the operator has closed the doors the operator will pull forward over the TWC loop L8, which will initiate a signal to the traffic controller to turn the traffic signals to red at the Union Station pedestrian bridge. Once the traffic signals are set to red, the traffic controller will illuminate a proceed indication via the bar signal S8, mounted on the traffic pole. Once the bar signal indicates proceed, the street car will proceed across the IJ in front of the points of switch which will drop the track occupancy track circuit. The track occupancy track circuit will latch the traffic signals red until the street car completes the diverging move on to the North Bound track. During this phase the pedestrian cross walk indicators shall prohibit pedestrians from crossing in the crosswalk. Once the street car clears the North Bound IJ, the occupancy track circuit relay will pickup and send a signal to the traffic control to change the traffic signal to green.
- d. Future possibility – will provide infrastructure.
- 1) Once the streetcar is properly positioned over the L4 TWC loop the operator will key down the west end of the vehicle and will then proceed to the opposite end of the vehicle and key up the east end. The operator will then initiate a route request for a move from S4 to S6 that will initiate a preemption sequence that will place the Grand Boulevard/West 3rd Street traffic signal to stop in all four directions including the traffic signal at 5th and Grand. Once the signaling microprocessor receives the indication that it is safe to clear signal S4, a request will be initiated that will route the streetcar over Switch 1 onto the Northbound Track (heading south), exiting at bar signal S6. The operator will then accept the signal and will proceed onto the North Bound mainline for a move back into the shop using TWC L6 and signal S6 as described above.
2. Train to Wayside Communications (TWC) systems to:
- a. Automatically call routes through interlockings
 - b. Call individual switches at interlockings
3. Interlockings
- a. The following requirements shall apply to all interlockings:
 - 1) Detector, approach, indication and route locking shall be provided at each interlocking.
 - 2) Detector locking at interlockings shall not be released until 5 seconds after the slow pick-up track repeater relays have closed their front contacts.
 - 3) All non-interfering movements shall be permitted simultaneously.
 - 4) The control of all interlockings and non-interlocked locations shall be microprocessor based.
 - 5) Circuit design shall conform to the American Railway Signaling Principles and Practices of the AREMA (AAR) Communications and Signals Manual, including, but not limited to, Part 16, Vital Circuit and Software Design.

- 6) Approach locking and time locking shall be released by a single track circuit indicating occupancy of the previously established route. This release shall be accomplished through the use of relay contacts of the first repeater relay of the appropriate track relay.
 - 7) Approach locking and time locking shall be effective for all interlocking signals in the event of a momentary loss and subsequent restoration of AC and/or DC signal power. This means that Approach Stick Relay's (ASR's) shall not be restored upon a momentary loss and restoration of power and that ASR circuits shall incorporate the use of a Power Off Stick Relay (POSR) type arrangement.
4. AC power supply system capable of powering all signal equipment used on the Project

1.6 STANDARDS AND CODES

- A. The Street Car Signal System shall be designed, constructed and tested to the latest revision at the time of award of the Contract to the following codes and standards:
1. U.S. Code of Federal Regulations (CFR 49 Part 236 and Part 234).
 2. American Railway Engineering and Maintenance-of-Way Association (AREMA, formerly AAR)
 - a. Communications and Signals Manual
 3. National Electrical Code (NEC)
 4. National Electrical Safety Code (NESC)
 5. Insulated Cable Engineers Association (ICEA)
 6. Institute of Electrical and Electronic Engineers (IEEE)
 7. National Fire Protection Association (NFPA)
 8. Underwriters Laboratories Inc. (UL)
 9. U.S. Department of Transportation, Federal Highway Administration "Manual on Uniform Traffic Control Devices"
 10. American Society for Testing and Materials (ASTM)
 11. American National Standards Institutes, Inc. (ANSI)
 12. Rules and Regulations of the Colorado Public Utilities Commission (PUC)

1.7 SERVICE PROVEN EQUIPMENT AND DESIGN

- A. The Contractor shall furnish signal equipment proven in similar railroad or rail transit service and shall make use of this experience to prepare a suitable and proven design for this application. Each component, subassembly and assembly furnished by the Contractor shall be of a proven design with a history of at least 10 years of successful revenue service operation on at least three different railroad or transit properties in North America.
- B. Vital relays, vital microprocessor interlocking equipment, switch machines, switch locks, switch circuit controllers, and signals shall have a history of at least 10 years of successful revenue service on each of at least three different railroad or rail transit properties in North America.

- C. Wire, cable and the wire and cable manufacturer shall have proven service histories as required by SECTION 34 42 16 – Wire And Cable.
- D. The Signal System shall have an expected service life of 40 years at the specified level of service. Achievement of this useful life shall be through the use of off-the-shelf proven hardware. Each major component, subassembly and assembly shall incorporate provisions to allow for the functional and physical interchangeability of replacement spare parts.
- E. The Contractor shall be fully responsible for designing, furnishing, installing and testing a safe and reliable Signal System, independent of any other requirement of this Specification.

1.8 DESIGN CRITERIA

- A. Failsafe Design
 - 1. The Contractor shall base the design of the Signal System on their System Safety and Security Certification Plan.
- B. The Agency Design Criteria shall be considered to be a part of this Specification.
- C. Modular Design
 - 1. The Contractor shall use modular design throughout.
 - 2. The Contractor shall organize electrical and mechanical components in rack-mounted, plug-in assemblies.
 - 3. The Contractor shall minimize the mixing of equipment associated with two subsystems into one plug-in assembly.
 - 4. Equipment serving similar functions shall be in the same relative location in all cases where practical.
 - 5. Printed circuit cards designed to perform the same function shall be interchangeable regardless of whether these cards are of the same or different subsystems.
 - 6. All printed circuit cards used for signal equipment shall be mechanically or electrically keyed to prevent improper insertion, damage or operation.
 - 7. Equipment Arrangement
 - a. All equipment and components shall be accessible for testing or replacement without removal of other components.
 - b. Two or more points of adjustment which are required during the same operation shall be located in such a way that they can be operated by one person.
 - 8. Wiring
 - a. All incoming cables shall be terminated on standard AAR terminals with concave test link nuts. These nuts, when backed off, will open the circuits without removing the wires from the terminal posts. A maximum of two wires shall be permitted on each AAR terminal. All spare conductors in all cables shall also be tagged and terminated on AAR terminals with test links.

- b. Main power feeders shall have segregated facilities for entering and leaving each relay case. Power feeders shall be terminated on the power rack, sideboards or shelves.
 - c. The Contractor shall provide insulated nuts and protective covers for personnel safety on all exposed terminations above 50V and shall meet the requirements of the AREMA Communications and Signals Manual, Part 11.1.1 (Recommended Functional/Operating Guidelines for Electrical Safety), except as otherwise specified herein, or as Approved by the Agency.
 - d. Wires distributing AC and DC power within each and case shall originate from the power buss and terminate on the power distribution terminals. These wires shall be a minimum of #10-gauge and sized to limit line loss to less than 5%.
 - e. Except for main power feeders, all wiring entering or leaving each relay case shall be connected with crimp connectors to AAR terminals located on the entrance rack.
 - f. Entrance rack terminations shall be constructed and arranged to permit case wiring to be isolated from the field wiring, on an individual wire basis, without removing wires from their terminals. This shall be accomplished by use of standard AAR terminals and concave test link nuts as specified above, or as Approved by the Agency.
 - g. All wiring shall be supported at intervals that maintain an orderly installation and provide strain relief, particularly near terminal points.
 - h. The mechanical strength of each connection shall be at least 85% of the mechanical strength of the wire. Electrical conductivity of each connection shall be at least 95% of the electrical conductivity of the wire.
 - i. A minimum of 10% spare terminals (but no less than two terminals) shall be provided on each terminal block. Terminals used for the termination of spare wires shall be considered spare terminals. Exceptions to this requirement shall be Approved by the Project Manager.
 - j. Where card cages, switch modules, or switch matrices are installed, all connections on the back plane or switch base shall be wired to the main frame regardless of whether cards are to be installed or switch or light functions are to be used in the initial system functions. Any panel connections shall be plug or connector ended to facilitate removal for maintenance.
 - k. All wires connecting to relay plug boards and sockets shall be crimped. No terminations requiring soldering shall be used.
9. Test Points
- a. Test points for checking essential voltages and waveforms and for injecting test signals shall be provided where required for troubleshooting and routine maintenance except where vital function of the circuit is compromised.
 - b. Selected test points shall be provided to detect defective printed circuit cards and equipment modules without disconnection of wires except where vital function of the circuit is compromised.
 - c. All test points shall be accessible without removing any components.

- d. Digital electronic equipment may use status or fault indicators in lieu of test points.
- D. Adjustments
1. Adjustable components shall be avoided wherever possible by use of appropriate circuitry, stable components, and high-tolerance circuits.
 2. Adjustable components not intended for adjustment by operating personnel shall have locking devices or shall be self-locking to prevent inadvertent operation or drift. Special precautions, including limitation of adjustment range, shall be established for vital calibrations.
 3. Interacting adjustments shall be avoided.
 4. Where possible, replacement of components or printed circuit cards with spares shall not require compensating adjustments to other components or modules.
 5. When built-in indicators or meters are associated with adjustments, the adjustment point shall be sufficiently close to the associated indicator so both may be manipulated and observed by one person.
 6. No combination of misadjustments shall result in equipment damage or an unsafe condition.
- E. Environmental Parameters
1. Except as otherwise specifically provided for in other Sections, all systems and equipment shall perform properly without damage under the following conditions, and shall meet the requirements of the AREMA Communications and Signals Manual, Part 11.5.1 (Recommended Environmental Requirements for Electrical and Electronic Railroad Signal System Equipment), except as otherwise specified herein, or as Approved by the Agency.
 - a. All equipment shall be designed to operate from a minimum temperature of -40 degrees Celsius (ambient) to a maximum temperature resulting from a combination of ambient temperature, maximum sun loading and maximum normal internal heat generation of +70 degrees Celsius.
 - b. Relative humidity range shall be 5% to 95% non-condensing.
- F. EMI-Related Design Requirements
1. The Signal System shall be designed to operate in the electromagnetic environment present in the general area of the Street Car while causing the minimum possible interference to other systems. The equipment shall be designed, selected and installed with consideration given to the electromagnetic environment, which includes but is not limited to traction power supply, AC power distribution systems, vehicle propulsion systems, communications systems, adjacent railroads and electric utility lines.

PART 2 - PRODUCTS

2.1 PRINTED CIRCUIT CARDS

- A. Printed circuit (PC) cards shall be as specified in SECTION 34 42 29 – Signals Electrical And Electronic Components for housing in 19-inch card files.

- B. Card-mounted components weighing more than 1/2 ounce or with a volume of more than 1/2 cubic-inch shall have a structural attachment to the card separate from the electrical attachment.
- C. When practical, wires serving the same function shall be connected to the same terminal of PC cards used in the same subsystem, and cards containing the same circuitry shall be interchangeable between subsystems.
- D. PC cards shall be wired so that removal does not create an unsafe condition.
- E. All PC cards shall have mechanical or electrical keying that will prevent improper insertion, damage or interchange.

2.2 ELECTRONIC CIRCUITS

- A. All electronic equipment used on this Contract shall be semiconductor type, except as otherwise specified.

PART 3 - EXECUTION

3.1 TRAIN SAFETY

- A. Train safety shall be the primary consideration in the design of the Signal System and in the selection of its components including relays and other devices with moving parts, insulated wire, wire terminals, terminal posts, fuses, circuit breakers, housings, junction boxes, conduits, power supplies, resistors, capacitors, transformers, inductors and other similar items. The entire Signal System shall meet the requirements of this Section.
- B. In this Section the terms "restrictive" and "permissive" are used in connection with the binary outputs of two-position components or subsystems and denote such alternatives as:
 - 1. Stop and proceed
 - 2. A lower speed and a higher speed
 - 3. Deceleration and acceleration
 - 4. Brakes applied and brakes released
 - 5. Actuation of alarm and no actuation of alarm
- C. The following requirements shall govern the design of the portions of the system or a subsystem, which affect train safety:
 - 1. Only components that have high reliability and predictable failure modes and have been proven in conditions similar to the projected service shall be utilized.
 - 2. Components shall be combined in a manner that ensures a restrictive rather than a permissive condition will result from a component failure.
 - 3. All circuits which are not confined to one housing and which affect safety shall be two wire, double-break, except signal and switch indicator lighting circuits.
 - 4. The design shall be based on closed circuit principles. Broken wires, dirty or high-resistance contacts, a relay failing to respond when energized, a loss of power supply energy, or any combination of these failures, shall not result in unsafe conditions.
 - 5. Component or system failures shall cause a more restrictive signal indication than that permitted with no failure.

6. System safety apparatus design shall be such that any single independent component or subsystem failure shall result in a safe condition. Failures that are not independent (those failures which in turn always cause others) shall be considered in combination as a single failure and shall not cause an unsafe condition.
7. Electronic circuit design shall ensure that the following types of component failures have a restrictive rather than a permissive effect:
 - a. Two terminal devices – open, short, partial open, or partial short
 - b. Multi-terminal devices – combination of opens, shorts, partial opens, and/or partial shorts
8. Wherever possible, built-in checks shall be included that impose a restriction and/or actuate an alarm whenever a device fails to assume its most restrictive position when conditions require that it should.
9. Redundancy shall not be considered an acceptable method of achieving design safety.
10. Circuits and grounds shall be wired so that equipment removal does not create a hazard.
11. Non-vital contacts shall not be intermixed with vital contacts in safety circuits except when non-vital contacts are located at the head (farthest from the relay coil) end of the positive and/or negative feeds to relay coils.
12. Equipment containing circuitry-affecting safety shall be designed to include mechanical and/or electrical keying to prevent improper insertion or interchange.
13. The normal position of switches shall be as shown on the Contract Drawings.
14. The supplied equipment shall function properly in an environment where the temperature may vary from -40 degrees Celsius to +70 degrees Celsius.
15. Any latent failure of the equipment, that is a failure, which by itself does not result in an unsafe condition, but which in combination with a second or subsequent failures could result in an unsafe condition, must be detected and negated within a stipulated time period.

3.2 SUBMITTALS

- A. Drawings, documents and software to be submitted by the Contractor to the Project Manager shall include, but not be limited to, those listed below. All submittals required by this Section shall be submitted to the Project Manager in accordance with SECTION 01 33 00 – Submittal Procedures. The Project Manager reserves the right to request additional drawings or documents as required, to clarify and amplify the intent of the items previously submitted. Agency approval of any submittal shall in no way relieve the Contractor from the responsibility to provide a safe system that meets all of the requirements of this Specification.
 1. Document, Drawing and Software Submittal List – A document, drawing and software submittal list shall be prepared by the Contractor and submitted to the Project Manager. This list shall contain all documents, drawings and software to be submitted and an estimated schedule for initial release through final or as-built versions for each document, drawing or piece of application software.

2. Drawing Index – An updated drawing showing each drawing's title, drawing number, sheet number and revision information shall be provided with each drawing submittal.
3. Symbols Listing – An updated drawing showing each circuit symbol and track symbol used on the circuit plans and other Contract Drawings, along with the meaning of each symbol, shall be provided with each drawing submittal.
4. A complete systemwide track and cable plan shall be submitted showing the location of all station platforms, track switches, switch machines, switch locks, switch circuit controllers, switch heaters, track circuit feed points, track circuit relay points, signals, TWC loops, signal cases, and interconnecting cables. This plan shall be to scale and show survey stationing. This plan shall be submitted to the Project Manager prior to the preparation of any circuit plans or software, and prior to ordering of any cable or other material.
5. Prior to the preparation of any final circuit plans, the Contractor shall submit to the Project Manager for Approval, a typical set of circuit plans for a typical interlocking. The Project Manager will review these sets of typical circuit plans for consistency with their current practices in terms of circuit nomenclature, drawing and circuit presentation, and circuit design principles and practices. The Contractor shall schedule and hold design review meetings at which time the principles depicted in the typical circuit plans shall be discussed and brought into compliance with the Agency design standards.
6. Prior to the preparation of any final application software the Contractor shall submit a sample program to the Project Manager for Approval for a typical interlocking. The Project Manager will review these programs in order to set up a standard format for all application programs. The intent is that all application programs have the same general format. The Contractor shall schedule and hold design review meetings at which time the principles depicted in the typical application programs shall be discussed and brought into compliance with the Agency design standards.
7. Apparatus Tabulations – A drawing containing an updated listing of each component used in the system shall be submitted with each drawing submittal. The apparatus tabulation shall contain each component's:
 - a. Reference number
 - b. Name
 - c. Contact configuration
 - d. Description
 - e. Manufacturer's name, address and component order number
 - f. Base or plug coupler manufacturer and component order number
 - g. Functional use or purpose in the system

8. Circuit Plans – Complete systemwide circuit plans shall be prepared by the Contractor and submitted to the Project Manager showing all signals, switch machines, switch locks, switch circuit controllers, switch heaters, termination points, relay coils and contacts, controls, signal equipment and energy busses with all interconnections. Spare contacts and contact usage shall be shown on a separate page of the circuit plans. Circuit plans shall be submitted to the Project Manager prior to any installation work or factory wiring of cases. These plans, combined with the application software, shall be the controlling documents of the design and shall be under the control of one design entity within the Contractor's organization. It shall be Contractor's responsibility to determine by means of a re-check of the completed system circuit plans and application software that these plans provide the safety and operation required by the Contract. The Contractor shall further be required to modify these plans and programs as required due to design changes such that the Agency receives a completely accurate set of plans when the job is complete.
9. Application Programs – Application programs shall be submitted to the Project Manager prior to any installation work or factory wiring of cases.
10. Software Document Control Procedure – The Contractor shall design and implement an application software control procedure. This procedure shall be designed to ensure that from the time the factory testing is complete through the time in-service testing is complete (cutover) strict control of the version of application software for each location is maintained. This control procedure shall be submitted to the Project Manager for Approval. This procedure shall be approved and in force prior to any locations being shipped to the Project. Violation of the provisions of the software control procedures shall be, at the discretion of the Project Manager, grounds to require complete re-testing of all affected locations.
11. Relay Equivalent Circuits – All application software shall be converted, by an automatic process, into relay equivalent circuits. The intent is that the application logic will be depicted using standard relay symbols such that an experienced signal person with no knowledge of ladder logic or Boolean algebra will be able to interpret the programs. A sample of the equivalent circuits shall be submitted to the Project Manager prior to writing any application programs. The relay equivalent circuits shall be included in the book of plans for each location.
12. Physical Layout Drawings – Drawings showing the physical arrangement of all wayside equipment including, but not limited to signals and cases. Also submit layouts for equipment within the relay case. In addition, physical layout drawings of all signals, local control panels, and track switches shall be submitted, prior to the manufacture of any of these items. These drawings shall be drawn to scale and contain a parts list of all items to be furnished by the Contractor. The Contractor may incorporate this information as a part of the circuit plans for each case. These drawings shall be submitted to the Project Manager for Approval.
13. Installation Drawings – Installation drawings shall be prepared for each major piece of signal equipment to be installed such as junction boxes, signals, relay racks, and signal cases, etc. These drawings shall be to scale and contain a parts listing. These drawings shall be submitted to the Project Manager prior to the start of any field installation work.
14. Test Program Plan – A test program plan shall be submitted to and Approved by the Project Manager as required by SECTION 34 42 76 – Signals Tests and Inspections.

15. Test Reports – A test report, for each test conducted pursuant to this Contract, shall be submitted to and Approved by the Project Manager prior to tendering the system for Street Car Completion. Each test report shall include a copy of the Project Manager Approved test procedure, copies of all test data sheets and shall bear the signature of the Contractor's Engineer/Inspector conducting the test.

3.3 PERCENTAGE SUBMITTALS

- A. Some of the submittals, as detailed below, shall be made on a percentage basis. The intent of this is to secure an early review of basic design concepts to avoid rework and schedule delays. The items to be included in each submittal at each percentage level are intended to be a guideline only. At all levels, the more details relating to the design that the Contractor can submit, the better.
 1. Application Software
 - a. 50% level – The basic elements to be reviewed at this level are the basic design concepts. At this level the program shall have enough details so that it is possible to determine how the signal system will operate. Elements to be reviewed include:
 - 1) Signal Control
 - 2) Switch Control
 - 3) Vital Logic
 - 4) Non-Vital Logic
 2. 90% level – At this level the program shall be essentially complete and ready for factory testing. The only items that are yet to be determined are “last minute” things such as timer settings, etc.
 3. Circuit Plans
 - a. 50% level – The basic element to be reviewed at this level is the operation of the location for which the circuits being reviewed have been prepared. The circuits, both vital and non-vital, shall have sufficient detail so that it is possible to determine all the details of how the associated location will function when it is placed in service. All hardware items to be used in the final design shall appear on the circuit plans at this level.
 - b. 90% level – At this level the location is essentially ready to be sent to the factory for wiring. All details relating to pin assignments, contact fanning, rack position, cable numbers, fuse and wire sizes, terminal numbers, etc. shall be included in the circuit plans to be reviewed.
 4. Physical Layout of Relay Cases
 - a. 90% level – At this level the case is essentially ready for manufacture. Elements to be reviewed at this level include but are not limited to:
 - 1) Details of the case layout. This includes where each piece of equipment is located in the rack, details of mounting, etc.
 - 2) Organization and layout of the entrance rack
 - 3) Details relating to the Local Control Panel
 - 4) Grounding details

- 5) Layouts of all terminal boards and power distribution
- 6) Power buss organization

3.4 SIGNAL EQUIPMENT REQUIRING APPROVAL

A. Signal equipment to be submitted by the Contractor to the Project Manager shall include, but not be limited to, the items listed below. For each item listed below, the Contractor shall submit a catalog-cut sheet and equipment service manual. The Project Manager reserves the right to request additional drawings or documents as required, to clarify and amplify the intent of the information submitted.

1. Batteries
2. Battery chargers
3. Circuit Breakers
4. Conduit
5. Exothermic welding kits
6. Fuses
7. Power Transfer switches
8. Junction boxes
9. Lightning arrestors
10. Local control panels
11. Non-vital relays
12. Padlocks
13. Power frequency track circuits
14. Power supplies
15. Signal cases
16. Signal case foundations
17. Signals
18. Spare parts
19. Special tools
20. Switch circuit controllers
21. Switch Heaters
22. Switch machines
23. Tags for wire, cable, rack, equipment, etc
24. Terminals and terminal strips
25. Transformers

26. TWC Interrogators
27. Vital and non-vital processors
28. Vital and non-vital relays
29. Wire and Cable

3.5 DRAWINGS AND DETAIL DESIGN EVALUATION DATA

- A. In support of the detail design reviews, provide five full-size prints of sufficient quality to make legible prints of those engineering drawings and documents that provide all essential data necessary to permit a meaningful evaluation and feasibility study of the proposed detail design. All drawings shall be dimensioned in English units. All text shall be in the English language.
- B. In addition to the other drawing requirements specified in these Specifications, five full-size prints of sufficient quality to make legible prints of the following shall be submitted for the Agency's Approval :
 1. Installation drawings for each type of field equipment.
 2. Outline drawings of all major equipment components showing:
 - a. Overall dimensions, orientation, points of normal support and method of mounting and removal
 - b. Location of access doors and covers showing the relation to equipment inside the enclosure
 - c. Required draw-out space and space for opening of access doors
 - d. This information may be included as a part of the physical layout of the relay cases.
- C. Manufacturing Drawings
 1. Throughout the engineering and manufacturing process, submit a continually updated list of manufacturing interconnect and assembly drawings and engineering change orders. Detail drawings shall be submitted at the Agency's request. Within 15 calendar days of their release or revision, five full-size prints of sufficient quality to make legible prints of manufacturing drawings shall be submitted to the Agency.
 2. Prior to completion of the Contract, the Contractor shall submit to the Agency a complete set of final (as-built) manufacturing drawings with all changes incorporated thereon. Two reproducible and five copies of the above drawings shall be submitted.
- D. Drawing Quality and Updating
 1. Drawings shall be of a quality where every line, number, letter and symbol is clearly legible. Reproducible drawings shall be capable of reproducing drawings to this quality level. The Contractor shall update each drawing, incorporating all outstanding approved changes, at least once every 60 days. In no event shall more than five approved changes be accumulated against a drawing without incorporation, irrespective of its scheduled update. Changes to drawings shall be incorporated sequentially. Copies of all updated drawings which were submitted to the Agency in an earlier revision shall be resubmitted in the original quantity and format.

- E. Calculations
 - 1. Furnish calculations and other required data on standard 8-1/2 by 11 inch sheets, printed on one side only. Each sheet shall bear the following: contract name and number; title and number of pages; data and revision status. The calculations shall include those for power, racks, relays, wire sizes and voltage drops, and all other required calculations.
- F. Drawing Approvals
 - 1. If Approved by the Project Manager, a reproducible copy of each drawing will be identified as having received such Approval by being so stamped and dated. Drawings stamped "not Approved" or "Approved subject to" and with required corrections shown will be returned to the Contractor for correction and resubmittal. Resubmittals will be handled in the same manner as first submittals.

3.6 CONFIGURATION MANAGEMENT PROGRAM

- A. Maintain and make available to the Agency accurate and current configuration records throughout the performance of the Contract and for a 3-year period after final Contract payment.
- B. Do not procure nor produce any hardware or software until such items have been Approved by the Agency.
- C. All items, beginning with the lowest level of repair or replacement, identified by the same part number shall have the same physical and functional characteristics, be equivalent in performance and durability, and be interchangeable without alteration to themselves or associated items, other than normal field adjustments. An item shall not be considered interchangeable if it requires modification for fit or performance. Old and new configuration items that require segregation shall be identified either by a new drawing number or a dash number added to the original drawing.
- D. Hardware Identification
 - 1. Mark all hardware components to the lowest level of repair and replacement with part number identification. The hardware identification marking shall coincide with the officially released engineering data. Nameplates on major equipment items will provide space for the Agency numbers to be added by the Contractor at the direction of the Agency. Serialization is required on each item of equipment delivered unless otherwise directed by the Agency. Assign an individual serial number in a numerical sequence established for the type or model series equipment being supplied. Do not use duplicate serial numbers within a type or model series. Serial numbers shall not exceed ten digits in length.
- E. Accountability
 - 1. Maintain records such that the configuration of any items being delivered shall be definable in terms of its component part numbers. Account for differences between the as-built configuration and the engineering released documentation. Record status of change approvals and incorporation at each point in product development, test, production or operational usage. Maintain a serialization and configuration record. Maintain the status of interface specifications, control documents and plans. Maintain status of software once a baseline has been defined.

3.7 AS-BUILT DRAWINGS, SOFTWARE, AND DOCUMENTATION

- A. As-Built or Final Design Documents shall be submitted to and Approved by the Project Manager prior to tendering the system to the Project Manager for Street Car Completion. These drawings and documents shall include the latest revision of all previously submitted drawings and documents and shall show the final system configuration as tendered for Street Car Completion. All of the final drawings and documents submitted to the Project Manager shall bear the seal of a Professional Engineer (P.E.) registered in the State of Missouri. All cable plans, apparatus tabulations, drawings, indexes, circuit plans, trenching plans, and case layout drawings, installation plans, TWC interrogator plans, equipment layout drawings, equipment schematic diagrams, block diagrams and all other drawings produced specifically for the Project shall be submitted per the Agency's latest revision of General Drafting and Design Standards for AutoCAD and Microstation.
1. The as-built drawings shall include a document and drawing list. This list shall contain all documents and drawings submitted.
- B. As-built or final application software shall be submitted to the Project Manager prior to tendering the system for Street Car Completion. This final application logic shall include all of the changes previously made and tested. The application logic shall also include final as-built versions of the relay equivalent circuits. The application logic shall be submitted in the following format.
1. The application logic and associated relay equivalent circuits for each wayside location shall be printed out on standard 8 1/2-inch by 11-inch paper. These printouts shall be placed in a standard three ring binder of the appropriate size. Each binder shall be labeled according to the location contained in the binder. These binders shall be placed in each relay case along with the required location circuit plans and route and aspect plans.

PART 4 - MEASUREMENT AND PAYMENT

4.1 MEASUREMENT

- A. The quantities of accepted work will be measured in the following units. All measurements will be plan measure except for authorized changes.
1. Description: Lump Sum

4.2 PAYMENT

- A. Payment will be made at the respective unit or lump-sum price listed in the proposal and shall be full compensation for all labor, materials, and equipment necessary to complete the respective unit in place. There will be no separate measurement or payment for any item of work not specifically identified and listed in the proposal, and all such work shall be considered a subsidiary item with all costs pertaining thereto included in the prices for other items listed in the proposal. At the Engineer's option, partial payment may be made for any lump sum item listed in the proposal, providing that the Contractor is diligently and satisfactorily pursuing full completion of such partially complete item in accordance with the approved job progress schedule.

END OF SECTION

SECTION 34 42 11**SIGNALS GENERAL INSTALLATION REQUIREMENTS****PART 1 - GENERAL****1.1 SUMMARY**

- A. This Section details the general requirements and responsibilities the Contractor shall adhere to when installing the various pieces of signal equipment.

1.2 RELATED SECTIONS

- A. SECTION 01 43 00 – Systems Quality Assurance
- B. SECTION 26 05 33.13 – Systemwide Electrical Raceways for Systems
- C. SECTION 26 05 43 – Systemwide Electrical Underground Ductbanks for Systems
- D. SECTION 34 42 16 – Signals Wire and Cable
- E. SECTION 34 42 33 – Signals Prefabricated Relay Cases
- F. SECTION 34 42 44 – Signals Power Distribution

1.3 SUBMITTALS

Not Used

1.4 QUALITY ASSURANCE

- A. The Contractor shall comply with the requirements of Division 1.

PART 2 - PRODUCTS

Not Used

PART 3 - EXECUTION**3.1 GENERAL**

- A. The Contractor shall provide an extension of incoming power services at all relay cases as specified in SECTION 34 42 44 – Signals Power Distribution.
- B. The Contractor shall provide the grounding system as specified in SECTION 34 42 33 – Signals Prefabricated Relay Cases and SECTION 34 42 44 – Signals Power Distribution.
- C. The Contractor shall cover all holes, trenches and excavations when they are not attended. Dimension lumber, planking and plywood shall be employed. Tape or other barrier shall not be acceptable for protection.
- D. The Contractor shall maintain clean ballast at all times. The Contractor shall correct all ballast contamination due to his work as part of this Contract.
- E. The material used for Thermite exothermic welding shall consist of a copper mixture and shall cause the rail joint bond connection to be fused to the rail in a solid homogenous mass. The resistance of 24 inches of conductor containing a welding connection shall not exceed the resistance of 30 inches of plain conductor.

F. General Bonding Requirements

1. The Contractor shall furnish and install two "C" type power bonds, as specified in SECTION 34 42 16 – Signals Wire And Cable, across all non-insulated rail joints on rails carrying traction power negative return current. The rail joint bonds shall be Thermite exothermically welded to the non-gauge side of the railhead within the limits of the rail joint bar.
2. The Contractor shall furnish and install two 250 MCM cables, as specified in SECTION 34 42 16 – Signals Wire And Cable where required for negative return rail transpositions. The cables shall be Thermite exothermically welded to the neutral axis of the rail.
3. The Contractor shall furnish and install all signal and power bonds necessary to meet the functional requirements of the Contract. This shall include but not be limited to traction power bonds, special track work bonding, etc.
4. All exposed cable and exothermic bonds shall be coated with an anti-oxidation coating. All bonding wires or cable not installed in conduit, other than the "C" type, shall be secured to the ties. All wire and cable installed between the rails shall be routed and secured in a manner that provides the maximum protection from dragging equipment and track maintenance equipment.

G. Signal Rail Bonds

1. Track circuit connections to the rail for power frequency track circuits shall be made with a piece of bond strand wire as specified in SECTION 34 42 16 – Signals Wire And Cable, which is manufactured for this specific application. The bond strand shall be cut to length and Thermite exothermically welded to the neutral axis of the rail. The bond strand between the stub-up and the rails shall be of sufficient length to permit a short service loop to be included in the run.
2. Signal rail transpositions, where required for power frequency track circuits, shall be made with two lengths of bond strand wire as specified, and Thermite exothermically welded to the neutral axis of the rail.
3. Negative return rail transpositions, where required for single rail power frequency track circuits, shall be made with two lengths of 250 MCM cable and Thermite exothermically welded to the neutral axis of the rail.

H. The Contractor shall ground junction boxes, relay cases and signal heads. Track switch machines shall be isolated from ground.

