- B. Proceed with installation only after unsatisfactory conditions have been corrected.

3.02 PREPARATION

- A. Suspended Assemblies: Coordinate installation of suspension systems with installation of overhead structure to ensure that inserts and other provisions for anchorages to building structure have been installed to receive hangers at spacing required to support the Work and that hangers will develop their full strength.
 1. Furnish concrete inserts and other devices indicated to other trades for installation in advance of time needed for coordination and construction.

3.03 INSTALLATION, GENERAL

- A. Installation Standard: ASTM C 754, except comply with framing sizes and spacing indicated.
 - 1. Gypsum Plaster Assemblies: Also comply with requirements in ASTM C 841 that apply to framing installation.
 - 2. Portland Cement Plaster Assemblies: Also comply with requirements in ASTM C 1063 that apply to framing installation.
 - 3. Gypsum Veneer Plaster Assemblies: Also comply with requirements in ASTM C 844 that apply to framing installation.
 - 4. Gypsum Board Assemblies: Also comply with requirements in ASTM C 840 that apply to framing installation.
- B. Install supplementary framing, and blocking to support fixtures, equipment services, heavy trim, grab bars, toilet accessories, furnishings, or similar construction.
- C. Install bracing at terminations in assemblies.
- D. Do not bridge building control and expansion joints with non-load-bearing steel framing members. Frame both sides of joints independently.

3.04 INSTALLING FRAMED ASSEMBLIES

- A. Where studs are installed directly against exterior masonry walls or dissimilar metals at exterior walls, install isolation strip between studs and exterior wall.
- B. Install studs so flanges within framing system point in same direction.
 - 1. Space studs as follows:
 - a. Single-Layer Application: 16 inches o.c. unless otherwise indicated.
 - b. Multilayer Application: 16 inches o.c. unless otherwise indicated.
 - c. Tile Backing Panels: 16 inches o.c. unless otherwise indicated.
- C. Install tracks (runners) at floors and overhead supports. Extend framing full height to structural supports or substrates above suspended ceilings, except where partitions are indicated to terminate at suspended ceilings. Continue framing around ducts penetrating partitions above ceiling.
 - 1. Slip-Type Head Joints: Where framing extends to overhead structural supports, install to produce joints at tops of framing systems that prevent axial loading of finished assemblies.
 - 2. Door Openings: Screw vertical studs at jambs to jamb anchor clips on door frames; install runner track section (for cripple studs) at head and secure to jamb studs.
 - a. Install two studs at each jamb unless otherwise indicated.
 - b. Install cripple studs at head adjacent to each jamb stud, with a minimum 1/2-inch clearance from jamb stud to allow for installation of control joint in finished assembly.
 - c. Extend jamb studs through suspended ceilings and attach to underside of overhead structure.
 - 3. Other Framed Openings: Frame openings other than door openings the same as required for door openings unless otherwise indicated. Install framing below sills of openings to match framing required above door heads.
 - 4. Fire-Resistance-Rated Partitions: Install framing to comply with fire-resistance-

rated assembly indicated and support closures and to make partitions continuous from floor to underside of solid structure.

- a. Firestop Track: Where indicated, install to maintain continuity of fire-resistance-rated assembly indicated.
5. Sound-Rated Partitions: Install framing to comply with sound-rated assembly indicated.
- D. Z-Furring Members:
1. Erect insulation (specified in Section 07 21 16 "Blanket Insulation") vertically and hold in place with Z-furring members spaced **16 inches** o.c.
 2. Except at exterior corners, securely attach narrow flanges of furring members to wall with concrete stub nails, screws designed for masonry attachment, or powder-driven fasteners spaced **24 inches** o.c.
 3. At exterior corners, attach wide flange of furring members to wall with short flange extending beyond corner; on adjacent wall surface, screw-attach short flange of furring channel to web of attached channel. At interior corners, space second member no more than **12 inches** from corner and cut insulation to fit.
- E. Installation Tolerance: Install each framing member so fastening surfaces vary not more than **1/8 inch** from the plane formed by faces of adjacent framing.

3.05 INSTALLING SUSPENSION SYSTEMS

- A. Install suspension system components in sizes and spacings indicated on Drawings, but not less than those required by referenced installation standards for assembly types and other assembly components indicated.
- B. Isolate suspension systems from building structure where they abut or are penetrated by building structure to prevent transfer of loading imposed by structural movement.
- C. Suspend hangers from building structure as follows:
1. Install hangers plumb and free from contact with insulation or other objects within ceiling plenum that are not part of supporting structural or suspension system.
 - a. Splay hangers only where required to miss obstructions and offset resulting horizontal forces by bracing, countersplaying, or other equally effective means.
 2. Where width of ducts and other construction within ceiling plenum produces hanger spacings that interfere with locations of hangers required to support standard suspension system members, install supplemental suspension members and hangers in the form of trapezes or equivalent devices.
 - a. Size supplemental suspension members and hangers to support ceiling loads within performance limits established by referenced installation standards and California requirements.
 3. Wire Hangers: Secure by looping and wire tying, either directly to structures or to inserts, eye screws, or other devices and fasteners that are secure and appropriate for substrate, and in a manner that will not cause hangers to deteriorate or otherwise fail.
 4. Flat Hangers: Secure to structure, including intermediate framing members, by attaching to inserts, eye screws, or other devices and fasteners that are secure and appropriate for structure and hanger, and in a manner that will not cause

-
- hangers to deteriorate or otherwise fail.
5. Do not attach hangers to steel roof deck.
 6. Do not attach hangers to permanent metal forms. Furnish cast-in-place hanger inserts that extend through forms.
 7. Do not attach hangers to rolled-in hanger tabs of composite steel floor deck.
 8. Do not connect or suspend steel framing from ducts, pipes, or conduit.
- D. Fire-Resistance-Rated Assemblies: Wire tie furring channels to supports.
- E. Seismic Bracing: Sway-brace suspension systems with hangers used for support.
- F. Grid Suspension Systems: Attach perimeter wall track or angle where grid suspension systems meet vertical surfaces. Mechanically join main beam and cross-furring members to each other and butt-cut to fit into wall track.
- G. Installation Tolerances: Install suspension systems that are level to within **1/8 inch in 12 feet** measured lengthwise on each member that will receive finishes and transversely between parallel members that will receive finishes.

END OF SECTION 09 22 16

SECTION 09 29 00**GYPSUM BOARD****PART 1 - GENERAL****1.01 RELATED DOCUMENTS**

- A. Drawings and general provisions of the Contract, including General and Supplementary Conditions and other Division 01 Specification Sections, apply to this Section.

1.02 SUMMARY

- A. Section Includes:

1. Interior gypsum board.
2. Tile backing panels

Gypsum Board Type	Room Name & Number	Comply with partition type for thickness and fire resistance using one of the following
INTERIOR & SPECIALTY GYPSUM BOARD		
Gypsum Board	As indicated on partition type unless noted otherwise in column below	Gypsum Board, Type X, 5/8 inch Thickness
Moisture- and Mold-Resistant Gypsum Board	Toilet and Bath Rooms	Moisture- and Mold-Resistant Gypsum Board, 5/8 inch thick Core, Type X
TILE BACKING PANELS		
Glass-Mat, Water-Resistant Backing Board	Shower surrounds	Glass-Mat, Water-Resistant Backing Board, 5/8 inch thick, Type X, Mold Resistant
Moisture- and Mold-Resistant Gypsum Backing Board	Toilet and Bath Rooms	Moisture- and Mold-Resistant Gypsum Board, 5/8 inch thick Core, Type X

- B. Related Requirements:

1. Section 06 16 00 "Sheathing" for gypsum sheathing for exterior walls.
2. Section 09 22 16 "Non-Structural Metal Framing" for non-structural framing and suspension systems that support gypsum board panels.

1.03 SUBMITTALS

- A. Product Data: For each type of product.

B. LEED Submittals:

1. Product Certificates for Credit MR 5: For products and materials required to comply with requirements for regional materials, certificates indicating location of material manufacturer and point of extraction, harvest, or recovery for each raw material. Include statement indicating distance to Project, cost for each regional material, and fraction by weight that is considered regional.
2. Product Data for Credit IEQ 4.1: For adhesives used to laminate gypsum board panels to substrates, documentation including printed statement of VOC content.

C. Samples: For the following products:

1. Trim Accessories: Full-size Sample in 12-inch- long length for each trim accessory indicated.

1.04 QUALITY ASSURANCE**A. Mockups: Before beginning gypsum board installation, install mockups of at least 100 sq. ft. in surface area to demonstrate aesthetic effects and set quality standards for materials and execution.**

1. Install mockups for the following:
 - a. Each level of gypsum board finish indicated for use in exposed locations.
2. Apply or install final decoration indicated, including painting and wallcoverings, on exposed surfaces for review of mockups.
3. Simulate finished lighting conditions for review of mockups.
4. Subject to compliance with requirements, approved mockups may become part of the completed Work if undisturbed at time of Substantial Completion.

1.05 DELIVERY, STORAGE AND HANDLING**A. Store materials inside under cover and keep them dry and protected against weather, condensation, direct sunlight, construction traffic, and other potential causes of damage. Stack panels flat and supported on risers on a flat platform to prevent sagging.****1.06 FIELD CONDITIONS**

- A. Environmental Limitations: Comply with ASTM C 840 requirements or gypsum board manufacturer's written recommendations, whichever are more stringent.**
- B. Do not install paper-faced gypsum panels until installation areas are enclosed and conditioned.**
- C. Do not install panels that are wet, those that are moisture damaged, and those that are mold damaged.**
 1. Indications that panels are wet or moisture damaged include, but are not limited to, discoloration, sagging, or irregular shape.
 2. Indications that panels are mold damaged include, but are not limited to, fuzzy or splotchy surface contamination and discoloration.

PART 2 - PRODUCTS

2.01 PERFORMANCE REQUIREMENTS

- A. Fire-Resistance-Rated Assemblies: For fire-resistance-rated assemblies, provide materials and construction identical to those tested in assembly indicated according to ASTM E 119 by an independent testing agency.
- B. STC-Rated Assemblies: For STC-rated assemblies, provide materials and construction identical to those tested in assembly indicated according to ASTM E 90 and classified according to ASTM E 413 by an independent testing agency.

2.02 GYPSUM BOARD, GENERAL

- A. Regional Materials: Gypsum panel products shall be manufactured within **500 miles** of Project site from materials that have been extracted, harvested, or recovered, as well as manufactured, within **500 miles** of Project site.
- B. Size: Provide maximum lengths and widths available that will minimize joints in each area and that correspond with support system indicated.

2.03 INTERIOR GYPSUM BOARD

- A. Manufacturers: Subject to compliance with requirements, available manufacturers offering products that may be incorporated into the Work include, but are not limited to, the following:
 - 1. CertainTeed Corp.
 - 2. Georgia-Pacific Gypsum LLC.
 - 3. Lafarge North America Inc.
 - 4. National Gypsum Company.
 - 5. USG Corporation.
- B. Gypsum Board, Type X: ASTM C 1396/C 1396M.
 - 1. Thickness: **5/8 inch**.
 - 2. Long Edges: Tapered and featured (rounded or beveled) for prefilling.
- C. Gypsum Ceiling Board: ASTM C 1396/C 1396M.
 - 1. Thickness: **1/2 inch**.
 - 2. Long Edges: Tapered.
- D. Moisture- and Mold-Resistant Gypsum Board: ASTM C 1396/C 1396M. With moisture- and mold-resistant core and paper surfaces.
 - 1. Core: **5/8 inch**, Type X, except where **1/2 inch**, regular type is indicated on Drawings.
 - 2. Long Edges: Tapered.
 - 3. Mold Resistance: ASTM D 3273, score of 10 as rated according to ASTM D 3274.

2.04 TILE BACKING PANELS

- A. Glass-Mat, Water-Resistant Backing Board: ASTM C 1178/C 1178M, with manufacturer's standard edges.

1. Products: Subject to compliance with requirements, provide one of the following:
 - a. CertainTeed Corp.; GlasRoc Tile Backer.
 - b. Georgia-Pacific Gypsum LLC; DensShield Tile Backer.
2. Core: 5/8 inch, Type X, except where 1/2 inch, regular type is indicated on Drawings.
3. Mold Resistance: ASTM D 3273, score of 10 as rated according to ASTM D 3274.

2.05 TRIM ACCESSORIES

- A. Interior Trim: ASTM C 1047.
 1. Material: Galvanized or aluminum-coated steel sheet, rolled zinc, plastic, or paper-faced galvanized steel shee.
 2. Shapes:
 - a. Cornerbead.
 - b. Bullnose bead.
 - c. LC-Bead: J-shaped; exposed long flange receives joint compound.
 - d. L-Bead: L-shaped; exposed long flange receives joint compound.
 - e. U-Bead: J-shaped; exposed short flange does not receive joint compound.
 - f. Expansion (control) joint.
 - g. Curved-Edge Cornerbead: With notched or flexible flanges.
- B. Aluminum Trim: Extruded accessories of profiles and dimensions indicated.
 1. Manufacturers: Subject to compliance with requirements, available manufacturers offering products that may be incorporated into the Work include, but are not limited to, the following:
 - a. Fry Reglet Corp.
 - b. Gordon, Inc.
 - c. Pittcon Industries.
 2. Aluminum: Alloy and temper with not less than the strength and durability properties of [ASTM B 221](#), Alloy 6063-T5.
 3. Finish: Corrosion-resistant primer compatible with joint compound and finish materials specified.