I. Unless otherwise specified, all hangers, brackets, clamps, bolts, nuts or washers shall be hot-dip galvanized. The zinc coating shall be of commercially pure zinc and shall be continuous and thorough with at least 2 ounces of zinc per square foot of galvanized surface. The plating shall not scale, blister or be removable by any process of handling during installation. All material shall be cut, formed or drilled prior to plating. All lock washers, bolts, nuts and washers used within enclosures shall be cadmium plated. The cadmium plating shall be an impervious, dense, hard, fine-grained, continuous, closely adhering coating of commercially pure cadmium. The plating shall completely cover the surface of the part with a minimum thickness of 0.0006 inches in a smooth, bright layer.

J. The Contractor shall not mount equipment on a station platform unless Approved by the Project Manager.

K. The Contractor shall perform all painting prior to installation. Any painted areas damaged during shipment or installation shall be repainted with matching colors.

- L. Where the emergency guardrail interferes with the installation of wayside signal equipment, the Contractor shall cut or notch the guardrail in a manner Approved by the Project Manager.
- M. The Contractor shall use pre-cast concrete bases or pedestals wherever signal equipment foundations are required.
- N. The Contractor shall excavate for the installation of signal and relay case foundations. When excavating, the Contractor shall
 - 1. Use a protective covering over track ballast to prevent contamination during excavation and backfill operations. Remove contaminated ballast and restore the ballast to original condition including tamping, sweeping, etc.
 - 2. Excavate to a depth of between 18 and 36 inches as directed by the Project Manager. Prior to the installation of a foundation, place a 6-inch minimum layer of 1 1/2 inch maximum washed gravel in the bottom of the hole and thoroughly tamp.
 - 3. Remove soft or unsuitable material existing below the required subgrade and replace with compacted gravel. Remove rock or boulders below the subgrade to a minimum depth of 1 foot below the bottom of the foundation.
- O. The Contractor shall provide service loops in all wire terminations.
- P. Signal Installation – The Contractor shall install all signals in accordance with
 - 1. Detailed signal equipment manufacturing/layout drawings submitted to the Project Manager.
 - 2. Detailed signal installation drawings prepared by the Contractor and submitted to the Project Manager for Approval. These drawings need not duplicate information previously submitted to the Project Manager as signal manufacturing/layout drawings. These installation drawings shall be to scale, show major dimensions, and contain a parts list with catalog references. These drawings shall include installation methods and procedures for all wayside signals.
 - 3. Signals shall be located in relation to insulated joints, track circuit boundaries, TWC loops, etc. as shown on the Contract Drawings.
 - 4. All openings in signal light units shall be suitably plugged or capped for protection during shipment.
- Q. Signal Mounting Arrangements and Foundations
 - 1. Wayside signals shall be mounted on the nearest appropriate OCS pole, traffic pole or individual signal pole.
 - 2. Each color light signal shall generally be on the right hand side of the tracks when viewed by a train traveling in the normal direction depending on streetscape and vehicular traffic. The locations of the signals are shown on the Contract Drawings.
 - 3. The Contractor shall manufacture and install all signal assemblies so that all parts clear the light rail car Dynamic Outline by 6 inches or more, as shown on the Contract Drawings
- R. Wiring
 - 1. Wires and cables to all signals shall be terminated on terminal blocks in accordance with AREMA (AAR) Communications and Signals Manual Part 14.1.8 (Recommended Design Criteria for Molded Terminal Block, Details & Assemblies).

2. Wires and cables to color light signals be run through underground conduit ductbanks, conforming to SECTION 26 05 43 – Systemwide Electrical Underground Ductbanks For Systems and SECTION 34 42 16 – Signals Wire And Cable, to AREMA (AAR) terminals in the junction box bases of each signal.
3. Cables inside manholes shall run on racks. Racks shall be fiberglass or have porcelain or fiberglass cable-support insulators made for that purpose. Metal parts shall be bonded to the manhole ground rod.
4. Supporting racks shall have a maximum spacing of 3 feet and shall be installed to avoid excessive weight or pressures on the cable insulation. Racks shall also prevent cable damage from short circuit forces. Cables shall be arranged in not more than two layers and secured with cable ties or straps

S. Painting

1. All paint and painting procedures shall be in accordance with applicable requirements given in the AREMA Communications and Signals Manual Part 1.5.10 (Recommended Instructions for Painting and Protective Coatings), except as otherwise specified, or as Approved by the Agency.
2. The Contractor shall prime and paint the inside and outside of all signal equipment installed, as required, to touch-up any nicks, scratches, dents, and other surface defects caused during manufacturing, shipping, installation or testing.

PART 4 - MEASUREMENT AND PAYMENT

4.1 MEASUREMENT

- A. The quantities of accepted work will be measured in the following units. All measurements will be plan measure except for authorized changes.
 1. Description: Lump Sum

4.2 PAYMENT

- A. Payment will be made at the respective unit or lump-sum price listed in the proposal and shall be full compensation for all labor, materials, and equipment necessary to complete the respective unit in place. There will be no separate measurement or payment for any item of work not specifically identified and listed in the proposal, and all such work shall be considered a subsidiary item with all costs pertaining thereto included in the prices for other items listed in the proposal. At the Engineer's option, partial payment may be made for any lump sum item listed in the proposal, providing that the Contractor is diligently and satisfactorily pursuing full completion of such partially complete item in accordance with the approved job progress schedule.

END OF SECTION

SECTION 34 42 16

SIGNALS WIRE AND CABLE

PART 1 - GENERAL

1.1 SUMMARY

- A. This Section includes Specifications for furnishing and installing wire and cable for the signal system. The intent of the Specification is that all cables supplied for this Project shall meet all AREMA standards.

1.2 RELATED SECTIONS

- A. SECTION 01 33 00 – Submittal Procedures
- B. SECTION 01 43 00 – Systems Quality Assurance
- C. SECTION 34 42 10 – Signals General Engineering and Design Requirements

1.3 QUALITY ASSURANCE

- A. The Contractor shall comply with the requirements of Division 1.
- B. Manufacturer Qualifications
 - 1. The manufacturer shall have at least 15 years of documented reliable experience in supplying vital-circuit signal cables of the type specified by this Contract with a minimum of 2,000,000 cable feet installed in the railroad or transit industry.
 - 2. The material and workmanship of the wire and cable shall be of the highest quality, assuring durability for the 40 year design life of the cable installation.
 - 3. The Contractor shall submit a list from the cable manufacturer, of the names of the railroads or transit agencies where the manufacturer's cables specified by this Contract have been installed.

1.4 SUBMITTALS

- A. Unless otherwise specified, all submittals by the Contractor shall be in accordance with SECTION 01 33 00 – Submittal Procedures and SECTION 34 42 10 – Signals General Engineering And Design Requirements.
 - 1. Drawings
 - a. Shop drawings and manufacturer's literature showing details of fabrication and technical data shall be submitted for each type of cable to be furnished. These documents shall be in the English language.
 - b. Working drawings showing specialized requirements for installation and termination shall be submitted.
 - c. Cable plans as detailed in SECTION 34 42 10 – Signals General Engineering And Design Requirements showing the locations and functions of all cables to be installed shall be submitted. These plans shall be included in the book of plans for each location.
 - 2. Wire and Cable Installation Plan

3. Test reports shall be submitted for all tests including:
 - a. Factory tests as specified herein on each completed length of cable
 - b. Appropriate factory test data on file for each similar type and size cable for each step in the manufacturing process and tests performed on samples in compliance with the referenced standards
 - c. Field tests after installation
 - d. Actual pulling tension measurements for each pull.
4. A 3-inch sample of each type of cable to be supplied shall be submitted
5. Delivery inspection report for all incoming material

1.5 DELIVERY, STORAGE AND HANDLING

- A. Each length of cable shall be wound on a separate reel. Reels shall be substantial enough to withstand reasonable handling and shall be so designed that the inner end of the cable shall be accessible but protected from injury. The diameter of the drum shall be at least 14 times the cable diameter to prevent damage to the cable during reeling. The arbor hole shall admit a spindle 2.5 inches in diameter without binding. The reels shall be designated and constructed as non-returnable when drum size and cable weight and volume permit.
- B. The Contractor shall inspect cables at time of delivery to the construction site to assure that no damage was done in shipping and that the specified cable was received. Every reel shall be inspected by the Contractor for physical damage such as nails driven into reels to secure shipping blocks, lagging or reel covering missing and cable and seals missing or damaged and a report shall be completed verifying that the reel was inspected and no damage was found. A copy of these inspection reports shall be submitted to the Project Manager. All damaged or rejected cable shall be replaced promptly by the Contractor at no cost to the Agency.
- C. Wires and cables shall be stored at the construction site on solid surfaces which shall adequately support the cable reels and shall be well drained and not allow accumulation of liquids, oils, or chemicals.
- D. The cable reels shall be aligned and protection provided so as not to allow the reel flanges to damage other reels. Adequate aisles and barricades shall provide accessibility but prevent construction equipment from damaging the cable reels.
- E. The Contractor shall pack and mark wire and cable in accordance with AREMA Signal Manual Part 10.3 (Wire and Cable), except as otherwise specified, or as Approved by the Agency.
- F. The Contractor shall ship, store, and handle material as specified in AREMA Signal Manual Part 10.4.1 (Recommended Instructions for Wire and Cable Installation and Maintenance), except as otherwise specified, or as Approved by the Agency.
- G. Cable reels shall be properly handled, i.e., by using a sling and spreader attached to a shaft through the reel hubs, or by cradling both flanges between lift truck forks. The reels shall not be lifted by the top reel flange or dropped from any height. Truck forks shall not touch cable surfaces on the reel. Reels shall always be rolled in the direction opposite the cable wind on the reel. Reels shall not be laid flat.
- H. Contractor shall seal both cable ends to prevent entrance of moisture during storage and handling prior to final cable termination.

PART 2 - PRODUCTS**2.1 SIGNAL WIRE AND CABLE****A. General**

1. The Contractor shall supply cable with insulating and jacketing materials capable of a 40-year average service life.
2. The Contractor shall supply cable suitable for installation at -20 degrees Celsius.
3. The capacitance of cables supplied by the Contractor shall be within the limits prescribed by the manufacturer of the equipment to which the cable is connected.
4. Cables may be manufactured as "composite" type where conductors of more than 1-gauge are wrapped in one overall jacket. If the Contractor opts to use this type of cable he will construct cables that comply with the Agency's standard configuration of conductors

B. Minimum voltage rating for both AC and DC

1. All cables shall be rated for 600 Volts minimum.
2. Power frequency track circuit cables shall be rated for 2000 Volts minimum.
3. Power bonds, crossbonds, and bond strand cable shall be rated for 2000 Volts minimum.

C. Conductors supplied by the Contractor shall be:

1. Sized to ensure operation of equipment based on the equipment loads and operating parameters for the systems in accordance with NEC and shall comply with AREMA Communications and Signals Manual Part 10.3.15 (Recommended Design Criteria for Insulated Signal Wire), except as otherwise specified, or as Approved by the Project Manager.
2. Case wire shall be used when the wire is located completely within a weather-protected housing. This wire shall be insulated with Ethylene Tetrafluoroethylene (ETFE) Fluorocarbon resin and shall comply with AREMA Communications and Signals Manual Part 10.3.14 (Recommended Design Criteria for Ethylene Tetrafluoroethylene Copolymer (ETFE) Insulated Signal Wire and Cable), except as otherwise specified, or as Approved by the Project Manager.
3. Coated conductors of annealed copper wire in accordance with ASTM B 33; Class C and Class D stranded conductors conforming to ASTM B 8 paragraph 1.2.4, Table 1 and Table 2; and Class G and Class H stranded conductors conforming to ASTM B173 paragraph 3.1.1, paragraph 3.1.2 and Table 1 as follows:
 - a. Equipment module, signal and instrumentation non-vital external wiring: No. 20 AWG minimum, Class C.
 - b. Power frequency track circuits: No. 6 AWG minimum, Class C.
 - c. Track switch machine operation and switch heater power: No. 6 AWG minimum, Class C.
 - d. Track switch machine control and indication: No. 14 AWG minimum, Class C.
 - e. Wayside signal circuits: No. 10 AWG minimum, Class D.

- f. Power bonds: C type, 250 MCM, Class G, bare.
 - g. Bond strand wire: No. 6 AWG minimum, Class H, for track circuit connections, and similar uses.
 - h. Signal bonds: C type, cadmium bronze, ASTM B 105, Alloy 80, bare stranded rope lay with one center rope of 19 wires surrounded by six ropes of 19 wires each, using wires of 0.125-inch with nominal cable diameter of 0.1875 inches.
 - i. All vital and other circuits: No. 16 AWG minimum, Class C.
- D. Exterior Cables
- 1. Except where interior type cable is specifically permitted, the Contractor shall use exterior cable for all circuits operating at or above 120 Volts AC/DC; for all power, signal, control, and instrumentation circuits installed along the wayside.
 - 2. Shall be certified for continuous operation at 90 degrees Celsius wet or dry
 - 3. Insulation
 - a. Single conductor cables and individual conductors of multiple conductor cables shall be insulated with a tight-fitting, clean-stripping, ozone-resistant ethylene-propylene rubber or other synthetic rubber vulcanized elastomer Approved by the Project Manager. Final insulation mixture shall be passed through an 80-mesh screen to ensure homogeneity.
 - b. The insulation shall not crack during installation at temperatures as low as -20 degrees Fahrenheit.
 - c. The average thickness of insulation shall not be less than that specified below. Minimum thickness at any point shall not be less than 90% of that specified. AC test voltages listed are at 60 Hz applied for 5 minutes, and DC test voltages are applied for 10 minutes. These cable tests shall comply with AREMA Communications and Signals Manual Part 10.3.19 (Recommended Design Criteria for Ethylene-Propylene Rubber Insulation for Wire and Cable), except as otherwise specified, or as Approved by the Project Manager.
 - 1) Insulation thickness and test voltages of single conductor cable prior to jacket application for circuits rated up to 2000 Volts shall be as shown in Table 1 of this Section.
 - 2) Insulation thickness and test voltages for individual conductors of multiple conductor cables on circuits rated up to 2000 Volts shall be as shown in Table 1.1 of this Section.
 - d. Physical and electrical characteristics shall conform to Table 6 of this Section when tested in accordance with NEMA WC 70/ICEA S-95-658 Section 6, as modified herein.
 - 4. Outer Jackets
 - a. Single conductor cables and multiple conductor cables shall be provided with outer jacket of applicable material as follows:

- 1) Cable jackets shall be of extruded black low density, high molecular weight Chlorosulfonated Polyethylene (HYPALON) and shall comply with AREMA Communications and Signals Manual Part 10.3.20 (Recommended Design Criteria for Neoprene, Chlorinated Polyethylene and Chlorosulfonated Polyethylene Jacketing for Wire and Cable), except as otherwise specified, or as Approved by the Agency. Physical and electrical characteristics conforming to Type 1, Class C, Grade E5 of ASTM D 1248 and Table 8 of this Section when tested in accordance with NEMA WC 70/ICEA S-95-658 Section 6.
- 2) Average jacket thickness on all cables shall be 65 mils minimum, and the average jacket thickness for the outer jacket on multiple conductor cables shall be in accordance with Table 2 of this Section. The minimum jacket thickness at any point shall not be less than 90% of that specified.

E. Interior Cables

1. Interior cables shall be used only for wiring inside cases. Wires running between two adjacent above ground piped connected relay cases will be considered interior cables.
2. Interior cables shall be certified for continuous operation at 90 degrees Celsius in wet or dry locations.
3. Interior cable insulation shall comply with the following:
 - a. Single conductor cables and individual conductors of multiple conductor cables shall be insulated with a tight-fitting, clean-stripping, ozone-resistant ethylene-propylene rubber or other synthetic rubber vulcanized elastomer Approved by the Project Manager. Final insulation mixture shall be passed through an 80-mesh screen to ensure homogeneity.
 - b. Average thickness of insulation shall not be less than that specified below. Minimum thickness at any point shall not be less than 90% of that specified.
 - c. Insulating thickness and test voltages of single conductor prior to jacket application, and individual conductors of multiple conductor cables for circuits rated up to 1000 Volts shall be as shown in Table 1.2 of this Section.
 - d. Physical and electrical characteristics shall be tested in accordance with NEMA WC 70/ICEA S-95-658 Section 6, as modified herein.
4. Outer Jackets
 - a. Jackets shall be of extruded black low density, high molecular weight Chlorosulfonated Polyethylene (HYPALON) material and shall be provided for:
 - 1) Single conductor cables
 - 2) Outer jacket of multiple conductor cables
 - b. Average jacket thickness on single conductor cables shall be 15 mils minimum.

- c. Average jacket thickness for outer or overall jacket on multiple conductor cables shall be 45 mils minimum.
 - d. The minimum jacket thickness at any point shall not be less than 90% of that specified.
- F. Assembly of Multiple Conductor Cables
- 1. Exterior multiple conductor cables
 - a. Shall be assembled in accordance with AREMA Communications and Signals Manual Part 10.3.16 (Recommended Design Criteria for Signal Cable, Non-Armored), paragraph F, and the jacket shall be as specified in paragraph G except as otherwise specified, or as Approved by the Project Manager.
 - 1) Cables shall also have a shock absorbing layer of non-hygroscopic extruded elastomeric material over the assembled conductors and fillers. The thickness shall be as shown in Table 3 of this Section.
 - 2) A pull cord shall be included beneath the cushion layer to provide for removal of the cushion layer for terminating the cable.
 - 3) Exterior type cables including single pair twisted cable shall be provided with a 10 mil minimum bronze tape beneath the outer jacket for rodent and other environmental protection in accordance AREMA Communications and Signals Manual Part 10.3.17 (Recommended Design Criteria for Signal Cable, Armored), paragraph F, except as otherwise specified, or as Approved by the Project Manager.
 - 4) Shall be equipped with additional shielding of metal tape or metal braid appropriate for installation and service conditions, and in accordance AREMA Communications and Signals Manual Part 10.3.17 (Recommended Design Criteria for Signal Cable, Armored), paragraph F, except as otherwise specified, or as Approved by the Project Manager.
 - 2. Two conductor twisted pair cable, and multiple twisted pair cables shall be assembled as specified above for multiple conductor cables.
 - 3. Interior multiple conductor cables shall be assembled in accordance with AREMA Communications and Signals Manual Part 10.3.16 (Recommended Design Criteria for Signal Cable, Non-Armored), paragraph F, and the jacket shall be as specified in paragraph G except as otherwise specified, or as Approved by the Project Manager.
- G. Conductor Identification
- 1. For twisted pair, insulation shall be identified as white on one conductor and black on the other conductor.
 - 2. Except as otherwise specified, each insulated conductor within multiple conductor cables shall be identified with a specific number or shall have a different color or tracer color combination. Color code of multiple conductor control cables shall conform to AREMA Communications and Signals Manual Part 10.3.14 (Recommended Design Criteria for Ethylene Tetrafluorethylene Copolymer (ETFE) Insulated Signal Wire and Cable) Table 10314-5: Color Code of Individual Wires of Multi Conductor Cables.

- H. The Contractor shall ensure that the cables are permanently identified as to manufacturer, year of manufacture, insulation type, conductor size, and voltage rating at intervals of not greater than 3 feet with non-hygroscopic marker tape under the jacket and parallel to the longitudinal axis of the cable and subject to approval by the Project Manager.

2.2 POWER CABLE

- A. The power cables for signal system and instrument housings shall be sized to carry the design loads and fault currents without exceeding the allowable cable temperatures. The cables shall be stranded copper conductors of minimum size #6 AWG (minimum 3C#6) and the conductors shall be ethylene-propylene rubber insulated in accordance with NEMA WC 70/ICEA S-95-658 and ASTM D 2802. The insulation level shall be consistent with the system nominal voltage. The cables shall be furnished with jackets of heavy duty extruded black low density, high molecular weight Chlorosulfonated Polyethylene (HYPALON) in accordance with ASTM D 752.

PART 3 - EXECUTION

3.1 INSTALLATION

- A. The Contractor shall verify that the installation design is correct and adequate for the cables to be installed. The Contractor shall assure that conduit size, conduit fill, conduit bend radii, manhole spacing, manhole size, raceways, ducts and associated hardware are proper for the intended installation.
- B. The Contractor shall install wires and cables in accordance with cable handling and pulling practice as defined by AREMA Communications and Signals Manual Part 10.4.1 (Recommended Instructions for Wire and Cable Installation and Maintenance), and the cable manufacturers' recommendations.
- C. The Contractor shall utilize only installers who are qualified and experienced in handling and installing underground cable in conduit. Experienced supervision shall be provided to ensure that all necessary precautions are taken and that the installation is in accordance with the requirements of this Section.
- D. The Contractor shall not exceed the minimum bending radius as permitted by NEMA WC 70/ICEA S-95-658 Appendix F or cable manufacturer. Cables shall not be subjected to tensions more than the manufacturer's recommendation.
- E. Direct buried cable should be avoided, but if required and Approved by the Project Manager, it shall be installed at a minimum depth of at least 30 inches or as required by local codes. The Contractor shall prevent cable from coming into contact with sharp objects, and damage to cable insulation during installation. Notify the Agency 24 hours prior to cable installation.
- F. Except as provided for in 3.1 E, all cable shall be installed in conduit.
- G. The Contractor shall verify that the raceway conduit system is free of obstructions by pulling a suitable wire brush, swab and mandrel through it to remove extraneous matter.
- H. The Contractor shall ensure that the raceway conduit system is dry before installation of cable and use lubricant approved by the cable manufacturer to facilitate pulling cable. The Contractor shall clean residue from conductors, boxes and equipment after the pull is made.
- I. Cables inside manholes shall run on racks. Racks shall be fiberglass or have porcelain or fiberglass cable-support insulators made for that purpose. Metal parts shall be bonded to the manhole ground rod.

- J. Supporting racks shall have a maximum spacing of 3 feet and be installed to avoid excessive weight or pressures on the cable insulation. Racks shall also prevent cable damage from short circuit forces. Cables shall be arranged in not more than two layers and secured with cable ties or straps.
- K. The Contractor shall submit to the Project Manager a Wire and Cable Installation Plan. This plan shall contain all wire and cable installation and pulling calculations, and for each conduit run where cable is to be installed using power winches, the following shall be included:
1. The equipment set-up including sheave and reel diameter, and installation methods including cable protection methods during installation
 2. A detailed installation description for conductors to be installed
- L. The Contractor shall calculate maximum cable lengths and allowable pulling tensions, and minimum bend radius for each type of cable to be installed to avoid exceeding manufacturer's installation recommendations. Consideration shall be given to the following parameters:
1. Fill
 2. Friction
 3. Clearance
 4. Configuration
 5. Jam ratio of the cables and conduit
 6. Weight correction factor
 7. Bend radii
 8. Training of the cables on entering and exiting the conduits
 9. Maximum allowable tension
 10. Sidewall load
 11. Weight of the cables

These factors shall be calculated for each pull as required and the Contractor shall not exceed the maximum allowable values of sidewall pressure, pulling strain on conductors or sheath, limits of pulling device and pulling tension.

- M. In general, the Contractor shall not exceed the following guidelines:
1. The maximum pulling strain on the cable with a pulling eye attached to the conductors is a function of the conductor area as follows:
 $TM = 0.008 \times n \times CM$
Where:
TM = Maximum tension pounds
n = number of conductors
CM = area of each conductor (circular mils)
 2. When a basket-weave grip is used in lieu of a pulling eye, the maximum tension shall not exceed the value calculated for the pulling eye method or 1,000 pounds per grip, whichever is less.

3. The sidewall pressure loads shall not exceed 300 pounds/foot or the Wire and Cable Manufacturer's recommendation, whichever is less.
 4. The jam ratio shall not fall between 2.8 and 3.2.
 5. The coefficient of friction for the cables with lubrication shall be taken to be 0.35.
- N. Suitable pulling apparatus in good working condition shall be used. The Contractor shall demonstrate the operation of the pulling apparatus for the Project Manager's review. It shall be provided with a smooth variable speed control for pulling. For plastic conduit, a manila hemp pulling line shall be used. Nylon line shall not be used due to its elongation under tension. A dynamometer to measure the pulling tensions shall be used by the Contractor at the pulling end of the installation and the measured value shall be recorded for each pull.
- O. Proper procedures for feeding cable into the conduit shall be established by the Contractor. Feed-in tubes, sheaves, cable reel jacks and other appropriate tools necessary to provide proper bending radii and minimal friction during installation shall be used. Direction or training of the cables on entering and exiting the conduit shall coincide with other parts of the installation arrangement so that the cable is not damaged or over-stressed.
- P. The Contractor shall use only the wire and cable manufacturer's approved pulling compound or lubricant compatible with the cable. The lubricant shall be used in ample quantity to reduce friction and applied in such a manner that the cable is lubricated throughout the entire length being pulled through the conduit. The lubricant shall be non-hygroscopic and vermin-proof.
- Q. The installation shall be in accordance with the Contractor's approved Wire and Cable Installation Plan, which shall include the following considerations:
1. Spare wires and cables shall be installed at the same time that the active wires and cables are being installed.
 2. Cables shall not be pulled into a conduit that already contains conductors.
 3. If it becomes necessary to remove a cable from a conduit, all cables in that conduit shall be removed. Cable removed from conduit shall not be reinstalled or used elsewhere.
 4. Two-way communication between pulling and feed ends shall be established before and during the installation.
 5. Pulling shall be done at a constant velocity, not less than 15 feet per minute nor more than 50 feet per minute. The pull shall not be stopped once started unless absolutely necessary.
 6. Cable shall be protected after installation and prior to terminating or splicing.
 7. After pulling, the tension end of the cable damaged in the pulling process shall be cut off.
 8. All cables shall be identified.
- R. Exposed cable shall not be permitted along the wayside.
- S. The Contractor shall not allow wires to cross one another when pulled into a conduit. The Contractor shall prevent kinking in conduit fittings or boxes.

- T. The Contractor shall not pull cable in trays or troughs. Cable shall be laid, with a minimum amount of crossover, in the trays and troughs and secured at least every 3 feet, and shall not be pulled tightly around bends. Conduits for cables entering or leaving trays shall be rigidly attached and supported at their ends by suitable brackets and conduit straps on the side of the trays.
- U. All exposed wires and cables entering or leaving relay cases, junction boxes and cable transition points shall be protected from abrasion. Chase nipples shall be provided in drilled or punched openings in equipment housings and junction boxes located trackside. Openings in equipment enclosures and junction boxes shall have split ring plastic grommets.
- V. The Contractor shall seal all openings in equipment enclosures and junction boxes where exposed cables enter the enclosure or box. A resilient sealing compound made expressly for the purpose shall be installed after the cables are in place.
- W. Open wiring on individual equipment racks shall be neatly arranged, bundled and tied approximately every 3 inches with nylon straps.
- X. Cable installed in conduit, regardless of length, shall not exceed the maximum fill recommendations of the manufacturer and the requirements of the NEC and local codes. Where the aforementioned codes do not apply, the maximum fill shall not exceed 60%.
- Y. The cable installation in manholes and pull boxes shall not interfere with the future use of or access to unused conduit.
- Z. Signal system cables shall not be combined in the same conduit with cables of other Systems elements.
- AA. Cable Duct and Manhole Access Points.
 - 1. Each cable duct to be used for the routing of signal cable shall be blown or swabbed dry. All cables to be placed in one duct shall be installed simultaneously. Extreme care must be used in installing cables so as to avoid twisting, kinking, or in any way injuring the cable or its sheath.
 - 2. The ends of the cable shall be immediately sealed until such time as the terminating and protecting of the cable in the manholes, cable pits, cases and relay cases is effected. All conduits entering manholes, or cable slots between cable pits and housings, shall be filled with sealing compound.
 - 3. When necessary, the Contractor shall pump water out of manholes, cable pits, and pull chambers before installing any cables and shall be responsible for maintaining manholes and pull chambers in a dry condition while the cables are being pulled.
 - 4. Cables shall be installed with slack in pull boxes. Pulling cables shall be attached to the conductors as well.

3.2 SPLICES AND TERMINATIONS

- A. Wires and cables shall be continuous between relay cases; between relay case and the intended termination point at the wayside or station equipment, and between other termination points. Splices shall not be permitted. If signal cable(s) cannot be run continuously between instrument enclosures shown on the contract drawings, the Contractor shall install an intermediate case for termination of such cables at no additional cost to the Agency.
- B. Terminations for 600 Volt Wire and Cable

1. Cables shall be trained into final position while observing minimum bending radii. Slack shall be provided at all terminals in an amount sufficient for at least two re-terminations.
 2. Wire and cables where connected directly to signal equipment shall be of sufficient length to allow access for removal and inspection of equipment. Wires and cables shall be continuous, without splices, between terminals within a housing and enclosure or piece of equipment.
 3. Termination work shall be conducted under clean and dry conditions.
 4. All wires and cables at the entrance rack and beyond, leaving the case shall be terminated on an AREMA (AAR) terminal block. Compression-type insulated terminal connections to terminal blocks shall use a single washer on top of the terminal. Wire eyes require two washers for one eye, three washers for two eyes. Connections shall be completed with double nuts and torqued to the rated value of the nut. All incoming cables shall terminate at the entrance rack.
 5. There shall be no more than two wires on one AREMA (AAR) terminal binding post.
 6. Intra-rack wires, beyond the entrance rack, may terminate on WAGO type terminals. The Contractor shall follow the manufacturer's recommendation when terminating wires on these type terminals.
 7. All wires and cables shall be identified during the termination process.
 8. All wires which are terminated on AREMA binding posts shall be fitted with an acceptable insulated crimped type terminal as described in AREMA Communications and Signals Manual Part 14.1.1 (Recommended Design Criteria and Functional/Operating Guidelines for Solderless Crimp-Type Wire Terminals for Use in Wiring Signal Apparatus). All terminations shall use tinned connections.
 9. The wire terminals shall be installed only with tools and techniques recommended by the terminal manufacturer and submitted to the Project Manager. Crimp tools shall be of the ratchet-type that do not release unless the wire terminal has been compressed to the proper thickness. Crimp tool shall be re-calibrated at regular, specified intervals using gauges provided by the crimp tool manufacturer.
 10. Terminal connections other than those described in 3.2 B 8 shall be UL listed and have capacity and insulation voltage ratings of not less than the ratings of the wire or cable terminated. All terminations shall use tinned connections.
 - a. Terminals for No. 10 and smaller wire: Vinyl-insulated, electro-tin-plated, electrolytic copper locking spade.
 - b. Terminals for No. 8 to 3/0 wire - Compression, tin-plated copper.
 - c. Terminals for No. 4/0 and larger wire - Long-barrel, tin-plated copper, compression type with two bolting holes in the pad (NEMA 2-hole pad).
- C. Other material including lugs, terminations, exothermic welds and bare jumpers shall be as manufactured by Erico Products or an approved equal.
- D. If terminations are not made immediately after installation, ends of cable shall be sealed as recommended by the manufacturer to prevent entrance of moisture.
- E. Spare conductors shall be tagged and terminated on spare terminal posts in each relay case or other enclosure.

- F. The Contractor shall separate signaling cables from parallel runs of AC feeder cable(s) where adjacent locations are fed from one AC service location, and parallel runs of feeder cables for snow melters.

3.3 IDENTIFICATION

- A. The Contractor shall comply with the requirements of this Section for wire and cable identification.
1. All single and multiple-conductor wires and cables shall be identified whenever they enter or leave a junction box, manhole, housing, or enclosure, and at all terminals.
 2. Permanent non-conducting marking tags fastened securely to the wires and cables shall be used for identification.
 3. Wire designations shall consistently conform to an overall scheme, submitted to the Project Manager for Approval, to indicate location, circuit, device, wire number, terminal branch, position, etc., in accordance with AREMA (AAR) symbols and nomenclature.
 4. Signal equipment room, case, case and junction box wires shall be identified with tags which show:
 - a. The wire's origin
 - b. Circuit nomenclature (wire name)
 - c. The wire's destination

3.4 SPARE CONDUCTORS

- A. Each multiple-conductor cable shall have 10% spares or a minimum of two spare conductors, whichever is greater, with the following exceptions:
1. It shall not be necessary to provide spare conductors for track circuit connections. That is, spare conductors are not required for the stranded cable that connects the running rails to the first termination, junction box or instrument case. Spare conductors are required for all track leads beyond the first termination from the track.

3.5 TESTING

- A. Wire and Cable
1. Control Testing
 - a. The Contractor shall perform the following control tests during manufacture.
 - 1) Voltage and insulation resistance tests on cables in accordance with Sections 2.2 and 2.3 of WC 53/ICEA T-27-581, modified as follows:
 - a) Test potentials for both AC and DC as specified herein.
 - b) All immersion tests shall be done after 24 hours minimum immersion.
 - c) Individual conductors of multiple conductor cables tested before assembly as specified for single conductor cables.

- 2) Shield isolation test on all combinations of pairs and over-all shield. After one minute at 500 Volts, the minimum resistance shall be 35,000 Megohms per 1,000 feet.
 - 3) Conductor resistance tests on all cables in accordance with Section 2.1 of NEMA WC 53/ICEA T-27-581.
 - 4) Physical characteristic tests on at least one sample from each type and size of cable in accordance with Section 4 of NEMA WC 53/ICEA T-27-581.
 - 5) AC voltage withstand test on each shipping reel of finished cable at the test insulation voltage for 1 minute prior to shipment.
2. Wire and Cable Insulation Qualification Tests
- a. All cables supplied must meet the test specifications outlined in AREMA Communications and Signals Manual Part 10.3 (Wire and Cable), NEMA WC 53/ ICEA T-27-581 and NEMA WC 70/ICEA S-95-658 except as otherwise specified, or as Approved by the Project Manager.
 - b. The wire and cable manufacturers shall have met the following qualification requirements for insulation in order to be approved for use on signal circuits.
 - 1) No insulation failure shall have occurred during these tests.
 - 2) Full documentation shall be submitted on the tests and the test results.
 - 3) The insulation shall be consistently uniform and established as suitable for service at potentials up to 15,000 Volts.
 - 4) The dielectric strength stability shall have been demonstrated by voltage-aging a test sample of a single conductor AWG 14 or larger size wire with 80-mil or thicker insulation, shielded with the shield grounded. The cable shall be tested in free air with a minimum of 10 feet between terminals. One of the voltage stresses listed in Table 4 (Voltage Aging {Dry} Requirements) of this Section shall have been applied to voltage-age the sample.
 - 5) The test sample shall then be subjected to a 60 Hz step-voltage test. Test voltages of 60 Hz AC increased in 10 kV steps for 5 minutes at each step shall be applied to the voltage-aged sample until breakdown occurs. The test shall start at the test voltage level used in the voltage-aging test. Breakdown shall be at a test voltage level greater than 350 Volts/mil. The 490 Volts/mil test sample is excluded from this test.
 - 6) Thermal aging is determined by the insulation being tested in a circulating-air oven using 80-mil-thick slabs and having an elongation not less than 50% after a minimum aging time of 25 hours at 135 degrees Celsius and 100 hours at 121 degrees Celsius.

- 7) To establish moisture-resistance characteristics, an insulated conductor sample, similar to that used for the voltage-aging test, shall be used. The test sample shall be at least 10 feet long, shall be immersed in water with the shield grounded and tested at room temperature. The insulated conductor without any coverings over the insulation shall be continuously energized with one of the voltage stresses listed in Table 5 (Voltage Aging {Wet} Requirements) of this Section applied with no failures occurring.
 - 8) When tested with methods described in NEMA WC 70/ICEA S-95-658 Section 6, as modified herein and the procedures specified herein, the cable insulation shall meet the requirements listed in Table 6 (Ethylene-Propylene Rubber Insulation, Physical and Electrical Characteristics) of this Section and AREMA Communications and Signals Manual Part 10.3.15 (Recommended Design Criteria for Insulated Signal Wire) except as otherwise specified, or as Approved by the Project Manager with no failures occurring.
 - 9) When tested with methods described in NEMA HP-100.2 and the procedures specified herein, the case wiring insulation shall have the guaranteed physical and electrical characteristics shown in Table 7 (Ethylene Tetra Fluoroethylene Copolymer (ETFE) Physical and Electrical Characteristics) of this Section and AREMA Communications and Signals Manual Part 10.3.14 (Recommended Design Criteria for Ethylene Tetrafluoroethylene Copolymer (ETFE) Insulated Signal Wire and Cable) except as otherwise specified, or as Approved by the Project Manager with no failures occurring.
 - 10) When tested with methods described in NEMA WC 70/ICEA S-95-658 Section 6, as modified herein and the procedures specified herein, the jacket material for all insulated cable shall meet the requirements listed in Table 8 (Chlorosulfonated Polyethylene (HYPALON) Jacket Physical and Electrical Characteristics) of this Section and AREMA Communications and Signals Manual Part 10.3.20 (Recommended Design Criteria for Neoprene, Chlorinated Polyethylene and Chlorosulfonated Polyethylene Jacketing for Wire and Cable) except as otherwise specified, or as Approved by the Project Manager with no failures occurring.
3. Production Tests
- a. Production tests shall be made on samples selected at random at the place of production in accordance with the requirements of NEMA WC 70/ICEA S-95-658 Section 6, as modified herein. Each test sample shall be taken from the accessible end of different reels. Each reel selected and the corresponding sample shall be identified. The number and lengths of samples shall be as specified under the individual test. The test methods and the quantities of samples shall be those required in NEMA WC 70/ICEA S-95-658 Section 6, as modified herein. All applicable tests for the cable materials and cable construction specified shall be performed.
 - b. The Contractor shall require the wire and cable manufacturers to provide at their expense, at the point of production, equipment and labor for making any or all of the following tests:
 - 1) Conductor size and physical characteristics

- 2) Insulation, voltage and resistance tests
 - 3) Physical dimension tests
 - 4) Special tests on insulation and jacket materials. Final voltage, insulation resistance and conductor resistance tests on wires and cables on shipping reels.
 - 5) Electrical and physical certified reports for all tests shall be submitted to the Project Manager for the finished single and multiple-conductor cables prior to the time of shipment to the work site. Each test document shall, in addition to the test results, indicate the date the tests were performed and the signature of the person who conducted the tests.
 - 6) Cable that does not meet the test requirements set forth in this Section shall be rejected. Wire or cable that shows defects or noncompliance with these requirements after arrival at the Site may be rejected by the Contractor or the Project Manager. The Contractor shall, upon request, advise the Project Manager regarding the disposition of the wire or cable in question and pay all transportation charges on the rejected and replacement material.
- c. The following tests shall be made on all insulated conductors and prior to application of outer jacket or braid and prior to cabling or twisting.
- 1) Dry "Spark" Test: Every individual length of insulated conductor shall be passed through high-voltage test electrodes energized with an AC Spark Test voltage adjusted to a minimum value of that shown in Table 1, 1.1 and 1.2 as appropriate (Wire Insulation Thicknesses and Test Voltages).
 - 2) AC Voltage Test (Wet Tank): Every individual length of insulated conductor shall be subjected to and withstand without failure for 5 minutes the 60 Hz AC test voltages listed in Table 1, 1.1 and 1.2 as appropriate (Wire Insulation Thicknesses and Test Voltages). Voltage shall be applied between the insulated conductor immersed in the test tank and the water. This test shall be made while submerged after not less than 24 hours immersion in water. There shall be no signs of puncture, overheating, or self-healing of punctures.
 - 3) Insulation Resistance Testing: Every individual length of insulated conductor shall be subjected to an insulation resistance test. This test shall be made while each conductor is submerged, and after not less than 24 hours immersion in water. The insulation resistance shall not be less than the value of R as calculated in the following industry standard formula, corrected to 15.6 degrees Celsius.
$$R = K \log_{10} D/d$$

Where:

R = Insulation resistance in megohms/1,000 feet at 15.6 degrees Celsius
K = 35,000 Megohms/1,000 feet (for cables) and 50,000 Megohms/1,000 feet (for case wiring)
D = Diameter over conductor insulation
d = Diameter under conductor insulation

- 4) DC Voltage Test: Every individual length of insulated conductor shall be subjected to and withstand the DC test voltage shown in Table 1, 1.1 and 1.2 as appropriate (Wire Insulation Thickness and Test Voltages) for 5 minutes. This test shall be made while each conductor is submerged, and after not less than 24 hours immersion in water. For each sample tested, spark tests, AC voltage tests and insulation resistance tests shall be completed before DC voltage tests are conducted. Sufficient time shall be allowed between this test and the insulation-resistance test to prevent polarization from affecting the results.

3.6 FINAL TESTS

- A. For the AC voltage test, every individual length of finished cable, while on the shipping reel, shall be subjected to a test voltage of Table 1, 1.1 and 1.2 as appropriate (Wire Insulation Thickness and Test Voltages) between conductors and ground and two times the test voltage between conductors. This test voltage shall be applied between adjacent insulated conductors and between adjacent layers of insulated conductors in the cable for a time period of 1 minute. Cables without a metallic armor tape shall be immersed in water for a period of not less than 6 hours prior to this test. Metallic armor type cables shall use the metal tape as ground, and water immersion is not required. Any metallic shield or armor shall be connected to ground potential.
- B. Every individual length of completed cable, following the 1 minute AC test, shall have an insulation resistance not less than the value specified in Table 6 (Ethylene-Propylene Rubber Insulation, Physical and Electrical Characteristics) and AREMA Communications and Signals Manual Part 10.3.15 (Recommended Design Criteria for Insulated Signal Wire) except as otherwise specified, or as Approved by the Project Manager.
- C. Every individual length of completed case wire, following the 1 minute AC test, shall have an insulation resistance not less than the value specified in Table 7 (Ethylene Tetra Fluoroethylene Copolymer (ETFE) Physical and Electrical Characteristics) and AREMA Communications and Signals Manual Part 10.3.14 (Recommended Design Criteria for Ethylene Tetrafluoroethylene Copolymer (ETFE) Insulated Signal Wire and Cable) except as otherwise specified, or as Approved by the Project Manager.
- D. Every individual length of completed cable and case wire shall have the DC resistance of each conductor measured and recorded. This value shall conform to NEMA WC 53/ ICEA T-27-581, Paragraph 2.1.
- E. Every individual length of completed shielded cable shall be tested for shield continuity.

**TABLE 6
ETHYLENE-PROPYLENE RUBBER INSULATION
PHYSICAL AND ELECTRICAL CHARACTERISTICS**

CHARACTERISTIC	TEST REQUIREMENT
Physical Requirements: Unaged tensile strength at rupture, minimum psi	1,200
Unaged tensile stress at 200% elongation, minimum psi	600
Unaged elongation at rupture, minimum percent	300
Unaged set in 2-inch gauge length, maximum percent	25
Aging Requirements Either (Circulating hot air oven test, 168 hours, 121 degrees Celsius): Tensile strength, minimum percent of unaged value	90
Elongation, minimum percent of unaged value	85
30 Days - Elongation, minimum percent of unaged value	80
60 Days - Elongation, minimum percent of unaged value	75
90 Days - Elongation, minimum percent of unaged value	70
And (Air-pressure heat test , 42 hours, 127 degrees Celsius, 80 psi) Tensile strength, minimum percent of unaged value	60
Elongation, minimum percent of unaged value	50
Or (Oxygen-pressure test, 168 hours, 80 degrees Celsius, 300 psi) Tensile strength, minimum percent of unaged value	90
Elongation, minimum percent of unaged value	85
Hot Creep Test (at 150 degrees Celsius): Elongation, maximum percent of unaged value	50
Set, maximum percent of unaged value	5
Insulation Resistance Constant (at 15.6 degrees Celsius): megaohms-1,000 feet, minimum	35,000
Mechanical Water Absorption (Gravimetric Method): 7 days 70 degrees Celsius, maximum mg per square inch	8
Accelerated Water Absorption (1-day immersion, maximum percent, with 80 Volts/mil measurement stress Dielectric constant 60 Hz @ 90 degrees Celsius):	4.0
Accelerated Water Absorption (Increase in dielectric constant): 1-14 days immersion, maximum percent	1.5
7-14 days immersion, maximum percent	1.0
1-90 days immersion, maximum percent	2.0
Accelerated Insulation Resistance Stability (at 90 degrees Celsius): 1-day immersion, minimum percent	1.0
90-day immersion, minimum percent	1.0
Cold Bend Requirement (1 hour at -40 degrees Celsius):	No Cracks
Specific Surface Resistivity (minimum Megaohms per NEMA WC 53/ ICEA T-27-581, Paragraph 2.8):	200,000
Ozone Resistance (168 hours @ 250 ppm concentration):	No Cracks

**TABLE 7

PHYSICAL AND ELECTRIC CHARACTERISTICS**

CHARACTERISTIC	TEST REQUIREMENT
Physical Requirements: Unaged tensile strength at rupture, minimum psi Unaged tensile stress at 200% elongation, minimum psi Unaged elongation at rupture, minimum percent Unaged set in 2-inch gauge length, maximum %	1,800 500 300 20
Aging Requirements (Air oven, 168 hours, 100 degrees Celsius): Tensile strength, minimum percent of unaged value Elongation at rupture minimum percent of unaged value (Air oven, 42 hours, 127 degrees Celsius): Tensile strength, minimum percent of unaged value Elongation at rupture minimum percent of unaged value	50 50 50 50
Oil immersion (18 hours, 121 degrees Celsius ASTM No. 2 oil): Tensile strength, minimum percent of unaged value Elongation, minimum percent of unaged value	60 60
Mechanical Water Absorption (Gravimetric Method): 7 days – 70 degrees Celsius, maximum mg. per square inch	35
Cold Bend Requirements (24 hour at -35 degrees Celsius):	No Cracks
Ozone Resistance (24 hours in 150 ppm ozone):	No Cracks
Flame Resistance (UL 1581 FT2):	Pass

PART 4 - MEASUREMENT AND PAYMENT

4.1 MEASUREMENT

- A. The quantities of accepted work will be measured in the following units. All measurements will be plan measure except for authorized changes.

1. Description: Lump Sum

4.2 PAYMENT

- A. Payment will be made at the respective unit or lump-sum price listed in the proposal and shall be full compensation for all labor, materials, and equipment necessary to complete the respective unit in place. There will be no separate measurement or payment for any item of work not specifically identified and listed in the proposal, and all such work shall be considered a subsidiary item with all costs pertaining thereto included in the prices for other items listed in the proposal. At the Engineer's option, partial payment may be made for any lump sum item listed in the proposal, providing that the Contractor is diligently and satisfactorily pursuing full completion of such partially complete item in accordance with the approved job progress schedule.

SECTION 34 42 19**SIGNALS MICROPROCESSOR-SYSTEMS****PART 1 - GENERAL****1.1 SUMMARY**

- A. This Section includes requirements for furnishing and installing microprocessor-based systems, including:
 - 1. Vital interlocking microprocessors;
 - 2. Microprocessor "test set"
 - 3. Event recorders
- B. The intent of the specification is to eliminate the use of both vital and non-vital relays, to the maximum extent possible, through the use of microprocessors.

1.2 RELATED SECTIONS

- A. SECTION 01 33 00 – Submittal Procedures
- B. SECTION 01 43 00 –Systems Quality Assurance
- C. SECTION 34 42 25 – Signals Relays and Plugboards
- D. SECTION 34 42 68 – Signals Circuit and Operational Requirements
- E. SECTION 34 42 72 – Signals Spare Parts, Manuals, and Training
- F. SECTION 34 42 76 – Signals Tests and Inspections

1.3 REFERENCES

- A. American Railway Engineering and Maintenance-of-Way Association, Communications & Signals Manual of Recommended Practice [AREMA C&S Manual]
 - 1. AREMA C&S Manual, Part 2.2.12 – Recommended Functional/Operating Guidelines for Vital Software-Based Interlocking Systems
 - 2. AREMA C&S MANUAL, PART 1.5.1 – Recommended Instructions for the Installation and Maintenance of Solid State Equipment.

 - 4. AREMA C&S MANUAL, PART 16.2 - All Recommended Symbols.

1.4 SUBMITTALS

- A. Vital Microprocessor Product Data: Submit product information for the microprocessor. Include all product data, assembly drawings, circuits, parts lists, and printed circuit board layouts. Include a functional block diagram for the vital microprocessor system components. The Contractor shall demonstrate the proposed microprocessor interlocking equipment has been successfully installed and in service in similar applications.

- B. Event Recorder Product Data: Submit product data for the event recorder, including cabling and all supporting equipment.

1.5 QUALITY ASSURANCE

- A. The Contractor shall comply with the requirements of Division 1.

PART 2 - PRODUCTS

2.1 GENERAL REQUIREMENTS

- A. General: Microprocessor-based systems shall operate:
 - 1. In accordance with the environmental requirements specified in Section 01 XX 0 – Signals and Communications Product Requirements
 - 2. Without forced air ventilation
 - 3. Maintained by a traditional battery-rectifier supply. A requirement for a special power supply or UPS is not acceptable. Connections to external circuits shall be designed to interface to standard signal equipment operating at normal voltages for the type of equipment.
- B. Microprocessor Units
 - 1. Equipment shall be rack mounted in card file modules, complete with accessories, and shall be modular in design.
 - 2. Utilize keying to prevent improper insertion of circuit boards.
 - 3. Provide the capability to communicate with other systems, both vitally and non-vitally, as required by the specific application.
 - 4. Plug-in printed circuit cards shall be used wherever possible and they shall be keyed or configured such that a card cannot be installed in the incorrect position.
 - 5. Electronic components, except primary surge protection and voltage adjusting resistors, shall be mounted on plug-in circuit cards or plug coupled subassemblies to facilitate testing and maintenance.
- C. Safety
 - 1. Vital microprocessor-based units shall be designed using the closed loop principle to achieve safety.
 - 2. Vital microprocessor-based units, especially with respect to outputs, shall react in a safe manner to all failure modes. The unit shall not continue system control if it fails to pass system integrity tests.
 - 3. Design shall be complete with all necessary lightning and surge protection for the equipment itself, the input and outputs, and the system as a whole. The design shall be entirely adequate for the electrical and environmental environment and the equipment being operated.
 - 4. All application specific logic in any signal related equipment shall be capable of modification by Administration personnel. The Contractor shall provide source codes and other utilities required to make both vital and non-vital modifications to the application software. The Contractor shall also furnish a “re-testing tool” designed to minimized the re-testing of application logic after a change has been made to the software.

- a. Application software shall be password protected. It shall not be possible to make changes to the application software without having the user selectable password.
 - b. All vital firmware must have complete identification on each individual ROM or other storage devices to prevent the application of the programming to the wrong location. The application logic shall include a keying system such that even if the program for another location is inadvertently installed in a microprocessor it shall not operate and shall alert the user as to the error.
5. Hardware whose failure modes may adversely affect the safe implementation of a vital function but which is not designed as vital hardware shall be considered vital. Failure modes in this hardware shall be revealed or otherwise accounted for by means other than vital hardware design techniques. These means include, but are not limited to, software checking and comparison of independent hardware circuits.
 6. Equip with onboard diagnostics to detect failed printed circuit boards or other hardware, as specified herein. The operation of any diagnostics that may change software routines or otherwise compromise safety shall be accessible through a hardware or software security system designed to warn the user that a dangerous situation may be created.
 7. Divide the operating instructions for the vital microprocessor into executive and application dependant portions. The use of electrically erasable programmable ROM (e.g., flash memory) is acceptable.
 - a. Store the executive instructions in solid state read only memory (ROM) or solid state programmable read only memory (PROM) devices and as the Executive Firmware.
 - b. Store the application dependant instructions in solid state PROM devices and designate as the Application Dependant Firmware.
 8. Refer to Section 01 43 00 –Systems Quality Assurance, for additional safety and reliability requirements.
- D. Serial Links
1. Serial communications between processors implementing vital functions shall be vital. Security protocol, including handshaking and error detection, shall be used to ensure the validity of data. Data shall default to the most restrictive state unless a valid transmission is received. Serially transmitted data between subsystems shall be repeatedly updated to ensure the integrity of the communications link.
- E. Documentation
1. Provide a complete and detailed hard copy print out, and an electronic copy, of all vital and non-vital software for each location in accordance with the requirements of Section 01 33 00 – Submittal Procedures. The programs shall be modularized in a logical and easily understood manner. Each module shall be fully annotated, including revision blocks with plain English explanations of the function of each module and the methods and means it uses to accomplish its tasks. Include for all related modules required to take part in the execution of the instructions.
 2. Identify all data passed from one vital controller to another vital controller and all data passed from any vital controller to the non-vital controller, local control processor, as well as hardwire interfaces. Identify all terms in the Boolean or ladder expressions and all data received by or sent from the controllers with standard relay logic nomenclature. Translation tables will not be accepted.

- F. Timers: Provisions shall be made in the design to adjust all functions requiring adjustable timers (e.g., ASR timers) without changing program software. Install timers external to the processors if necessary. External timers shall meet the requirements of Section 34 42 25 Relays and Plugboards.

2.2 VITAL INTERLOCKING MICROPROCESSOR

- A. General: The vital microprocessor-based unit shall be "fail-safe" in all modes of operation and shall meet the Product Requirements of Section 01 XX 00. The microprocessor shall:
1. Operate according to AREMA C&S Manual, Part 2.2.12 – Recommended Functional/Operating Guidelines for Vital Software-Based Interlocking Systems.
 2. Provide all controls, indications, safety checks, and all other functions required for the signal system. The processor shall be capable of receiving signal, switch, and route requests from the LCP and the TWC System.
- B. Connections: Connections to external non-electronic vital signal apparatus shall be on compression-type terminals or other solderless connectors, as approved by the Resident Engineer.
- C. Inputs/Outputs (I/O)
1. The microprocessor system shall provide for vital and non-vital inputs. A visual indication, such as a light emitting diode (LED), shall be provided for each input on the input board. It shall illuminate continuously when the input is activated. Vital inputs for the equipment shall have an option to selectively debounce each input. Vital inputs shall be electrically and physically vitally isolated from each other.
 2. The microprocessor shall provide vital and non-vital outputs. A visual indication, such as an LED, shall be provided for each output on the output board. It shall illuminate continuously without use of a pushbutton when the output is activated. Vital outputs shall be electrically and physically isolated from the logic power supply. If output is used to drive double break circuitry, the output shall be physically and electrically isolated from each other.
 3. Inputs shall be buffered and shall be immune to contact bouncing and shall be electrically and physically isolated from one another in accordance with AREMA recommended practice for vital circuits. Access to inputs must be unique in the sense that under failure, reading of the incorrect input circuit will not result in a falsely permissive input being utilized in vital processing.
 4. A label shall be provided for each input and output indication which denotes the respective function of each to facilitate troubleshooting and maintenance.
 5. A falsely permissive non-vital input shall not adversely affect the safety of the vital function processing.
 6. Outputs shall be electrically and physically isolated from one another in accordance with AREMA recommended practice for vital circuits. Single break type outputs may have a common reference. . The executive software shall constantly check to verify that all outputs are in the state requested by the application software. Access to the outputs shall be unique in the sense that under failure, writing to the wrong output circuit will not result in a falsely permissive output being generated. Processor communication with each output shall vitally assure that the proper output is in the proper state (on or off).

7. The vital processor shall assure correspondence of each vital output between the actual and requested states. No output shall remain active when requested inactive. Means shall be provided to assure the capability to remove all energy from a failed vital output. Wherever possible, the system should be fault-tolerant such that single output failures do not force a system shutdown, unless the state of a vital output is potentially unknown.
- D. Internal Diagnostics: The processor subsystem shall incorporate vital self-checking tests to ensure the equipment and program is functioning as intended. The checks shall be integral parts of both hardware and software to provide for a secure system.
1. The vital processor shall not allow false information to persist long enough to allow an unsafe condition to occur, or allow false information to be transmitted to external devices which will create a hazardous condition. Processor shall use a vital "kill" relay circuit to de-energize all outputs in the event of a safety related I/O or processor failure. In the event that the "kill" relay becomes de-energized, signals shall be lit red rather than being dark. The "kill" circuit shall de-energize all outputs in a time less than the fastest activation time of any external device connected to a vital output. The kill circuit shall use vital circuit design techniques to assure that no false signal that could be generated by any other device in the relay case (e.g., power supplies, audio or coded equipment), or harmonics of these devices shall energize the output power relay.
 2. Provide visual indicators, such as LEDs, to demonstrate that the system is functioning as intended; similarly provide failure and diagnostic indications. Indicators shall isolate a failure to a particular function, or the interface between two functions.
 3. Transmission of false information from a non-vital to a vital subsystem shall not affect the safety of the vital subsystem.
 4. System outputs shall be positively monitored with independent current/voltage sensors and compared to the requested value. The "kill" circuit shall de-energize all outputs and shutdown the system when the outputs fail to correspond to the required state or a more restrictive state. Diagnostic checks shall act on current (fresh) data only. Memory locations used to determine the proper states of inputs and outputs shall be cleared or overwritten prior to being reused during each cycle of tests to ensure the integrity of the check. The diagnostic checks shall be independent of the application logic for the system. The system shall attempt an automatic restart after executing safety checks.
 5. Diagnostics shall check to assure synchronized tasks shall execute correctly in the proper order. Checks shall shutdown the system in the event the processor is overloaded.
 6. PROMs and erasable programmable read only memory (EPROMs) shall be checked, as part of program execution, during each cycle, to ensure they have been unaltered during processor execution. Benchmarks shall be created for blocks of memory to implement these tests.
- E. Access: A method of security shall be provided to allow only authorized user access. The system shall not interfere with operation of the wayside vital processor system. Access shall be through the use of the laptop computers provided in this Contract. Refer to Section 34 42 72 – Spare Parts, Manuals, and Training for additional requirements.

- F. Trouble-Shooting: The microprocessor system shall be capable of interconnection to the portable laptops, provided in this Contract, to permit interrogation (via keyboard/keypad) and observation (via monitor/display) of internal logic bits during testing and normal operations. This interface shall use English-Text and Arabic numeral nomenclature with explanation of faults in easy to read text. Operator interface shall be via menu driven commands with an on-line HELP feature to describe use of commands.
- G. Noise: The microprocessor system shall be designed to operate in the presence of the following noise sources:
1. Lightning surges and voltage surges from external power distribution systems;
 2. Transients from nearby power lines, propulsion return currents, back electricmagnetic field (EMF) from operating relay coils, arcing contacts, radio frequency (RF) noise such as hand-held radios and;
 3. I/O wiring from the I/O card file to external terminal strips.
- H. Site Specific Firmware: Provide site specific application dependent firmware for each location that meets the operational requirements Section 34 42 68 – Signals Circuit and Operational Requirements, and the Contract Drawing Route and Aspect Charts.
- I. Support Equipment: Provide tools and test equipment in accordance with the requirements of Section 34 42 72 – Signals Spare Parts, Manuals, and Training.

2.3 MICROPROCESSOR TEST SET

- A. The Contractor shall supply a “test set” for the vital microprocessor. The intent of this requirement is to provide the signal maintainers with a known good unit into which they can substitute suspect PCB’s from other vital microprocessor units to determine if they are in fact good or bad. The test set shall:
1. Be completely contained in a portable “half rack” so that no assembly or disassembly is required to move it. This “half rack” shall be mounted on lockable wheels so as to make it easily transportable.
 2. Have all of the wiring contained within the half rack so that the only required connection is to plug the unit into a standard 110VAC power outlet (wall plug).
 3. Have a self-contained power supply to convert the 110VAC to the required system operating voltage.
 4. Contain at least one of every type of PCB (both vital and non-vital) that is used at the interlockings controlled by a vital microprocessor.
 5. Be programmed so that all of the boards in the test set are functioning completely. This means that:
 - a. All serial ports are defined and working.
 - b. All parallel I/O points are defined and working.
 - c. All parallel I/O points are changeable and the results are observable. For example, output one may be mapped to input one such that when the input is changed the corresponding output also changes and is observable.
 6. Provide a means to toggle each input point.
 7. Provide a means to see that each output is changing state as requested.

8. Provide all of the diagnostics that would be available if this were a working unit in the field.
- B. The proposed design of the test set shall be forwarded to the VMR prior to manufacture for approval.
- C. Provide a similar test set for the solid state highway crossing controller.

2.4 EVENT RECORDERS

A. General

1. Provide an event recorder in all cases to record controls, indications, and internal variables. An event recorder is not required in a relay case if the vital microprocessor-based equipment provided can store the same information under the same conditions, as specified herein. In addition to recording the controls and indications sent via the TWC system or the local control panel, record all vital functions as necessary for AGENCY to accurately re-create an event. Provide AGENCY a complete list of proposed functions to be recorded with the product submittal. Such functions shall include;
 - a. Approaching locking
 - b. Time locking
 - c. Switch locking
 - d. Route locking
 - e. Route check
 - f. Signal clear
 - g. Directional sticks
 - h. Switch position
 - i. Track circuit occupancy
2. Provide sufficient memory to store a minimum of 7 days worth of normal operations monitoring without the loss of any data (e.g., without the necessity to overwrite the first recorded occurrence of the 7 day period).
3. Provide a unit that is capable of generating alarm status based on user definable conditions.
4. Provide a unit that is capable of being configured, monitored, and tested by the laptop computers provided in this Contract, connected locally. The unit shall be Windows-based, and shall, to the maximum extent practicable, be user friendly.
5. The unit shall record all functions in plain English, at the time the event actually occurred. Event logs shall be readable without requiring numeric to alphanumeric conversion.
6. Provide accurate and reliable sequence of event reporting in the playback mode.

PART 3 - EXECUTION**3.1 INSTALLATION**

A. General

1. Provide all units complete with mounting hardware, power supply, cables, connectors, and all other miscellaneous equipment and material required for configuration, operation, and testing.
2. Mount all equipment, including associated power supply and support equipment, in the wayside signal building or case.
3. Install microprocessor equipment per the recommendations of AREMA C&S Manual, Part 1.5.1 Recommended Instructions for the Installation and Maintenance of Solid state Equipment.
4. Before proceeding with any software upgrade, employ electrostatic discharge precautions to ensure that PROM internal circuits are not accidentally damaged by high static voltages or electrostatic fields. Such precautions shall include, but not be limited to:
 - a. Removal, old PROMs shall be inserted into conductive foam material.
 - b. Except when necessary, avoid touching the PROM leads.
 - c. Use integrated circuit extractor/insertor tools designed to remove and install electrostatic PROMs.
 - d. When replacing PROMs, always lay the module on the electrostatic bag provided by the manufacturer, not on the work surface.

B. Following Noise Mitigation: Suppress or prevent noise from entering into the system using the following practices:

1. Use lightning arrestors and secondary surge suppressers to protect against lightning and other voltage surges, in accordance with AREMA C&S Manual, Part 11.2.1 Recommended General Practices for Electrical Surge Protection of Signal Systems.
2. Ground all card files, modems and other system components to the cabinet ground stud to earth ground through a capacitor to establish ground.
3. Connect shields on serial communication cables to earth ground on one end only.
4. Provide required load to unused outputs.
5. Ensure proper pickup and dropaway relay currents per relay specifications when interfacing relays to I/O cardfiles.
6. Install standard suppression on all relay coils.
7. Use twisted pair wires for all inputs.
8. Shorten wire harnesses from I/O cardfiles to external terminal strips and dress these wires away from the central processing unit (CPU).
9. "Oversize" power supplies and design associated power busses to minimize noise produced by voltage drop of transient currents. External filtering may be used to reduce transient current noise on the power bus.

10. Separate connections to external apparatus from internal wiring carrying processor signals.
 11. Keep cabling between cardfiles as short as possible to minimize induced noise and group microprocessor-based system racks together, although sufficient slack shall be provided for a service loop.
 12. Mitigate the effects of noise, transients and grounds that appear on inputs and outputs to the system. Cable conductors and track mounted devices are regularly exposed to water and traction power induced transients. System instability, processor rest or processor shutdown shall not be a normal response to these input and output conditions.
 13. Power wires or wires that could have transient currents and that run in the racks shall be isolated to running on one side of the rack away from any I/O card files.
- C. Maintenance: To facilitate maintenance, diagnostics shall be organized such that detectable failures will energize LED indicators mounted on the edge of either the individual PC cards, or on a centralized board, which will allow a technician to determine system operating status and errors. A method of security shall be provided to allow only authorized user access. The security system shall not interfere with operation of the vital microprocessor subsystem.
- D. Test: Test microprocessor-based systems in accordance with the requirements of Section 34 42 76– Signals Tests and Inspections.

PART 4 - MEASUREMENT AND PAYMENT

4.1 MEASUREMENT

- A. The quantities of accepted work will be measured in the following units. All measurements will be plan measure except for authorized changes.
1. Description: Lump Sum

4.2 PAYMENT

- A. Payment will be made at the respective unit or lump-sum price listed in the proposal and shall be full compensation for all labor, materials, and equipment necessary to complete the respective unit in place. There will be no separate measurement or payment for any item of work not specifically identified and listed in the proposal, and all such work shall be considered a subsidiary item with all costs pertaining thereto included in the prices for other items listed in the proposal. At the Engineer's option, partial payment may be made for any lump sum item listed in the proposal, providing that the Contractor is diligently and satisfactorily pursuing full completion of such partially complete item in accordance with the approved job progress schedule.