2.06 JOINT TREATMENT MATERIALS

- A. General: Comply with ASTM C 475/C 475M.
- B. Joint Tape:
 1. Interior Gypsum Board: Paper.
 2. Tile Backing Panels: As recommended by panel manufacturer.
- C. Joint Compound for Interior Gypsum Board: For each coat use formulation that is compatible with other compounds applied on previous or for successive coats.
 1. Prefilling: At open joints, and damaged surface areas, use setting-type taping compound.
 2. Embedding and First Coat: For embedding tape and first coat on joints, fasteners, and trim flanges, use drying-type, all-purpose compound.
 3. Fill Coat: For second coat, use drying-type, all-purpose compound.

4. Finish Coat: For third coat, use drying-type, all-purpose compound.

D. Joint Compound for Tile Backing Panels:

1. Moisture- and Mold-Resistant Gypsum Backing Board: Use setting-type taping compound and setting-type, sandable topping compound.

2.07 AUXILIARY MATERIALS

A. General: Provide auxiliary materials that comply with referenced installation standards and manufacturer's written recommendations.

B. Steel Drill Screws: ASTM C 1002, unless otherwise indicated.

1. Use screws complying with ASTM C 954 for fastening panels to steel members from 0.033 to 0.112 inch thick.
2. For fastening cementitious backer units, use screws of type and size recommended by panel manufacturer.

C. Sound Attenuation Blankets: ASTM C 665, Type I (blankets without membrane facing) produced by combining thermosetting resins with mineral fibers manufactured from glass, slag wool, or rock wool.

1. Fire-Resistance-Rated Assemblies: Comply with mineral-fiber requirements of assembly.
2. Recycled Content of Blankets: Postconsumer recycled content plus one-half of preconsumer recycled content not less than 50 percent.

D. Acoustical Joint Sealant: Manufacturer's standard nonsag, paintable, nonstaining latex sealant complying with ASTM C 834. Product effectively reduces airborne sound transmission through perimeter joints and openings in building construction as demonstrated by testing representative assemblies according to ASTM E 90.

1. Products: Subject to compliance with requirements, available products that may be incorporated into the Work include, but are not limited to, the following:
 - a. Accumetric LLC; BOSS 824 Acoustical Sound Sealant.
 - b. Grabber Construction Products; Acoustical Sealant GSC.
 - c. Pecora Corporation; AIS-919.
 - d. Specified Technologies, Inc.; Smoke N Sound Acoustical Sealant.
 - e. USG Corporation; SHEETROCK Acoustical Sealant.
2. Acoustical joint sealant shall have a VOC content of 250 g/L or less when calculated according to 40 CFR 59, Subpart D (EPA Method 24).

E. Thermal Insulation: As specified in Section 07 21 00 "Blanket Insulation."

F. Vapor Retarder: As specified in Section 07 21 00 "Blanket Insulation."

PART 3 - EXECUTION

3.01 EXAMINATION

A. Examine areas and substrates including welded hollow-metal frames and framing, with Installer present, for compliance with requirements and other conditions affecting performance.

- B. Examine panels before installation. Reject panels that are wet, moisture damaged, and mold damaged.
- C. Proceed with installation only after unsatisfactory conditions have been corrected.

3.02 APPLYING AND FINISHING PANELS, GENERAL

- A. Comply with ASTM C 840.
- B. Install ceiling panels across framing to minimize the number of abutting end joints and to avoid abutting end joints in central area of each ceiling. Stagger abutting end joints of adjacent panels not less than one framing member.
- C. Install panels with face side out. Butt panels together for a light contact at edges and ends with not more than $1/16$ inch of open space between panels. Do not force into place.
- D. Locate edge and end joints over supports, except in ceiling applications where intermediate supports or gypsum board back-blocking is provided behind end joints. Do not place tapered edges against cut edges or ends. Stagger vertical joints on opposite sides of partitions. Do not make joints other than control joints at corners of framed openings.
- E. Form control and expansion joints with space between edges of adjoining gypsum panels.
- F. Cover both faces of support framing with gypsum panels in concealed spaces (above ceilings, etc.), except in chases braced internally.
 - 1. Unless concealed application is indicated or required for sound, fire, air, or smoke ratings, coverage may be accomplished with scraps of not less than 8 sq. ft. in area.
 - 2. Fit gypsum panels around ducts, pipes, and conduits.
 - 3. Where partitions intersect structural members projecting below underside of floor/roof slabs and decks, cut gypsum panels to fit profile formed by structural members; allow $1/4$ - to $3/8$ -inch- wide joints to install sealant.
- G. Isolate perimeter of gypsum board applied to non-load-bearing partitions at structural abutments, except floors. Provide $1/4$ - to $1/2$ -inch- wide spaces at these locations and trim edges with edge trim where edges of panels are exposed. Seal joints between edges and abutting structural surfaces with acoustical sealant.
- H. Attachment to Steel Framing: Attach panels so leading edge or end of each panel is attached to open (unsupported) edges of stud flanges first.
- I. Wood Framing: Install gypsum panels over wood framing, with floating internal corner construction. Do not attach gypsum panels across the flat grain of wide-dimension lumber, including floor joists and headers. Float gypsum panels over these members or provide control joints to counteract wood shrinkage.
- J. STC-Rated Assemblies: Seal construction at perimeters, behind control joints, and at openings and penetrations with a continuous bead of acoustical sealant. Install acoustical sealant at both faces of partitions at perimeters and through penetrations. Comply with ASTM C 919 and with manufacturer's written recommendations for locating edge trim and closing off sound-flanking paths around or through assemblies, including sealing partitions above acoustical ceilings.
- K. Install sound attenuation blankets before installing gypsum panels unless blankets are

readily installed after panels have been installed on one side.

3.03 APPLYING INTERIOR GYPSUM BOARD

A. Install interior gypsum board in the following locations:

1. Wallboard Type: As indicated on Drawing.
2. Type X: Where required for fire-resistance-rated assembly.
3. Ceiling Type: As indicated on Drawings.
4. Moisture- and Mold-Resistant Type: As indicated on Drawings.

B. Single-Layer Application:

1. On ceilings, apply gypsum panels before wall/partition board application to greatest extent possible and at right angles to framing unless otherwise indicated.
2. On partitions/walls, apply gypsum panels horizontally (perpendicular to framing) unless otherwise indicated or required by fire-resistance-rated assembly, and minimize end joints.
 - a. Stagger abutting end joints not less than one framing member in alternate courses of panels.
 - b. At stairwells and other high walls, install panels horizontally unless otherwise indicated or required by fire-resistance-rated assembly.
3. On Z-furring members, apply gypsum panels vertically (parallel to framing) with no end joints. Locate edge joints over furring members.
4. Fastening Methods: Apply gypsum panels to supports with steel drill screws.

C. Multilayer Application:

1. On partitions/walls, apply gypsum board indicated for base layers and face layers vertically (parallel to framing) with joints of base layers located over stud or furring member and face-layer joints offset at least one stud or furring member with base-layer joints, unless otherwise indicated or required by fire-resistance-rated assembly. Stagger joints on opposite sides of partitions.
2. On Z-furring members, apply base layer vertically (parallel to framing) and face layer either vertically (parallel to framing) or horizontally (perpendicular to framing) with vertical joints offset at least one furring member. Locate edge joints of base layer over furring members.
3. Fastening Methods: Fasten base layers and face layers separately to supports with screws.

3.04 APPLYING TILE BACKING PANELS

- A. Glass-Mat, Water-Resistant Backing Panels: Comply with manufacturer's written installation instructions and install at showers, tubs, and where indicated. Install with [1/4-inch](#) gap where panels abut other construction or penetrations.
- B. Where tile backing panels abut other types of panels in same plane, shim surfaces to produce a uniform plane across panel surfaces.

3.05 INSTALLING TRIM ACCESSORIES

- A. General: For trim with back flanges intended for fasteners, attach to framing with same fasteners used for panels. Otherwise, attach trim according to manufacturer's written instructions.

- B. Control Joints: Install control joints according to ASTM C 840 and in specific locations approved by Architect for visual effect.
- C. Interior Trim: Install in the following locations:
 - 1. Cornerbead: Use at outside corners
 - 2. LC-Bead: Use at exposed panel edges.
 - 3. L-Bead: Use where indicated
 - 4. U-Bead: Use at exposed panel edges.

3.06 FINISHING GYPSUM BOARD

- A. General: Treat gypsum board joints, interior angles, edge trim, control joints, penetrations, fastener heads, surface defects, and elsewhere as required to prepare gypsum board surfaces for decoration. Promptly remove residual joint compound from adjacent surfaces.
- B. Prefill open joints and damaged surface areas.
- C. Apply joint tape over gypsum board joints, except for trim products specifically indicated as not intended to receive tape.
- D. Gypsum Board Finish Levels: Finish panels to levels indicated below and according to ASTM C 840:
 - 1. Level 2: Panels that are substrate for tile.
 - 2. Level 4: At panel surfaces that will be exposed to view unless otherwise indicated.
 - a. Primer and its application to surfaces are specified in other Section 09 91 23 "Interior Painting." Level 5 is suitable for surfaces receiving gloss and semigloss enamels and other surfaces subject to severe lighting. It is considered a high-quality gypsum board finish.
 - 3. Level 5: Where indicated on Drawings.
 - a. Primer and its application to surfaces are specified in Section 09 91 23 "Interior Painting."
- E. Glass-Mat Faced Panels: Finish according to manufacturer's written instructions.
- F. Cementitious Backer Units: Finish according to manufacturer's written instructions.

3.07 PROTECTION

- A. Protect adjacent surfaces from drywall compound and promptly remove from floors and other non-drywall surfaces. Repair surfaces stained, marred, or otherwise damaged during drywall application.
- B. Protect installed products from damage from weather, condensation, direct sunlight, construction, and other causes during remainder of the construction period.
- C. Remove and replace panels that are wet, moisture damaged, and mold damaged.
 - 1. Indications that panels are wet or moisture damaged include, but are not limited to, discoloration, sagging, or irregular shape.
 - 2. Indications that panels are mold damaged include, but are not limited to, fuzzy or splotchy surface contamination and discoloration.

END OF SECTION 09 29 00

SECTION 09 30 00**TILING****PART 1 - GENERAL****1.01 RELATED DOCUMENTS**

- A. Drawings and general provisions of the Contract, including General and Supplementary Conditions and Division 01 Specification Sections, apply to this Section.

1.02 SUMMARY**A. Section Includes:**

- 1. Ceramic tile.
- 2. Porcelain tile.
- 3. Waterproof membrane.
- 4. Crack isolation membrane.
- 5. Metal edge strips.

B. Related Sections:

- 1. Section 07 92 00 "Joint Sealants" for sealing of expansion, contraction, control, and isolation joints in tile surfaces.
- 2. Section 09 29 00 "Gypsum Board" for glass-mat, water-resistant backer board.

1.03 DEFINITIONS

- A. General: Definitions in the ANSI A108 series of tile installation standards and in ANSI A137.1 apply to Work of this Section unless otherwise specified.
- B. ANSI A108 Series: ANSI A108.01, ANSI A108.02, ANSI A108.1A, ANSI A108.1B, ANSI A108.1C, ANSI A108.4, ANSI A108.5, ANSI A108.6, ANSI A108.8, ANSI A108.9, ANSI A108.10, ANSI A108.11, ANSI A108.12, ANSI A108.13, ANSI A108.14, ANSI A108.15, ANSI A108.16, and ANSI A108.17, which are contained in "American National Standard Specifications for Installation of Ceramic Tile."
- C. Module Size: Actual tile size plus joint width indicated.
- D. Face Size: Actual tile size, excluding spacer lugs.

1.04 ACTION SUBMITTALS

- A. Product Data: For each type of product indicated.
- B. LEED Submittals:
 - 1. Product Data for Credit IEQ 4.1: For adhesives and sealants, documentation including printed statement of VOC content.
 - 2. Product Data for Credit IEQ 4.3: For adhesives and grouts, documentation including printed statement of VOC content.
 - 3. Product Data for Credit IEQ 4.3: For tile floors, documentation from an independent testing agency indicating compliance with the FloorScore Standard.

- C. Shop Drawings: Show locations of each type of tile and tile pattern. Show widths, details, and locations of expansion, contraction, control, and isolation joints in tile substrates and finished tile surfaces.
- D. Samples for Initial Selection: For each type of tile and grout indicated. Include Samples of accessories involving color selection.
- E. Samples for Verification:
 - 1. Full-size units of each type and composition of tile and for each color and finish required.
 - 2. Assembled samples mounted on a rigid panel, with grouted joints, for each type and composition of tile and for each color and finish required. Make samples at least 12 inches square, but not fewer than 4 tiles. Use grout of type and in color or colors approved for completed Work.
 - 3. Full-size units of each type of trim and accessory for each color and finish required.
 - 4. Metal edge strips in 6-inch lengths.

1.05 INFORMATIONAL SUBMITTALS

- A. Qualification Data: For qualified Installer.
- B. Master Grade Certificates: For each shipment, type, and composition of tile, signed by tile manufacturer and Installer.
- C. Product Certificates: For each type of product, signed by product manufacturer.
- D. Material Test Reports: For each tile-setting and -grouting product.