END OF SECTION

THIS PAGE INTENTIONALLY LEFT BLANK

SECTION 34 42 25**SIGNALS RELAYS AND PLUGBOARDS****PART 1 - GENERAL****1.1 SUMMARY**

- A. This Section includes the requirements for furnishing and installing vital and non-vital signal relays. All signal logic shall be generated by microprocessor-based systems. The use of relays shall be minimized to the maximum extent possible. The Contractor is encouraged to submit any functions such as light out protection or switch control that are normally handled by special purpose relays that can be included as an integral part of the microprocessor system to the Agency Representative for approval. Where Relays are required for specific applications, they shall meet the following requirements:

1.2 RELATED SECTIONS

- A. SECTION 01 33 00 – Submittal Procedures
- B. SECTION 01 43 00 – Systems Quality Assurance

1.4 QUALITY ASSURANCE

- A. The Contractor shall comply with the requirements of Division 1

1.5 SUBMITTALS

- A. Unless otherwise specified, all submittals shall be in accordance with SECTION – 01 33 00 - Submittal Procedures and SECTION 34 42 10 – Signals General Engineering And Design Requirements.
- B. Vital Relay Product Data: Submit catalogue cuts and technical data including fully dimensioned layouts, in plan and elevation, showing arrangement of components and all pertinent data for each type of vital relay, including timers, proposed for use. Include suppression details and plugboards.
- C. AREMA Office Records Test Form: Submit an applicable AREMA Office Records Test Form for each vital relay furnished as a part of this contract. Type in all information required on the form and field verify.
- D. Non-Vital Relay Product Data: Submit catalogue cuts and technical data for each type of non-vital relay and plugboard proposed.

PART 2 - PRODUCTS

2.1 VITAL LOGIC RELAYS

- A. General: Provide Safetran plug-in type relays, Alstom Signaling plug-in type relays, Union Switch and Signal (an Ansaldo affiliated company) "PN" series, or "owner approved equal," meeting the requirements of AREMA C&S Manual Part 6.2
 - 1. Relays of each type shall be uniform in design and contact assembly.
 - 2. Provide relays complete with relay unit, plug base, crimp type two wire terminals, base and relay tags, all mounting hardware, identification and keying plates and accessories necessary to complete the installation.
 - 3. Facilities shall be provided on the front of the plug board for testing current.
 - 4. Provide a means, built into the relay cover, for mounting a typed or printed relay name tag on the front of each relay. The name tag shall be easily replaceable, but shall not come off during normal service. The relay plugboard shall also be supplied with a name tag, on both the front and the back.
- B. Contacts
 - 1. With the exception of special function relays (i.e., overload relays), provide each relay with either six dependent front-back contacts or four dependent front-back contacts, two front contacts, and one back contact.
 - 2. Provide front contacts of silver-to-silver impregnated carbon and make all back contacts silver-to-silver. Contacts shall meet the requirements of the AREMA C&S Manual, Section 6.5.1.
 - 3. Design the relay contacts so that when cycled 5,000,000 times while interrupting and making a current of 0.25 A at 12 V to 16 V, the contact resistance shall not exceed 0.5 Ω .
- C. Interchangeability: Provide identical relays for all signal logic functions, except special function relays.

- D. Biased Neutral
 - 1. Design so that their armature will not pick up with the permanent magnet demagnetized.
 - 2. Design so that their armature will not pick up when coils fail to receive current due to an interruption of the normal magnetic circuit.
 - 3. Design so that up to at least 50 times working energization voltage applied for 2 seconds at both normal and reverse polarity will not affect their operating characteristics by more than 2 percent, and will not pick up their armature on reverse polarity.

2.2 VITAL SWITCH CONTROL RELAYS

- A. General: Provide vital switch control relays, external to the microprocessor-based system, as specified, meeting the requirements for vital DC relays except as modified herein.
- B. Switch Operating Relays
 - 1. Provide a minimum of two independent front contacts and two independent back contacts.
 - 2. Equip each contact with a magnetic blow-out feature to extinguish electrical arcs caused by the interruption of high currents and to minimize contact wear.
 - 3. Each contact shall be capable of interrupting the normal switch-and-lock movement current 10,000 times without its resistance exceeding 1.0 Ω measured at 5 A.
 - 4. The relay shall be from the same manufacturer as the switch machine. If the contractor wants to use a different manufacturer for the relay, then the contractor shall submit for approval the technical details of the switch machine and relay illustrating sufficient contact rating of the relays for the application.
- C. Switch Overload Relays: Provide relays to detect an overcurrent condition during operation of power switch machines, meeting the following requirements:
 - 1. Equip relays with two separately wired, non-biased coils: one coil series-connected in the switch operating circuit to detect overcurrent conditions, and the other coil used as a holding coil in the overload stick circuit.
 - 2. Furnish relays with a sufficient number of make-before-break contacts to perform functions specified herein.
- D. Flasher Relays: Provide electronically-driven flasher relays to control flashing aspects for crossing warning systems, if required.
 - 1. Equip relay with a minimum of four dependent front-back, heavy duty, non-fusing lamp control contacts of silver cadmium oxide.
 - 2. Contacts shall maintain full back contact pressure while the relay is not operating.
 - 3. Flasher shall operate from the 12 VDC power supply available in the building or case.
 - 4. Flasher shall maintain a constant ratio of "on-off" time of 56 to 64 flashes per minute throughout the system variations in voltage and temperature.

2.3 VITAL DC TIMER RELAYS

A. General

1. Vital DC timer relays shall be solid-state. Provide each vital DC timer relay with a minimum of two independent timing contacts, which provide an equivalent of a front-back contact.
2. Vital DC timer relays shall be in accordance with AREMA C&S Manual, Part 6.1.20, except as otherwise specified.

B. Adjustment: Equip timers with a sealable timing interval adjustment, to meet design requirements, in increments of 1 sec or less.

1. When adjustment is sealed, it shall not be possible to adjust the timing interval without breaking the seal.
2. Once adjusted, the timing interval shall be repeatable with an error of no more than +/- 5 percent under specified variations in operating voltage and ambient conditions.

2.4 VITAL AC VANE RELAYS

A. General

1. Provide plug-in two-element, 60 Hz, induction relays.
2. Relays shall conform to AREMA C&S Manual, Part 6.1.35 and Part 6.2.1.
3. Provide a minimum of two dependent front-back contacts.

B. Voltage: Relays shall operate continuously without damage with a minimum voltage range of 100 to 135 V AC applied to the local winding, and with a minimum voltage range of 0.75 to 5 V AC applied to the control winding.

2.5 VITAL RELAY PLUGBOARDS

A. General

1. Provide a rack-mounted type plugboard for each vital relay.
2. Plugboards shall be in accordance with the applicable sections of AREMA C&S Manual, Part 6.2.2.
3. The fastening of relay to plugboard shall hold the relay securely in place and facilitate removal.
4. Plugboards shall facilitate voltage testing.

B. Contacts

1. Design plugboards for insertion of removable-type connectors. Attach wires to the removable connectors by a solderless crimped connection. Fast-ons or other non-insert connectors are not acceptable.
2. Design vital relay plugboards so that the removable connectors will have a direct connection with the relay coil and with the contact prongs.
3. Contacting members to carry current between relay and plugboard shall be in constant contact, and the contact resistance shall not exceed 0.03 Ω .

- C. Identification: Plugboard shall have a tag, on both front and back, unless approved otherwise, to indicate the nomenclature of the relay for which it is wired. Provide relay contact identification on the plugboard.
- D. Registration: Equip vital relay plugboards with a registration plate to prevent relays of wrong style, contact arrangement, or operating characteristics from being inserted.

2.6 NON-VITAL RELAYS

- A. General: Provide non-vital relays in accordance with the requirements of AREMA C&S Manual, Part 6.3.1.

2.7 NON-VITAL RELAY PLUGBOARDS

- A. General
 - 1. Provide a rack-mounted type plugboard for each relay or pair of relays.
 - 2. The fastening of relay to plugboard shall hold the relay securely in place and facilitate removal.
- B. Contacts: Design plugboards for insertion of removable-type connectors. Attach wires to the removable connectors by a solder-less crimped connection. Fast-ons or other non-insert connectors are not acceptable.
- C. Identification: Plugboard shall have a tag, on both front and back, unless approved otherwise, to indicate the nomenclature of the relay for which it is wired. Provide relay contact identification on the plugboard.

PART 3 - EXECUTION

3.1 APPLICATION

- A. General: Refer to SECTION 34 42 68 – Signals Circuits And Operational Requirements, for requirements.
- B. Timers: Provisions shall be made in the design to adjust all functions requiring adjustable timers (e.g, ASR timers) without changing program software. Install timers external to the processors if necessary.

3.2 INSTALLATION

- A. General
 - 1. Ensure that all power buses are open while installing relays. Do not reconnect these buses until all relays have been installed and power and ring out tests have been performed.
 - 2. Keep all relays covered at all times except while tests or approved modifications involving those relays are in progress.
- B. Vital Relays: Install all relays in plugboards on racks. In cases, install on mounting hardware specifically designed for relays.
- C. Shipping: After completion of factory test, remove relays from racks and cases and pack separately.
- D. Test: Test relays in accordance with the requirements of SECTION 34 42 76 – Signals Tests And Inspections

PART 4 - MEASUREMENT AND PAYMENT**4.1 MEASUREMENT**

A. The quantities of accepted work will be measured in the following units. All measurements will be plan measure except for authorized changes.

1. Description: Lump Sum

4.2 PAYMENT

A. Payment will be made at the respective unit or lump-sum price listed in the proposal and shall be full compensation for all labor, materials, and equipment necessary to complete the respective unit in place. There will be no separate measurement or payment for any item of work not specifically identified and listed in the proposal, and all such work shall be considered a subsidiary item with all costs pertaining thereto included in the prices for other items listed in the proposal. At the Engineer's option, partial payment may be made for any lump sum item listed in the proposal, providing that the Contractor is diligently and satisfactorily pursuing full completion of such partially complete item in accordance with the approved job progress schedule.

END OF SECTION

SECTION 34 42 29**SIGNALS ELECTRICAL AND ELECTRONIC COMPONENTS****PART 1 - GENERAL****1.1 SUMMARY**

- A. This Section includes Specifications for electrical and electronic components.

1.2 RELATED SECTIONS

- A. SECTION 01 33 00 – Submittal Procedures
- B. SECTION 01 43 00 – Systems Quality Assurance
- C. SECTION 34 42 10 – Signals General Engineering and Design Requirements
- D. SECTION 34 42 44 – Signals Power Distribution
- E. SECTION 34 42 76 – Signals Tests and Inspections

1.3 SUBMITTALS

- A. Unless otherwise specified, all submittals shall be in accordance with SECTION 01 33 00 – Submittal Procedures and SECTION 34 42 10 – Signals General Engineering And Design Requirements.
1. The Contractor shall submit manufacturer's specifications, product literature and shop drawings for the following:
- a. Power supplies
 - b. Transformers
 - c. Printed circuit cards
 - d. Integrated circuits
 - e. Characteristics of all semiconductors, resistors, reactors, capacitors, inductors and fuses
 - f. Printed circuit card connectors
 - g. Electronic data processing equipment (including microprocessors and event recorders)
- B. The Contractor shall submit detailed product information, including hardware and software specifications, functional descriptions, block diagrams and flow charts for all electronic data processing hardware and software. Software listings shall be submitted which accurately and completely characterize the operating and application programs in use and fully describe the means to reprogram such equipment at the user level.
- C. The Contractor shall submit as-built drawings for all components and equipment to provide accurate and complete documentation of the in-service configuration and status.

1.4 QUALITY ASSURANCE

- A. The Contractor shall comply with requirements of Division 1
- B. The Contractor shall factory test all electrical and electronic components prior to installation in accordance with manufacturer's test procedures and provisions of SECTION 34 42 76 – Signals Tests And Inspections.

PART 2 - PRODUCTS

2.1 GENERAL

- A. Electrical and electronic components shall be:
 - 1. New and free of manufacturing defects
 - 2. Free of storage and handling damage
 - 3. Clearly and permanently labeled with values or type identification
 - 4. Rated to operate at levels exceeding by at least 25%, those operating parameters such as power, voltage, current and temperature, which the component will be subject to in normal service, except as otherwise specified, or as Approved by the Agency.
 - 5. Commercially identified and available in the Kansas City area
 - 6. Capable of operating in the environment specified

2.2 SEMICONDUCTORS

- A. Semiconductors shall be silicon type with Joint Electron Device Engineering Council (JEDEC) numbers, except as otherwise specified, or as Approved by the Agency.
 - 1. Zener diodes used for voltage regulation or reference levels shall not be damaged if the entire load is removed and shall have a zener voltage tolerance of plus or minus 5% maximum. Zener diodes used for transient protection shall not be damaged in performing their function under all actual conditions encountered in the operating system.
 - 2. The use of integrated circuits shall be such that manufacturer's ratings are not exceeded under normal operation. Integrated circuits shall be protected against over-voltage and noise in the designed installation.
 - 3. Optically coupled isolators using gallium arsenide emitters and gallium arsenide phosphide light-emitting diodes will be permitted. Manufacturer's ratings shall not be exceeded under normal operation.

2.3 ELECTRICAL DEVICES FOR USE WITH ELECTRONIC COMPONENTS

- A. Resistors
 - 1. Resistors shall have a maximum tolerance of plus or minus 5% and shall be rated to dissipate a minimum of 1.5 times the maximum operating power.

- B. Capacitors
1. Capacitors 10 microfarads or less in value used in electronic modules shall have a maximum tolerance of plus or minus 10% and shall be rated for at least 1.5 times the maximum operating peak voltage.
 2. All other capacitors shall have a maximum tolerance of -50% to +75% and shall be rated for at least 1.5 times the maximum peak operating voltage.
- C. Inductors
1. All inductors used in electronic modules shall have impregnated windings and shall withstand twice the maximum peak-to-peak voltage they will be subjected to in operation.
- D. Transformers
1. All power transformers used in electronic modules shall have:
 - a. Minimum inter-winding breakdown voltage of 1000 VDC
 - b. No emitted audible noise in excess of 40dB referenced to 0.0002 dynes/square centimeter at a distance of 2 feet while operating at rated voltage and load
 - c. Impregnated windings
- E. Printed Circuit Cards
1. Shall be of NEMA G-10 epoxy glass laminate construction.
 2. Shall have thickness sufficient to permit easy insertion and removal.
 3. Shall have circuits formed by etching.
 4. Conductor material shall be copper and protected from exposure to air.
 5. Shall be marked with identification for each component adjacent to the place where it is to be installed.
 6. The Contractor shall provide diagrams illustrating the layout and identification of each component on the printed circuit card as Approved by the Agency.
- F. Printed Circuit Card Connectors
1. Printed circuit card connectors and associated terminals shall be:
 - a. Etched on both sides of the printed circuit card connections
 - b. Gold plated 0.000025-inch minimum
 - c. Insulation resistance greater than 1000 Megohms at 500 VDC
 - d. Temperature rating of -55 degrees Celsius to +105 degrees Celsius
 - e. Connector shall withstand card removal/insertion for regular maintenance
 - f. Keyed to accept only those cards intended for that particular position, unless an electrical keying scheme is employed.

2.4 ELECTRICAL DEVICES FOR OTHER APPLICATIONS

- A. Power Transformers shall be as referred to in SECTION 34 42 44 – Signals Power Distribution.
- B. DC power supplies, except as otherwise specified, shall meet the following specifications:
1. Input Voltage – 120 VAC \pm 10%, 100 Hz or 60 Hz as required
 2. Regulated output voltage – nominal DC voltage \pm 5%, adjustable to \pm 50%
 3. Output current – 50% over normal load
 4. Overload protection
 5. Reverse current protection
 6. Equipped with power off detection. The power off detection of each of the power supplies shall be gathered together to operate the “DC Power Off” light on the local control panel.
 7. Clearly and permanently labeled with the rating or type, identification and function
 8. Sufficiently filtered to ensure that rated output voltage will be maintained for power interruptions of less than 65 milliseconds at rated load
 9. Adjustable over-voltage protection that disables the output when the trip level is exceeded
 10. Ripple shall be less than 100 millivolts RMS or 1% of the output voltage. Ripple maximums shall be compatible with the solid state equipment supplied by the Contractor.
 11. Power supply shall be mounted in perforated enclosures.
 12. Power supply front panel shall contain at a minimum, an output ammeter, and an output voltmeter (this may be one meter with selector switch). Meter accuracy shall be \pm 2%.
- C. Fuses
1. Shall be the non-renewable, of fiber-case, time-lag, fusion, indicating type
 2. Shall be the correct size and rating to protect electrical equipment from overload
 3. In DC circuits, a protective unit shall be provided
 4. Shall be centrally located on the power distribution panels and power racks

2.5 CIRCUIT INTERRUPTERS (BREAKERS)

- A. Equipment intended to break current at fault levels shall have interrupting rating sufficient for the system voltage and the current which is available at the line terminals of the equipment. Equipment intended to break current at other than fault levels shall have an interrupting rating at system voltage sufficient for the current that must be interrupted.

PART 3 - EXECUTION

Not Used

PART 4 - MEASUREMENT AND PAYMENT**4.1 MEASUREMENT**

A. The quantities of accepted work will be measured in the following units. All measurements will be plan measure except for authorized changes.

1. Description: Lump Sum

4.2 PAYMENT

A. Payment will be made at the respective unit or lump-sum price listed in the proposal and shall be full compensation for all labor, materials, and equipment necessary to complete the respective unit in place. There will be no separate measurement or payment for any item of work not specifically identified and listed in the proposal, and all such work shall be considered a subsidiary item with all costs pertaining thereto included in the prices for other items listed in the proposal. At the Engineer's option, partial payment may be made for any lump sum item listed in the proposal, providing that the Contractor is diligently and satisfactorily pursuing full completion of such partially complete item in accordance with the approved job progress schedule.

END OF SECTION

THIS PAGE INTENTIONALLY LEFT BLANK

SECTION 34 42 33**SIGNALS PRE-FABRICATED RELAY CASES****PART 1 - GENERAL****1.1 SUMMARY**

- A. Section Includes:
 - 1. Furnish and install factory wired relay cases as described herein and as shown in the Contract Drawings.
 - 2. Provide relay cases adequate to house all equipment and provide spare space as described in these Specifications.
 - 3. Furnish AC Power as necessary.

1.2 RELATED SECTIONS

- A. SECTION 01 33 00 – Submittal Procedures
- B. SECTION 01 43 00 – Systems Quality Assurance
- C. SECTION 34 42 10 – Signals General Engineering And Design Requirements

1.3 SUBMITTALS

- A. Unless otherwise specified, all submittals shall be in accordance with SECTION 01 33 00 – Submittal Procedures and SECTION 34 42 10 – Signals General Engineering And Design Requirements.
 - 1. A listing of each relay case to be used with its location and proposed size shall be submitted within 14 days of NTP. This information will be used to real estate allocations.
 - 2. Description and/or catalog cut of the proposed relay cases furnished including the proven equipment history.
 - 3. Drawings showing the proposed size, equipment layout, and the method of mounting the required local control panel, vital microprocessor, event recorders, communication interface equipment, and construction of each relay case.
 - 4. Factory test procedure.
- B. Drawings showing the concrete foundations to be used and the ground grid to be installed.
- C. Details of relay case power distribution plan.

1.4 QUALITY ASSURANCE

- A. The Contractor shall comply with the requirements of Division 1.

PART 2 - PRODUCTS**2.1 SIGNAL CASES**

- A. Signal cases shall be constructed from powder-coated, galvanized steel.
- B. Free-standing signal cases, whether or not they house signal instruments, shall be constructed from 12 gauge (minimum) sheet steel on the top, bottom, and all sides.
- C. Signal cases shall be furnished with 1 inch (minimum) of Thermax® insulation on the walls and top.
- D. Signal cases shall also be furnished with backboards and battery boards.
- E. Equipment carrying more than 150V shall be separated and segregated from all other equipment in that same signal case.
- F. Conductors carrying more than 150V shall be in conduit inside of any signal case.
- G. Equipment carrying more than 150V shall be enclosed in a separate metal enclosure inside of any signal case.
- H. Each signal case that contains any signal equipment, other than cases used only for the termination of cables, shall be provided with fluorescent lighting and two 117 Vac duplex convenience outlets.
- I. Design and Fabrication:
 - 1. Doors:
 - a. Hinge and gasket the exterior doors (three minimum) so that they will provide a dust proof and weatherproof seal. Gasket material shall meet requirements of AREMA Communications and Signals Manual, Part 15.2.10 (Recommended Functional Guidelines for Gasket Material Suitable for Circuit Controllers, Signal Cases and Other Signal Apparatus Housings).
 - b. Provide one or two doors that are used to access the rear end of the main terminal board (entrance rack).
 - c. Design doors with a two-position latching device which shall prevent them from being struck by passing trains when open.
 - d. Provide doors with handles, hasps, and a three-point locking device which will ensure door cannot be locked when it is not fully closed.
 - e. Each door shall contain ventilating openings in accordance with the manufacturer's standards. Louvers shall be closeable, covered with fine stainless steel mesh screens, dust filters and protected by weather caps, which shall prevent the entrance of moisture.
 - f. Hinges shall be separate castings securely fastened to the housing and door. Equip the hinges with bronze hinge pins and pressure lubricating fittings. Lubricate hinges before the case is shipped.
 - 2. Relay cases shall be sized to easily accommodate all of the required equipment plus at least 10% usable continuous spare space. If necessary to use more than 1 relay case interconnecting wires shall be pipe connected.

3. Prior to purchase and fabrication equipment layouts within the case shall be as submitted for approval to ensure ease of maintenance and that spare space requirements have been met.
4. The relay case shall be dust tight and insulated to provide maximum heating system efficiency.

2.2 CASE FACILITIES

A. AC Power

1. All relay cases shall be furnished complete with utility connection, meter, circuit protective devices and all appurtenances necessary to supply the AC power required at each site.
2. The Contractor shall be responsible to obtain power for all relay cases. This includes obtaining all required permits.
3. All relay cases shall be provided with a main entrance circuit breaker as a part of the load center. In addition, power inputs to the following signal equipment shall be provided with fuses or circuit breakers:
 - a. Duplex Outlets
 - b. Switch Machines
 - c. Switch indicators/Signals (each signal)
 - d. Power Frequency Track Circuits
 - e. Battery Chargers
 - f. Local Control Panel
 - g. Power Supplies/Rectifiers

B. Contractor shall coordinate division of work between factory installed wiring and field run wiring.

C. Lighting/Outlets:

1. Provide fluorescent lighting at the top of the case.
2. Control the lights by a switch located immediately adjacent to one of the relay case front doors.
3. All convenience outlets installed in relay cases shall be duplex, 120VAC Ground Fault Circuit Interrupter (GFCI) outlets.
4. Each relay case shall be equipped with one convenience outlet adjacent to each front door. All outlets shall be protected by circuit breakers with a minimum rating of 15 amps
5. Power calculations shall assume a constant total draw of 6 amps.

D. Lightning and Transient Protection

1. All relay cases shall be designed, fabricated, and installed in accordance with AREMA Communications and Signals Manual Part 11.1.1 (Recommended Functional/Operating Guidelines for Electrical Safety).

2. High Voltage lightning arrestors shall be applied to commercial power connections.

E. Grounding:

1. Provide a grounding system at each relay case as specified herein. The grounding system shall meet the requirements of AREMA Communications and Signals Manual, Part 11.4.1 (Recommended Instructions for Made Grounds for Signal Systems Utilizing Earth Electrodes), except as otherwise specified herein.
2. For each relay case, provide a ground grid consisting of at least 2 ground rods buried a minimum of 6 inches below finished grade, connected together with a 4/0 bare copper wire to form the grid.
3. The ground rod shall be copper-clad steel with a minimum length of ten feet, and a minimum diameter of 0.75 inch.
4. The ground rod to cable connection shall be by Thermite welding.
5. Provide a hard drawn pure copper ground bus plate for each relay case with a minimum size of 4-inches square and a minimum thickness of $\frac{3}{8}$ inches. This plate shall have a minimum conductivity of 98 percent per ASTM B187/B187M.
6. Connect the ground buss to the ground grid by a minimum of two #6 AWG solid copper conductors.
7. Test and measure ground resistance of each ground connection in an approved manner and shall add as many ground rods as necessary to achieve a resistance between the object being grounded and the ground not to exceed 15 ohms. This test shall be preformed in accordance with IEEE standard 81 requirements.
8. Install ground rods and the connections between arrestors and ground rods in accordance with AREMA Communications and Signals Manual Parts 11.2.1 (Recommended General Practices for Electrical Surge Protection for Signal Systems), 11.3.1 (Recommended Design Criteria and Functional/Operating Guidelines for Primary Surge Protectors for Electrical Surge Protection of a Signal System), and 11.3.2 (Recommended Design Criteria and Functional/Operating Guidelines for Secondary Surge Protectors for Electrical Surge Protection of Signal Systems) Protect all electronic equipment by surge suppressors in addition to primary lightning arrestors in accordance with AREMA Communications and Signals Manual Part 11.3.3 (Recommended Design Criteria for Surge Withstand Capability of Electronic Signal Equipment for Signal Systems).

F. Ground Detectors

1. Provide solid state DC ground detectors for each relay case which shall automatically provide a visual annunciation if any of the vital DC energy buses experiences a ground leakage current greater than or equal to 50 percent of the release value of any vital relay used in the system.
2. Furnish a separate ground detector meeting the following requirements for each DC voltage supply from which external safety circuits or equipment are operated.
 - a. Each DC ground detector unit shall be provided with three indications and a test control.
 - 1) Two indicators, one each for positive and negative, shall indicate the presence of a ground.
 - 2) The third indicator shall indicate that the ground detector is operating properly and no grounds are present.

- 3) The ground fault monitor shall have both an automatic and a manual self test feature and shall latch in the alarm mode if a ground fault is detected.
- b. Ground detectors shall be either rack or wall-mounted in relay cases.
- G. Cable Entrance Rack, Backboards, and Battery Boards
1. Cable entrance and termination racks shall be made of $\frac{3}{4}$ -inch thick non-combustible, moisture-resistant, fire retardant plywood meeting requirements of ASTM E 162 (Test Method For Surface Flammability Of Materials Using A Radiant Heat Energy Source), and ASTM E 662 (Test Method For Specific Optical Density of Smoke generated By Solid Materials); or other suitable equivalent such as "Transite HT" as manufactured by BNZ Materials, Inc.
 2. Mount the entrance and termination backboard on an equipment rack frame as approved by the Authority.
 3. Furnish entrance rack backboard large enough to accommodate all required terminals plus 10 percent spares.
 4. Terminate all conductors of all cables on the entrance rack. Terminals used to terminate spare conductors shall count towards the required 10 percent spares.
 5. All AAR terminals carrying greater than 50 volts shall be insulated.
 6. Separate and segregate equipment carrying more than 150 volts from all other equipment in that same relay case.
 7. Place conductors carrying more than 150 volts in conduit when inside of any relay case.
 8. Enclose equipment carrying more than 150 volts in a separate metal enclosure when inside of any relay case.

PART 3 - EXECUTION

3.1 SHIPPING AND INSTALLATION

- A. Plug-in relays and other equipment subject to damage shall be dismantled, placed in shipping cartons which shall prevent damage, secured and shipped in the relay case.
- B. Mount each relay case on standard pre-cast concrete foundations. Install the relay case in the area shown on the Contract Drawings and not less than 8 feet-6 inches from centerline of tracks at any point.
- C. Level and plumb each relay case and mount on an approved neoprene pad. Install the pad between the base of the relay case and the concrete foundation.

3.2 GROUNDING

- A. Ground rods shall be driven to a depth of 11 feet-6 inches and will be buried a minimum of six inches below the top of grade.
- B. In the event that an obstruction is encountered, the Contractor may use a shorter ground rod if it will result in at least 8 feet of the rod being usable after allowing for it to be buried the minimum of 6 inches below top of grade.
- C. Connect ground bus plate as specified above in each relay case to earth ground using two #6 AWG solid copper conductors.

- D. Ground wire for any equipment connected to ground plate shall be at least a #6 stranded bare copper wire.
- E. Prevent any closed loop arrangement in the grounding layout.
- F. Test and measure ground resistance in an approved manner (as detailed in IEEE standard 81) and shall add as many ground rods as necessary to achieve a resistance between the object being grounded and the ground not to exceed 15 ohms and shall meet the requirements of AREMA Communications and Signals Manual, Part 11.4.1 (Recommended Instructions for Made Grounds for Signal Systems Utilizing Earth Electrodes), except as otherwise specified herein.

PART 4 - MEASUREMENT AND PAYMENT

4.1 MEASUREMENT

- A. The quantities of accepted work will be measured in the following units. All measurements will be plan measure except for authorized changes.
 - 1. Description: Lump Sum

4.2 PAYMENT

- A. Payment will be made at the respective unit or lump-sum price listed in the proposal and shall be full compensation for all labor, materials, and equipment necessary to complete the respective unit in place. There will be no separate measurement or payment for any item of work not specifically identified and listed in the proposal, and all such work shall be considered a subsidiary item with all costs pertaining thereto included in the prices for other items listed in the proposal. At the Engineer's option, partial payment may be made for any lump sum item listed in the proposal, providing that the Contractor is diligently and satisfactorily pursuing full completion of such partially complete item in accordance with the approved job progress schedule.

- A. SECTION 01 33 00 – Submittal Procedures
- B. SECTION 01 43 00 – Systems Quality Assurance
- C. SECTION 34 42 10 – Signals General Engineering and Design Requirements

1.3 SUBMITTALS

- A. Unless otherwise specified, all submittals shall be in accordance with SECTION 01 33 00 – Submittal Procedures and SECTION 34 42 10 – Signals General Engineering And Design Requirements.
- B. Switch Point Heater Data: Submit product data, including point heater controller, control cabinet, point heater elements, rail temperature sensor, and humidity sensor. Include product material specifications, drawings and parts lists.
- C. Switch Point Heater Installation Drawings: Submit an installation drawing for switch point heaters connections at the rail as well as for other associated equipment including temperature and humidity sensors necessary to completely identify the installation. Refer to Section 01 33 00 – Submittal Procedures, for additional requirements.

1.4 QUALITY ASSURANCE

- A. The Contractor shall comply with requirements of Division 1.

PART 2 - PRODUCTS**2.1 DESIGN REQUIREMENTS**

- A. General
 - 1. Switch point heaters shall keep track switch points clear of snow or ice to the extent necessary to permit free and unobstructed operation in all weather conditions. The Contractor shall install the switch point heaters in accordance with AREMA Communications and Signals Manual Part 12.6.10 (Recommended Functional/Operating Guidelines for Winter Switch Protection Devices) and the manufacturer's instructions, except as otherwise specified, or as approved by the Agency. Switch point heater mounting hardware shall not interfere with switch point movement and hardware.

2. Switch Point Heaters shall meet the following requirements:
 - a. The rail web heaters shall be operable at 230 VAC nominal. The Contractor shall ensure that the operating voltage of the heaters matches the source voltage available. The Contractor shall provide autotransformers if necessary to obtain the correct operating voltage for the switch point heaters.
 - b. The Contractor shall furnish and install point heaters of sufficient length to ensure the points of the switch machine are kept free and clear of ice and snow under all conditions.
 - c. The switch heaters shall include both rail temperature and humidity sensors.
 - d. The Contractor shall furnish, install, and test the switch point heaters as well as all associated sensors, cables, junction boxes, and installation hardware required to install the heaters.

B. Control Cabinet

1. The switch point heater control equipment shall be housed in a weatherproof case separate from any signal case in the area. The intent is that the Contractor shall furnish a standard, stand alone heater control cabinet manufactured by the same manufacturer as the switch point heaters.
2. The Contractor shall install the switch point heater control cabinet on the ground in close proximity to the switch points.
3. The Contractor shall be responsible to furnish and install a suitable concrete foundation to support the control cabinet.

2.2 MANUFACTURER'S REFERENCE

- A. Switch Point Heaters as manufactured by Hanning & Kahl, GmbH & Co KG. which is represented in North America by SECA International Railway Consultants, Inc. 885 Arvita Court Oceanside, Ca. 92057 Phone: 714-720-9129.
- B. Or accepted equal

PART 3 - EXECUTION

3.1 INSTALLATION

- A. General: Install equipment in accordance with the manufacturer's recommendations and requirements, and as specified in these technical specifications.
- B. Switch point heaters shall be provided at four switches:
 1. The spring switch located at approximately 203+35
 2. The power turnout located at approximately 519+65
 3. The manual switches in the yard at approximately 23+32 and 24+12

PART 4 - MEASUREMENT AND PAYMENT**4.1 MEASUREMENT**

A. The quantities of accepted work will be measured in the following units. All measurements will be plan measure except for authorized changes.

1. Description: Lump Sum

4.2 PAYMENT

A. Payment will be made at the respective unit or lump-sum price listed in the proposal and shall be full compensation for all labor, materials, and equipment necessary to complete the respective unit in place. There will be no separate measurement or payment for any item of work not specifically identified and listed in the proposal, and all such work shall be considered a subsidiary item with all costs pertaining thereto included in the prices for other items listed in the proposal. At the Engineer's option, partial payment may be made for any lump sum item listed in the proposal, providing that the Contractor is diligently and satisfactorily pursuing full completion of such partially complete item in accordance with the approved job progress schedule.