1.06 MAINTENANCE MATERIAL SUBMITTALS

- A. Furnish extra materials that match and are from same production runs as products installed and that are packaged with protective covering for storage and identified with labels describing contents.
 - 1. Tile and Trim Units: Furnish quantity of full-size units equal to 3 percent of amount installed for each type, composition, color, pattern, and size indicated.
 - 2. Grout: Furnish quantity of grout equal to 3 percent of amount installed for each type, composition, and color indicated.

1.07 QUALITY ASSURANCE

- A. Source Limitations for Tile: Obtain tile from one source or producer.
 - 1. Obtain tile of each type and color or finish from same production run and of consistent quality in appearance and physical properties for each contiguous area.
- B. Source Limitations for Setting and Grouting Materials: Obtain ingredients of a uniform quality for each mortar, adhesive, and grout component from one manufacturer and each aggregate from one source or producer.
- C. Source Limitations for Other Products: Obtain each of the following products specified in this Section from a single manufacturer for each product:
 - 1. Waterproof membrane.
 - 2. Crack isolation membrane.

3. Joint sealants.
 4. Metal edge strips.
- D. Mockups: Build mockups to verify selections made under sample submittals and to demonstrate aesthetic effects and set quality standards for materials and execution.
1. Build mockup of each type of floor tile installation.
 2. Build mockup of each type of wall tile installation.
 3. Approved mockups may become part of the completed Work if undisturbed at time of Substantial Completion.

1.08 DELIVERY, STORAGE, AND HANDLING

- A. Deliver and store packaged materials in original containers with seals unbroken and labels intact until time of use. Comply with requirements in ANSI A137.1 for labeling tile packages.
- B. Store tile and cementitious materials on elevated platforms, under cover, and in a dry location.
- C. Store aggregates where grading and other required characteristics can be maintained and contamination can be avoided.
- D. Store liquid materials in unopened containers and protected from freezing.
- E. Handle tile that has temporary protective coating on exposed surfaces to prevent coated surfaces from contacting backs or edges of other units. If coating does contact bonding surfaces of tile, remove coating from bonding surfaces before setting tile.

1.09 PROJECT CONDITIONS

- A. Environmental Limitations: Do not install tile until construction in spaces is complete and ambient temperature and humidity conditions are maintained at the levels indicated in referenced standards and manufacturer's written instructions.

PART 2 - PRODUCTS

2.01 PRODUCTS, GENERAL

- A. ANSI Ceramic Tile Standard: Provide tile that complies with ANSI A137.1 for types, compositions, and other characteristics indicated.
 1. Provide tile complying with Standard grade requirements unless otherwise indicated.
- B. ANSI Standards for Tile Installation Materials: Provide materials complying with ANSI A108.02, ANSI standards referenced in other Part 2 articles, ANSI standards referenced by TCA installation methods specified in tile installation schedules, and other requirements specified.
- C. FloorScore Compliance: Tile for floors shall comply with requirements of FloorScore Standard.
- D. Factory Blending: For tile exhibiting color variations within ranges, blend tile in factory and package so tile units taken from one package show same range in colors as those taken from other packages and match approved Samples.

- E. Mounting: For factory-mounted tile, provide back- or edge-mounted tile assemblies as standard with manufacturer unless otherwise indicated.
 - 1. Where tile is indicated for installation in wet areas, do not use back- or edge-mounted tile assemblies unless tile manufacturer specifies in writing that this type of mounting is suitable for installation indicated and has a record of successful in-service performance.
- F. Factory-Applied Temporary Protective Coating: Where indicated under tile type, protect exposed surfaces of tile against adherence of mortar and grout by precoating with continuous film of petroleum paraffin wax, applied hot. Do not coat unexposed tile surfaces.

2.02 TILE PRODUCTS

A. Tile Type WT-1

- 1. Basis-of-Design Product: Subject to compliance with requirements, provide products as listed on Finish Legend, or comparable product by one of the following:
 - a. American Olean; Division of Dal-Tile International Inc.
 - b. Daltile; Division of Dal-Tile International Inc.
 - c. Deutsche Steinzeug America, Inc.
 - d. Endicott Tile Ltd.; Endicott Clay Products Co.
 - e. Florida Brick & Clay Company Inc.
 - f. Florida Tile Industries, Inc.
 - g. Interceramic.
 - h. Metropolitan Ceramics.
 - i. Portobello America, Inc.
 - j. Quarry Tile Co.
 - k. Seneca Tiles, Inc.
 - l. Summitville Tiles, Inc.
 - m. United States Ceramic Tile Company.
- 2. Face Size: [As shown on Finish Legend](#).
- 3. Tile Color and Pattern: As indicated on Finish Legend.
- 4. Grout Color: As indicated on Finish Legend. Trim Units: Coordinated with sizes and coursing of adjoining flat tile where applicable and matching characteristics of adjoining flat tile. Provide shapes as follows, selected from manufacturer's standard shapes:

B. Tile Type WT-2.

- 1. Basis-of-Design Product: Subject to compliance with requirements, provide mosaic tiles as indicated on Finish Legend or comparable product by one of the following:
 - a. American Marazzi Tile, Inc.
 - b. Crossville, Inc.
 - c. Daltile; Division of Dal-Tile International Inc.
 - d. Laufen.
 - e. Lone Star Ceramics Company.
 - f. Grupo Porcelanite.
 - g. Portobello America, Inc.
 - h. Seneca Tiles, Inc.
 - i. United States Ceramic Tile Company.

2. Composition: Impervious natural clay or porcelain.
3. Tile Color and Pattern: As indicated on Finish Legend.
4. Grout Color: As indicated on Finish Legend.

C. Tile Type TF-1:

1. Basis-of-Design Product: Subject to compliance with requirements, provide product indicated on Finish Legend or comparable product by one of the following:
 - a. American Marazzi Tile, Inc.
 - b. Daltile; Division of Dal-Tile International Inc.
 - c. Deutsche Steinzeug America, Inc.
 - d. Florida Tile Industries, Inc.
 - e. Florim USA.
 - f. Laufen.
 - g. Grupo Porcelanite.
 - h. Portobello America, Inc.
 - i. Seneca Tiles, Inc.
 - j. United States Ceramic Tile Company.
2. Tile Color and Pattern: As indicated on Finish Legend.
3. Grout Color: As indicated on Finish Legend.

2.03 WATERPROOF MEMBRANE

- A. General: Manufacturer's standard product selected from the following, that complies with ANSI A118.10 and is recommended by the manufacturer for the application indicated. Include reinforcement and accessories recommended by manufacturer.
- B. Chlorinated Polyethylene Sheet: Nonplasticized, chlorinated polyethylene faced on both sides with nonwoven polyester fabric; 0.030-inch nominal thickness.
 1. Products: Subject to compliance with requirements, available products that may be incorporated into the Work include, but are not limited to, the following:
 - a. Noble Company (The); Nobleseal TS.
- C. PVC Sheet: Two layers of PVC sheet heat-fused together and to facings of nonwoven polyester; 0.040-inch nominal thickness.
 1. Compotite Corporation; Composeal Gold.
- D. Polyethylene Sheet: Polyethylene faced on both sides with fleece webbing; 0.008-inch nominal thickness.
 1. Products: Subject to compliance with requirements, available products that may be incorporated into the Work include, but are not limited to, the following:
 - a. Schluter Systems L.P.; KERDI.
- E. Fabric-Reinforced, Modified-Bituminous Sheet: Self-adhering, SBS-modified-bituminous sheet with woven reinforcement facing; 0.040-inch nominal thickness.
 1. Products: Subject to compliance with requirements, available products that may be incorporated into the Work include, but are not limited to, the following:

- a. National Applied Construction Products, Inc.; Strataflex.
- F. Fabric-Reinforced, Fluid-Applied Membrane: System consisting of liquid-latex rubber or elastomeric polymer and continuous fabric reinforcement.
1. Products: Subject to compliance with requirements, available products that may be incorporated into the Work include, but are not limited to, the following:
 - a. Boiardi Products; a QEP company; Elastiment 344 Reinforced Waterproofing and Anti-Fracture/Crack Suppression Membrane.
 - b. Bonsal American; an Oldcastle company; B 6000 Waterproof Membrane with Glass Fabric.
 - c. Bostik, Inc.; Hydroment Blacktop 90210.
 - d. Custom Building Products; 9240 Waterproofing and Anti-Fracture Membrane.
 - e. Laticrete International, Inc.; Laticrete 9235 Waterproof Membrane.
 - f. MAPEI Corporation; Mapelastik HPG with MAPEI Fiberglass Mesh.
 - g. Mer-Kote Products, Inc.; Hydro-Guard 2000.
- G. Fluid-Applied Membrane: Liquid-latex rubber or elastomeric polymer.
1. Products: Subject to compliance with requirements, available products that may be incorporated into the Work include, but are not limited to, the following:
 - a. Boiardi Products; a QEP company; Elastiment 644 Membrane Waterproofing System.
 - b. Bonsal American; an Oldcastle company; B 6000 Waterproof Membrane.
 - c. Bostik, Inc.; Durabond D-222 Duraguard Membrane.
 - d. C-Cure; Pro-Red Waterproofing Membrane 63.
 - e. Custom Building Products; Redgard Waterproofing and Crack Prevention Membrane.
 - f. Jamo Inc.; Waterproof.
 - g. Laticrete International, Inc.; Latapoxy 24hr HydroProofing.
 - h. MAPEI Corporation; Mapelastik HPG.
 - i. Southern Grouts & Mortars, Inc.; Southcrete 1100 Crack Suppression and Waterproofing.
 - j. TEC; a subsidiary of H. B. Fuller Company; HydraFlex - Waterproofing Crack Isolation Membrane.
- H. Latex-Portland Cement: Flexible mortar consisting of cement-based mix and latex additive.
1. Products: Subject to compliance with requirements, available products that may be incorporated into the Work include, but are not limited to, the following:
 - a. Boiardi Products; a QEP company; Elastiment 323 Cement Based Waterproofing, Anti-Fracture/Crack Suppression Membrane.
 - b. C-Cure; UltraCure 971.
 - c. MAPEI Corporation; Mapelastik (PRP 315).
 - d. Southern Grouts & Mortars, Inc.; Southcrete 1100.
 - e. TEC; a subsidiary of H. B. Fuller Company; Triple Flex Waterproofing, Crack Isolation Membrane & Mortar.
- I. Urethane Waterproofing and Tile-Setting Adhesive: One-part, liquid-applied urethane, with a VOC content of 65 g/L or less when calculated according to 40 CFR 59, Subpart D (EPA Method 24), in a consistency suitable for trowel application and intended for use as both waterproofing and tile-setting adhesive in a two-step process.

1. Products: Subject to compliance with requirements, available products that may be incorporated into the Work include, but are not limited to, the following:
 - a. Bostik, Inc.; Hydroment Ultra-Set .

2.04 CRACK ISOLATION MEMBRANE

- A. General: Manufacturer's standard product, selected from the following, that complies with ANSI A118.12 for standard performance and is recommended by the manufacturer for the application indicated. Include reinforcement and accessories recommended by manufacturer.
- B. Chlorinated Polyethylene Sheet: Nonplasticized, chlorinated polyethylene faced on both sides with nonwoven polyester fabric; 0.030-inch nominal thickness.
 1. Products: Subject to compliance with requirements, available products that may be incorporated into the Work include, but are not limited to, the following:
 - a. Noble Company (The); Nobleseal CIS.
- C. Polyethylene Sheet: Polyethylene faced on both sides with fleece webbing; 0.008-inch nominal thickness.
 1. Products: Subject to compliance with requirements, available products that may be incorporated into the Work include, but are not limited to, the following:
 - a. Schluter Systems L.P.; KERDI.
- D. Corrugated Polyethylene: Corrugated polyethylene with dovetail-shaped corrugations and with anchoring webbing on the underside; 3/16-inch nominal thickness.
 1. Products: Subject to compliance with requirements, available products that may be incorporated into the Work include, but are not limited to, the following:
 - a. Schluter Systems L.P.; DITRA.
- E. Fabric-Reinforced, Modified-Bituminous Sheet: Self-adhering, modified-bituminous sheet with fabric reinforcement facing; 0.040-inch nominal thickness.
 1. Products: Subject to compliance with requirements, available products that may be incorporated into the Work include, but are not limited to, the following:
 - a. MAPEI Corporation; Mapelastic SM.
 - b. National Applied Construction Products, Inc.; Strataflex.
- F. Fabric-Reinforced, Fluid-Applied Membrane: System consisting of liquid-latex rubber or elastomeric polymer and fabric reinforcement.
 1. Products: Subject to compliance with requirements, available products that may be incorporated into the Work include, but are not limited to, the following:
 - a. Boiardi Products; a QEP company; Elastiment 344 Reinforced Waterproofing and Anti-Fracture/Crack Suppression Membrane.
 - b. Bonsal American; an Oldcastle company; B 6000 Waterproof Membrane with Glass Fabric.
 - c. Bostik, Inc.; Hydroment Blacktop 90210.
 - d. Custom Building Products; 9240 Waterproofing and Anti-Fracture

- Membrane.
 - e. Laticrete International, Inc.; Laticrete Blue 92 Anti-Fracture Membrane.
 - f. MAPEI Corporation; Mapelastc HPG with MAPEI Fiberglass Mesh.
 - g. Mer-Kote Products, Inc.; Hydro-Guard 2000.
- G. Fluid-Applied Membrane: Liquid-latex rubber or elastomeric polymer.
- 1. Products: Subject to compliance with requirements, available products that may be incorporated into the Work include, but are not limited to, the following:
 - a. Bostik, Inc.; Durabond D-222 Duraguard Membrane.
 - b. Custom Building Products; Redgard Waterproofing and Crack Prevention Membrane.
 - c. Jamo Inc.; Waterproof.
 - d. Mer-Kote Products, Inc.; Fracture-Guard 5000.
 - e. Southern Grouts & Mortars, Inc.; Southcrete 1100 Crack Suppression and Waterproofing.
 - f. TEC; a subsidiary of H. B. Fuller Company; HydraFlex - Waterproofing Crack Isolation Membrane.
- H. Latex-Portland Cement: Flexible mortar consisting of cement-based mix and latex additive.
- 1. Products: Subject to compliance with requirements, available products that may be incorporated into the Work include, but are not limited to, the following:
 - a. C-Cure; UltraCure 971.
 - b. MAPEI Corporation; Mapelastc (PRP 315).
 - c. TEC; a subsidiary of H. B. Fuller Company; Triple Flex Waterproofing, Crack Isolation Membrane & Mortar.
- I. Urethane Crack Isolation Membrane and Tile-Setting Adhesive: One-part, liquid-applied urethane, with a VOC content of 65 g/L or less when calculated according to 40 CFR 59, Subpart D (EPA Method 24), in a consistency suitable for trowel application and intended for use as both waterproofing and tile-setting adhesive in a two-step process.
- 1. Products: Subject to compliance with requirements, available products that may be incorporated into the Work include, but are not limited to, the following:
 - a. Bostik, Inc.; Hydroment Ultra-Set.

2.05 SETTING MATERIALS

- A. Latex-Portland Cement Mortar (Thin Set): ANSI A118.4.
- 1. Manufacturers: Subject to compliance with requirements, available manufacturers offering products that may be incorporated into the Work include, but are not limited to, the following:
 - a. Boiardi Products; a QEP company.
 - b. Bonsal American; an Oldcastle company.
 - c. Bostik, Inc.
 - d. C-Cure.
 - e. Custom Building Products.
 - f. Jamo Inc.
 - g. Laticrete International, Inc.
 - h. MAPEI Corporation.

- i. Mer-Kote Products, Inc.
 - j. Southern Grouts & Mortars, Inc.
 - k. Summitville Tiles, Inc.
 - l. TEC; a subsidiary of H. B. Fuller Company.
2. For wall applications, provide mortar that complies with requirements for nonsagging mortar in addition to the other requirements in ANSI A118.4.

2.06 GROUT MATERIALS

- A. Sand-Portland Cement Grout: ANSI A108.10, composed of white or gray cement and white or colored aggregate as required to produce color indicated.
- B. Polymer-Modified Tile Grout: ANSI A118.7.
 1. Manufacturers: Subject to compliance with requirements, available manufacturers offering products that may be incorporated into the Work include, but are not limited to, the following:
 - a. Boiardi Products; a QEP company.
 - b. Bonsal American; an Oldcastle company.
 - c. Bostik, Inc.
 - d. C-Cure.
 - e. Custom Building Products.
 - f. Jamo Inc.
 - g. Laticrete International, Inc.
 - h. MAPEI Corporation.
 - i. Southern Grouts & Mortars, Inc.
 - j. Summitville Tiles, Inc.
 - k. TEC; a subsidiary of H. B. Fuller Company.

2.07 MISCELLANEOUS MATERIALS

- A. Trowelable Underlayments and Patching Compounds: Latex-modified, portland cement-based formulation provided or approved by manufacturer of tile-setting materials for installations indicated.
- B. Temporary Protective Coating: Either product indicated below that is formulated to protect exposed surfaces of tile against adherence of mortar and grout; compatible with tile, mortar, and grout products; and easily removable after grouting is completed without damaging grout or tile.
 1. Petroleum paraffin wax, fully refined and odorless, containing at least 0.5 percent oil with a melting point of 120 to 140 deg F per ASTM D 87.
 2. Grout release in form of manufacturer's standard proprietary liquid coating that is specially formulated and recommended for use as temporary protective coating for tile.
- C. Tile Cleaner: A neutral cleaner capable of removing soil and residue without harming tile and grout surfaces, specifically approved for materials and installations indicated by tile and grout manufacturers.
- D. Metal Edge Strips: Angle shape, height to match tile and setting-bed thickness, metallic or combination of metal and PVC or neoprene base, designed specifically for flooring applications; stainless-steel, ASTM A 666, 300 Series exposed-edge material. Provide RENO-RAMP by Schluter Systems.

- E. Grout Sealer: Manufacturer's standard product for sealing grout joints and that does not change color or appearance of grout.
 - 1. Products: Subject to compliance with requirements, available products that may be incorporated into the Work include, but are not limited to, the following:
 - a. Bonsal American; an Oldcastle company; Grout Sealer.
 - b. Bostik, Inc.; CeramaSeal Grout & Tile Sealer.
 - c. C-Cure; Penetrating Sealer 978.
 - d. Custom Building Products; Surfaceguard Sealer.
 - e. Jamo Inc.; Penetrating Sealer.
 - f. MAPEI Corporation; KER 004, Keraseal Penetrating Sealer for Unglazed Grout and Tile.
 - g. Southern Grouts & Mortars, Inc.; Silicone Grout Sealer.
 - h. Summitville Tiles, Inc.; SL-15, Invisible Seal Penetrating Grout and Tile Sealer.
 - i. TEC; a subsidiary of H. B. Fuller Company; TA-256 Penetrating Silicone Grout Sealer.

2.08 MIXING MORTARS AND GROUT

- A. Mix mortars and grouts to comply with referenced standards and mortar and grout manufacturers' written instructions.
- B. Add materials, water, and additives in accurate proportions.
- C. Obtain and use type of mixing equipment, mixer speeds, mixing containers, mixing time, and other procedures to produce mortars and grouts of uniform quality with optimum performance characteristics for installations indicated.

PART 3 - EXECUTION

3.01 EXAMINATION

- A. Examine substrates, areas, and conditions where tile will be installed, with Installer present, for compliance with requirements for installation tolerances and other conditions affecting performance of installed tile.
 - 1. Verify that substrates for setting tile are firm, dry, clean, free of coatings that are incompatible with tile-setting materials including curing compounds and other substances that contain soap, wax, oil, or silicone; and comply with flatness tolerances required by ANSI A108.01 for installations indicated.
 - 2. Verify that concrete substrates for tile floors installed with thin-set mortar comply with surface finish requirements in ANSI A108.01 for installations indicated.
 - a. Verify that surfaces that received a steel trowel finish have been mechanically scarified.
 - b. Verify that protrusions, bumps, and ridges have been removed by sanding or grinding.
 - 3. Verify that installation of grounds, anchors, recessed frames, electrical and mechanical units of work, and similar items located in or behind tile has been completed.
 - 4. Verify that joints and cracks in tile substrates are coordinated with tile joint locations; if not coordinated, adjust joint locations in consultation with Architect.
- B. Proceed with installation only after unsatisfactory conditions have been corrected.

3.02 PREPARATION

- A. Fill cracks, holes, and depressions in concrete substrates for tile floors installed with thin-set mortar with trowelable leveling and patching compound specifically recommended by tile-setting material manufacturer.
- B. Where indicated, prepare substrates to receive waterproofing by applying a reinforced mortar bed that complies with ANSI A108.1A and is sloped $\frac{1}{4}$ inch per foot toward drains.
- C. Blending: For tile exhibiting color variations, verify that tile has been factory blended and packaged so tile units taken from one package show same range of colors as those taken from other packages and match approved Samples. If not factory blended, either return to manufacturer or blend tiles at Project site before installing.
- D. Field-Applied Temporary Protective Coating: If indicated under tile type or needed to prevent grout from staining or adhering to exposed tile surfaces, precoat them with continuous film of temporary protective coating, taking care not to coat unexposed tile surfaces.

3.03 TILE INSTALLATION

- A. Comply with TCA's "Handbook for Ceramic Tile Installation" for TCA installation methods specified in tile installation schedules. Comply with parts of the ANSI A108 Series "Specifications for Installation of Ceramic Tile" that are referenced in TCA installation methods, specified in tile installation schedules, and apply to types of setting and grouting materials used.
 - 1. For the following installations, follow procedures in the ANSI A108 Series of tile installation standards for providing 95 percent mortar coverage:
 - a. Tile floors in wet areas.
 - b. Tile floors composed of tiles 8 by 8 inches or larger.
 - c. Tile floors composed of rib-backed tiles.
- B. Extend tile work into recesses and under or behind equipment and fixtures to form complete covering without interruptions unless otherwise indicated. Terminate work neatly at obstructions, edges, and corners without disrupting pattern or joint alignments.
- C. Accurately form intersections and returns. Perform cutting and drilling of tile without marring visible surfaces. Carefully grind cut edges of tile abutting trim, finish, or built-in items for straight aligned joints. Fit tile closely to electrical outlets, piping, fixtures, and other penetrations so plates, collars, or covers overlap tile.
- D. Provide manufacturer's standard trim shapes where necessary to eliminate exposed tile edges.
- E. Jointing Pattern: Lay tile in grid pattern unless otherwise indicated. Lay out tile work and center tile fields in both directions in each space or on each wall area. Lay out tile work to minimize the use of pieces that are less than half of a tile. Provide uniform joint widths unless otherwise indicated.
 - 1. For tile mounted in sheets, make joints between tile sheets same width as joints within tile sheets so joints between sheets are not apparent in finished work.
 - 2. Where adjoining tiles on floor, base, walls, or trim are specified or indicated to be same size, align joints.

3. Where tiles are specified or indicated to be whole integer multiples of adjoining tiles on floor, base, walls, or trim, align joints unless otherwise indicated.
- F. Joint Widths: Unless otherwise indicated, install tile with the following joint widths:
 1. Ceramic Mosaic Tile: 1/16 inch.
 2. Glazed Wall Tile: 1/16 inch.
 - G. Lay out tile wainscots to dimensions indicated or to next full tile beyond dimensions indicated.
 - H. Expansion Joints: Provide expansion joints and other sealant-filled joints, including control, contraction, and isolation joints, where indicated. Form joints during installation of setting materials, mortar beds, and tile. Do not saw-cut joints after installing tiles.
 1. Where joints occur in concrete substrates, locate joints in tile surfaces directly above them.
 - I. Metal Edge Strips: Install where exposed edge of tile flooring meets other flooring that finishes below top of tile and no threshold is indicated.
 - J. Grout Sealer: Apply grout sealer to grout joints in tile floors according to grout-sealer manufacturer's written instructions. As soon as grout sealer has penetrated grout joints, remove excess sealer and sealer from tile faces by wiping with soft cloth.

3.04 WATERPROOFING INSTALLATION

- A. Install waterproofing to comply with ANSI A108.13 and manufacturer's written instructions to produce waterproof membrane of uniform thickness and bonded securely to substrate.
- B. Do not install tile or setting materials over waterproofing until waterproofing has cured and been tested to determine that it is watertight.

3.05 CRACK ISOLATION MEMBRANE INSTALLATION

- A. Install crack isolation membrane to comply with ANSI A108.17 and manufacturer's written instructions to produce membrane of uniform thickness and bonded securely to substrate.
- B. Do not install tile or setting materials over crack isolation membrane until membrane has cured.

3.06 CLEANING AND PROTECTING

- A. Cleaning: On completion of placement and grouting, clean all ceramic tile surfaces so they are free of foreign matter.
 1. Remove latex-portland cement grout residue from tile as soon as possible.
 2. Clean grout smears and haze from tile according to tile and grout manufacturer's written instructions but no sooner than 10 days after installation. Use only cleaners recommended by tile and grout manufacturers and only after determining that cleaners are safe to use by testing on samples of tile and other surfaces to be cleaned. Protect metal surfaces and plumbing fixtures from effects of cleaning. Flush surfaces with clean water before and after cleaning.

3. Remove temporary protective coating by method recommended by coating manufacturer and that is acceptable to tile and grout manufacturer. Trap and remove coating to prevent drain clogging.
- B. Protect installed tile work with kraft paper or other heavy covering during construction period to prevent staining, damage, and wear. If recommended by tile manufacturer, apply coat of neutral protective cleaner to completed tile walls and floors.
- C. Prohibit foot and wheel traffic from tiled floors for at least seven days after grouting is completed.
- D. Before final inspection, remove protective coverings and rinse neutral protective cleaner from tile surfaces.