END OF SECTION

THIS PAGE INTENTIONALLY LEFT BLANK

SECTION 34 42 40

SIGNALS TAGS, LOCKS AND KEYS

PART 1 - GENERAL

1.1 SUMMARY

- A. This Section includes Specifications for furnishing and installing tags, locks and keys.

1.2 RELATED SECTIONS

- A. SECTION 01 33 00 – Submittal Procedures
- B. SECTION 01 43 00 – Systems Quality Assurance
- C. SECTION 34 42 10 – Signals General Engineering and Design Requirements

1.3 SUBMITTALS

- A. Unless otherwise specified, all submittals by the Contractor shall be in accordance with SECTION 01 33 00 – Submittal Procedures and SECTION 34 42 10 – Signals General Engineering And Design Requirements.
- B. The Contractor shall submit a sample of each type of tag for Approval.
- C. The Contractor shall submit padlock and key shop drawings and literature for Approval.

1.4 QUALITY ASSURANCE

- A. The Contractor shall comply with requirements of Division 1.

PART 2 - PRODUCTS

2.1 PLASTIC TAGS

- A. All plastic tags shall have a minimum font size of 10 points with a minimum spacing between lines of 7 points. A point is defined as 1/72 of an inch.
- B. All tags shall be waterproof and the lettering protected from fading and smudging.
- C. The lettering on all plastic tags shall be computer generated. No tags shall be hand lettered.
- D. Each flat tag shall have the following minimum characteristics:
1. White laminated phenolic or vinyl plastic, with black lettering
 2. A minimum of two holes for screw mounting
 3. Minimum thickness of 0.050 inches
- E. Each wire tag shall have the following minimum characteristics:
1. White vinyl plastic with black lettering, protected with a 0.005-inch clear overlamine.
 2. Minimum thickness of 0.020 inches

- 3. All corners rounded to an approximately 1/8-inch radius.
- F. Each cable tag shall have the following minimum characteristics:
 - 1. Same as wire tags, except attached to cable with pre-tied nylon cord loops.
- G. Each sleeve tag shall have the following minimum characteristics:
 - 1. White vinyl plastic with black lettering
 - 2. Lengths as required, minimum length 3/4 inch
 - 3. Diameter shall be selected for a snug fit on wire

2.2 METAL TAGS

- A. Each cast metal tag shall have the following minimum characteristics:
 - 1. Malleable cast metal
 - 2. Painted white
 - 3. Minimum height 3 inches
 - 4. Minimum thickness 1/16 inch
- B. Each brass tag shall have the following minimum characteristics:
 - 1. 1/4 inch high letters and numbers stamped onto the tag
 - 2. Sufficient size to contain required information, DANGER 750 VOLTS, without crowding
 - 3. Minimum thickness 1/32 inch
 - 4. All stencil markings shall be clearly legible and shall be made using white enamel paint.

2.3 LOCKS AND KEYS

- A. The Contractor shall provide padlocks per owner's requirements. Each key shall have the following minimum characteristics:
 - 1. The keys shall not be commercially duplicable
 - 2. Furnish two keys per lock that open all locks of that same type

PART 3 - EXECUTION

3.1 TAGGING

- A. The Contractor shall provide and install a unique equipment identification code for each type of fixed equipment and replaceable element. The identification code shall be up to ten digits in length. All wiring, including color coded wires, shall be tagged as detailed below.
- B. The Contractor shall install flat tags onto the following system components:
 - 1. Relays and relay plugboards to show relay designation
 - 2. Equipment to show equipment designation

- C. The Contractor shall install "three line" sleeve type wire tags on all wires.
 - 1. All wire tags shall contain three pieces of information.
 - a. Line one shall be the location of the wire on which the tag is being installed.
 - b. Line two shall be the circuit nomenclature that the wire is a part of.
 - c. Line three shall be the destination of the wire.
 - 2. Wire tags shall be installed in all of the following situations:
 - a. On terminal ends of all wires and cable conductors installed in the system
 - b. Adjacent to terminals or binding posts wherever possible
 - 3. Tags shall not slide off the wire when it is disconnected from its termination point.
- D. Install cable tags, showing unique cable identification, with pre-tied nylon cord loops on cable sheath near the pothead.
- E. Cast Metal Tags
 - 1. Install two letters, "N" and "R", at least 6 inches high and painted white at each switch point.
- F. Stenciling
 - 1. Field cases, junction boxes and switch machines using 1-1/2 inch lettering to identify location.

3.2 PADLOCKS

- A. Contractor shall install padlocks onto the following:
 - 1. Wayside relay cases, cases and junction boxes
 - 2. Terminal cases
 - 3. Signal heads
 - 4. Switch machines, circuit controllers, etc., and associated equipment cases
- B. The Contractor shall provide locks and keys for the various applications as detailed below. Update this table when information is available.

Usage	Lock Type & Manufacturer	Quantity	Key Code	Key/wrench Quantity	Remarks
Signals	Coordinate with the owner	3 per signal	NA	1 per signal	
Mainline Switch Machine – Operating & Hand Throw Levers	Coordinate with the owner	1 per switch	NA	2 per switch	
Mainline Switch Machine – Access Panel & Terminal Box	Coordinate with the owner	2 per switch	NA	1 per switch	
Point Detectors	Coordinate with the owner	1 per circuit controller	NA	1 per circuit controller	
Cases	Coordinate with the owner	1 per door	NA	2 per door	
Spares	Coordinate with the owner	10% of total number of locks supplied	NA	20% of the total number of keys supplied	

PART 4 - MEASUREMENT AND PAYMENT

4.1 MEASUREMENT

A. The quantities of accepted work will be measured in the following units. All measurements will be plan measure except for authorized changes.

1. Description: Lump Sum

4.2 PAYMENT

A. Payment will be made at the respective unit or lump-sum price listed in the proposal and shall be full compensation for all labor, materials, and equipment necessary to complete the respective unit in place. There will be no separate measurement or payment for any item of work not specifically identified and listed in the proposal, and all such work shall be considered a subsidiary item with all costs pertaining thereto included in the prices for other items listed in the proposal. At the Engineer’s option, partial payment may be made for any lump sum item listed in the proposal, providing that the Contractor is diligently and satisfactorily pursuing full completion of such partially complete item in accordance with the approved job progress schedule.

END OF SECTION

SECTION 34 42 44**SIGNALS POWER DISTRIBUTION****PART 1 - GENERAL****1.1 SUMMARY**

- A. This Section includes Specifications for the furnishing and installation of the power distribution for signal equipment, including feeders, buses, transformers, ground detectors and associated auxiliary materials and equipment. The Contractor shall be responsible to furnish, install, wire, and test all power distribution equipment as detailed below including obtaining the actual power drop from the local power company. The Contractor shall also be responsible to provide documentation to show that all components of the power distribution systems are sized adequately.

1.2 RELATED SECTIONS

- A. SECTION 01 33 00 – Submittal Procedures
- B. SECTION 01 43 00 – Systems Quality Assurance
- C. SECTION 34 42 10 – General Engineering and Design Requirements
- D. SECTION 34 42 16 – Wire and Cable
- E. SECTION 34 42 29 – Electrical and Electronic Components
- F. SECTION 34 42 33 – Prefabricated Relay Cases
- G. SECTION 34 42 76 – Tests and Inspections

1.3 SUBMITTALS

- A. Unless otherwise specified, all submittals shall be in accordance with SECTION 01 33 00 – Submittal Procedures and SECTION 34 42 10 – Signals General Engineering And Design Requirements.
 - 1. The Contractor shall submit computations of the AC and DC power requirements for each signal equipment location.
 - 2. The Contractor shall submit drawings showing power layout of feeders, transformers, switches, fuses, breakers and buses internal to the relay case.
 - 3. The Contractor shall submit drawings of DC power supplies showing mechanical and electrical characteristics, performance data and method of protection.
 - 4. The Contractor shall submit as-built drawings of all power distribution circuitry and equipment installations internal to the relay case.

1.4 QUALITY ASSURANCE

- A. The Contractor shall comply with requirements of Division 1.
- B. The Contractor shall perform field testing as specified in SECTION 34 42 76 – Signals Tests And Inspections.

1.5 POWER DISTRIBUTION CRITERIA

- A. The Contractor shall provide each relay case with AC power.
1. For all relay cases the Contractor shall;
 - a. Coordinate with the local power company on the drop location
 - b. Obtain the necessary permits
 - c. Furnish and install the required conduit from the power company's point of demarcation to the relay case load center including service cable, meter pan and service disconnect switch per the latest edition of the NEC.
 - d. Provide load calculations confirming all of the required amperages needed for each relay case for sizing the service cable and main breaker in the case.
 - e. Furnish and install the relay case and all the necessary power distribution equipment within the relay case up to and including the load center.
 2. The following requirements shall apply to all relay cases:
 - a. The incoming AC power will terminate in a standard load center that shall have sufficient space to accommodate all of the required breakers plus a minimum of 50% spare spaces.
 - b. The load center shall provide separate breakers for:
 - 1) Relay case lighting and convenience outlets
 - 2) Relay case ventilation
 - 3) Switch heater cabinets at locations with switch heaters
 - c. The Contractor's power calculations shall determine the size of the breakers required.
 - d. The load center breakers shall feed a bank of indicating type fuses, which shall in turn distribute the AC power throughout the case as required.
- B. Power Calculations
1. The Contractor shall be responsible to calculate the load of each relay case.
 2. The Contractor shall compute the size of the power distribution system required to feed equipment.
 3. The Contractor shall design the complete power layout of feeders, transformers, fuses and buses, based on locations and size of individual signal loads.
 4. The Contractor shall size feeders to carry the rated load plus 15% for future load, with a voltage drop of not more than 4%, except that no feeder shall be smaller than #6 AWG. The feeders shall be sized so as to be able to carry a load equal to 125% of the total load that will be imposed by the portion of the system to be fed.
 5. The Contractor's calculations shall assume a worst case load, including case lighting is on, all signals are lit, maximum microprocessor/relay load, maximum track circuit load, switches are moving and drawing 14 Amps each, all power supplies are drawing their maximum rated current, switch heaters are on, and a 6 Amp draw from case convenience outlets.

6. The Contractor's calculations shall demonstrate that:
 - a. The incoming service feed is adequately sized.
 - b. The fuses, buss feeder wires, transformers, DC power supplies, etc., are adequately sized.
 - c. The proposed power distribution system meets the requirements detailed in the Specification.
 7. The Contractor's calculations shall demonstrate that the batteries supplied are of sufficient capacity to provide for the required 8 hours of normal Street Car system operation in the event of loss of commercial AC power. The calculations shall:
 - a. Assume one train movement in each direction every 15 minutes continuously over the 8 hour period.
 8. The Contractor shall submit these calculations and the system design to the Agency for Approval prior to purchasing any equipment.
- C. Lightning and Transient Protection
1. All relay cases shall be designed, fabricated and installed in accordance with AREMA Communications and Signals Manual Part 11.1.1 (Recommended Functional/Operating Guidelines for Electrical Safety), except as otherwise specified herein, or as Approved by the Agency.
 2. All track circuits shall be protected from lightning per AREMA Communications and Signals Manual Part 11.3.1 (Recommended Design Criteria and Functional/Operating Guidelines for Primary Surge Protectors for Electrical Surge Protection of Signal Systems), except as otherwise specified herein, or as Approved by the Agency.
 3. All ground rods and the connections between arrestors and ground rods shall be installed in accordance with AREMA Communications and Signals Manual Parts 11.2.1 (Recommended General Practices for Electrical Surge Protection of Signal Systems), 11.3.1 (Recommended Design Criteria and Functional/Operating Guidelines for Primary Surge Protectors for Electrical Surge Protection of Signal Systems), 11.3.2 (Recommended Design Criteria and Functional/Operating Guidelines for Secondary Surge Protectors for Electrical Surge Protection of Signal Systems), 11.3.4 (Recommended Design Criteria for Copper Clad Steel Ground Rods and Connections for Signal Systems) and 11.3.5 (Recommended Design Criteria for Chemically Enhanced Ground Electrode Systems for Signal Systems), except as otherwise specified herein, or as Approved by the Agency.
 4. All electronic equipment shall be protected by surge suppressors in addition to primary lightning arrestors in accordance with AREMA Communications and Signals Manual Part 11.3.3 (Recommended Design Criteria for Surge Withstand Capability of Electronic Signal Equipment for Signal Systems) and Part 11.3.6 (Recommended Design Criteria and Function for Solid State AC Primary Surge Protective Devices (SPDs) for Communication and Signal Systems), except as otherwise specified herein, or as Approved by the Agency.
 5. High voltage lightning arrestors shall be applied to commercial connections.

D. Relay Case and Junction Box Wiring

1. The Contractor shall comply with the requirements of this Section for all relay case and junction box wiring.
2. All cable conductors, including spare conductors provided over and above the Contract requirements shall be terminated on multiple unit AREMA (AAR) terminal blocks in accordance with AREMA Communications and Signals Manual Part 14.1.8 (Recommended Design Criteria for Molded Binding Post Type Terminal Block, Details and Assemblies). Track wires and cables may be terminated on lightning arrestors.
3. If energy is distributed to various points in a relay case or junction box by wire loops, the details of each loop and its various connections shall be illustrated on the circuit plans. Such loops shall have both ends connected to the buss.
4. If the same energy source is needed at various points in the relay case power loop shall be created. Minimum wire size for the power loop shall be #10. The Contractor shall ensure that voltage loss within the wiring of the buss does not affect the operation of the equipment that the buss is powering. Calculations shall be based upon the assumption that the incoming power may sag up to 10%.
5. Both ends of all wires and terminal boards shall be tagged with nomenclature, which is shown on the circuit plans. Tags shall be permanent, non-conductive, and attached to the wire and terminal board so as not to be easily removed.

PART 2 - PRODUCTS**2.1 POWER CABLE**

- A. Power cable for distribution of power to signal equipment locations and highway grade crossing warning system equipment locations shall be as specified in SECTION 34 42 16 – Signals Wire And Cable.

2.2 POWER EQUIPMENT**A. DC Power Supplies**

1. Shall be as specified in SECTION 34 42 29 - Signals Electrical and Electronic Components.
2. In addition to any other power supplies required by the Contractor's design, the Contractor shall provide a separate Line Battery (LB) supply. This power supply shall be used exclusively to supply DC power to loads outside of the relay case other than signal bulbs. Such loads shall include but not be limited to:
 - a. Switch indication circuits
 - b. Line circuits
3. In addition to any other power supplies required, the Contractor shall provide a separate Signal Lighting Battery (EB) supply. This supply shall be used exclusively to provide power to light wayside signals.

B. Batteries

1. Back-up batteries shall be furnished for each relay case.
2. Batteries shall be added in parallel as needed to provide a minimum of 8 hours of normal equipment operation without AC power.

3. Batteries shall be sealed lead acid batteries in accordance with AREMA Communications and Signals Manual Part 9.1 (Recommended Batteries), except as otherwise specified, or as Approved by the Agency.
 4. The batteries shall be Optima Gel model D34M-950 or approved equal.
- C. Battery Chargers
1. One battery charger shall be furnished for each set of backup batteries.
 2. The battery chargers shall be NRS (National Railway Supply) model ERB-C 12/20 or approved equal.
- D. Transformers
1. All transformers shall be of the air cooled, dry type conforming to AREMA Communications and Signals Manual, Part 14.2.10 (Recommended Design Criteria for Transformer, Dry-Type, Air-Cooled) and NEMA ST 20-1992 (R1997), appropriately de-rated per ANSI C.57.12.01 for altitude above 3,300 feet, except as otherwise specified herein, or as Approved by the Agency.
 2. All transformers shall be sized for 125% of the normal continuous load, and shall be equipped with taps sufficient to adjust for line losses and normal voltage variations. Primary and secondary taps shall be brought to a terminal board mounted on the transformer case. Taps shall be labeled on the terminal board with respect to voltage.
 3. Power frequency track circuit transformers shall have an input of 120 Volts, 60 Hz and an adjustable output. Secondary windings shall be provided with taps to supply voltages in steps as Approved by the Agency. Taps shall be provided in the primary windings for 110 Volts and 115 Volts. Track transformers shall be capable of carrying the track circuit load plus 25% overload.
 4. Flux density shall be sufficiently below saturation to allow a minimum of 10% over-voltage excitation.
 5. Noise level shall not exceed limits set by local regulations, and shall not exceed the following, as determined in accordance with NEMA ST 20-1992 (R1997):
 - a. For transformers sized 0 to 9 kVA: 40 dBA sound level
 - b. For transformers sized 10 kVA to 50 kVA: 45 dBA sound level
 - c. For transformers sized 51 kVA and above: 50 dBA sound level
 6. Finishes: Thoroughly cleaned, degreased, coated with hot phosphate chemical bath, corrosion inhibiting primer or undercoat, and overall finish coat of manufacturer's standard electrical paint. Colors as Approved by the Agency.
- E. Switch Heater Transformers
1. It expected that in most cases the AC power available to power the switch heaters will be 240 VAC. The Contractor shall furnish and install an appropriately sized transformer to convert the incoming AC service voltage to the voltage required by the switch heaters.

F. Indicating Fuses

1. The Contractor's power calculations shall determine the size of the individual fuses required. All fuses shall meet the following requirements:
 - a. Fuses shall be fiber-case, non-renewable, time-lag, fusion, indicating type.
 - b. Shall be the correct size and rating to protect the wiring of the circuit they are in.
 - c. If in a circuit carrying more than 50 Volts, the fuse block shall be provided with a clear plastic cover to reduce shock hazard.
 - d. The fuses shall be constructed in such a way that it is readily apparent from a visual inspection whether a fuse is blown or not.
 - e. The blown fuse indications shall be collected and used to drive the "Blown Fuse" indication on the local control panel.
 - f. All fuses shall be centrally located on the power distribution panels or power racks.

PART 3 - EXECUTION**3.1 POWER EQUIPMENT****A. Power Supplies**

1. All power supplies shall be either wall, shelf or rack mounted.

B. Transformers

1. The Contractor shall install transformers in accordance with the manufacturer's instructions.
2. Flexible metal conduit not less than 18 inches or more than 36 inches in length shall be used to connect to conduits unless otherwise Approved by the Agency.
3. The Contractor shall verify that all circuits are connected as shown on the Contract Drawings.
4. The Contractor shall perform insulation and circuit continuity tests prior to connecting primary service.

C. Grounding

1. Grounding shall be as specified in SECTION 34 42 33 PREFABRICATED RELAY CASES.

PART 4 - MEASUREMENT AND PAYMENT**4.1 MEASUREMENT**

A. The quantities of accepted work will be measured in the following units. All measurements will be plan measure except for authorized changes.

1. Description: Lump Sum

4.2 PAYMENT

A. Payment will be made at the respective unit or lump-sum price listed in the proposal and shall be full compensation for all labor, materials, and equipment necessary to complete the respective unit in place. There will be no separate measurement or payment for any item of work not specifically identified and listed in the proposal, and all such work shall be considered a subsidiary item with all costs pertaining thereto included in the prices for other items listed in the proposal. At the Engineer's option, partial payment may be made for any lump sum item listed in the proposal, providing that the Contractor is diligently and satisfactorily pursuing full completion of such partially complete item in accordance with the approved job progress schedule.

END OF SECTION

THIS PAGE INTENTIONALLY LEFT BLANK

SECTION 34 42 52**SIGNALS POWER SWITCH AND LOCK MACHINES****PART 1 - GENERAL****1.1 SUMMARY**

- A. This Section includes requirements for furnishing power switch and lock machines and associated layouts for embedded track.

1.2 RELATED SECTIONS

- A. SECTION 01 33 00 – Submittal Procedures
- B. SECTION 01 43 00 – Systems Quality Assurance
- C. SECTION 34 42 10 – Signals General Engineering and Design Requirements
- D. SECTION 34 42 25 – Signals Relays and Plugboards
- E. SECTION 34 42 68 – Signals Circuit and Operational Requirements.
- F. SECTION 34 42 76 – Signals Tests and Inspections

1.3 QUALITY ASSURANCE

- A. The Contractor shall comply with the requirements of Division 1. The Systems Contractor shall also conduct tests for all wayside signal equipment in accordance with SECTION 34 42 76 – Signals Tests And Inspections.

1.4 REFERENCES

- A. American Railway Engineering and Maintenance-of-Way Association, Communications & Signals Manual of Recommended Practice [AREMA C&S Manual]
 - 1. AREMA C&S MANUAL, PART 1.5.10 – Recommended Instructions for Painting and Protective Coatings.
 - 2. AREMA C&S MANUAL, PART 14.1.8 – Recommended Design Criteria for Molded Binding Post Type Terminal Block, Details and Assemblies.

1.5 SUBMITTALS

- A. Unless otherwise specified, all submittals shall be in accordance with
 - 1. Switch Machine Product Data: Submit performance data, and mechanical and electrical drawings, for each type of switch machine, including interconnecting rods and all associated hardware. Include parts list, and switch numbers and letters
 - 2. Earth Box: Submit product data for earth boxes in accordance with the requirements of this Section.
 - 3. Junction Boxes: Submit product data for junction boxes in accordance with the requirements of this Section.

4. Switch Machine Installation Drawings: Submit an installation drawing for each type of switch installation. Include switch layout, mounting material and methods (including method of insulating installation from track), corrosion preventive grease, junction box locations, identification numbers and letters, signal or switch point indicator locations (as applicable), and all other associated equipment and conditions necessary to completely identify the installation
5. Switch Machine Mounting Details: Submit, for each type of switch machine (and switch circuit controller if applicable) to be provided, mounting hole layouts for the trackwork procurement contractor to provide the concrete switch ties with insulated embedded threaded female inserts to suit the switch machine mounting holes.

PART 2 - PRODUCTS

2.1 GENERAL

- A. Power Switch and Lock Machines: Furnish and install embedded power-operated switch machines where indicated in the Contract Drawings.
- B. Manual Switch and Lock Machines: Provide embedded hand-operated switch machines where indicated in the drawings that accompany this Request for Proposal. These machines shall be suitable for spring-type operation.
- C. Insulation: Supply insulators to electrically insulate the switch machine layout from the running rails.
- D. Operating Voltage:
 1. Switch machines shall be rated for operation at either 120 VAC or 240 VAC. Switch operating voltage shall be measured at the motor connection while switch is moving.
- E. Point Detection and Indication
 1. Provide point detection and indication in accordance with the requirements of Section 34 42 68 – CIRCUIT AND OPERATIONAL REQUIREMENTS.
- F. Layout
 1. The switch layout shall include (as applicable) housing with non-rusting cover, earth case, junction boxes, mounting brackets, conduit, hoses, tubing, terminals, hardware, and all other electrical materials and fittings necessary to interconnect the track switch machine to the ductbank and the relay case.
 2. All rods shall be standard in design. No bending of rods shall be permitted to complete an installation.
 3. Switch machines, their accessories, and the connections to the track switch, shall be compatible with the conditions of the embedded special track work.
- G. Identification
 1. Power Switch and Lock Machines: Provide embedded power-operated switch machines where indicated in the drawings that accompany this Request for Proposal.
 2. For each embedded type switch machine stencil the switch number on the switch machine earth box cover plate. Coordinate size, lettering, and placement with the Resident Engineer.

- H. Relays: Provide relays for switch control in accordance with the requirements of Section 34 42 25 – RELAYS AND PLUGBOARDS. As an alternative, submit a solid state equivalent for this function for approval
- I. Lubricant: Provide a “dry” graphite based switch plate lubricant common to the railroad industry. Motor oil or any lithium or similar petroleum-based “bearing” greases is not permitted.
- J. Padlocks: Provide padlocks for motor compartments, hand throw levers, switch machine junction boxes, and circuit controller enclosures, as applicable, in accordance with the requirements of Section 34 40 42 TAGS, LOCKS, AND KEYS..

2.2 MANUFACTURER’S REFERENCE

- A. Power Machines
 - 1. Contec GmbH is represented in North America by H. J. Skelton (Canada) Ltd., 165 Oxford Street, East London, Ontario N6A 1T4 Canada. Phone 1-877-235-1883
 - a. Model CSV 24, accepted
 - 2. Hanning & Kahl, GmbH & Co KG. is represented in North America by SECA International Railway Consultants, Inc. 885 Arvita Court Oceanside, Ca. 92057 Phone: 714-720-9129
 - a. Model HWE 61, accepted
 - 3. Or accepted equal
- B. Hand Operated Spring and Return Machines:
 - 1. Hanning & Kahl GmbH & Co KG is represented in North America by SECA International Railway Consultants, Inc. 885 Arvita Court Oceanside, Ca. 92057 Phone: 714-720-9129
 - a. Model HWU42 Slap/Return
 - b. Or accepted equal

2.3 DETAILS OF DESIGN

- A. Furnish switch machine and earth box with the shallowest possible height to reduce concrete penetration.
- B. Switch Machine:
 - 1. Switch Point Indication: Provide an electro-mechanical switch machine design with a double interlocking point setting mechanism and point detectors.
 - 2. Provide two (2) hardwearing, inductive proximity switches to sense the switch point position of both normal and reverse indications respectively, for signaling the correct position of end points and the downward locking movement.
 - 3. Provide point position indicator signal as an integral part of the machine.
 - 4. Throwing force: 5000N, minimum, and adjustable up to 7000N.
 - 5. Holding force shall be not less than 7000N.
 - 6. Include positive locking on the drive and point detector.

7. If furnishing the Hanning and Kahl HWE-61 switch machine also furnish the Harting Cable to power the machine.
- C. Earth Box:
1. Design the earth boxes for the switch machines to accommodate the internal housing of the point setting mechanism. If furnishing the Hanning and Kahl HWE-61 switch machine, furnish the "large" earth box to accommodate future switch machine changes.
 2. Design both the earth box and the surface cover to be capable of supporting AASHTO HS20 loading.
 3. Design the cover to be fastened to the earth box with 4 bolts, minimum.
 4. Design the earth box assemblies to provide electrical isolation from the switch housing and the track slab.
 5. Design the insulated contact connection (bolted) of the earth box to the switch housing.
 6. Color: Provide the earth box cover of a color to match the surrounding embedment concrete.
 7. Drainage: Design the earth box for drainage system via a floor drain connection as shown on the Plans.
 8. Earth Box Materials: Reinforced polyester concrete formulation of polyester resins as follows:
 - a. "High Density Polymer Concrete", a Synertech Molded Product by Oldcastle Precast, Chicago, IL 60604, telephone (773) 622-1177, or accepted equal.

PART 3 - EXECUTION

3.1 DELIVERY, STORAGE, AND HANDLING

- A. Packaging:
1. Prior to shipment, coat all unpainted metal parts of the switch machine and layouts with accepted corrosion preventive grease sufficient to prevent corrosion, in accordance with manufacturer's recommendations.
 2. Ship each unit securely wrapped, crated or packaged; and labeled to avoid damage or distortion and for safe handling in shipment.
 3. Suitably plug or cap all unused threaded outlets.
 4. Package all small parts in containers such as boxes, crates, or barrels to avoid dispersal and loss.
 5. Firmly secure an itemized list and description of contents to each such container.
 6. Protect projecting parts by blocking with wood, by providing bracing, or by other accepted methods.

- B. Ocean Shipments:
1. Ship materials in suitable crates or in ocean going cargo containers. Do not ship open or palletized in general cargo area of the hold of the ship.
 2. Implement protective measures so as to prevent damage in shipping due to salt water, salt spray, humidity, shifted cargo, and similar causes.

PART 4 - MEASUREMENT AND PAYMENT

4.1 MEASUREMENT

- A. The quantities of accepted work will be measured in the following units. All measurements will be plan measure except for authorized changes.
1. Description: Lump Sum

4.2 PAYMENT

- A. Payment will be made at the respective unit or lump-sum price listed in the proposal and shall be full compensation for all labor, materials, and equipment necessary to complete the respective unit in place. There will be no separate measurement or payment for any item of work not specifically identified and listed in the proposal, and all such work shall be considered a subsidiary item with all costs pertaining thereto included in the prices for other items listed in the proposal. At the Engineer's option, partial payment may be made for any lump sum item listed in the proposal, providing that the Contractor is diligently and satisfactorily pursuing full completion of such partially complete item in accordance with the approved job progress schedule.

THIS PAGE INTENTIONALLY LEFT BLANK

SECTION 34 42 56

SIGNAL LAYOUTS

PART 1 - GENERAL

1.1 SUMMARY

- A. This Section includes the requirements for furnishing and installing wayside signals and associated accessories, to be provided in the Contract.

1.2 RELATED SECTIONS

- A. SECTION 01 33 00 – Submittal Procedures
- B. SECTION 01 43 00 – Systems Quality Assurance
- C. SECTION 34 42 40 – Signals Tags, Locks, and Keys
- D. SECTION 34 42 68 – Signals Circuit and Operational Requirements
- E. SECTION 34 42 76 – Signals Tests and Inspections

1.3 REFERENCES

- A. American Railway Engineering and Maintenance-of-Way Association, Communications & Signals Manual of Recommended Practice [AREMA C&S Manual]
 - 1. AREMA C&S MANUAL, PART 1.5.10 – Recommended Instructions for Painting and Protective Coatings

1.4 SUBMITTALS

- A. Unless otherwise specified, all submittals shall be in accordance with SECTION 01 33 00 – Submittal Procedures and SECTION 34 42 10 – Signals General Engineering and Design Requirements.
- B. Signal Product Data: Submit complete drawings of each type of signal layout to be used, including all mounting and wiring. Include all necessary product material drawings, signal identification sign, and part lists.
- C. Signal Installation Drawings: Submit installation drawings for each type of signal layout. Refer to Section 01 33 00 – Submittal Procedures, for additional requirements.

1.5 QUALITY ASSURANCE

- A. The Contractor shall comply with requirements of Division 1.
- B. The Contractor shall factory test all electrical and electronic components prior to installation in accordance with manufacturer's test procedures and provisions of SECTION 34 42 76 - Signals Tests And Inspections.

PART 2 - PRODUCTS**2.1 GENERAL**

- A. Visibility: Signals and indicators shall be designed to be located so that the unit shall provide a distinct and unmistakable aspect at a distance of 300 feet.
- B. Mounting: Wayside signals may be mounted on nearby OCS poles or separate signal poles. Contractor to do final design and submit to the Project Manager for Approval
- C. Grounding: Signals to be grounded to 25 ohms or less.
- D. Painting: Paint housings and mounting hardware a non-reflecting dull grey, in accordance with AREMA C&S Manual, Part 1.5.10 Recommended Instructions for Painting and Protective Coatings.

2.2 SIGNALS

- A. General: Signals shall be 3 aspect bar signal (horizontal, 45°, and 90°) and be manufactured such that they are capable of being mounted on a variety of diameter poles. The intent is to mount the signals on nearby OCS poles or separate signal poles based on the contractor's final design. Contractor to coordinate with OCS pole and foundation design if mounting on OCS poles is desired.
 - 1. The signals shall be supplied by Hanning & Kahl or "owner approved equal".
- B. Layout:
 - 1. Provide signals general locations indicated on the Contract Drawings. Coordinate final locations with the facilities designs.
 - 2. Layouts shall be completely equipped with LEDs (unless approved or specified otherwise), terminals, number plates, and all other mounting hardware and components to complete the installation.
 - 3. Housings shall permit easy access to internal components. Each unit shall be factory wired and pre-focused.
 - 4. Signals shall be powered from the applicable microprocessor-based system output, when practical. Where distances between signals and the controlling relay case do not permit the use of a direct feed from the vital microprocessor (e.g., 120 VAC feed required), furnish and install all required equipment, including isolation transformer, necessary to provide a complete and operational system.

PART 3 - EXECUTION**3.1 INSTALLATION**

- A. General
 - 1. Install in accordance with approved Contractor-provided installation plan and drawings, and in accordance with the requirements of the Contract Drawing Typical Installation Drawings.
- B. Clearance Requirements: The design and installation of the equipment shall not interfere with the dynamic clearance of the vehicle.
- C. Security: Provide locks and/or other security in accordance with the requirements of SECTION 34 42 40 – Signals Tags, Locks, And Keys.

- D. Identification:
1. Include signal identification number as a part of the signal layout. Face the identification number in the direction that allows it to be read by the vehicle operator.
 2. Coordinate size, lettering, and placement with the Resident Engineer.
- E. Test: Test signals and indicators in accordance with the requirements of Section 34 42 76 –Signals Tests And Inspections.

PART 4 - MEASUREMENT AND PAYMENT

4.1 MEASUREMENT

- A. The quantities of accepted work will be measured in the following units. All measurements will be plan measure except for authorized changes.
1. Description: Lump Sum

4.2 PAYMENT

- A. Payment will be made at the respective unit or lump-sum price listed in the proposal and shall be full compensation for all labor, materials, and equipment necessary to complete the respective unit in place. There will be no separate measurement or payment for any item of work not specifically identified and listed in the proposal, and all such work shall be considered a subsidiary item with all costs pertaining thereto included in the prices for other items listed in the proposal. At the Engineer's option, partial payment may be made for any lump sum item listed in the proposal, providing that the Contractor is diligently and satisfactorily pursuing full completion of such partially complete item in accordance with the approved job progress schedule.

THIS PAGE INTENTIONALLY LEFT BLANK

SECTION 34 42 58**SIGNALS TRACK CIRCUITS AND BONDING****PART 1 - GENERAL****1.1 SUMMARY**

- A. This Section includes:
 - 1. Requirements for furnishing and installing power frequency (PF) track circuit equipment
 - 2. Requirements for power bonding at turnout locations
 - 3. Requirements for crossbonding

1.2 RELATED SECTIONS

- A. SECTION01 33 00 – Submittal Procedures
- B. SECTION01 43 00 – Systems Quality Assurance
- C. SECTION34 42 10 – Signals General Engineering and Design Requirements
- D. SECTION34 24 25 – Signals Relays and Plugboards
- E. SECTION34 42 40 – Signals Tags, Locks, and Keys
- F. SECTION34 42 76 – Signals Tests and Inspections

1.3 REFERENCES

- A. American Railway Engineering and Maintenance-of-Way Association, Communications & Signals Manual of Recommended Practice [AREMA C&S Manual]
 - 1. AREMA C&S MANUAL, PART 8.1.33 – Recommended Design Criteria for Copper Based Exothermically Welded-Type Propulsion Rail-Web Bonds and Track Connections.

1.4 SUBMITTALS

- A. Unless otherwise specified, all submittals shall be in accordance with SECTION01 33 00 – Submittal Procedures and SECTION 34 42 10 – Signals General Engineering And Design Requirements.
- B. Track Circuit Product Data: Submit product data for each type of track circuit. Include as a minimum, parts lists, circuit drawing and description identifying that shunting and other performance requirements have been met, and component drawings and data. Identify pre-shunt and post-shunt characteristics.
- C. Power Bonding Product Data: Submit product data on each type of bond. Include as a minimum catalog, data, exothermic weld material, mold numbers, and manufacturer's installation data.
- D. Track Circuit and Power Bonding Installation Drawings: Submit installation drawings identifying the proposed track circuit and power bonding layouts for each turnout.

- E. Insulated Joint Location Documentation: Submit documentation that the locations of all insulated joints indicated on the Contract Drawings are acceptable for the Contractor's proposed signal design. Indicate additions, deletions, or relocations, if required.
- F. Relay Product Data: Submit relay product data in accordance with SECTION 34 42 25 – Signals Relays And Plugboards.

1.5 QUALITY ASSURANCE

- A. The Contractor shall comply with requirements of Division 1.

PART 2 - PRODUCTS

2.1 GENERAL

- A. Design
 - 1. Furnish and install track circuits, including all associated hardware to complete the installation. The Signal System indicated in the Contract Documents is a preliminary design and indicates intended functionality. The Contractor shall complete the final design as required in order to provide a fully operational, flexible, reliable and safe Signal System that conforms to all applicable parts of the AREMA C&S Manual, Section 8.
 - 2. Track circuits shall function to provide continuous train detection throughout the entire length of the circuit whenever a shunt of 0.20 ohms (Ω) is applied to the rails at any location within the track circuit boundary, including shunt fouling regions within turnouts. Assume the following rail to ground resistance values:
 - a. Ballasted Track - 250 ohms per 1000' of double track system.
 - b. Direct Fixation - 250 ohms per 1000' of double track system.
 - c. Embedded Track - 100 ohms per 1000' of double track system.
 - 3. The design of track circuits in crossovers shall minimize dead sections through the interlocking to the maximum extent possible.
 - 4. Does not use shunt fouling in turnouts. Instead provide a track circuit which either uses two relays or arranges insulated joints to provide a series track circuit.
 - 5. The Contractor's designs shall provide for all design details, including insulated joints, operating voltages, filtering, frequency separation, impedance matching, surge protection, cable and wiring, and all related items required to ensure properly operating, safe, reliable, and low maintenance track circuits.
- B. Operating Temperature Ranges: Wayside equipment shall operate normally within the temperature ranges specified in SECTION 34 42 10 – Signals General Engineering And Design Requirements.
- C. Interference and Protection
 - 1. The design of all wayside signaling equipment shall incorporate electro-magnetic compatibility concepts to minimize potential interference from within the Signal System and nearby electrical systems.
 - 2. No vital signal relays, filters, modules, or other components shall have an operating frequency within the harmonic spectrum of the DC traction power transformer/rectifier harmonic output.

3. The equipment shall not generate spurious emissions, or introduce interference in other systems. The equipment shall be electro-magnetically compatible with other systems and equipment in its environment.
 4. Other than for primary protection, surge protection shall be built-in to the equipment. All external connections shall be via standard AREMA terminals.
 5. The Contractor shall ascertain if there are any facilities in proximity along the right of way, where the equipment is to be applied, that may adversely affect the equipment or system operation. If necessary, steps shall be taken to preclude interference with system operation.
- D. Insulated Joints
1. Preliminary insulated joint locations have been indicated on the Contract Drawings. Final circuit design, drawings, and coordination with the Trackwork Contractor (via the AGENCY), shall be the responsibility of the Contractor.
 2. Should the design require additional insulated joints, or relocation or deletion of existing joints the Contractor shall coordinate final locations with the Resident Engineer.
- E. Relays: Refer to SECTION 34 42 25 – Signals Relays And Plugboards, for requirements.

2.2 POWER FREQUENCY TRACK CIRCUITS

- A. Design
1. Equipment shall operate normally from a range of 90 VAC to 130 VAC.
 2. The signal system shall use single ac track circuits for main line train protection, as indicated on the Contract Drawings. Review the functional design indicated and propose a design that provides the functionality specified.
 3. Track circuit limits shall be as defined by the insulated joints, and track circuit detection shall extend to cover the clear point of tracks connected to the main line.

2.3 CROSSBONDS

- A. The only crossbonding associated with the signal system will be just beyond the insulated joints that define the OS track circuits.
- B. The Contractor shall furnish, install, and test 2-500 KCMIL jumpers to electrically connect all of the rails together just beyond the insulated joint at the OS track circuits.
- C. Welds: Provide rail welds meeting the requirements of AREMA C&S Manual, Part 8.1.33 Recommended Design Criteria for Copper Based Exothermically Welded-Type Propulsion Rail-Web Bonds and Track Connections.

2.4 POWER AND SIGNAL RAIL BONDING

- A. General: Furnish and install bonding for special trackwork, as indicated in Contract Drawing Typical Installation Plans. Bonds shall be applied to all bolted rail joints.
- B. Power and Signal Rail Bonding: Install in accordance with the Contract Drawing Typical Installation Drawings.
- C. Welds: Provide rail welds meeting the requirements of AREMA C&S MANUAL, Part 8.1.33 Recommended Design Criteria for Copper Based Exothermically Welded-Type Propulsion Rail-Web Bonds and Track Connections.

PART 3 - EXECUTION**3.1 GENERAL**

- A. Clearance Requirements: The design and installation of the equipment shall not interfere with the dynamic clearance of the vehicle.
- B. Security: Provide locks and/or other security in accordance with the requirements of Section 34 42 40 – Signals Tags, Locks, And Keys.
- C. Installation
 - 1. Install per the approved Contractor-provided installation drawings.
 - 2. Preparation of the running rail and the installation of the rail connections shall be in accordance with the bond manufacturer's recommendations unless otherwise specified. Rail surfaces that will be in contact with molten metal during welding shall be ground to remove all rust and deposits. Clean welds of all slag and debris. Inspect each bond to ensure that a properly fused joint has been made. Bond connections to the rails shall be exothermically welded to the neutral axis of the rails.
 - 3. Exposed copper shall be painted with an approved non-oxide grease within 8 hours of installation of bonds. Bonds shall be lubricated to prevent internal friction.
- D. Insulated Joint Locations: Provide final locations of required insulated joints to the Resident Engineer as specified so as to minimize impacts to work by others on the project.
- E. Protection of Ballast: The Contractor shall take all of the necessary precautionary measures to ensure that track ballast is not fouled (contaminated with dirt or sub-ballast) during the course of his work. The Contractor shall minimize any disruption to the ballast after it has been dressed by the preceding facilities contract, and shall be responsible to re-dress any ballast that has been disturbed.

3.2 TRACK CIRCUITS

- A. General
 - 1. Track circuit connections shall include installation of flexible conduit from the pullbox or junction box to the rail. Band conduit to concrete tie. Epoxy bolts to the concrete invert. Conduit shall be sealed immediately after installation of bond strand wire.
 - 2. Bond strand connections shall be exothermically welded to the neutral axis of the rail and within 6 inches of the insulated joint bar. Provide sufficient slack in bond strand at termination points to allow for minor rail movement and for a minimum of 3 re-terminations without having to replace or re-run the wire. Slack for re-terminations shall be kept in rail clips that are designed to attach to the rail without drilling.
 - 3. Plug bonds shall not be used.
- B. Track Circuit Connections
 - 1. Install track circuit connections as close to insulated joint location as possible.
- C. Test: Test track circuits in accordance with the requirements of SECTION 34 42 76 – Signals Tests And Inspections.

3.3 SPECIAL TRACKWORK POWER BONDING

A. General

1. Bond connections shall be made using approved exothermic weld techniques and materials that provide a thorough mechanical connection and electrical contact. Welding shall be performed in accordance with the bond manufacturer's recommendations and in accordance with Contract Drawing Typical Installation Drawings.
2. Conduit used for the installation of bonding cables shall be immediately resealed with an approved resilient sealing compound made expressly for the purpose.

B. Embedded Track

1. The Contractor shall be responsible to furnish, install, and test all power bonding.

3.4 CROSSBONDS

A. Locations: Coordinate the locations of crossbonds with AGENCY prior to installation.

B. Crossbond Cable

1. In non-signaled territory, cut cable to appropriate lengths, install and weld directly to the rail or plate, as indicated on the Contract Drawings.

PART 4 - MEASUREMENT AND PAYMENT

4.1 MEASUREMENT

A. The quantities of accepted work will be measured in the following units. All measurements will be plan measure except for authorized changes.

1. Description: Lump Sum

4.2 PAYMENT

A. Payment will be made at the respective unit or lump-sum price listed in the proposal and shall be full compensation for all labor, materials, and equipment necessary to complete the respective unit in place. There will be no separate measurement or payment for any item of work not specifically identified and listed in the proposal, and all such work shall be considered a subsidiary item with all costs pertaining thereto included in the prices for other items listed in the proposal. At the Engineer's option, partial payment may be made for any lump sum item listed in the proposal, providing that the Contractor is diligently and satisfactorily pursuing full completion of such partially complete item in accordance with the approved job progress schedule.

END OF SECTION

THIS PAGE INTENTIONALLY LEFT BLANK

SECTION 34 42 60**SIGNALS TRAIN-TO-WAYSIDE COMMUNICATIONS****PART 1 - GENERAL****1.1 SUMMARY**

- A. This Section includes the requirements for furnishing and installing the Train-to-Wayside Communications (TWC) System.

1.2 RELATED SECTIONS

- A. SECTION 01 33 00 – Submittal Procedures
- B. SECTION 01 43 00 – Systems Quality Assurance
- C. SECTION 34 42 10 – Signals General Engineering and Design Requirements
- D. SECTION 34 42 16 – Signals Wire and Cable
- E. SECTION 34 42 40 – Signals Tags, Locks, and Keys
- F. SECTION 34 42 76 – Signals Test and Inspections

1.3 SUBMITTALS

- A. Unless otherwise specified, all submittals shall be in accordance with SECTION 01 33 00 – Submittal Procedures and SECTION 34 42 10 – Signals General Engineering And Design Requirements.
- B. TWC Product Data: Submit TWC product data, including interrogator, filter, tuning kit, encapsulation kit, and all printed circuit boards. Include product material specifications, drawings and parts lists. Include proposed paint for the wayside loops.
- C. TWC Cable: Submit TWC cable in accordance with the requirements of SECTION 34 42 16 – Signals Wire And Cable.
- D. TWC Installation Drawings: Submit an installation drawing for each type of loop (e.g., ballast, embedded). Include loop layout, mounting material and methods (e.g. epoxy filler for embedded loops), pullbox or junction box location, and other associated equipment and conditions necessary to completely identify the installation. Refer to SECTION 01 33 00 – Submittal Procedures, for additional requirements.
- E. TWC Programming Software: Submit three sets of software for the programming of the decoder card. Include instructions for programming and the proposed destination assignment scheme.
- F. TWC Programmer's Resume: Submit a resume for the proposed engineer to perform TWC programming.

1.4 QUALITY ASSURANCE

- A. The Contractor shall comply with requirements of Division 1.

PART 2 - PRODUCTS**2.1 DESIGN REQUIREMENTS**

- A. The Signal System shall use the Train-to-Wayside Communications System to provide control of select interlocking routes from on-board the Street Car. The system provided shall be HSC-R system, supplied by Hanning & Kahl, or owner approved equal. Contractor to verify required TWC equipment with the carborne TWC supplied equipment. Contractor shall also coordinate with traffic signal operation during the desing of the signal system
- B. The interface to the vital microprocessor shall be coordinated to address the physical, electrical, and message protocol requirements.
- C. The unit shall communicate at 9600 bps, which shall be the default setting in the case of a loss of communications.

2.2 WAYSIDE EQUIPMENT

- A. Interrogator
 - 1. Provide each interrogator unit capable of controlling for up to four wayside loops. The interrogator unit shall be complete with all cards and devices necessary for system operation, and shall include, but is not limited to:
 - a. Power supply;
 - b. Transmitter/receiver;
 - c. Register;
 - d. Application backplane;
 - e. Programmable decoder, and;
 - f. Relay interface.
 - 2. The latest version of the programmable decoder card shall be utilized within the interrogator. Each card shall be programmed to perform all the functions required for its application at the respective location. The programming of each unit shall be recorded.
 - 3. A relay interface card, installed in the application backplane, shall be used for the interface between the programmable decoder card and the vital microprocessor.
 - 4. With all required cards installed, the application backplane shall have two spare slots available.
 - 5. At a minimum, whether used or not, the unit shall include:
 - a. Provisions for interfacing to 8 form 1C contact closures, and;
 - b. Provisions for controlling 8 external relays.
- B. Loop
 - 1. Furnish and install wire loops between the rails, at the locations indicated on the Contract Drawings, to read information from the train.
 - 2. Backfill the sawcut made in the concrete to install the loop with an appropriate material.

3. Adjust the size and location of the loops in accordance with the manufacturer's recommendations.
 4. Provide the number of turns in loop cable in accordance with the manufacturer's recommendations.
- C. Cable
1. The type, size and characteristics of the cable between the interrogator location and the loop location shall be as recommended by the manufacturer for this application. It shall be suitable for installation in a systemwide ductbank in an electrified railroad environment.
 2. Furnish an install a compatible interface cable for interconnections between the interrogator and the vital signal microprocessor, per the requirement of SECTION 34 42 16 – Signals Wire And Cable.
 3. The Contractor shall submit the type of protocol and interface standard used. The protocol shall be an industry standard used in North America, and shall be compatible with other signal and communications systems functions.
- D. Support Equipment: Provide hardware, software, adjusting equipment, special tools, and test equipment for installation, adjustment, and testing of the TWC System. Provide required connecting cables and/or interfaces for use with the laptop computer described in SECTION 34 42 72 – Signals Spare Parts, Manuals, And Training. Software shall function properly on the personal computer specified. Provide an additional copy of the software for backup and installation on the Vehicle maintenance laptop computers.
- E. Power: Furnish and install necessary power supplies.

PART 3 - EXECUTION

3.1 APPLICATION

- A. Operation: Provide a system that meets the operational requirements specified in SECTION 34 42 68 – Signals Circuit and Operational Requirements, and as indicated in the Contract Drawings.
- B. Function: The TWC System will permit the following capabilities:
1. Automatic routing of trains at select interlockings, based on train destination.
 2. Selectable routing to a specific track at select interlockings.
 3. The ability to cancel a selected route and request an alternate or the same route as desired.
- C. Route Control
1. TWC shall be provided at locations where route selection is required, as indicated on the Contract Drawings. At these locations, the interrogator will interface with the signal microprocessors (e.g., route requests). Provide for the following routing functions:
 - a. Primary Route.
 - b. Secondary/Storage Route.
 - c. Route/Crossing Cancel.

- D. Destination Routing
 - 1. The design shall permit the routing of trains based on destination settings on the vehicles. The design shall permit future extensions of the system.
- E. Programming
 - 1. Program the system so that in the event of a system power failure, once power has been restored, the system maintains the proper data rate to communicate with the vital microprocessor.
 - 2. Programming shall be performed by someone who has had experience in doing so, preferably by the manufacturer's representative. Submit, to the satisfaction of the Resident Engineer, the qualifications of the person who will be performing the programming.

3.2 INSTALLATION

- A. General: Install equipment in accordance with the manufacturer's recommendations and requirements, and as specified in these technical specifications.
- B. Clearance Requirements: The design and installation of the equipment shall not interfere with the dynamic clearance of the vehicle.
- C. Security: Provide locks and/or other security in accordance with the requirements of Section 34 42 40 – TAGS, LOCK, AND KEYS.
- D. Wayside Loops
 - 1. The loop wire shall be installed in the concrete with a saw cut.
 - 2. After installation of the wire loop, seal over wire with an approved waterproof epoxy filler or sealant that does not impede reception of signals from the vehicle.
- E. Filter Unit
 - 1. Each loop shall be tuned according to the manufacturer's directions and recommendations. Loop operation shall be tested to confirm proper system operation before sealing the filter units. Sealing of the units shall be in accordance with the manufacturer's specifications or recommendations using approved encapsulation kits.
 - 2. In embedded areas, install a junction box in the pullbox provided by the facilities contractor adjacent the blockout, and install the filter in the junction box.
 - 3. The wire from the loop to the filter unit shall be twisted and no longer than permitted by the manufacturer.
- F. Interrogator
 - 1. The interrogator shall be properly mounted in the relay case. It shall be located so that the cards are easily accessible for testing or replacement by maintenance personnel.
 - 2. Wiring and connections for power and interfaces to the interrogator shall be according to the manufacturer's instructions.
- G. Cable Terminations: Install and terminate signal cables entering the relay case in accordance with the requirements of SECTION 34 42 16 – Signals Wire and Cable.

- H. Test: Test the TWC System in accordance with the requirements of SECTION 34 42 76 – Signals Tests and Inspections.

PART 4 - MEASUREMENT AND PAYMENT

4.1 MEASUREMENT

- A. The quantities of accepted work will be measured in the following units. All measurements will be plan measure except for authorized changes.

1. Description: Lump Sum

4.2 PAYMENT

- A. Payment will be made at the respective unit or lump-sum price listed in the proposal and shall be full compensation for all labor, materials, and equipment necessary to complete the respective unit in place. There will be no separate measurement or payment for any item of work not specifically identified and listed in the proposal, and all such work shall be considered a subsidiary item with all costs pertaining thereto included in the prices for other items listed in the proposal. At the Engineer's option, partial payment may be made for any lump sum item listed in the proposal, providing that the Contractor is diligently and satisfactorily pursuing full completion of such partially complete item in accordance with the approved job progress schedule.

THIS PAGE INTENTIONALLY LEFT BLANK

SECTION 34 42 68**SIGNALS CIRCUIT AND OPERATIONAL REQUIREMENTS****PART 1 - GENERAL****1.1 SUMMARY**

- A. This Section includes:
 - 1. Requirements pertaining to operation of the signaling system.
 - 2. Requirements for the design of specific vital and non-vital circuits.
 - 3. Site-specific operating requirements for each location that shall supplement the requirements of the Contract Drawing Route and Aspect Charts.

1.2 RELATED SECTIONS

- A. SECTION 01 33 00 – Submittal Procedures.
- B. SECTION 01 43 00 – Systems Quality Assurance.
- C. SECTION 34 42 25 – Signals Relays and Plugboards
- D. SECTION 34 42 76 – Signals Tests and Inspections

1.3 REFERENCES

- A. American Railway Engineering and Maintenance-of-Way Association, Communications & Signals Manual of Recommended Practice [AREMA C&S Manual]
 - 1. AREMA C&S Manual, Part 2.2.10 – Recommended Functional/Operating Guidelines for Interlockings.
 - 2. AREMA C&S Manual, Part 11.2.1 – Recommended General Practices for Electrical Surge Protection of Signal Systems.
- B. Federal Railroad Administration [FRA]
 - 1. FRA 236 – Rules, Standards, and Instruction Governing the Installation, Inspection, Maintenance, and Repair of Signal and Train Control Systems, Devices, and Applications.

1.4 QUALITY ASSURANCE

- A. The Contractor shall comply with the requirements of Division 1. The Contractor shall also conduct tests for all wayside signal equipment in accordance with SECTION 34 42 76 – Signals Tests And Inspections.

1.5 SUBMITTALS

- A. Unless otherwise specified, all submittals shall be in accordance with SECTION 01 33 00 – Submittal Procedures and SECTION 34 42 10 – Signals General Engineering and Design Requirements.

- B. Circuits: Submittal of circuits and signal software equations shall be part of the Book of Plans submitted for each relay case as specified in SECTION 01 33 00 – Submittal Procedures.
- C. Preliminary Operational Description: Submit a complete operational description of each interlocking using the descriptions included herein as a basis. Include descriptions for all routes. Submit concurrently with the Preliminary Track Plans, as specified in SECTION 01 33 00 – Submittal Procedures.
- D. Final Operational Description: Submit an updated operational description of each interlocking after System Integration testing has been completed. Identify final time delay settings.

PART 2 - PRODUCTS

2.1 OPERATIONAL DESCRIPTION

- A. Interlocking Descriptions: Using the operational descriptions included in Article 3.01 herein, in combination with the requirements of the Contract Drawing Route and Aspect Charts, provide a complete operational description for each interlocking, including manual crossovers. Expand the descriptions and fully describe how the signal system will operate. Include, at a minimum:
 - 1. Normal operating scenarios
 - 2. Reverse running scenarios
 - 3. Crossover moves
 - 4. All modes of route initiation and cancellation, including:
 - a. Local Control Panel (LCP)
 - b. Train-to-Wayside Communications (TWC)
 - 5. Signal aspects
 - 6. Time release settings: Identify the time release setting provided for each crossing activation point and each signal apparatus, including all approach and/or time locking settings.

PART 3 - EXECUTION

3.1 OPERATIONAL DESCRIPTIONS

- A. General Operating Requirements
 - 1. Under normal operating conditions, interlockings shall be controlled by a train stopping at the interlocking limits and making a TWC request for the desired route. Each interlocking shall be provided with a local control panel for use in the event of a TWC failure or for routine maintenance.
 - 2. Separation of trains in general will be performed through the use of train scheduling, with trains operating under “line of sight” rules, unless specified otherwise.
 - 3. Except at interlockings, train movement along the alignment will be regulated by the street traffic signal system and be “line-of-sight”.

4. The only "signalized" portion of the alignment shall be within interlocking limits. Movements through interlockings shall be governed by 3 aspect wayside signals. Standard railroad signal techniques shall be employed to control the home signals, line routes, lock switches, etc.
5. Contractor furnished and installed interlocking signals shall be placed at interlocking limits to provide the Street Car operator with a visual indication that a route through an interlocking is aligned and locked. Home signals shall be mounted on OCS poles adjacent to the right-of-way as close as possible to the interlocking limits.
6. No traffic circuits shall be provided between interlockings.
7. The signal system shall allow reverse movements through interlockings as indicated on the contract drawings.

3.2 GENERAL

- A. Microprocessor Logic: Although the requirements for the design of the signal system circuits described herein are based on relay-based functional descriptions, the Contractor provide a vital microprocessor-based approach to the design of the Signal System, which shall conform to the AREMA C&S Manual, Parts 2.2.12, Recommended Functional/Operational Guidelines for Vital Software-Based Interlocking Systems unless specified or approved otherwise. The intent of the specification is to eliminate the use of both vital and non-vital relays, to the maximum extent possible, through the use of microprocessors. The Contractor is encouraged to submit solid state alternatives to functions which would be normally be handled by relays, such as light out detection, switch control, etc. for approval. The Contractor shall depict microprocessor-based logic in standard relay logic format or ladder logic depending on the format used for its development.
- B. Fail-Safe: Provide fail-safe circuit design and equipment, unless specified otherwise. Vital circuits shall be of fail-safe design, based on closed loop circuit principles, and meet AREMA requirements for the use of vital relays.
- C. Spare Contacts: Where relays are utilized, design circuits to provide a minimum of one independent front-back contact on the first relay of that function, or on the last series repeater of that function.
- D. Electrical Surge Suppression: System shall be protected against lightning and other voltage surges in rail and power supply leads when installed in conjunction with external surge protection, conforming to AREMA C&S Manual, Part 11.2.1, Recommended General Practices for Electrical Surge Protection of Signal Systems.

3.3 VITAL CIRCUITS

- A. General: All vital circuits that energize a relay located outside of a relay case and all circuits which energize a vital relay located inside a case but which contain contacts outside of the relay case, shall be two-wire double break circuits, energized from an ungrounded DC power supply.
- B. Relays: Construct vital circuits using vital relays, vital relay timers and other vital components. Non-vital components shall not be placed in vital circuitry.
- C. Repeater Relays: Provide repeater relays as necessary to meet design needs and spare contact requirements. Provide series repeater circuits for vital circuits. Establish guidelines for use of primary and repeater relay contacts, based on system safety requirements, and to minimize the impact to system operation should a repeater relay fail to operate in conjunction with its primary relay.

- D. Vital Functions: Vital circuits shall include:
1. Route security and check circuits
 2. Switch locking circuits
 3. Switch correspondence circuits
 4. Switch repeater circuits
 5. Loss of shunt (OS track)
 6. Detector locking
 7. Train detection
 8. Switch operating circuits
 9. Signal lighting circuits
 10. Signal clearing circuits
 11. Time locking circuits
 12. Track repeater circuits
 13. Line circuits, where applicable
 14. Track circuits

3.4 NON-VITAL CIRCUITS

- A. Positive Energy: Provide positive-energy single break type non-vital relay circuits.
- B. Repeater Relays: Provide series or parallel repeaters of non-vital relays.
- C. Non-Vital Functions: Non-vital circuits shall include, as a minimum, the following:
1. Switch request logic to request alignment of individual switches in response to action by TWC or the LCP.
 2. Signal control request circuits to request and cancel signal clearing. Control this circuit from TWC or by the LCP.
 3. Local manual control panel circuits to facilitate transfer of control and to provide LCP lighting.
 4. Provide route request logic to request or cancel signals for those locations indicated in the Contract Drawings, in response to LCP or TWC activation.
 5. Power On Indication.

3.5 CIRCUIT REQUIREMENTS

- A. Route Request Circuits: Route request circuits perform the functions required before acknowledging and processing signal clearing requests. Route request circuits shall:
1. Prevent signal clear request from being acted upon when conflicting routes are aligned.
 2. Provide cancel functions to cancel route request and signal clear request.

3. Provide non-vital type signal call circuits that request and cancel routes over switches.
4. Route request circuits will operate under hierarchical control. Local control shall have the highest priority followed by TWC. The normal mode of operation shall be via the TWC system. When placed in Local Control, the panel may override route requests made via TWC. Changing the mode of operation shall not in itself cancel a request made in another mode of operation.
5. Provide a signal fleeting function for normal direction moves for all locations. The fleeting column on the Contract Drawing Route and Aspect Charts indicate those signals fledged for normal operation. Fleeting is the type of control in which route selections are automatically re-established after the passage of trains, thereby permitting continuous system operation without requiring LCP intervention to align routes.
6. Route initiation and cancellation shall be capable via:
 - a. Train to Wayside Communications (TWC) System.
 - 1) Provide route request circuits to interface TWC requests to the switch request, signal clearing, and cancel request circuitry for those locations and routes indicated.
 - 2) The TWC request shall not process switch position requests or signal clearing unless all conditions necessary for the clearing of that route are available. The system shall store the request until conditions allow its execution.
 - 3) The circuitry shall remember the TWC request until the route is cleared or cancelled by a subsequent request. The TWC system shall allow a train operator to re-request the same route after it has been cancelled.
 - 4) TWC requested moves through interlockings shall normally be requested by destination numbers programmed into the TWC unit. The train operator shall also have the ability to request individual switches and signals.
 - b. Local Control Panel (LCP) – The local control panel described below is based on a standard panel with physical levers, pushbuttons, and lights and is intended to be used only as a general description of how the LCP shall function. The Contractor shall furnish a PC based LCP with an LCD display. The display shall be the largest one that will mount in the relay case. At a minimum the local control panel shall provide the following features;
 - 1) Be PC based and communicate serially with the signal system microprocessor for the status of wayside equipment such as switches, track occupancy, signal aspects, etc.
 - 2) Communications parameters between the local control panel and the signal system microprocessor such as baud rate shall be adjustable with a default function to automatically return them to factory settings.
 - 3) Have the ability to monitor and decode the serial messages being sent between the local control panel PC and the signal system microprocessor.

- 4) Have a "Link Health" monitor that automatically shows the status of the serial link (OK or failed) between the local control panel PC and the signal microprocessor.
 - 5) Have the ability to display alarm indications such as ground faults, power off, burned out signal bulb, etc on the local control panel.
 - 6) The colors, line weights, and text fonts shall be adjustable. For example, a track section shall be able to change both, its color and line weight based upon occupancy, route lined, etc. Switches shall be able to change color based upon locked/unlocked, blocked, etc. Signals shall change colors based upon, clear, at stop, fleeted, blocked, etc.
 - 7) Signal indications on the panel shall match the indication of the signal in the field. A flashing aspect in the field shall be displayed as flashing on the local control panel.
- c. The proposed equipment as well as the actual proposed display shall be submitted for approval prior to fabricating the panel. The colors, line weights, and fonts used to depict the objects and conditions shown on the panel such as switches, signals, track segments, etc. will be selected by the Agency as a part of the approval of this submittal. The final local control panel display will then be created using these selections as a basis for the objects and text shown on the panel. As a part of this submittal the Contractor shall provide a written description of the differences between what is described below and how the actual panel will function. Operation of the LCP shall follow standard "unit-lever" type operation.
- 1) The panel shall provide all required controls and indications to support unit lever operation. To establish a route when in MANUAL (Local) operation, the LCP operator switches shall first aligned to the desired route with the switch levers. Switch position indicators on the local control panel shall flash in the direction requested until the switch points indicated correspondence with the request.
 - 2) Once the route is aligned, the track sections shall create a white line through the interlocking limits. The LCP operator shall next request the desired signal by pressing the appropriate signal request pushbutton. All signals shall also be equipped with signal cancel pushbuttons. Signals for moves in the "normal" direction shall also be equipped with fleeting pushbuttons.
 - 3) When the signal clears, the appropriate signal indication will illuminate and the route through the interlocking shall turn to green. As the Street Car moves through the route, the green light shall change to red to indicate occupied track circuits. If the operator wants to fleet a signal he will first clear it and then the push the "fleet" pushbutton. In order to cancel a fleeted signal the operator will use the signal cancel pushbutton. A signal that is "in-time" shall flash red.
 - 4) Provide lamp-out indications for each signal.
 - 5) As the Street Car clears each track circuit, the indication shall return to dark.

- 6) To cancel a signal, the cancel pushbutton shall be operated for the designated signal.
 - 7) Provide auxiliary switch control levers to operate the switches independently without setting up a route.
 - 8) Provide a "key-switch" that must be operated in order to assume control of the interlocking via the LCP.
- B. Switch Lock Circuits: Provide one vital switch locking circuit for each powered switch turnout or switch correspondence group. Switch lock circuits shall include detector locking, approach and/or time locking (as applicable), and loss of shunt protection. Switch locking shall only be released when approach locking, time locking, and route locking are released, and detector track circuits are unoccupied.
- C. Switch Control Circuits: Provide one vital normal and one vital reverse control relay wired in parallel for opposite polarities.
1. Provide three-wire, double-break, polar circuit for the switch operating relay network.
 2. Control operation of the switch machine by opening, closing, and reversing polarity to motor windings via contacts of the switch control relays. Provide a magnetic blow-out feature with these contacts. If the switch operating relay is not the same manufacturer of the switch machine, Contractor shall submit evidence that the contact ratings are applicable for the switch machine.
 3. Check front contacts of the switch control relay against the control relay for the opposite switch position. If both switch control relays are de-energized or both are energized, do not apply power to switch machine motor.
 4. Provide overload stick relays to remove power from the switch machine if the operating current rises to the level and duration to which the friction clutch is adjusted. Wire one coil of the overload stick relay in series with the switch operating circuit to energize the overload stick relay if an overcurrent condition occurs; use of an external nichrome wire is acceptable. Energize the other coil of the overload stick relay located in the switch control circuit so that overload stick relay remains energized until switch call is removed or reversed. Energizing the overload stick relay will de-energize the switch control relays of the switch machine. The overload relay shall energize in accordance with the requirements of the switch machine manufacturer.
- D. Switch Correspondence Circuit: Provide vital switch correspondence circuits to indicate agreement between physical switch position and switch call.
1. Provide one normal and one reverse switch correspondence relay for each switch or pair of switches that work together (crossover).
 2. Energize switch correspondence relays using a biased-neutral relay, controlled by two-wire, double-break, polar circuit. Correct polarity energy for energizing the correspondence relay shall appear across relay coils when both the switch machine and switch point detector circuit controllers indicate that switch is mechanically locked in the desired position. Verify that the opposite switch call relays and opposite switch correspondence relays are de-energized. Provide a combination switch correspondence relay for switch pairs when necessary to verify that the position of both switches are in agreement before requesting a route over the interlocking.