3.07 INTERIOR TILE INSTALLATION SCHEDULE

- A. Interior Floor Installations, Concrete Subfloor:
 1. Tile Installation F113: Thin-set mortar; TCA F113.
 - a. Tile Type: FT-1.
 - b. Thin-Set Mortar: Latex-portland cement mortar.
 - c. Grout: Polymer-modified sanded grout.
 2. Tile Installation F122: Thin-set mortar on waterproof membrane for wet areas; TCA F122.
 - a. Tile Type: FT-1.
 - b. Thin-Set Mortar: Latex-portland cement mortar.
 - c. Grout: Polymer-modified sanded grout.
 3. Tile Installation F125A: Thin-set mortar on crack isolation membrane; TCA F125A.
 - a. Tile Type: FT-1.
 - b. Thin-Set Mortar: Latex-portland cement mortar.
 - c. Grout: Polymer-modified sanded grout.
- B. Interior Wall Installations, Metal Studs
 1. Tile Installation B420: Thin-set mortar on waterproof membrane on coated glass-mat, water-resistant backer board; TCA B420.
 - a. Tile Type: WT-1.
 - b. Thin-Set Mortar: Latex-portland cement mortar.
 - c. Grout: Polymer-modified sanded grout.
- C. Interior Wall Installations, Metal Studs or Furring:
 1. Tile Installation W245: Thin-set mortar on coated glass-mat, water-resistant gypsum backer board; TCA W245.
 - a. Tile Type: WT-1 or WT-2.
 - b. Thin-Set Mortar: Latex-portland cement mortar.
 - c. Grout: Polymer-modified unsanded grout.
- D. Shower Receptor and Wall Installations, Concrete or Masonry:

1. Tile Installation B422: Thin-set mortar on waterproof membrane with integrated bonding flange for bonded membranes; TCA B422.
 - a. Tile Type: WT-1.
 - b. Thin-Set Mortar: Latex-portland cement mortar.
 - c. Grout: Polymer-modified unsanded grout.

END OF SECTION 09 30 00

SECTION 09 51 13**ACOUSTICAL PANEL CEILINGS****PART 1 - GENERAL****1.01 RELATED DOCUMENTS**

- A. Drawings and general provisions of the Contract, including General and Supplementary Conditions and Division 01 Specification Sections, apply to this Section.

1.02 SUMMARY

- A. Section includes acoustical panels and exposed suspension systems for ceilings.
- B. Products furnished, but not installed under this Section, include anchors, clips, and other ceiling attachment devices to be cast in concrete.

1.03 ACTION SUBMITTALS

- A. Product Data: For each type of product.
- B. LEED Submittals:
 - 1. Product Data for Credit MR 4: For products having recycled content, documentation indicating percentages by weight of postconsumer and preconsumer recycled content. Include statement indicating costs for each product having recycled content.
 - 2. Product Data for Credit EQ 4.1: For sealants, documentation including printed statement of VOC content.
- C. Samples: For each exposed product and for each color and texture specified, 6 inches in size.
- D. Samples for Initial Selection: For components with factory-applied color finishes.
- E. Samples for Verification: For each component indicated and for each exposed finish required, prepared on Samples of size indicated below.
 - 1. Acoustical Panel: Set of 6-inch- square Samples of each type, color, pattern, and texture.
 - 2. Exposed Suspension-System Members, Moldings, and Trim: Set of 6-inch- long Samples of each type, finish, and color.

1.04 INFORMATIONAL SUBMITTALS

- A. Coordination Drawings: Reflected ceiling plans, drawn to scale, on which the following items are shown and coordinated with each other, using input from installers of the items involved:
 - 1. Suspended ceiling components.
 - 2. Structural members to which suspension systems will be attached.
 - 3. Size and location of initial access modules for acoustical panels.
 - 4. Items penetrating finished ceiling including the following:
 - a. Lighting fixtures.
 - b. Air outlets and inlets.

- c. Speakers.
- d. Sprinklers.
- e. Access panels.

5. Perimeter moldings.

- B. Qualification Data: For testing agency.
- C. Product Test Reports: For each acoustical panel ceiling, for tests performed by manufacturer and witnessed by a qualified testing agency.
- D. Evaluation Reports: For each acoustical panel ceiling suspension system and anchor and fastener type, from ICC-ES.
- E. Field quality-control reports.

1.05 CLOSEOUT SUBMITTALS

- A. Maintenance Data: For finishes to include in maintenance manuals.

1.06 MAINTENANCE MATERIAL SUBMITTALS

- A. Furnish extra materials that match products installed and that are packaged with protective covering for storage and identified with labels describing contents.
 - 1. Acoustical Ceiling Panels: Full-size panels equal to 2 percent of quantity installed.
 - 2. Suspension-System Components: Quantity of each exposed component equal to 2 percent of quantity installed.
 - 3. Hold-Down Clips: Equal to 2 percent of quantity installed.

1.07 QUALITY ASSURANCE

- A. Testing Agency Qualifications: Qualified according to NVLAP for testing indicated.
- B. Mockups: Build mockups to verify selections made under sample submittals and to demonstrate aesthetic effects and set quality standards for materials and execution.
 - 1. Build mockup of typical ceiling area as shown on Drawings.
 - 2. Subject to compliance with requirements, approved mockups may become part of the completed Work if undisturbed at time of Substantial Completion.

1.08 DELIVERY, STORAGE, AND HANDLING

- A. Deliver acoustical panels, suspension-system components, and accessories to Project site in original, unopened packages and store them in a fully enclosed, conditioned space where they will be protected against damage from moisture, humidity, temperature extremes, direct sunlight, surface contamination, and other causes.
- B. Before installing acoustical panels, permit them to reach room temperature and a stabilized moisture content.
- C. Handle acoustical panels carefully to avoid chipping edges or damaging units in any way.

1.09 FIELD CONDITIONS

- A. Environmental Limitations: Do not install acoustical panel ceilings until spaces are enclosed and weatherproof, wet work in spaces is complete and dry, work above ceilings is complete, and ambient temperature and humidity conditions are maintained at the levels indicated for Project when occupied for its intended use.
 - 1. Pressurized Plenums: Operate ventilation system for not less than 48 hours before beginning acoustical panel ceiling installation.

PART 2 - PRODUCTS

2.01 PERFORMANCE REQUIREMENTS

- A. Surface-Burning Characteristics: Comply with ASTM E 84; testing by a qualified testing agency. Identify products with appropriate markings of applicable testing agency.
 - 1. Flame-Spread Index: Comply with ASTM E 1264 for Class A materials.
 - 2. Smoke-Developed Index: 50 or less.
- B. Fire-Resistance Ratings: Comply with ASTM E 119; testing by a qualified testing agency. Identify products with appropriate markings of applicable testing agency.
 - 1. Indicate design designations from UL's "Fire Resistance Directory" or from the listings of another qualified testing agency.

2.02 ACOUSTICAL PANELS, GENERAL

- A. Low-Emitting Materials: Acoustical panel ceilings shall comply with the testing and product requirements of the California Department of Health Services' "Standard Practice for the Testing of Volatile Organic Emissions from Various Sources Using Small-Scale Environmental Chambers."
- B. Source Limitations:
 - 1. Acoustical Ceiling Panel: Obtain each type from single source from single manufacturer.
 - 2. Suspension System: Obtain each type from single source from single manufacturer.
- C. Source Limitations: Obtain each type of acoustical ceiling panel and supporting suspension system from single source from single manufacturer.
- D. Recycled Content: Postconsumer recycled content plus one-half of preconsumer recycled content not less than 70 percent.
- E. Glass-Fiber-Based Panels: Made with binder containing no urea formaldehyde.
- F. Acoustical Panel Standard: Provide manufacturer's standard panels of configuration indicated that comply with ASTM E 1264 classifications as designated by types, patterns, acoustical ratings, and light reflectances unless otherwise indicated.
 - 1. Mounting Method for Measuring NRC: Type E-400; plenum mounting in which face of test specimen is 15-3/4 inches away from test surface according to ASTM E 795.
- G. Acoustical Panel Colors and Patterns: Match appearance characteristics indicated for each product type.

1. Where appearance characteristics of acoustical panels are indicated by referencing pattern designations in ASTM E 1264 and not manufacturers' proprietary product designations, provide products selected by Architect from each manufacturer's full range that comply with requirements indicated for type, pattern, color, light reflectance, acoustical performance, edge detail, and size.

2.03 ACOUSTICAL PANELS

- A. Basis-of-Design Product: Subject to compliance with requirements, provide product Optima by Armstrong, or a comparable product by one of the following:
 1. CertainTeed Corp.
 2. Chicago Metallic Corporation.
 3. USG Interiors, Inc.; Subsidiary of USG Corporation.
- B. ACT-1: Optima by Armstrong, 24x24
- C. Classification: Provide panels complying with ASTM E 1264 for type, form, and pattern as follows:
 1. Type and Form: Type XII, Form 2.
 2. Pattern: E (lightly textured).
- D. Color: White.
- E. LR: Not less than 0.90.
- F. NRC: Not less than 0.95.
- G. AC: Not less than 190
- H. Edge/Joint Detail: Tegular.
- I. Thickness: As indicated on Drawings.
- J. Broad Spectrum Antimicrobial Fungicide and Bactericide Treatment: Provide acoustical panels treated with manufacturer's standard antimicrobial formulation that inhibits fungus, mold, mildew, and gram-positive and gram-negative bacteria and showing no mold, mildew, or bacterial growth when tested according to ASTM D 3273 and evaluated according to ASTM D 327 or ASTM G 21.

2.04 METAL SUSPENSION SYSTEMS, GENERAL

- A. Recycled Content: Postconsumer recycled content plus one-half of preconsumer recycled content not less than 25 percent.
- B. Metal Suspension-System Standard: Provide manufacturer's standard direct-hung metal suspension systems of types, structural classifications, and finishes indicated that comply with applicable requirements in ASTM C 635/C 635M.
 1. High-Humidity Finish: Comply with ASTM C 635/C 635M requirements for "Coating Classification for Severe Environment Performance" where high-humidity finishes are indicated.
- C. Attachment Devices: Size for five times the design load indicated in ASTM C 635/C 635M, Table 1, "Direct Hung," unless otherwise indicated. Comply with seismic design requirements.

1. Anchors in Concrete: Anchors of type and material indicated below, with holes or loops for attaching hangers of type indicated and with capability to sustain, without failure, a load equal to five times that imposed by ceiling construction, as determined by testing according to ASTM E 488 or ASTM E 1512 as applicable, conducted by a qualified testing and inspecting agency.
 - a. Type: Postinstalled bonded anchors.
 - b. Corrosion Protection: Carbon-steel components zinc plated to comply with ASTM B 633, Class Fe/Zn 5 for Class SC 1 service condition.
 - c. Corrosion Protection: Stainless-steel components complying with ASTM F 593 and ASTM F 594, Group 1 Alloy 304 or 316 for bolts; Alloy 304 or 316 for anchor.
 - d. Corrosion Protection: Components fabricated from nickel-copper-alloy rods complying with ASTM B 164 for UNS No. N04400 alloy.
 2. Power-Actuated Fasteners in Concrete: Fastener system of type suitable for application indicated, fabricated from corrosion-resistant materials, with clips or other accessory devices for attaching hangers of type indicated and with capability to sustain, without failure, a load equal to 10 times that imposed by ceiling construction, as determined by testing according to ASTM E 1190, conducted by a qualified testing and inspecting agency.
- D. Wire Hangers, Braces, and Ties: Provide wires complying with the following requirements:
1. Zinc-Coated, Carbon-Steel Wire: ASTM A 641/A 641M, Class 1 zinc coating, soft temper.
 2. Stainless-Steel Wire: ASTM A 580/A 580M, Type 304, nonmagnetic.
 3. Size: Select wire diameter so its stress at three times hanger design load (ASTM C 635/C 635M, Table 1, "Direct Hung") will be less than yield stress of wire, but provide not less than 0.135-inch-diameter wire.
- E. Hanger Rods: Mild steel, zinc coated or protected with rust-inhibitive paint.
- F. Angle Hangers: Angles with legs not less than 7/8 inch wide; formed with 0.04-inch-thick, galvanized-steel sheet complying with ASTM A 653/A 653M, G90 coating designation; with bolted connections and 5/16-inch-diameter bolts.
- G. Seismic Stabilizer Bars: Manufacturer's standard perimeter stabilizers designed to accommodate seismic forces.
- H. Seismic Struts: Manufacturer's standard compression struts designed to accommodate seismic forces.
- I. Seismic Clips: Manufacturer's standard seismic clips designed and spaced to secure acoustical panels in place.
- J. Hold-Down Clips: Where indicated, provide manufacturer's standard hold-down clips spaced 24 inches o.c. on all cross tees.
- K. Impact Clips: Where indicated, provide manufacturer's standard impact-clip system designed to absorb impact forces against acoustical panels.

2.05 METAL SUSPENSION SYSTEM

- A. Manufacturers: Subject to compliance with requirements, available manufacturers offering products that may be incorporated into the Work include, but are not limited

to, the following:

1. Armstrong World Industries, Inc.
 2. CertainTeed Corp.
 3. Chicago Metallic Corporation.
 4. USG Interiors, Inc.; Subsidiary of USG Corporation.
- B. Narrow-Face, Capped, Double-Web, Steel Suspension System: Main and cross runners roll formed from cold-rolled steel sheet; prepainted, electrolytically zinc coated, or hot-dip galvanized according to ASTM A 653/A 653M, not less than G30 coating designation; with prefinished 9/16-inch- wide metal caps on flanges.
1. Structural Classification: Heavy-duty system.
 2. End Condition of Cross Runners: Override (stepped) or butt-edge type.
 3. Face Design: Flanges formed with an integral center reveal.
 4. Cap Material: Steel cold-rolled sheet.
 5. Cap Finish: Painted in color as selected from manufacturer's full range.

2.06 METAL EDGE MOLDINGS AND TRIM

- A. Manufacturers: Subject to compliance with requirements, available manufacturers offering products that may be incorporated into the Work include, but are not limited to, the following:
1. Armstrong World Industries, Inc.
 2. CertainTeed Corp.
 3. Chicago Metallic Corporation.
 4. Fry Reglet Corporation.
 5. Gordon, Inc.
 6. USG Interiors, Inc.; Subsidiary of USG Corporation.
- B. Roll-Formed, Sheet-Metal Edge Moldings and Trim: Type and profile indicated or, if not indicated, manufacturer's standard moldings for edges and penetrations that comply with seismic design requirements; formed from sheet metal of same material, finish, and color as that used for exposed flanges of suspension-system runners.
1. Provide manufacturer's standard edge moldings that fit acoustical panel edge details and suspension systems indicated and that match width and configuration of exposed runners unless otherwise indicated.
 2. For lay-in panels with reveal edge details, provide stepped edge molding that forms reveal of same depth and width as that formed between edge of panel and flange at exposed suspension member.
 3. For circular penetrations of ceiling, provide edge moldings fabricated to diameter required to fit penetration exactly.
- C. Provide Axiom 4 inch trim at all exposed suspension system edges.

2.07 ACOUSTICAL SEALANT

- A. Acoustical Sealant: Manufacturer's standard sealant complying with ASTM C 834 and effective in reducing airborne sound transmission through perimeter joints and openings in building construction as demonstrated by testing representative assemblies according to ASTM E 90.
1. Exposed and Concealed Joints: Nonsag, paintable, nonstaining latex sealant.
 2. Concealed Joints: Nondrying, nonhardening, nonskinning, nonstaining, gunnable, synthetic-rubber sealant.
 3. Acoustical sealant shall have a VOC content of 250 g/L or less when calculated

according to 40 CFR 59, Subpart D (EPA Method 24).

PART 3 - EXECUTION

3.01 EXAMINATION

- A. Examine substrates, areas, and conditions, including structural framing to which acoustical panel ceilings attach or abut, with Installer present, for compliance with requirements specified in this and other Sections that affect ceiling installation and anchorage and with requirements for installation tolerances and other conditions affecting performance of acoustical panel ceilings.
- B. Examine acoustical panels before installation. Reject acoustical panels that are wet, moisture damaged, or mold damaged.
- C. Proceed with installation only after unsatisfactory conditions have been corrected.

3.02 PREPARATION

- A. Measure each ceiling area and establish layout of acoustical panels to balance border widths at opposite edges of each ceiling. Avoid using less-than-half-width panels at borders, and comply with layout shown on reflected ceiling plans.

3.03 INSTALLATION

- A. General: Install acoustical panel ceilings to comply with ASTM C 636/C 636M and seismic design requirements indicated, according to manufacturer's written instructions and CISCA's "Ceiling Systems Handbook."
 1. Fire-Rated Assembly: Install fire-rated ceiling systems according to tested fire-rated design.
- B. Suspend ceiling hangers from building's structural members and as follows:
 1. Install hangers plumb and free from contact with insulation or other objects within ceiling plenum that are not part of supporting structure or of ceiling suspension system.
 2. Splay hangers only where required to miss obstructions; offset resulting horizontal forces by bracing, countersplaying, or other equally effective means.
 3. Where width of ducts and other construction within ceiling plenum produces hanger spacings that interfere with location of hangers at spacings required to support standard suspension-system members, install supplemental suspension members and hangers in form of trapezes or equivalent devices.
 4. Secure wire hangers to ceiling-suspension members and to supports above with a minimum of three tight turns. Connect hangers directly either to structures or to inserts, eye screws, or other devices that are secure and appropriate for substrate and that will not deteriorate or otherwise fail due to age, corrosion, or elevated temperatures.
 5. Secure flat, angle, channel, and rod hangers to structure, including intermediate framing members, by attaching to inserts, eye screws, or other devices that are secure and appropriate for both the structure to which hangers are attached and the type of hanger involved. Install hangers in a manner that will not cause them to deteriorate or fail due to age, corrosion, or elevated temperatures.
 6. Do not support ceilings directly from permanent metal forms or floor deck. Fasten hangers to cast-in-place hanger inserts, postinstalled mechanical or adhesive anchors, or power-actuated fasteners that extend through forms into concrete.

7. When steel framing does not permit installation of hanger wires at spacing required, install carrying channels or other supplemental support for attachment of hanger wires.
 8. Do not attach hangers to steel deck tabs.
 9. Do not attach hangers to steel roof deck. Attach hangers to structural members.
 10. Space hangers not more than 48 inches o.c. along each member supported directly from hangers unless otherwise indicated; provide hangers not more than 8 inches from ends of each member.
 11. Size supplemental suspension members and hangers to support ceiling loads within performance limits established by referenced standards and publications.
- C. Secure bracing wires to ceiling suspension members and to supports with a minimum of four tight turns. Suspend bracing from building's structural members as required for hangers, without attaching to permanent metal forms, steel deck, or steel deck tabs. Fasten bracing wires into concrete with cast-in-place or postinstalled anchors.
- D. Install edge moldings and trim of type indicated at perimeter of acoustical ceiling area and where necessary to conceal edges of acoustical panels.
1. Apply acoustical sealant in a continuous ribbon concealed on back of vertical legs of moldings before they are installed.
 2. Screw attach moldings to substrate at intervals not more than 16 inches o.c. and not more than 3 inches from ends, leveling with ceiling suspension system to a tolerance of 1/8 inch in 12 feet. Miter corners accurately and connect securely.
 3. Do not use exposed fasteners, including pop rivets, on moldings and trim.
- E. Install suspension-system runners so they are square and securely interlocked with one another. Remove and replace dented, bent, or kinked members.
- F. Install acoustical panels with undamaged edges and fit accurately into suspension-system runners and edge moldings. Scribe and cut panels at borders and penetrations to provide a neat, precise fit.
1. Arrange directionally patterned acoustical panels as follows:
 - a. As indicated on reflected ceiling plans.
 - b. Install panels with pattern running in one direction parallel to long short axis of space.
 - c. Install panels in a basket-weave pattern.
 2. For square-edged panels, install panels with edges fully hidden from view by flanges of suspension-system runners and moldings.
 3. For reveal-edged panels on suspension-system runners, install panels with bottom of reveal in firm contact with top surface of runner flanges.
 4. For reveal-edged panels on suspension-system members with box-shaped flanges, install panels with reveal surfaces in firm contact with suspension-system surfaces and panel faces flush with bottom face of runners.
 5. Paint cut edges of panel remaining exposed after installation; match color of exposed panel surfaces using coating recommended in writing for this purpose by acoustical panel manufacturer.
 6. Install hold-down impact clips in areas indicated, in areas required by authorities having jurisdiction, and for fire-resistance ratings; space as recommended by panel manufacturer's written instructions unless otherwise indicated.
 7. Install clean-room gasket system in areas indicated, sealing each panel and fixture as recommended by panel manufacturer's written instructions.
 8. Protect lighting fixtures and air ducts to comply with requirements indicated for fire-resistance-rated assembly.

3.04 FIELD QUALITY CONTROL

- A. Special Inspections: Owner will engage a qualified special inspector to perform the following special inspections:
 - 1. Compliance of seismic design.
- B. Testing Agency: Owner will engage a qualified testing agency to perform tests and inspections and prepare test reports.
- C. Perform the following tests and inspections of completed installations of acoustical panel ceiling hangers and anchors and fasteners in successive stages. Do not proceed with installations of acoustical panel ceiling hangers for the next area until test results for previously completed installations show compliance with requirements.
 - 1. Extent of Each Test Area: When installation of ceiling suspension systems on each floor has reached 20 percent completion but no panels have been installed.
 - a. Within each test area, testing agency will select one of every 10 power-actuated fasteners and postinstalled anchors used to attach hangers to concrete and will test them for 200 lbf of tension; it will also select one of every two postinstalled anchors used to attach bracing wires to concrete and will test them for 440 lbf of tension.
 - b. When testing discovers fasteners and anchors that do not comply with requirements, testing agency will test those anchors not previously tested until 20 pass consecutively and then will resume initial testing frequency.
- D. Acoustical panel ceiling hangers and anchors and fasteners will be considered defective if they do not pass tests and inspections.
- E. Prepare test and inspection reports.

3.05 CLEANING

- A. Clean exposed surfaces of acoustical panel ceilings, including trim, edge moldings, and suspension-system members. Comply with manufacturer's written instructions for cleaning and touchup of minor finish damage. Remove and replace ceiling components that cannot be successfully cleaned and repaired to permanently eliminate evidence of damage.

END OF SECTION 09 51 13

SECTION 09 61 13**CAST IN PLACE (CIP) TACTILE WARNING SURFACE TILES****PART I – GENERAL****1.1 SUMMARY****A. Description**

The work of this Section includes installation of tactile warning material on station platforms. These materials shall consist of a tactile tile cast into Portland Cement Concrete surfaces at the following locations:

1. Edge of platform

1.2 RELATED SECTIONS**A. Section 13 13 50 Station Platforms****1.3 SUBMITTALS**

- Submit two copies of manufacturer's literature for all products furnished, including appropriate Material Safety Data Sheets (MSDS) to Architect.
- Submit representative samples of all materials including any required mortars, grouts, or recommended repair materials to Architect and client for approval.
- Submit representative color samples to Architect and client for approval.

1.4 QUALITY CONTROL

- Quality control shall be made in accordance with the requirements of the General Provisions, except as modified herein.
- Engage an experienced installer (either as a direct employee or as a subcontractor) who has completed warning strip installations similar in material, design, and extent to that indicated for this Project and with a record of successful in-service performance.
- Source or brands of mortar, grout or admixture materials shall not be changed during the course of the Work. Obtain each color and type of joint and setting materials from a single source with resources to provide products and materials of consistent quality in appearance and physical properties without delaying the work.

1.5 DELIVERY, STORAGE AND HANDLING

- Tactile warning materials shall be protected during storage and construction against wetting by rain, snow or ground water and against spoilage or intermixture with earth or other types of materials. Wrap materials in plastic or use other packaging materials that will prevent rust marks from steel strapping.
- Grout and mortar materials shall be protected from deterioration by moisture and temperature. Contractor shall store in a dry location or in waterproof containers. Containers shall be kept tightly closed and away from open flames. Liquid components

shall be protected from freezing. Comply with manufacturer's recommendations for storage if more stringent, and with minimum and maximum storage temperature requirements.

- C. Protect stored materials from discoloration due to differential light exposure.

1.6 PROJECT CONDITIONS

A. Pre-Installation Conference

1. Before beginning tactile warning strip and associated work, the Subcontractor, with concrete foreman, shall meet at the Project site with the Contractor's Superintendent, the installer of each component of the associated work, the representatives of the warning strip manufacturer, installers of other work requiring coordination with warning strip work and the Engineer for a pre-installation conference.
2. The material selections and procedures to be followed in performing the work shall be reviewed to verify compliance with the requirements specified.
3. Expansion joint materials compatibility shall be verified to meet requirements herein.
4. If either the concrete foreman or Contractor's Superintendent are replaced before completion of work of this Section, the conference shall be repeated.

B. Frozen Work

1. Frozen materials or materials mixed or coated with ice or frost shall not be used.
2. Tactile warning strip work damaged by frost or freezing shall be removed and replaced at no cost to the Owner.

PART II - PRODUCTS

2.1 ACCEPTABLE MANUFACTURERS

- A. ADA Solutions,
- B. Engineered Plastics - Armor Tile,
- C. or approved equals.

2.2 MATERIALS

- A. Standard manufactured cast-in-place tiles
- B. Nominal tile dimensions shall be 24"x24"- w/ 2.35" o.c. dome spacing

2.3 SUPPLEMENTAL MATERIALS

- A. Other materials used in the installation shall be as approved by tile manufacturer.

PART III – EXECUTION

3.1 TRAINED AND CERTIFIED BY THE MANUFACTURER

- A. Acceptable installers shall be trained and certified by the manufacturer.

3.2 INSTALLATION - CONCRETE PLATFORMS AND HIGH BLOCKS

- A. Tactile warning strips containing chips, cracks and other defects that may be detrimental

to the safety or aesthetic qualities of the finished job or are out of dimensional requirements shall not be used.

1. Tiles shall not vary from sizes stated in subparagraphs of Paragraph 2.2 by more than plus or minus 1/8 inch.
- B. Tactile warning strips shall be cut with motor-driven saw equipment, only, designed to cut tactile warning strips with clean, sharp, unchipped edges. Warning strips shall be cut as required to provide the pattern shown and to fit adjoining work neatly. Full warning strips shall be used without cutting wherever possible. Where cutting is required, the largest tactile warning strip possible shall be used with no cutting through raised domes.
- C. Before initial set of concrete bed occurs, tactile warning strips shall be placed. Tactile warning strips shall be tamped and beat in for a complete contact with setting bed. Each tactile warning strip shall be set and leveled in a single operation.
1. Tactile warning strips shall be set in pattern shown on Contract Drawings with varying joint widths as necessary to align the centerlines of joints with a 1'-0" module and with the centerlines of concrete scoring joints, concrete construction joints, concrete control joints, and concrete expansion joints.
 2. Tactile warning strips shall be placed firmly on the concrete bed in a manner assuring a minimum of 95% contact. Surface plane of the tactile warning strips shall not vary more than 1/8 inch plus or minus from the designed grade at any point.
- D. Install expansion joints where warning strips abut restraining surfaces, such as perimeter walls, curbs, columns, wall corners, and directly over cold joints (pour joints) and control joints in structural surfaces. Conform to Contract Drawings, requirements of this Section, and the requirements of Section 07 92 13. Protect and preserve the expansion joint sealant backer assembly. Take reasonable and extraordinary precautions required to protect, prevent damage, preserve, and maintain indicated alignment and grade.