3. Lock the switch in the normal or reverse position before the associated switch correspondence relay will energize. Wire the circuit so that the position of the switch machine can be checked at the relay case, and switch junction box, to facilitate maintenance.
 4. De-energize the correspondence relays when the hand crank is inserted for manual operation or when the selector lever is moved from the power position to the hand position.
- E. Solid State Alternative: The intent of the specification is to eliminate the use of relays to the maximum extent possible. As an alternative the Contractor is encouraged to submit for approval an alternative solid state device which will provide switch control, indication, and overload functions. The intent of the specification is that the proposed device shall provide all of the functionality described above without the use of vital relays.
- F. Route Check Circuits: Provide route check circuits to initiate signal clearing, or provide an input to the street traffic controller, for each controlling interlocking signal.
1. Energize vital route check relays to initiate wayside signal clearing when conditions required for the route are verified:
 2. Verify that no conflicting conditions exist in the interlocking.
 3. Verify that switch positions are correct by using switch correspondence relays.
- G. Approach Locking Circuits: Provide an approach locking relay for each signal, where applicable.
1. Approach locking shall lock switches within a route governed by a cleared interlocking signal and shall prevent opposing or conflicting routes.
 2. Approach locking for an interlocking signal shall lock movement of switches when that signal is cleared by the route check relay. Approach locking circuits shall prevent simultaneous clearing of conflicting signals within interlocking.
 3. Release approach locking when approach locking relay is energized. Release approach locking for signals when one of the following has occurred:
 - a. Street Car passes signal and the signal goes to STOP. Include the POS in the circuit.
 - b. Signal is set to STOP and time locking has been released.
- H. Time Locking: Prevents the position of a switch from being changed until a pre-determined time has elapsed after a signal governing movements over the route has been caused to display a stop aspect. Provide, in accordance with AREMA guidelines, for all routes not having approach locking. Initially set timers for 30 seconds.
- I. Route Locking: Prevents the movement of any switch on a cleared route in advance of a train. Provide in accordance with AREMA guidelines.
1. Route locking shall be effective when a train passes a signal displaying an aspect for the train to proceed.
 2. Release route locking when route locking relays are energized.
 3. Release route locking when a train has passed the interlocking signal, approach or time locking has been released, and track circuits within the route have become unoccupied.

4. Where sectional release of route locking is required, release each section independently as it becomes unoccupied.
 5. Release route locking when approach or time locking releases after interlocking signal has been set to STOP.
- J. Signal Clearing Circuits: Signal clearing circuits shall verify that:
1. Route check circuit indicates route has been established.
 2. Approach locking for interlocking signal is in effect.
 3. Approach or time locking for opposing signals is not in effect.
 4. Switches within the route correspond with their calls and are mechanically and electrically locked.
 5. No conflicting routes are being processed.
 6. Appropriate interlocking track circuits are unoccupied.
 7. No residual time is left on approach locking timer.
- K. Signal Lighting Circuits and Aspects: Provide vital signal lighting circuits for each signal using a direct output from the vital microprocessor. Signal lighting shall be configured such that:
1. A horizontal aspect is illuminated for a signal set to STOP.
 2. A steady 45° aspect is illuminated for a signal set to CLEAR with the switch points reverse, normal direction of travel.
 3. A steady 90° aspect is illuminated for a signal set to CLEAR with the switch points normal, normal direction of travel.
 4. A flashing 45° aspect is illuminated for a signal set to CLEAR with the switch points reverse, reverse direction of travel.
 5. A flashing 90° aspect is illuminated for a signal set to CLEAR, with the switch points normal, reverse direction of travel.
 6. A dark aspect shall not create a condition to display a less restrictive aspect, and shall be interpreted as STOP.
- L. Line Circuits
1. Provide other line circuits, as required by the Contractor's final design, to provide line information not supported by the vital interlocking microprocessor.
 2. Information between locations may be transmitted via line wire to DC relays or may be coded information for microprocessor logic with requirements as follows:
 3. Relay Logic
 - a. Provide double break type line wire circuits using ungrounded energy to control vital bias neutral relays.
 - b. Provide a line resistor for each circuit.

- M. Event Recorder
 - 1. Record vital signal system functions, including, but not limited to:
 - a. Track circuit occupancy
 - b. Route locking
 - c. Approach locking
 - d. Time locking
 - e. Switch correspondence
 - f. Switch lock
 - g. Signal clear
 - h. Power On indication
 - i. Loss of shunt
 - 2. Record all alarms.
 - 3. Time stamp all events.

3.6 APPLICATION

- A. General: Design and install the circuits described above in a manner that provides a complete and functional system, meeting all the requirements of the Contract Documents.
- B. Safety
 - 1. Safety of operations for AGENCY's Street Car System is primarily the responsibility of operator adherence to AGENCY's operating rule-book. There is, however, no equipment on board the Street Car, such as overspeed protection, to enforce wayside signals. Whenever an unsafe condition could develop from an equipment failure or a procedural error, fail-safe design techniques shall be used to prevent the occurrence of the unsafe condition. All control methods, circuitry, mechanical equipment, solid-state apparatus, and operating procedures provided under this Project for vital operation shall conform to this requirement.
- C. Vital Circuits: The term vital, when used in these technical specifications, shall be used to mean any function, application, or technique whose purpose it is to maintain the safety of life and property.
- D. Fail-Safe, General: As used in these technical specifications, the fail-safe principle shall mean that whenever an equipment failure, a human error or a failure to act, or an adverse environmental condition affects the specified operation of a system involved with the safety of life or property, that system shall revert to a state known to be safe. The following shall apply to all circuit design:
 - 1. The failure of a circuit or of equipment, which results in an indication of a dangerous or restrictive condition, whether or not there is in fact actual danger, shall have met the fail-safe requirement of these technical specifications. Conversely, a failure which results in an indication of safe or of a less restrictive condition when a dangerous condition exists shall not have met the fail-safe requirements.

2. The failure of any of the vital Signal System components shall not in any way affect the safety of train operation. System design shall include means of protecting the equipment from malfunction or damage due to voltage transients on or induced in the wiring. The equipment shall also be protected from damage from accidental overvoltage or voltage reversal, and be immune to the existing or possible extraneous frequencies or energy which may be present.
 3. The Signal System shall be based on principles that shall permit the attainment of fail-safe operation in all known or discovered failure modes.
 4. Fail-safe circuits shall employ the closed loop principle and shall protect against open circuits, shorted circuits, grounded circuits, or any combination of these.
 5. All line circuits, which control vital functions, shall be two-wire, double-break circuits. All circuits of a vital nature shall be energized from ungrounded power supplies.
 - a. In addition to any other power supplies required by the Contractor's design, the Contractor shall provide a separate LB (Line Battery) supply. This power supply shall be used exclusively to supply DC power to loads outside of the signal case other than signal bulbs. Such loads shall include but not be limited to;
 - 1) Switch indication circuits
 - 2) Control and Indication circuits for electric locks
 - 3) Line circuits
 6. Relays used in vital circuits shall be "vital" as specified herein.
 7. Spurious oscillations from any electronic equipment or component thereof, whether passive or active, shall not cause an unsafe condition.
 8. Filters used in fail-safe circuits shall be designed to prevent undesired signals, of a level which could cause an unsafe condition, from appearing at the filter output.
 9. All vital signal relays, filters, modules, and other components shall not have an operating frequency within the harmonic spectrum of the DC traction power transformer/rectifier harmonic output.
- E. Fail-Safe, Circuit Design: In producing a fail-safe design, consider the following and other possible equipment failures and conditions:
1. Vital Relays: Open coils, shorted coils, or high contact resistance.
 2. Non-vital Relays: Open coils, shorted coils, fused contacts, high contact resistance, armature sticking, and broken springs.
 3. Transformers: Open primary, open secondary, shorted turns, primary to secondary shorts, or combinations of these conditions:
 4. Resistors: Increase in resistance or decrease in resistance.
 5. Capacitors: Shorted, open, or electrolyte leakage.
 6. Transistors: Shorted, open, leakage, or a loss of Beta.
 7. Diodes: Shorts, opens, or reverse leakage.
 8. Coils: Open or shorted turns.

9. The loss or degradation of power sources.
 10. The effects of electrical interference.
 11. Presence of abnormal signal levels, electrical noise levels, frequencies and delays in any electronic equipment.
 12. The absence of or abnormal input signals.
 13. Opens or shorts in internal circuitry.
 14. Drift or instability of amplifiers, receivers, transmitters, oscillators, switching circuits, and power supplies.
 15. Mechanical shock or vibrations.
 16. The deterioration of contacts, connectors, solder connections, terminals, printed circuits, circuit adjusting devices, and mechanical devices.
 17. Consider and minimize, in producing a design, the possibility of unsafe failures arising from procedural error and neglect, including:
 18. The careless adjustment of equipment and controls.
 19. The removal of components and/or assemblies.
 20. The incorrect assembly of equipment.
 21. Insufficient maintenance in all categories.
- F. Loss of Shunt: Arrange interlocking circuitry so a momentary loss of shunt does not cause release of the following circuits:
1. Route locking
 2. Detector locking
 3. Signal clearing
 4. Approach locking, where applicable
- G. Timers: Provisions shall be made in the design to adjust all functions requiring adjustable timers (e.g., approach stick timer) without changing program software. Install timers external to the processors if necessary. Timers shall meet the requirements of SECTION 34 42 25 – Signals Relays and Plugboards.

PART 4 - MEASUREMENT AND PAYMENT**4.1 MEASUREMENT**

A. The quantities of accepted work will be measured in the following units. All measurements will be plan measure except for authorized changes.

1. Description: Lump Sum

4.2 PAYMENT

A. Payment will be made at the respective unit or lump-sum price listed in the proposal and shall be full compensation for all labor, materials, and equipment necessary to complete the respective unit in place. There will be no separate measurement or payment for any item of work not specifically identified and listed in the proposal, and all such work shall be considered a subsidiary item with all costs pertaining thereto included in the prices for other items listed in the proposal. At the Engineer's option, partial payment may be made for any lump sum item listed in the proposal, providing that the Contractor is diligently and satisfactorily pursuing full completion of such partially complete item in accordance with the approved job progress schedule.

END OF SECTION

SECTION 34 42 72**SIGNALS SPARE PARTS, MANUALS AND TRAINING****PART 1 - GENERAL****1.1 SUMMARY**

- A. This Section includes the requirements for spare parts, manuals and training for the Signal System to be bid as part of this Contract.

1.2 RELATED SECTIONS

- A. SECTION 01 33 00 – Submittal Procedures
- B. SECTION 01 43 00 – Systems Quality Assurance
- C. SECTION 34 42 10 – Signals General Engineering and Design Requirements

1.3 SUBMITTALS

- A. Unless otherwise specified, all submittals shall be in accordance with SECTION 01 33 00 – Submittal Procedures and SECTION 34 42 10 – Signals General Engineering And Design Requirements.
 - 1. The Contractor shall submit Instructors Training Guides for proposed signal training classes.
 - 2. The Contractor shall submit a list of equipment manuals to be provided.
 - 3. The Contractor shall submit a list of recommended special tools, gauges, and test equipment.
 - 4. The Contractor shall submit a list of printed circuit boards used on the project.
 - 5. The Contractor shall submit a Recommended Spare Parts List.
 - 6. The Contractor shall submit a training schedule and curriculum.

1.4 QUALITY ASSURANCE

- A. The Contractor shall comply with the requirements of Division 1.

PART 2 - PRODUCTS**2.1 SPARE TOOLS AND PARTS**

- A. Special Tools – The Contractor shall furnish all special tools, gauges, and test equipment needed to maintain signal system equipment. The Contractor shall compile and submit a list of recommended special tools, gauges, and test equipment. The agency will review the list for completeness and approve it. The Contractor shall then furnish all of the items on the list as a part of the contract.

- B. Mandatory Spare Parts – The following items shall be supplied to the Agency as spare parts.

Item	Description	Quantity
	Each type of non-vital relay used as a part of the Contract.	10
	Two complete portable Train-to-Wayside Communications (TWC) test interrogators, transponders, and two 100kHz radios. This equipment is used to: Simulate a train to input a digital message to the TWC loop to determine that the TWC equipment can properly receive and decode a message Determine that the equipment is correctly transmitting a message to the train.	
	Each size and type of power supply used as a part of the Contract.	2
	Each type of vital relay used as a part of the Contract.	2
	Filter-V for Vetag TWC Equipment	10
	Communications Card W/O modem PDCC7	2
	H&K Interrogator	3
	Rail Web heaters of the same type furnished for the Contract sufficient to equip a #6 turnout.	2 sets
	Any fiber modems used on the Project.	2 of each type
	Laptop computer with trouble shooting and repair software	1
	Trouble shooting and repair software to be loaded on future computers	1

- C. Printed Circuit Boards – The Contractor shall compile a list of all of the circuit boards used in all of the electronic units furnished as a part of this Contract. These units shall include, but not be limited to, electronic track circuits, vital and non-vital microprocessor units, and TWC equipment. Based upon this list, the Contractor shall furnish 10% spare boards, with a minimum of two, for each type of board identified as being used as a part of this Contract.
- D. Recommended Spare Parts – In addition to printed circuit boards the Contractor shall compile a list of recommended spare parts that he feels are needed to adequately maintain the signal system.

2.2 PRODUCT MANUALS

- A. The Contractor shall furnish product manuals for each major item of equipment supplied as a part of this Contract including, but not limited to, switch machines, snow melters, vital and non-vital microprocessor systems, vital relays, track circuits, TWC equipment, and signals. These manuals shall deal with theory of operation, maintenance, troubleshooting, and replacement of defective parts with ordering references for each subsystem. The Contractor’s standard service manual shall be sufficient provided it covers the topics detailed above. The Contractor shall compile and submit a list of the manuals he proposes to furnish to meet this requirement to the Project Manager for Approval.
- B. The Contractor shall furnish a “master” copy as well as ten standard copies of each manual. The master copy shall be a standard manual that has been removed from its normal binding. Each page shall be laminated in heavy-duty plastic to protect it but allow copying on a standard Xerox copy machine. The individual pages shall be collected and assembled into a three ring binder with re-enforced holes.

2.3 TRAINING

- A. The Contractor shall provide training classes for the Agency Maintenance of Way (MOW) group. The Contractor can assume that the subject audience is conversant in basic electronics and troubleshooting techniques.
1. The training shall consist of 240 hours of training subdivided into six 40 hour courses. Training schedule and curriculum shall be submitted to the Agency for Approval.
 2. Each of the three classes shall consist of a maximum of ten the AGENCY personnel. In general, the students will be the AGENCY MOW personnel although occasionally the AGENCY Engineering may opt to audit a class.
 3. The training shall cover theory of operation, maintenance, and troubleshooting of major components of the signal system. These components shall include, but not be limited to, vital and non-vital microprocessors, TWC, local panel operation, power frequency track circuits, and switch heaters.
- B. As a part of the training class the Contractor shall create two manuals. These manuals shall be submitted for Approval prior to delivering the training to ensure that the content of the training classes is acceptable to the AGENCY.
1. The first manual shall be written as an instructor's guide. This manual shall be structured to lead the instructor through the training to be delivered. The intent is that by consulting the instructor's guide the AGENCY personnel will be able to deliver future training covering the same topics.
 2. The second manual shall be the student's guide. It shall be structured to re-enforce the training being delivered by the instructor. The manual shall be heavily illustrated with adequate space for the students to take notes on the pages that deal with the subject being covered. The Contractor shall provide adequate manuals so that each student has his own and the manual shall become the student's property when the training class is complete.
- C. Follow-up Training – If, after the training has been delivered, some basic element of the signal system design is changed by the Contractor, as determined by the AGENCY, a reasonable amount of additional training may be required. Such additional training shall be at no cost to the AGENCY.

PART 3 - EXECUTION

3.1 DELIVERY

- A. The Contractor shall deliver all spare parts to a location in the Kansas City area as directed by the AGENCY. Pack all material for warehouse storage and clearly mark with manufacturer's part and/or style number.
- B. The Contractor shall deliver master manual and ten standard manuals to the AGENCY maintenance as directed by the AGENCY.
- C. The Contractor shall unload and store all items neatly in the AGENCY-furnished storage facility as directed by the AGENCY.
- D. The Contractor shall complete delivery and storage for all spare parts no earlier than 30 days prior to, or no later than, the completion of system testing.

- E. The Contractor shall, at a minimum, supply one complete set of all special tools and test equipment necessary to service, repair, maintain and overhaul each system delivered for use in training program. At the completion of training program these special tools, test equipment and training aids shall be turned over to the AGENCY, in proper working order, by the Contractor.

3.2 WARRANTY USE

- A. In the event that provision items must be used in the course of satisfying Warranty procedures, Contractor shall replace such items within 30 days at no cost to the AGENCY.

PART 4 - MEASUREMENT AND PAYMENT

4.1 MEASUREMENT

- A. The quantities of accepted work will be measured in the following units. All measurements will be plan measure except for authorized changes.
 - 1. Description: Lump Sum

4.2 PAYMENT

- A. Payment will be made at the respective unit or lump-sum price listed in the proposal and shall be full compensation for all labor, materials, and equipment necessary to complete the respective unit in place. There will be no separate measurement or payment for any item of work not specifically identified and listed in the proposal, and all such work shall be considered a subsidiary item with all costs pertaining thereto included in the prices for other items listed in the proposal. At the Engineer's option, partial payment may be made for any lump sum item listed in the proposal, providing that the Contractor is diligently and satisfactorily pursuing full completion of such partially complete item in accordance with the approved job progress schedule.

END OF SECTION

SECTION 34 42 76**SIGNALS TESTS AND INSPECTIONS****PART 1 - GENERAL****1.1 SUMMARY**

- A. This Section includes Specifications for tests and inspections to be performed at points of assembly and on the job site, and is intended to provide minimum requirements for testing. The Contractor shall organize a test program that verifies the adequacy of the signal system to meet all technical and performance requirements in an orderly and logical sequence.
- B. Tests and inspections shall be for the purpose of verifying design and nameplate ratings, ensuring proper performance and safety and demonstrating compliance with these Specifications.
- C. The Contractor shall inspect and functionally test each item to be delivered in accordance with the Contract Documents and Contract Drawings. Test procedures and inspections shall be conducted according to the manufacturers' standards except as otherwise specified, or Approved by the Agency.
- D. The Contractor shall conduct all tests in accordance with approved test procedures. Except as otherwise specified, the Contractor shall furnish all labor and materials necessary to perform tests, record data, and prepare reports. Tests shall demonstrate compliance with the requirements of these Specifications. All inspection and testing instructions shall provide for reporting non-conformance or questionable conditions to the Project Manager. Any changes required to bring the system into compliance shall be at no additional cost to the Agency, including the costs associated with the additional testing. After the completion of each test, the Contractor shall remove all test equipment and temporary facilities, and restore the system to full operational status.
- E. The Contractor shall permit the Project Manager, at his discretion, to participate in all inspections and to witness all tests, both at the manufacturers' plant and at the Site. Whether or not the Project Manager inspects or tests any materials or equipment, the Contractor shall not be relieved from any responsibility regarding defects or other failures to meet the Contract requirements nor shall such inspection or test be considered a guarantee of approval of any material or equipment, which may be delivered later for incorporation into the work. The Project Manager shall have access to all Work at the Site at any time during normal working hours. Except as otherwise agreed to by the Project Manager, inspections to be witnessed by the Project Manager shall be performed during normal business hours.
- F. The Contractor shall be responsible for the cost of all testing, whether conducted at his factory or on site.

1.2 RELATED SECTIONS

- A. SECTION 01 33 00 – Submittal Procedures
- B. SECTION 01 43 00 – System Quality Assurance
- C. SECTION 34 42 10 – Signals General Engineering and Design Requirements
- D. SECTION 34 42 25 – Signals Relays and Plugboards

- E. SECTION 34 42 44 – Signals Power Distribution
- F. SECTION 34 42 72 – Signals Spare Parts, Manuals, and Training

1.3 SUBMITTALS

- A. Unless otherwise specified, all submittals shall be in accordance with SECTION 01 33 00 – Submittal Procedures and SECTION 34 42 10 – Signals General Engineering and Design Requirements.
 - 1. The Contractor shall submit a Test Program Plan for Approval within 120 days subsequent to notice to proceed. This plan shall include a list of all factory and on-site tests to be performed, the approximate date, and location of each test.
 - 2. The Contractor shall submit test procedures for approval at least 30 days prior to implementation. Except where tests are to be performed in full accordance with published standards, each test plan shall include:
 - a. The definition of the purpose and objectives of the test
 - b. The description of the test to be performed
 - c. The definition and listing of prerequisites, which must be successfully completed prior to the start of the test -- including prior installation work, prior tests, and the prior review by the Project Manager
 - d. A list of equipment required for each test
 - e. A listing of the final test report documentation to be supplied to the Project Manager
 - f. A step-by-step test procedure
 - g. Blank test data sheet forms, with the range of acceptable test values pre-printed on each form.
 - 1) Except where results are recorded on a test data plate affixed to the component or unit, the Contractor shall submit certified test reports.
 - 2) The Contractor shall submit records of all field tests, giving procedures used and results.
 - 3) The Contractor shall submit for Approval reports of factory inspection procedures employed to ensure the quality of the product.
 - 4) the Agency reserves the right to witness and photograph, at its expense, any and all phases of equipment manufacturing, test, installation and construction, including subcontractor work, without restriction.

1.4 QUALITY ASSURANCE

- A. The Contractor shall comply with requirements of Division 1.
- B. The Contractor shall submit a list of instruments to be used for testing. The list shall include the manufacturer's name, model number, serial number, and calibration certificates for each instrument. The calibration certificate shall show that each instrument was calibrated by an independent agency within the previous 180 days. The Contractor shall not use items provided in SECTION 34 42 72 – Signals Spare Parts, Manuals, and Training to conduct the tests outlined in this Section. The Contractor shall implement tests and procedures as required in this Section.

PART 2 - PRODUCTS

2.1 TEST PROGRAM PLAN

- A. The Contractor shall develop and submit a Test Program Plan for the Signal System. The purpose of this plan is to ensure that the Contractor has considered all the testing requirements contained in this and other Sections of the Specification and has made adequate provisions for testing in his overall program plans and schedules; and to achieve an early mutual understanding between the Contractor and the Agency on range, depth and other aspects of tests to be conducted. The Program Test Plan shall contain, as a minimum, the following data:
 - 1. A flow diagram indicating the logical sequence of tests starting with factory assembly tests and concluding with system integration tests
 - 2. A list of test procedures (by test procedure number) to be submitted, preliminary submittal schedule, a preliminary schedule of tests, and a brief description of each factory and field test
 - 3. An outline and format of procedures and test data sheets for each type of test
 - 4. Requirements (if any) for the Agency-furnished material, personnel or equipment
 - 5. Requirements and recommendations for witnessing by the Agency personnel
 - 6. A description of the Contractor's in-plant and field test organizations
 - 7. Flow of Quality Assurance and field test data and use within the Contractor's Systems Engineering and Quality Assurance functions

2.2 FACTORY TESTS AND INSPECTIONS

- A. General
 - 1. All systems, subsystems and components forming an integral part of a failsafe circuit or subsystem shall be completely inspected and tested.
 - 2. All components or units, other than those related to failsafe circuits, may be tested on a sampling basis. An approved number of randomly selected components or units from the manufacturing process shall be tested to ensure the adequacy and acceptability of all components and units produced.
 - 3. Each component and unit shall be inspected at its point of manufacture and evidence of this inspection and acceptability shall be indicated on the item where practical.

4. The Contractor shall notify the Agency, in writing, a minimum of 1 week in advance of each test. When tests are to be conducted continuously as a production line routine, the Contractor shall inform the Agency in writing at least 2 weeks in advance of the date of commencing the tests and the expected duration. The Contractor shall notify the Corridor Project Manager 21 days in advance of tests of assembled relay cases that are undergoing final testing prior to being shipped to the field.
- B. All vital relays shall be factory-tested in accordance with AREMA Communications and Signals Manual, Parts 6.4.1 (Recommended Instructions for Direct-Current Relays), 6.4.5, (Recommended Instructions for Alternating Current Relays) and SECTION 34 42 25 – Signals Relays and Plugboards as applicable.
 - C. All wayside signal equipment including but not limited to signals, switch machines, switch point heaters, relays, and TWC equipment shall be inspected and tested prior to shipment.
 - D. All signal equipment shall be operationally tested and inspected as a complete functional assembly prior to shipment. Test each function by simulating operating conditions. Where equipment is related to a safety function, each component or subassembly shall be separately inspected and tested.
 - E. The Contractor shall perform tests and inspections needed to verify the system safety requirements.
 - F. Equipment functional tests shall be performed on the following equipment items. These tests shall be designed to show the proper operation of each major feature of each item. Certified test reports shall be submitted to the Agency before shipment showing the successful completion of each test.
 1. Switch machines
 2. Switch circuit controllers
 3. Signals
 4. Power converters
 5. Train-to-Wayside Communications (TWC) interrogators and wayside antennas
 6. TWC carborne equipment
 7. Switch heaters
 8. Vital relays
 9. Track circuits and track circuit equipment
 10. Local control panels
 11. Vital microprocessor interlocking equipment
 - G. Factory Wired Relay Racks/Cases
 1. Factory wired cases shall be tested as described below. For these tests, all cases and associated with a particular location shall be inter-connected so as to function as one unit. External equipment such as signals, switch machines, switch circuit controllers, and TWC interrogators and antennas shall be simulated and monitored during these tests. All relays shall be installed for this test.

- a. All factory wiring shall be continuity tested. The continuity test shall be done with a buzzer and appropriate battery. A continuity test using an ohmmeter will not be acceptable. During this test, all tagging shall be checked and verified. The set of plans used to wire the rack shall be used during this test. As each wire is tested it shall be "greened-off" the plans. When all wires on a page have been greened-off, the tester shall sign and date the page.
- b. A wire count shall be performed to verify that the number of wires that are connected to terminal posts, relay plug board receptacle springs and other termination points are in accordance with the approved circuit plans.
- c. All vital and non-vital wiring shall receive a complete circuit selection (breakdown) test. Each relay contact (separate openings for heel, front and back contacts) shall be opened, the appropriate relays shall be observed to drop, and the appropriate signal equipment shall be observed to respond as intended. The correct operation of each break point shall be noted on the plans with a check mark. When all breaks on a page have been checked-off, the tester shall sign and date the page.
- d. Operating tests shall be performed to verify that the factory wired equipment functions as intended.

H. Relays

1. Vital relays shall be factory tested to conform to the "shop" requirements of the AREMA Communications and Signals Manual Part 6.4.1 (Recommended Instructions for Direct-Current Relays) or Communications and Signals Part 6.4.5 (Recommended Instructions for Alternating-Current Relays). All relays shall be tested twice as described in SECTION 34 42 25 – Signals Relays and Plugboards. Test values shall be submitted to the Agency on standard FRA relay test data cards for reference.

I. Vital Microprocessor Interlocking Equipment Tests

1. The entire complement of cases for a given vital interlocking shall be set up at the point of assembly, with all equipment installed. The cases shall be interconnected with the same plug connector cables as will be shipped to the field, all in accordance with the accepted plans. The Contractor shall simulate functions external to the relay case, where required. All functions of the system shall be tested to determine that each function of the system operates as required.
2. The Contractor shall observe strict software version control during the testing. Prior to shipment, the Contractor shall correct all deficiencies identified during factory testing. The entire test procedure shall be passed successfully without making a change to the application software. If, at any point in the testing, it becomes necessary to modify the application software, at the discretion of the Project Manager, the test procedure shall begin again from the start.

2.3 CALIBRATION OF INSTRUMENTS

- A. All instruments or recorders employed in these test programs shall bear a record of calibration against certified standards. Such calibrations shall be made at least each 180 days and at such other periods as may be directed by the Agency. Each test record shall identify the specific instrument employed in the test and latest date on which it was calibrated.

2.4 FIELD TESTS AND INSPECTIONS

A. General

1. The Contractor shall perform all tests required to ensure proper and safe operation of all mainline equipment and prove the adequacy and acceptability of the total installation.
2. The tests to be performed shall cause each system and subsystem to be sequenced through all required operations and shall include simulated conditions to prove the installation is in compliance with failsafe requirements.
3. Prior to operational testing, the Contractor shall check the quality of installation by visual inspection and by tests of continuity, insulation resistance, and resistance of ground connections, vital circuit breakdown, and other tests as required.
4. The Agency shall receive written notification at least 48 hours prior to each test.
5. The Contractor shall check the dynamic outline clearance of all wayside installed signal equipment with a test train.

B. Prior to Installation and After Receipt on Site

1. All relays shall be inspected for shipping damage and tested to assure that pick-up and drop-away values and contact resistances agree with the "shop" values. Vital relays shall be tested to conform to the "shop" requirements of the AREMA Communications and Signals Manual Part 6.4.1 (Recommended Instructions for Direct-Current Relays) or AREMA Communications and Signals Manual Part 6.4.5 (Recommended Instructions for Alternating-Current Relays), and SECTION 34 42 25 – Signals Relays and Plugboards, as applicable. Non-vital relays shall be tested to conform to the non-vital relay manufacturer's specifications insofar as armature pick-up, armature drop-away, and contact resistance values are concerned. These tests shall be performed by a Relay Quality Control Inspector from the vital relay manufacturer who's normal and customary duties center on relay inspection. During this on-site relay test, the timing characteristics of all timing relays shall be checked and adjusted and the set values shall be recorded. The pickup and drop-away values for all vital relays shall be recorded on FRA relay cards AREMA Communications and Signals Manual Part 6.4.1 Form 641-1 (Recommended Office Record of Test of DC Electrical Apparatus) or AREMA Communications and Signals Manual Part 6.4.5 Form 645-1 (Recommended Office Record of Test of AC Electrical Apparatus) and submitted to the Agency. One FRA relay card shall be filled out for each vital relay. When testing is completed the relay cards shall be submitted to the Agency for their permanent record.

C. Wire, Cable Conductor and Shield

1. Each wire, cable and shield shall be individually checked with a ringer or buzzer to identify its two ends, the tagging checked for conformity with circuit plans, and the exact termination points (relay name and contact number, terminal number, equipment binding post, etc.) compared with that shown on the circuit plans. A check mark shall be applied to the installation copy of the circuit plans at each end of each wire tested at the time it is tested and found acceptable. This on-site test applies to all wires and cable conductors, however, point-to-point testing of rack and case wiring required by this Subsection, which was done at the factory, need not be repeated on-site provided the Contractor attests in writing that there have been no changes in the rack wiring after completion of the factory tests.

- D. Wire Count
1. A wire count shall be performed to verify that the number of wires connected to each terminal post, relay plug board receptacle spring and other termination point is in accordance with the accepted circuit plans.
- E. Megger Test
1. A 1000 Volt megger shall be used to determine insulation resistance of each underground cable conductor to ground and between conductors. A minimum of 5 Megohms between each conductor and ground and between each of the conductors is required. During this test, all associated signal equipment not under test shall be disconnected and terminals grounded. All electronic devices or signal equipment shall be disconnected or unplugged prior to any testing. All cable splices shall be completed. The test equipment manufacturer's instructions as to operation and electrical connections shall be followed. Test data and results shall be submitted to the Project Manager by the Contractor. The data shall be furnished in a form that complies with the FRA "Rules, Standards and Instructions for Railroad Signal Systems", CFR 49 Part 236.
- F. Breakdown Test
1. A complete circuit selection (breakdown) test of all relay cases and circuit controller wiring shall be performed. Each circuit shall, with the circuit energized, have each circuit break point (termination, front contact, back contact, heel contact, etc.) individually opened by hand to determine that the controlled device becomes de-energized with the circuit opened and re-energized when the test opening is re-closed. A check mark shall be applied to the installation copy of the circuit plans at each circuit break at the time it is determined that it is effective. During this test, line circuits to and from adjacent signal cases shall be connected and the adjacent signal cases shall be functional.
 2. This on-site test applies to all signal circuits, however, breakdown testing of case circuits required by this Subsection, which was done at the factory, need not be repeated on-site provided the Contractor attests in writing that there have been no changes in the case wiring after completion of the factory tests.
- G. Power Buss Test
1. With the system in working order, each energy buss shall be tested with a 500 Volt megger and shown to be at least 1 Megohm above ground. High voltage buses shall be de-energized when they are tested. At interlockings this test shall be performed with each possible route lined up.
- H. Power Supply Adjustment
1. The Contractor shall verify that each installed fuse is the correct type and amperage according to the circuit plans. Power supplies and rectifiers shall be set to the appropriate values. Voltages and transformer tap settings shall be recorded and noted on the as-built circuit plans.
- I. Timer Setting
1. Adjustable timers throughout the system shall be checked and adjusted and the set values shall be recorded and shown on the circuit plans.