3.4 FIELD QUALITY CONTROL

- A. Engineer shall be notified 7 days in advance of beginning or resuming work.
- B. The Contractor shall have each 200 square feet of tactile warning strips inspected by Engineer for conformance to this Contract.

3.4 ADJUSTING AND CLEANING

- A. Tactile warning strips which are loose, chipped, broken, stained or otherwise damaged, and warning strips which do not match adjoining warning strips, shall be removed and replaced. Warning strips which have exposed surfaces above or below adjacent warning strips shall also be removed and replaced. Replacement of tactile shall include the necessary removal and replacement of concrete surface necessary to match the remaining tile.
- B. New warning strips to match adjoining warning strips shall be furnished and installed in fresh mortar or grout, and shall be pointed to eliminate evidence of replacement.
- C. Remove excess cement paste from exposed tactile warning strip surfaces, wash and scrub clean.
- D. Provide final protection and maintain conditions in a manner acceptable to installer that ensures that tactile warning strip work is without damage or deterioration at the time of Substantial Completion.

PART IV - MEASUREMENT

4.1 Measurement – No Separate measurement will be made for Work described in this Section.

PART V - PAYMENT

5.1 Payment – Payment for items in this Section will be incidental to the Contract lump sum cost of the Station Stops.

END OF SECTION

SECTION 09 65 13**RESILIENT BASE AND ACCESSORIES****PART 1 - GENERAL****1.01 RELATED DOCUMENTS**

- A. Drawings and general provisions of the Contract, including General and Supplementary Conditions and Division 01 Specification Sections, apply to this Section.

1.02 SUMMARY

- A. Section Includes:
 - 1. Resilient base.
 - 2. Resilient molding accessories.

1.03 ACTION SUBMITTALS

- A. Product Data: For each type of product.
- B. LEED Submittals:
 - 1. Product Data for Credit IEQ 4.1: For adhesives, documentation including printed statement of VOC content.
 - 2. Product Data for Credit IEQ 4.3: For adhesives, documentation including printed statement of VOC content.
 - 3. Product Data for Credit IEQ 4.3: For resilient stair accessories, documentation from an independent testing agency indicating compliance with the FloorScore standard.
- C. Samples: For each exposed product and for each color and texture specified, not less than 12 inches long.
- D. Samples for Initial Selection: For each type of product indicated.
- E. Samples for Verification: For each type of product indicated and for each color, texture, and pattern required in manufacturer's standard-size Samples, but not less than 12 inches long.
- F. Product Schedule: For resilient base and accessory products. Use same designations indicated on Drawings.

1.04 MAINTENANCE MATERIAL SUBMITTALS

- A. Furnish extra materials that match products installed and that are packaged with protective covering for storage and identified with labels describing contents.
 - 1. Furnish not less than 10 linear feet for every 500 linear feet or fraction thereof, of each type, color, pattern, and size of resilient product installed.

1.05 QUALITY ASSURANCE

- A. Mockups: Build mockups to verify selections made under Sample submittals and to demonstrate aesthetic effects and set quality standards for materials and execution.
 - 1. Coordinate mockups in this Section with mockups specified in other Sections.

1.06 DELIVERY, STORAGE, AND HANDLING

- A. Store resilient products and installation materials in dry spaces protected from the weather, with ambient temperatures maintained within range recommended by manufacturer, but not less than 50 deg F or more than 90 deg F.

1.07 FIELD CONDITIONS

- A. Maintain ambient temperatures within range recommended by manufacturer, but not less than 70 deg F or more than 95 deg F, in spaces to receive resilient products during the following time periods:
 - 1. 48 hours before installation.
 - 2. During installation.
 - 3. 48 hours after installation.
- B. After installation and until Substantial Completion, maintain ambient temperatures within range recommended by manufacturer, but not less than 55 deg F or more than 95 deg F.
- C. Install resilient products after other finishing operations, including painting, have been completed.

PART 2 - PRODUCTS

2.01 PERFORMANCE REQUIREMENTS

- A. FloorScore Compliance: Resilient base shall comply with requirements of FloorScore certification.
- B. Low-Emitting Materials: Flooring system shall comply with the testing and product requirements of the California Department of Public Health's "Standard Method for the Testing and Evaluation of Volatile Organic Chemical Emissions from Indoor Sources Using Environmental Chambers."

2.02 THERMOSET-RUBBER BASE

- A. Basis of Design: Subject to requirements, provide products as shown on Finish Legend or a comparable product by one of the following:
 - 1. Burke Mercer Flooring Products, Division of Burke Industries Inc.
 - 2. Flexco.
 - 3. Roppe Corporation, USA.
- B. Product Standard: ASTM F 1861, Type TS (rubber, vulcanized thermoset), Group I (solid, homogeneous).
 - 1. Style and Location:
 - a. Style A, Straight: Provide in areas with carpet.
 - b. Style B, Cove: Provide in areas with resilient flooring or with no applied floor finish.
- C. Thickness: 0.125 inch.
- D. Height: As indicated on Drawings.

- E. Lengths: Coils in manufacturer's standard length
- F. Outside Corners: Job formed or preformed.
- G. Inside Corners: Job formed or preformed.
- H. Colors: As indicated on Drawings.

2.03 VINYL MOLDING ACCESSORY

- A. Basis of Design: Subject to requirements, provide products as shown on Finish Legend or a comparable product by one of the following:
 - 1. Burke Mercer Flooring Products, Division of Burke Industries Inc.
 - 2. Flexco.
 - 3. Roppe Corporation, USA.
- B. Description: Vinyl reducer strip for resilient flooring.
- C. Profile and Dimensions: As indicated.
- D. Locations: Provide vinyl molding accessories in areas indicated.
- E. Colors and Patterns: As selected by Architect from full range of industry colors.

2.04 INSTALLATION MATERIALS

- A. Trowelable Leveling and Patching Compounds: Latex-modified, portland cement based or blended hydraulic-cement-based formulation provided or approved by resilient-product manufacturer for applications indicated.
- B. Adhesives: Water-resistant type recommended by resilient-product manufacturer for resilient products and substrate conditions indicated.
 - 1. Adhesives shall have a VOC content of 50 g/L or less.
- C. Metal Edge Strips: Extruded aluminum with mill finish of width shown, of height required to protect exposed edges of flooring, and in maximum available lengths to minimize running joints.
- D. Floor Polish: Provide protective, liquid floor-polish products recommended by resilient stair-tread manufacturer.

PART 3 - EXECUTION

3.01 EXAMINATION

- A. Examine substrates, with Installer present, for compliance with requirements for maximum moisture content and other conditions affecting performance of the Work.
 - 1. Verify that finishes of substrates comply with tolerances and other requirements specified in other Sections and that substrates are free of cracks, ridges, depressions, scale, and foreign deposits that might interfere with adhesion of resilient products.
- B. Proceed with installation only after unsatisfactory conditions have been corrected.

1. Installation of resilient products indicates acceptance of surfaces and conditions.

3.02 PREPARATION

- A. Prepare substrates according to manufacturer's written instructions to ensure adhesion of resilient products.
- B. Concrete Substrates for Resilient Stair Accessories: Prepare horizontal surfaces according to ASTM F 710.
 1. Verify that substrates are dry and free of curing compounds, sealers, and hardeners.
 2. Remove substrate coatings and other substances that are incompatible with adhesives and that contain soap, wax, oil, or silicone, using mechanical methods recommended by manufacturer. Do not use solvents.
 3. Alkalinity and Adhesion Testing: Perform tests recommended by manufacturer. Proceed with installation only after substrate alkalinity falls within range on pH scale recommended by manufacturer in writing, but not less than 5 or more than 9 or 10. Insert number pH.
 4. Moisture Testing: Proceed with installation only after substrates pass testing according to manufacturer's written recommendations, but not less stringent than the following:
 - a. Perform anhydrous calcium chloride test according to ASTM F 1869. Proceed with installation only after substrates have maximum moisture-vapor-emission rate of 3 lb of water/1000 sq. ft. Insert rate in 24 hours.
 - b. Perform relative humidity test using in situ probes according to ASTM F 2170. Proceed with installation only after substrates have maximum 75. Insert number percent relative humidity level.
- C. Fill cracks, holes, and depressions in substrates with trowelable leveling and patching compound; remove bumps and ridges to produce a uniform and smooth substrate.
- D. Do not install resilient products until they are the same temperature as the space where they are to be installed.
 1. At least 48 hours in advance of installation, move resilient products and installation materials into spaces where they will be installed.
- E. Immediately before installation, sweep and vacuum clean substrates to be covered by resilient products.

3.03 RESILIENT BASE INSTALLATION

- A. Comply with manufacturer's written instructions for installing resilient base.
- B. Apply resilient base to walls, columns, pilasters, casework and cabinets in toe spaces, and other permanent fixtures in rooms and areas where base is required.
- C. Install resilient base in lengths as long as practical without gaps at seams and with tops of adjacent pieces aligned.
- D. Tightly adhere resilient base to substrate throughout length of each piece, with base in continuous contact with horizontal and vertical substrates.
- E. Do not stretch resilient base during installation.

- F. On masonry surfaces or other similar irregular substrates, fill voids along top edge of resilient base with manufacturer's recommended adhesive filler material.
- G. Preformed Corners: Install preformed corners before installing straight pieces.
- H. Job-Formed Corners:
 - 1. Outside Corners: Use straight pieces of maximum lengths possible and form with returns not less than 3 inches in length.
 - a. Form without producing discoloration (whitening) at bends.
 - 2. Inside Corners: Use straight pieces of maximum lengths possible and form with returns not less than 3 inches in length.
 - a. Miter or cope corners to minimize open joints.

3.04 RESILIENT ACCESSORY INSTALLATION

- A. Comply with manufacturer's written instructions for installing resilient accessories.
- B. Resilient Molding Accessories: Butt to adjacent materials and tightly adhere to substrates throughout length of each piece. Install reducer strips at edges of floor covering that would otherwise be exposed.

3.05 CLEANING AND PROTECTION

- A. Comply with manufacturer's written instructions for cleaning and protecting resilient products.
- B. Perform the following operations immediately after completing resilient-product installation:
 - 1. Remove adhesive and other blemishes from exposed surfaces.
 - 2. Sweep and vacuum horizontal surfaces thoroughly.
 - 3. Damp-mop horizontal surfaces to remove marks and soil.
- C. Protect resilient products from mars, marks, indentations, and other damage from construction operations and placement of equipment and fixtures during remainder of construction period.
- D. Floor Polish: Remove soil, visible adhesive, and surface blemishes from resilient stair treads before applying liquid floor polish.
 - 1. Apply [one] [two] [three] [Insert requirement] coat(s).
- E. Cover resilient products subject to wear and foot traffic until Substantial Completion.

END OF SECTION 09 65 13

SECTION 09 65 16**LINOLEUM SHEET FLOORING****PART 1 - GENERAL****1.01 RELATED DOCUMENTS**

- A. Drawings and general provisions of the Contract, including General and Supplementary Conditions and Division 01 Specification Sections, apply to this Section.

1.02 SUMMARY

- A. Section Includes linoleum sheet flooring.
- B. Related Sections:
 - 1. Division 09 Section "Resilient Base and Accessories" for resilient base, reducer strips, and other accessories installed with linoleum floor covering.

1.03 SUBMITTALS

- A. Product Data: For each type of product indicated.
- B. LEED Submittals:
 - 1. Product Data for Credit MR 6.0: For linoleum flooring, including printed statement of costs for each rapidly renewable material.
 - 2. Product Data for Credit EQ 4.1: For adhesives, including printed statement of VOC content.
- C. Shop Drawings: For each type of floor covering. Include floor covering layouts, locations of seams, edges, columns, doorways, enclosing partitions, built-in furniture, cabinets, and cutouts.
 - 1. Show details of special patterns.
- D. Samples for Initial Selection: For each type of floor covering indicated.
 - 1. Include similar Samples of installation accessories involving color selection.
- E. Samples for Verification: In manufacturer's standard size, but not less than 6-by-9-inch sections of each color and pattern of floor covering required.
- F. Product Schedule: For floor covering. Use same designations indicated on Drawings.
- G. Qualification Data: For qualified Installer.
- H. Maintenance Data: For each type of floor covering to include in maintenance manuals.

1.04 QUALITY ASSURANCE

- A. Installer Qualifications: A qualified installer who employs workers for this Project who are competent in techniques required by manufacturer for floor covering installation.