- J. Lamp Voltage Adjustment
1. All lamp voltages (including signal and switch indicator and local control panel) shall be individually checked and adjusted. The tap settings and lamp voltage levels shall be recorded and submitted to the Agency.
- K. TWC Interrogator Test
1. All TWC interrogators shall be tested in accordance with its manufacturer's recommendations to assure that the TWC systems function as intended.
- L. Shunt Test
1. Checks shall be made to determine that the corresponding track relay drops when a 0.20-Ohm shunt is applied successively to each end and in the middle of each track circuit and at each end of all fouling circuits.
- M. Ground Test
1. Each ground network installation shall be tested to determine that a successful (15.0 Ohms, maximum) ground has been obtained and the values recorded.
- N. Power Switch Obstruction Test
1. Mainline power switches shall be checked to determine that:
 - a. Signal protection is provided when either switch point is in any position other than full normal or full reverse
 - b. A 1/4 inch gap, 6 inches from the point-of-switch, between either switch point and the stock rail causes the signal governing movements over the switch to display a "STOP" aspect, even if the switch points are locked
 - c. A 3/16 inch gap between either switch point and the stock rail does not cause the signal governing movements over the switch to display a "STOP" aspect
 2. Mainline power switches shall also be tested to assure that the latchout mechanisms, switch machine heaters, switch indicators, clutches and overload relays are all functioning properly. Normal and obstructed switch currents shall be measured and recorded. If necessary, the clutch shall be adjusted to bring the recorded values to within the manufacturer's recommendations. Tests shall be performed on both the normal and reverse points. All switch machines shall be checked to determine that the locking dog cannot enter the slot in the lock rod with a 1/4 inch obstruction gauge between the stock rail and the switch point.
- O. Switch Heater Test
1. Switch heaters shall be tested to ensure that they function properly.
- P. Local Control Panel Test
1. Local control panels shall be tested to ensure that they function properly including, but not limited to:
 - a. The ability to control all required functions
 - b. Properly display all indications

- Q. Event Recorder Test
1. Event recorders shall be tested to ensure that they function properly and provide the required 72 hours of recording capability.
- R. Power Distribution Test
1. Signal power converters, power transfer equipment, power distribution equipment and signal power conductors shall be tested to ensure that the system functions properly and as intended. As part of this test the spare capacity of the power system shall be calculated by the Contractor, using test data. The results of these calculations shall be submitted as a part of the power distribution calculations required in SECTION 34 42 44 – Signals Power Distribution.
- S. Signal Alignment Test
1. Signal alignment shall be checked and signals adjusted to provide maximum visibility. During this test, the light-out protection feature shall be checked for each signal so equipped.

2.5 ON-SITE OPERATIONAL TEST (CUTOVER)

- A. The final test prior to the Signal System Integration Test shall be the On-Site Operational Test (cutover). At this point all of the signal equipment shall be powered up and working with nothing being simulated except the movement of trains. The movement of trains shall be simulated by applying shunt wires to the track circuits and placing TWC test transponders over the appropriate TWC antennas. Tests shall be made to ensure all of the signal system functions work as intended. In addition to testing that all of the expected functions work as intended the test shall be structured so that functions that should be prevented from happening are in fact not allowed. Tests shall be made to determine, through direct observation that the appropriate signal aspects are displayed. During this test, line circuits to and from adjacent signal cases shall be connected and the adjacent signal cases shall be functional.
- B. All possible interlocking routes shall be set up and observations shall be made to determine that the correct signal aspects, for both conflicting and non-conflicting routes, are displayed and that detector, approach, indication, and route locking are effective. All combinations of route requests shall be tested. Tests shall ensure that all appropriate routes are granted.
- C. Test Forms
1. The test forms for this test shall be a step by step procedure that as a minimum lists:
 - a. The step number
 - b. Any set up conditions
 - c. The action to be taken
 - d. The expected outcome
 - e. A place to check off that the expected outcome did indeed occur
 - f. A place for the tester and the Project Manager's witness to sign and date the test sheet

D. Discrepancy Report

1. The test procedure shall also include a “discrepancy action report”. Any time an expected outcome does not occur the test shall immediately stop. The discrepancy action report shall log:
 - a. The step of the test that failed
 - b. The cause of the failure
 - c. The action taken to correct the failure
 - d. A place for the tester and the Project Manager to date and initial the report
2. One discrepancy action report shall be completed for each failure
3. After a failure, the Project Manager, may require that the entire test procedure be repeated, or may require only certain pertinent steps of the test procedure to be repeated.
4. When the test is completed and all test data sheets are dated and signed, the test data sheets shall be submitted to the Project Manager for Approval.

E. Test Reports and Records

1. Test reports shall be prepared for all tests and shall be submitted to the Project Manager within 10 days after completion of the tests for Approval. Reports shall include test methods followed, values of all test results, unusual conditions found, resolutions to any problems, serial numbers and calibration dates from all test equipment used, certification of passage of the test and copies of all check-off drawings or sheets used.
2. Copies of all adjustment or setting values shall be submitted to the Project Manager prior to submitting the system for Street Car Completion.
3. Certificates of compliance with factory test reports shall precede all shipments.

2.6 SIGNAL SYSTEM INTEGRATION TESTS

- A. After the Contractor has completed installation tests and verified system operation within the local limits of work, the following tests shall be performed, at a minimum, utilizing light rail vehicles and any other the Agency system elements as necessary:
 1. Interlocking Tests shall be performed to verify system safety through dynamic operation of passenger vehicles. Tests shall thoroughly exercise automatic signal and route clearing, Vetag-initiated routing and routing via the local control panel. The Contractor shall test all mainline to mainline movements.
 2. TWC tests shall be performed to verify proper TWC operation as designed. Tests shall thoroughly exercise all functions of Vetag at all locations, as indicated on the Contract Drawings.
- B. System Interface Tests
 1. The Contractor shall test all interfaces between existing systems and the work performed under this Contract to verify that there have been no adverse effects on safety or proper operation of the existing systems.

PART 3 - EXECUTION**3.1 TESTS**

- A. The Contractor shall conduct all tests in accordance with the approved test plan and procedures. Except as otherwise specified, the Contractor shall furnish all labor and materials necessary to perform tests, record data and prepare reports. Tests shall demonstrate compliance with the requirements of these Specifications. Any changes required to bring the systems into compliance shall be at no additional cost to the Agency, including the costs for additional testing. After the completion of a test, the Contractor shall remove all test equipment and temporary facilities and restore all systems to full operational status.

3.2 TRAINS FOR TESTING

- A. The Agency will provide trains with crews to support the testing program. The Contractor shall schedule test trains at least one week in advance using the Agency's standard application/approval procedure. Trains for testing will normally be scheduled 8 hours per day, 5 days per week, with the 1st hour of each day reserved for track inspection and setting up test limits, and the last 30 minutes reserved to bring the operating crew to the yard.

PART 4 - MEASUREMENT AND PAYMENT**4.1 MEASUREMENT**

- A. The quantities of accepted work will be measured in the following units. All measurements will be plan measure except for authorized changes.
1. Description: Lump Sum

4.2 PAYMENT

- A. Payment will be made at the respective unit or lump-sum price listed in the proposal and shall be full compensation for all labor, materials, and equipment necessary to complete the respective unit in place. There will be no separate measurement or payment for any item of work not specifically identified and listed in the proposal, and all such work shall be considered a subsidiary item with all costs pertaining thereto included in the prices for other items listed in the proposal. At the Engineer's option, partial payment may be made for any lump sum item listed in the proposal, providing that the Contractor is diligently and satisfactorily pursuing full completion of such partially complete item in accordance with the approved job progress schedule.

END OF SECTION

THIS PAGE INTENTIONALLY LEFT BLANK

SECTION 41 22 00**HOISTS AND CRANES****PART 1 - GENERAL**

The General Provisions of the Contract, including General and Special Conditions and the requirements of Division 1, apply to the Work in this Section.

1.01 WORK INCLUDED

- A. Equipment items as listed below by Equipment Identifier:
 - 1. 5208 Crane, jib, foundation insert mounted, 7.5 ton, 19 foot span, motorized mast (Ref. Part 2.01)
 - 2. 5392 Hoist, chain, electric, motorized trolley, 2 ton (Ref. Part 2.02)
 - 3. 5397A Hoist, chain, electric, motorized trolley, 7.5 ton (Ref. Part 2.03)
 - 4. 5397B Hoist, chain, electric, motorized trolley, 7.5 ton (Ref. Part 2.04)
- B. Roughing-in, installation of equipment, and final connection of utilities, with labor, services, and incidentals necessary for complete and operational equipment installation.
- C. Wiring, and switching between equipment and utilities.

1.02 QUALITY ASSURANCE

- A. Equipment shall be produced by a manufacturer of established reputation with a minimum of five years experience supplying specified equipment.
- B. Manufacturer's Representative:
 - 1. Installation: Provide a qualified manufacturer's representative at site to supervise work related to equipment installation, check out, and start up.
 - 2. Training: Provide technical representative to provide training to Owner's maintenance personnel in operation and maintenance of specified equipment.
 - 3. Quality standards shall meet or exceed ISO-9001.

1.03 SUBMITTALS

- A. Product Data: Submit Product Data in accordance with Division 1 of these specifications.
- B. Operations and Maintenance Manual:
 - 1. Submit Operations and Maintenance Manuals in accordance with Division 1- General Requirements of these specifications.
 - 2. Provide complete parts, operating, and maintenance manual covering equipment at time of installation.
 - 3. Description of system and components.
 - 4. Schematic diagrams of electrical, plumbing, and compressed air system.

5. Manufacturer's printed operating instructions.
 6. Printed listing of periodic preventive maintenance items and recommended frequency to validate warranties. Failure to provide maintenance information will indicate that preventive maintenance is not a condition for validation of warranties.
- C. Shop Drawings: Submit Shop Drawings in accordance with Division 1.

1.04 PRODUCT SUBSTITUTIONS

- A. Follow requirements specified in Division 1 - General Requirements.
- B. Additional costs resulting from substitution of products other than those specified, by model number, including drawing changes and construction, will be at the expense of the Contractor.
- C. Substitution Approval: Prior to delivery or installation, submittals for each equipment item by Equipment Identifier shall be provided in accordance with Division 1 - General Requirements. Acceptance will be based on the technical requirements herein as determined by Owner and Architect.

1.05 WARRANTY

- A. Warrant work specified herein for one year from substantial completion against defects in materials, functions, and workmanship.
- B. Warranty shall include materials and labor necessary to correct defects.
- C. Defects shall include, but not be limited to noisy, rough or substandard operation; loose, damaged, and missing parts; and abnormal deterioration of finish. Defects shall not include damage due to neglect, misuse, or situations resulting from non-performance of a manufacturer's recommended preventive maintenance schedule.
- D. Submit warranties in accordance with Division 1 - General Requirements of these specifications.
- E. All parts shall be readily available locally in the United States.

1.06 PRODUCT DELIVERY, STORAGE, AND HANDLING

- A. Deliver equipment in manufacturer's containers, appropriately packaged and/or crated for protection during domestic shipment and storage in humid and/or dusty conditions.
- B. Indelibly label all containers, including those contained in others, on outside with item description(s) per title and Equipment Identifier of this specification.
- C. Provide equipment and material specified complete in one shipment for each equipment item. Split or partial shipments are not permissible.

1.07 BUY AMERICA COMPLIANCE

- A. The Contractor shall comply with the applicable Buy America requirements set forth in 49 U.S.C. 5323(j) and the applicable regulations in 49 C.F.R. Part 661, as amended. If the Contractor procures any capital items with Federal funds, it is the Contractor's responsibility to obtain the Buy America certification required under such regulations.
- B. Reference Division 1 for Buy America provisions.

PART 2 - PRODUCTS

2.01 CRANE, JIB, FOUNDATION INSERT MOUNTED, 7.5 TON, 19 FOOT SPAN, MOTORIZED MAST Equipment Identifier: 5208

- A. Manufacturer's Reference:
 1. Prime manufacturer: Specifications are based on equipment identified herein by manufacturer's name and model to establish minimal acceptable standards of quality, features, performance, and construction.
 - a. Abell-Howe, Forest Park, IL (708) 366-4800
 - b. Model: J-904-360-W27FMD, 7.5 ton, 19 foot span
 2. Alternate manufacturers: *Contingent upon compliance with these specifications* and documentation requirements set forth in SUBMITTALS, equipment produced by other manufacturers, including the following, *may* be considered as equal.
 - a. Yale Industrial Products, Forest City, AR (501) 633-2250
 - b. Gobel, Fishers, NY (585) 924-6262
- B. Capacities/Dimensions:
 1. Lifting capacity: 7.5 tons
 2. Dimensions:
 - a. Boom span (center of pivot to boom end): 19 feet
 - b. Boom length: 21 feet, 5 inches
 - c. Boom depth: 27 inches
 - d. Clearance under boom: 10 feet, 6 inches
 - e. Mast height: 12 feet, 9-1/4 inches
 3. Swing: 180 degrees
 4. Weight (nominal): 9,980 pounds
 5. Weight, hoist/trolley (maximum): 2,250 pounds
 6. Mast motor: 1/2 HP
- C. Features/Performance/Construction
 1. Mounting plate, and anchor bolts shall be provided by manufacturer. (See shop drawings for anchor bolt pattern.)

2. Crane boom shall be of American standard I-beam construction with trolley stops at both ends.
 3. Crane mast head:
 - a. Mast head shall be of a steel plate box type welded construction or seamless tubing.
 - b. Mast head assembly shall surround mast on a sleeve principle with mating surfaces carried on upper and lower bearings.
 4. Mast shall be a structural steel pipe with wall thickness sized for minimum deflection. Mast shall be equipped with stops to insure boom does not over swing.
 5. Crane shall be able to swing a maximum of 360 degrees. Crane stops shall prevent any portion of the boom, hoist, or tagline system from coming in contact with the building structure or walls. Verify placement of stops in the field.
 6. Crane shall have 7.5 ton hoist (Equipment Item 5397) mounted to boom.
 7. Mast shall be motorized.
- D. Accessories: Crane shall include a tagline assembly with cable rings.
- E. Utility requirements:
1. Electrical: 460 VAC, 3 phase, 1/2 HP
- F. Finish: Crane finish shall be a durable enamel in manufacturer's standard color.
- 2.02 HOIST, CHAIN, ELECTRIC, MOTORIZED TROLLEY, 2 TON
Equipment Identifier: 5392
- A. Manufacturer's Reference:
1. Prime manufacturer: Specifications are based on equipment identified herein by manufacturer's name and model to establish minimal acceptable standards of quality, features, performance, and construction.
 - a. Coffing Hoist, Wadesboro, NC (704) 694-2156
 - b. Model: ECMT4008-3-with 26 foot lift, 2 ton hoist with low speed trolley and accessories
 2. Alternate manufacturers: *Contingent upon compliance with these specifications* and documentation requirements set forth in SUBMITTALS, equipment produced by other manufacturers, including the following, *may* be considered as equal.
 - a. Lift-Tech International, Inc., Muskegon, MI (231) 733-0821
 - b. Yale Hoists, Inc., Forrest City, AR (501) 633-2250
- B. Capacities/Dimensions:
1. Hoist:

- a. Lifting capacity: 2 tons
 - b. Motor: 1 HP
 - c. Lifting speed: 8 FPM
 - d. Lifting range: Verify with monorail
 - e. Headroom, with trolley: 20 inches (maximum)
2. Trolley:
 - a. Capacity: 2 tons
 - b. Motor: 1/4 HP
 - c. Travel speed: 35 FPM
 - d. I-beam size range: 6 to 18 inches, American Standard Section
 3. Weight: 213 pounds (represents 10 foot lift)
- C. Features/Performance/Construction:
1. Hoist shall have needle and ball type bearings with gears running in oil bath.
 2. Frame shall be cast aluminum alloy.
 3. Load hook and chain: Hook shall be forged steel with safety clip and shall be attached to cadmium plated chain by bearing type swivel.
 4. Safety: Safety features shall include ratches pawl mechanical load brake, overheating, and positive limit switches.
 5. Hoist mounting: Hoist shall be lug mounted to trolley for minimum headroom.
 6. Pendant height: Pendant shall hang 36 inches above finished floor.
 7. Hoist shall be mounted on monorail as shown on Equipment Layout Drawing Q102.
- D. Controls: Four push button, radio controlled, for hoist UP/DOWN and trolley FORWARD/REVERSE
- E. Accessories:
1. Chain container: Mounted to hoist, Coffing Hoist No. 927JG18
 2. Conductor Bar System: Duct-o-wire, (800) 735-1922
- F. Utility Requirements:
1. Electrical: 460 VAC, 3 phase, 1-1/4 HP
- 2.03 HOIST, CHAIN, ELECTRIC, MOTORIZED TROLLEY, 7.5 TON
Equipment Identifier: 5397-A
- A. Manufacturer's Reference:
1. Prime manufacturer: Specifications are based on equipment identified herein by manufacturer's name and model to establish minimal acceptable standards of quality, features, performance, and construction.

- a. Coffing Hoist, Wadesboro, NY (704) 694-2156
 - b. Model: CM 5291M, 7.5 ton hoist with low speed trolley and accessories
 2. Alternate manufacturers: *Contingent upon compliance with these specifications* and documentation requirements set forth in SUBMITTALS, equipment produced by other manufacturers, including the following, *may* be considered as equal.
 - a. KCI Konecranes, Inc., Santa Fe Springs, CA (562) 903-1371
 - b. Yale Industrial Products, Inc., Forest City, AR (501) 633-2250
- B. Capacities/Dimensions:
 1. Hoist:
 - a. Lifting capacity: 7.5 tons
 - b. Motor: 5-3/4 HP
 - c. Lifting speed: 10 FPM
 - d. Lifting range: 10 feet
 - e. Headroom, with trolley: 34-5/8 inches
 2. Trolley:
 - a. Capacity: 7.5 tons
 - b. Motor: 1/4 HP
 - c. Travel speed: 35 FPM
 - d. Control cable length: 33 feet
 - e. I-beam size range: 6 to 18 inches, American Standard Section
 3. Weight: 870 pounds (represents 10 feet lift)
- C. Features/Performance/Construction:
 1. Hoist shall have needle and ball type bearings with gears running in oil bath.
 2. Frame shall be cast aluminum alloy.
 3. Load hook and chain: Hook shall be forged steel with safety clip and shall be attached to cadmium plated chain by bearing type swivel.
 4. Safety: Safety features shall include ratchet pawl mechanical load brake, overheating, and positive limit switches.
 5. Hoist mounting: Hoist shall be lug mounted to trolley for minimum headroom.
 6. Pendant height: Pendant shall hang 36 inches above finished floor.
 7. Hoist shall be mounted on jib crane, as shown on Equipment Detail Drawing Q101.
- D. Controls:
 1. Four pushbutton pendant, with cord strain relief bushings, for hoist UP/DOWN and trolley FORWARD/REVERSE

E. Accessories:

1. Festoon kit: CM No. 3566
2. Chain container: Mounted to hoist, CM No. 5242
3. Power cable length: 33 feet

F. Utility Requirements:

1. Electrical: 460 VAC, 3 phase, 6 HP

2.04 HOIST, CHAIN, ELECTRIC, MOTORIZED TROLLEY, 7.5 TON
Equipment Identifier: 5397-B

A. Manufacturer's Reference:

1. Prime manufacturer: Specifications are based on equipment identified herein by manufacturer's name and model to establish minimal acceptable standards of quality, features, performance, and construction.
 - a. Coffing Hoist, Wadesboro, NY (704) 694-2156
 - b. Model: CM 5291M, 7.5 ton hoist with low speed trolley and accessories
2. Alternate manufacturers: *Contingent upon compliance with these specifications* and documentation requirements set forth in SUBMITTALS, equipment produced by other manufacturers, including the following, *may* be considered as equal.
 - a. KCI Konecranes, Inc., Santa Fe Springs, CA (562) 903-1371
 - b. Yale Industrial Products, Inc., Forest City, AR (501) 633-2250

B. Capacities/Dimensions:

1. Hoist:
 - a. Lifting capacity: 7.5 tons
 - b. Motor: 5-3/4 HP
 - c. Lifting speed: 10 FPM
 - d. Lifting range: 14 feet
 - e. Headroom, with trolley: 34-5/8 inches
 - f. Finish: Exterior grade
2. Trolley:
 - a. Capacity: 7.5 tons
 - b. Motor: 1/4 HP
 - c. Travel speed: 35 FPM
 - d. Control cable length: 33 feet
 - e. I-beam size range: 6 to 18 inches, American Standard Section
 - f. Finish: Exterior grade

3. Weight: 870 pounds (represents 10 feet lift)
- C. Features/Performance/Construction:
1. Hoist shall have needle and ball type bearings with gears running in oil bath.
 2. Frame shall be cast aluminum alloy.
 3. Load hook and chain: Hook shall be forged steel with safety clip and shall be attached to cadmium plated chain by bearing type swivel.
 4. Safety: Safety features shall include ratchet pawl mechanical load brake, overheating, and positive limit switches.
 5. Hoist mounting: Hoist shall be lug mounted to trolley for minimum headroom.
 6. Pendant height: Pendant shall hang 36 inches above finished floor.
 7. Hoist shall be mounted on monorail, as shown on Equipment Detail Drawing Q101.
- D. Controls:
1. Four pushbutton pendant, with cord strain relief bushings, for hoist UP/DOWN and trolley FORWARD/REVERSE
- E. Accessories:
1. Festoon kit: CM No. 3566
 2. Chain container: Mounted to hoist, CM No. 5242
 3. Power cable length: 33 feet
- F. Utility Requirements:
1. Electrical: 460 VAC, 3 phase, 6 HP
- G. Finish: Finish shall be for exterior application.

PART 3 - EXECUTION

3.01 INSPECTION

- A. Coordinate location of rough-in work and utility stub-outs to assure match with equipment to be installed.
- B. Inspect delivered equipment for damage from shipping and exposure to weather. Compare delivered equipment with packing lists and specifications to assure receipt of all equipment items and specified accessories.

3.02 INSTALLATION

- A. Perform work under direct supervision of Foreman of Construction Superintendent with authority to coordinate installation of scheduled equipment with Architect or designated representative.

- B. Install equipment in accordance with plans, shop drawings, and manufacturer's instructions:
 - 1. Positioning: Place equipment in accordance with any noted special positioning requirements generally level (or slight slope as required by instructions), plumb, and at right angles to adjacent work.
 - 2. Fitting: Where field cutting or trimming is necessary, perform in a neat, accurate, professional manner without damaging equipment or adjacent work.
 - 3. Anchorage: Attach equipment as directed by Architect or designated representative. Installation fasteners shall be installed to avoid scratching or damaging adjacent surfaces.
- C. Upon completion of work, finish surfaces shall be free of tool marks, scratches, blemishes, and stains.

3.03 TESTING

- A. After final installation is complete and prior to authorizing payment, specified equipment shall be checked with specifications in the presence of the Architect or designated representative using acceptance procedures provided by the manufacturer.

3.04 CLEANUP

- A. Touch-up damage to painted finishes.
- B. Wipe and clean equipment of any oil, grease, and solvents, and make ready for use.
- C. Clean area around equipment installation and remove packing and installation debris from job site.
- D. Notify Architect or designated representative for acceptance inspection.

3.05 TRAINING

- A. Direct the technical representative to provide specified hours of training to designated Owner's maintenance personnel in operation and maintenance of the following equipment. Coordinate, with Owner, training schedule and list of personnel to be trained.
 - 1. 5208 Crane, jib, foundation insert mounted, 7.5 ton, 19 foot span, motorized mast; 4 hours (minimum)
 - 2. 5392 Hoist, chain, electric, motorized trolley, 2 ton; 2 hours (minimum)
 - 3. 5397A Hoist, chain, electric, motorized trolley, 7.5 ton; 2 hours (minimum)
 - 4. 5397B Hoist, chain, electric, motorized trolley, 7.5 ton; 2 hours (minimum)

- A. Obtain, from technical representative, a list of Owner's personnel trained in equipment operations and maintenance.

END OF SECTION 41 22 00

SECTION 45 39 00**FABRICATED EQUIPMENT****PART 1 - GENERAL**

The General Provisions of the Contract, including General and Special Conditions and the requirements of Division 1, apply to the Work in this Section.

1.01 WORK INCLUDED

- A. Equipment items as listed below by Equipment Identifier:
 - 1. 1447 Rack, storage, stand, HVAC (Ref. Part 2.01)
 - 2. 1448 Rack, storage, truck (Ref. Part 2.02)
 - 3. 1860 Workbench, severe use, 6 feet (Ref. Part 2.03)
- B. Installation of equipment with labor, services, and incidentals necessary for complete and operational equipment installation.

1.02 QUALITY ASSURANCE

- A. Equipment shall be manufactured by a manufacturer of established reputation with a minimum of five years experience performing similar fabrication techniques.

1.03 SUBMITTALS

- A. Shop Drawings shall be submitted in accordance with Division 1 - General Requirements of these specifications.

1.04 PRODUCT SUBSTITUTIONS

- A. Follow requirements specified in Division 1 - General Requirements.
- B. Additional costs resulting from substitution of products other than those specified, by model number, including drawing changes and construction, will be at the expense of the Contractor.
- C. Substitution Approval: Prior to delivery or installation, submittals for each equipment item by Equipment Identifier shall be provided in accordance with Division 1 - General Requirements. Acceptance will be based on the technical requirements herein as determined by Owner and Architect.

1.05 WARRANTY

- A. Warrant work specified herein for one year from substantial completion against defects in materials, functions, and workmanship.
- B. Warranty shall include materials and labor necessary to correct defects.

- C. Defects shall include, but not be limited to noisy, rough or substandard operation; loose, damaged, and missing parts; and abnormal deterioration of finish. Defects shall not include damage due to neglect, misuse, or situations resulting from non-performance of a manufacturer's recommended preventive maintenance schedule.
- D. Submit warranties in accordance with Division 1 - General Requirements of these specifications.

1.06 PRODUCT DELIVERY, STORAGE, AND HANDLING

- A. Deliver equipment in manufacturer's containers, appropriately packaged and/or crated for protection during domestic shipment and storage in humid and/or dusty conditions.
- B. Indelibly label all containers, including those contained in others, on outside with item description(s) per title and Equipment Identifier of this specification.
- C. Provide equipment and material specified complete in one shipment for each equipment item. Split or partial shipments are not permissible.

1.07 BUY AMERICA COMPLIANCE

- A. The Contractor shall comply with the applicable Buy America requirements set forth in 49 U.S.C. 5323(j) and the applicable regulations in 49 C.F.R. Part 661, as amended. If the Contractor procures any capital items with Federal funds, it is the Contractor's responsibility to obtain the Buy America certification required under such regulations.
- B. Reference Division 1 for Buy America provisions.

PART 2 - PRODUCTS

2.01 RACK, STORAGE, STAND, HVAC Equipment Identifier: 1447

- A. Manufacturer's Reference: Fabricated item as shown on Equipment Detail Drawing Q500.
- B. Contractor shall confirm size of HVAC unit with car manufacturer prior to fabrication.
- C. Capacities/Dimensions:
 - 1. Load capacity: 2,000 pounds
 - 2. Overall dimensions:
 - a. Length: 100 inches
 - b. Width: 72 inches
 - c. Height: 60 inches
- D. Features/Performance/Construction:

1. Legs: Rack legs shall be fabricated of 3 by 3 by 3/16 inch steel tube.
 2. Leg braces: Leg braces shall be 3 by 3 by 3/16 and 6 by 3 by 3/16 inch steel tube continuously welded.
 3. Feet platforms: Feet platforms shall be 3/8 inch steel plates with continuous welds to tubing.
 4. Casters: Casters shall be 6 inches.
 5. Welds: All welds shall conform to American Welding Society standards.
- E. Finish: Cover all exposed steel surfaces including legs, braces, and feet platforms with one coat of zinc chromate primer and two coats of epoxy per manufacturer's recommendations in Owner's choice of color.
- 2.02 RACK, STORAGE, TRUCK
Equipment Identifier: 1448
- A. Manufacturer's Reference: Fabricated item as shown on Equipment Detail Drawing Q500.
 - B. Contractor shall confirm size of trucks with car manufacturer prior to fabrication.
 - C. Capacities/Dimensions:
 1. Load capacity: 12,000 pounds
 2. Overall dimensions:
 - a. Length: 94-1/4 inches
 - b. Width: 65-1/2 inches
 - c. Height: 68-1/8 inches
 - D. Features/Performance/Construction:
 1. Frame/Bracing: Bracing shall be fabricated of 3 by 3 by 3/16 inch steel tube.
 2. Gusset Plates: Gusset plates shall be 1/2 inch steel plate continuously welded to tubing - 8 total.
 3. Side Plates: Plates shall be 1 inch steel plate with continuous welds to tubing - 4 total.
 4. Welds: All welds shall conform to American Welding Society standards.
 - E. Finish: Cover all exposed steel surfaces including braces and legs with one coat of zinc chromate primer and two coats of epoxy per manufacturer's recommendations in Owner's choice of color.
- 2.03 WORKBENCH, SEVERE USE, 6 FEET
Equipment Identifier: 1860
- A. Manufacturer's Reference: Fabricated item as shown on Equipment Detail Drawing Q500.
 - B. Capacities/Dimensions:

1. Load capacity: 2,500 pounds
 2. Work surface thickness: 3/8 inch
 3. Overall dimensions:
 - a. Length: 72 inches
 - b. Depth: 32 inches
 - c. Height: 34 inches
- C. Features/Performance/Construction:
1. Legs: Workbench legs shall be fabricated of 3 by 3 by 3/16 inch steel tube.
 2. Leg braces: Leg braces shall be 3 by 1/4 inch steel plate continuously welded to tubing.
 3. Top braces: Top braces shall be 3 by 3 by 1/4 inch steel angle with continuous electrical welds to tubing.
 4. Top: Top shall be 3/8 inch steel plate with 50 percent minimum electrical welds to top braces. Corners of top shall have a 2 inch radius for protection of personnel. All edges shall be ground smooth.
 5. Skid plate: Skid plate shall be 4 by 4 by 1/4 inches steel plate with continuous welds to tubing.
 6. Welds: All welds shall conform to American Welding Society standards.
- D. Finish: Cover all exposed steel surfaces including both sides of top, braces, and legs with one coat of zinc chromate primer and two coats of epoxy per manufacturer's recommendations in Owner's choice of color.

PART 3 - EXECUTION

3.01 INSPECTION

- A. Coordinate location of rough-in work and utility stub-outs to assure match with equipment to be installed.
- B. Inspect delivered equipment for damage from shipping and exposure to weather. Compare delivered equipment with packing lists and specifications to assure receipt of all equipment items and specified accessories.

3.02 INSTALLATION

- A. Perform work under direct supervision of Foreman of Construction Superintendent with authority to coordinate installation of scheduled equipment with Architect.
- B. Install equipment in accordance with plans, shop drawings, and manufacturer's instructions:
 1. Positioning: Place equipment in accordance with any noted special positioning requirements generally level (or slight slope as required by instructions), plumb, and at right angles to adjacent work.

2. Fitting: Where field cutting or trimming is necessary, perform in a neat, accurate, professional manner without damaging equipment or adjacent work.
 3. Anchorage: Attach equipment as directed by Architect or designated representative. Installation fasteners shall be installed to avoid scratching or damaging adjacent surfaces.
- C. Upon completion of work, finish surfaces shall be free of tool marks, scratches, blemishes, and stains.

3.03 TESTING

- A. After final connections are made and prior to authorizing payment, specified equipment shall be tested for compliance with specifications in the presence of the Architect or designated representative using acceptance procedures provided by the manufacturer.

3.04 CLEANUP

- A. Touch-up damage to painted finishes.
- B. Wipe and clean equipment of any oil, grease, and solvents, and make ready for use.
- C. Clean area around equipment installation and remove packing and installation debris from job site.
- D. Notify Architect or designated representative for acceptance inspection.