1. Engage an installer who employs workers for this Project who are trained or certified by manufacturer for installation techniques required.
- B. Fire-Test-Response Characteristics: As determined by testing identical products according to ASTM E 648 or NFPA 253 by a qualified testing agency.
 1. Critical Radiant Flux Classification: Class I, not less than 0.45 W/sq. cm.
- C. Mockups: Build mockups to verify selections made under sample submittals and to demonstrate aesthetic effects and set quality standards for materials and execution.
 1. Build mockups for floor coverings including accessories.
 - a. Size: Minimum 100 sq. ft. for each type, color, and pattern in locations directed by Architect.

1.05 DELIVERY, STORAGE, AND HANDLING

- A. Store floor coverings and installation materials in dry spaces protected from the weather, with ambient temperatures maintained within range recommended by manufacturer, but not less than 65 deg F or more than 90 deg F.
 1. Sheet Flooring: Store rolls upright.

1.06 PROJECT CONDITIONS

- A. Maintain ambient temperatures within range recommended by manufacturer, but not less than 70 deg F or more than 95 deg F, in spaces to receive floor coverings during the following time periods:
 1. 72 hours before installation.
 2. During installation.
 3. 72 hours after installation.
- B. Until Substantial Completion, maintain ambient temperatures within range recommended by manufacturer, but not less than 55 deg F or more than 95 deg F .
- C. Close spaces to traffic during floor covering installation.
- D. Close spaces to traffic for 72 hours after floor covering installation.
- E. Install floor coverings after other finishing operations, including painting, have been completed.

1.07 EXTRA MATERIALS

- A. Furnish extra materials that match products installed and that are packaged with protective covering for storage and identified with labels describing contents.
 1. Sheet Flooring: Furnish not less than 10 linear feet for every 500 linear feet or fraction thereof, in roll form and in full roll width for each color, pattern, and type of sheet flooring installed.

PART 2 - PRODUCTS

2.01 MANUFACTURERS

- A. Products: Subject to compliance with requirements, provide products indicated on Finish Legend or a comparable product by one of the following:
1. Armstrong World Industries, Inc.
 2. Forbo Flooring, Inc.
 3. Tarkett Inc.

2.02 LINOLEUM FLOOR COVERING

- A. Sheet Flooring: ASTM F 2034, Type I, linoleum sheet with backing.
1. Roll Size: In manufacturer's standard length by not less than 78 inches wide.
- B. Seaming Method: Standard.
- C. Thickness: 0.08 inch 0.10 inch 0.13 inch 0.16 inch 0.18 inch <Insert thickness>.
- D. Colors and Patterns: As indicated by manufacturer's designations.

2.03 INSTALLATION MATERIALS

- A. Trowelable Leveling and Patching Compounds: Latex-modified, portland cement based or blended hydraulic-cement-based formulation provided or approved by manufacturer for applications indicated.
- B. Adhesives: Water-resistant type recommended by manufacturer to suit products and substrate conditions indicated.
1. Use adhesives that have a VOC content of not more than 50 g/L <Insert requirement> when calculated according to 40 CFR 59, Subpart D (EPA Method 24).
- C. Floor Polish: Provide protective liquid floor polish products as recommended by manufacturer.

PART 3 - EXECUTION

3.01 EXAMINATION

- A. Examine substrates, with Installer present, for compliance with requirements for maximum moisture content and other conditions affecting performance of the Work.
- B. Verify that finishes of substrates comply with tolerances and other requirements specified in other Sections and that substrates are free of cracks, ridges, depressions, scale, and foreign deposits that might interfere with adhesion of floor coverings.
- C. Proceed with installation only after unsatisfactory conditions have been corrected.

3.02 PREPARATION

- A. Prepare substrates according to manufacturer's written instructions to ensure adhesion of floor coverings.

- B. Concrete Substrates: Prepare according to ASTM F 710.
1. Verify that substrates are dry and free of curing compounds, sealers, and hardeners.
 2. Remove substrate coatings and other substances that are incompatible with floor covering adhesives and that contain soap, wax, oil, or silicone, using mechanical methods recommended by manufacturer. Do not use solvents.
 3. Alkalinity and Adhesion Testing: Perform tests recommended by manufacturer. Proceed with installation only after substrates pass testing.
 4. Moisture Testing: Perform tests recommended by manufacturer and as follows. Proceed with installation only after substrates pass testing.
 - a. Perform anhydrous calcium chloride test, ASTM F 1869. Proceed with installation only after substrates have maximum moisture-vapor-emission rate of [3 lb of water/1000 sq. ft.] [Insert emission] in 24 hours.
 - b. Perform relative humidity test using in situ probes, ASTM F 2170. Proceed with installation only after substrates have maximum [75 percent] [Insert acceptable percentage] relative humidity level measurement.
- C. Fill cracks, holes, and depressions in substrates with trowelable leveling and patching compound and remove bumps and ridges to produce a uniform and smooth substrate.
- D. Do not install floor coverings until they are same temperature as space where they are to be installed.
1. Move floor coverings and installation materials into spaces where they will be installed at least 72 hours in advance of installation.
- E. Sweep and vacuum clean substrates to be covered by floor coverings immediately before installation.

3.03 INSTALLATION, GENERAL

- A. Comply with manufacturer's written instructions for installing floor coverings.
- B. Scribe and cut floor coverings to butt neatly and tightly to vertical surfaces, permanent fixtures, and built-in furniture including cabinets, pipes, outlets, edgings, thresholds, and nosings.
- C. Extend floor coverings into toe spaces, door reveals, closets, and similar openings.
- D. Maintain reference markers, holes, or openings that are in place or marked for future cutting by repeating on floor coverings as marked on subfloor. Use chalk or other nonpermanent marking device.
- E. Install floor coverings on covers for telephone and electrical ducts and similar items in finished floor areas. Maintain overall continuity of color and pattern between pieces of floor covering installed on covers and adjoining floor covering. Tightly adhere floor covering edges to substrates that abut covers and to cover perimeters.
- F. Adhere floor coverings to substrates using a full spread of adhesive applied to substrate to produce a completed installation without open cracks, voids, raising and puckering at joints, telegraphing of adhesive spreader marks, and other surface imperfections.

3.04 LINOLEUM SHEET FLOORING INSTALLATION

- A. Unroll sheet floorings and allow them to stabilize before cutting and fitting.
- B. Lay out sheet floorings as follows:
 - 1. Maintain uniformity of floor covering direction.
 - 2. Minimize number of seams; place seams in inconspicuous and low-traffic areas, at least 6 inches away from parallel joints in floor covering substrates.
 - 3. Match edges of floor coverings for color shading at seams.
 - 4. Avoid cross seams.
 - 5. Eliminate deformations that result from hanging method used during drying process (stove bar marks).
- C. Integral-Flash-Cove Base: Cove linoleum floor covering [6 inches] [dimension indicated] [Insert dimension] up vertical surfaces. Support floor covering at horizontal and vertical junction with cove strip. Butt at top against cap strip.

3.05 CLEANING AND PROTECTION

- A. Comply with manufacturer's written instructions for cleaning and protection of floor coverings.
- B. Perform the following operations immediately after completing floor covering installation:
 - 1. Remove adhesive and other blemishes from exposed surfaces.
 - 2. Sweep and vacuum surfaces thoroughly.
 - 3. Damp-mop surfaces to remove marks and soil.
- C. Protect floor coverings from mars, marks, indentations, and other damage from construction operations and placement of equipment and fixtures during remainder of construction period.
- D. Floor Polish: Remove soil, visible adhesive, and surface blemishes from floor coverings before applying liquid floor polish.
 - 1. Apply [two] [three] [Insert requirement] coat(s).
- E. After allowing drying room film (yellow film caused by linseed oil oxidation) to disappear, cover floor coverings until Substantial Completion.

END OF SECTION 09 65 16

SECTION 09 65 19
RESILIENT TILE FLOORING**PART 1 - GENERAL****1.01 RELATED DOCUMENTS**

- A. Drawings and general provisions of the Contract, including General and Supplementary Conditions and Division 01 Specification Sections, apply to this Section.

1.02 SUMMARY

- A. Section Includes:
 - 1. Vinyl composition floor tile.
- B. Related Sections:
 - 1. Section 09 65 13 "Resilient Base and Accessories" for resilient base, reducer strips, and other accessories installed with resilient floor coverings.

1.03 ACTION SUBMITTALS

- A. Product Data: For each type of product indicated.
- B. Shop Drawings: For each type of floor tile. Include floor tile layouts, edges, columns, doorways, enclosing partitions, built-in furniture, cabinets, and cutouts.
 - 1. Show details of special patterns.
- C. Samples for Verification: Full-size units of each color and pattern of floor tile required.
- D. Product Schedule: For floor tile. Use same designations indicated on Drawings.

1.04 INFORMATIONAL SUBMITTALS

- A. Qualification Data: For qualified Installer.

1.05 CLOSEOUT SUBMITTALS

- A. Maintenance Data: For each type of floor tile to include in maintenance manuals.

1.06 MATERIALS MAINTENANCE SUBMITTALS

- A. Furnish extra materials that match products installed and that are packaged with protective covering for storage and identified with labels describing contents.
 - 1. Floor Tile: Furnish 1 box for every 50 boxes or fraction thereof, of each type, color, and pattern of floor tile installed.

1.07 QUALITY ASSURANCE

- A. Installer Qualifications: A qualified installer who employs workers for this Project who are competent in techniques required by manufacturer for floor tile installation indicated.

1. Engage an installer who employs workers for this Project who are trained or certified by manufacturer for installation techniques required.
- B. Fire-Test-Response Characteristics: As determined by testing identical products according to ASTM E 648 or NFPA 253 by a qualified testing agency.
 1. Critical Radiant Flux Classification: Class I, not less than 0.45 W/sq. cm.
- C. Mockups: Build mockups to verify selections made under sample submittals and to demonstrate aesthetic effects and set quality standards for materials and execution.
 1. Build mockups for floor tile including resilient base and accessories.
 - a. Size: Minimum 100 sq. ft. for each type, color, and pattern in locations directed by Architect.

1.08 DELIVERY, STORAGE, AND HANDLING

- A. Store floor tile and installation materials in dry spaces protected from the weather, with ambient temperatures maintained within range recommended by manufacturer, but not less than 50 deg F or more than 90 deg F. Store floor tiles on flat surfaces.

1.09 PROJECT CONDITIONS

- A. Maintain ambient temperatures within range recommended by manufacturer, but not less than 70 deg F or more than 95 deg F, in spaces to receive floor tile during the following time periods:
 1. 48 hours before installation.
 2. During installation.
 3. 48 hours after installation.
- B. Until Substantial Completion, maintain ambient temperatures within range recommended by manufacturer, but not less than 55 deg F or more than 95 deg F.
- C. Close spaces to traffic during floor tile installation.
- D. Close spaces to traffic for 48 hours after floor tile installation.
- E. Install floor tile after other finishing operations, including painting, have been completed.

PART 2 - PRODUCTS

2.01 PERFORMANCE REQUIREMENTS

- A. FloorScore Compliance: Resilient tile flooring shall comply with requirements of FloorScore Standard.

2.02 VINYL COMPOSITION FLOOR TILE VCT-1 and VCT-2

- A. Basis of Design: Subject to compliance with requirements, provide Cortina Grande by Azrock
- B. Tile Standard: ASTM F 1700, Class 1, Type A.
- C. Wearing Surface: Smooth.

- D. Thickness: 0.125 inch.
- E. Size: 16 by 16 inches.
- F. Colors and Patterns: As indicated by manufacturer's designations on Finish Legend

2.03 VINYL COMPOSITION FLOOR TILE VCT-3 and VCT-4

- A. Basis of Design: Subject to compliance with requirements, provide Striations by Armstrong Commercial Flooring.
- B. Tile Standard: ASTM F 1066, Class 2 - through pattern.
- C. Wearing Surface: Smooth.
- D. Thickness: 0.125 inch.
- E. Size: 12 by 24 inches.
- F. Colors and Patterns: As indicated by manufacturer's designations on Finish Legend

2.04 INSTALLATION MATERIALS

- A. Trowelable Leveling and Patching Compounds: Latex-modified, portland cement based or blended hydraulic-cement-based formulation provided or approved by manufacturer for applications indicated.
- B. Adhesives: Water-resistant type recommended by manufacturer to suit floor tile and substrate conditions indicated.
 - 1. Adhesives shall comply with the following limits for VOC content when calculated according to 40 CFR 59, Subpart D (EPA Method 24):
 - a. VCT and Asphalt Tile Adhesives: Not more than 50 g/L.
 - 2. Adhesives shall comply with the testing and product requirements of the California Department of Health Services' "Standard Practice for the Testing of Volatile Organic Emissions from Various Sources Using Small-Scale Environmental Chambers."
- C. Seamless-Installation Accessories:
 - 1. Heat-Welding Bead: Manufacturer's solid-strand product for heat welding seams.
 - a. Color: Match floor tile.
- D. Floor Polish: Provide protective liquid floor polish products as recommended by manufacturer.

PART 3 - EXECUTION

3.01 EXAMINATION

- A. Examine substrates, with Installer present, for compliance with requirements for maximum moisture content and other conditions affecting performance of the Work.

- B. Verify that finishes of substrates comply with tolerances and other requirements specified in other Sections and that substrates are free of cracks, ridges, depressions, scale, and foreign deposits that might interfere with adhesion of floor tile.
- C. Proceed with installation only after unsatisfactory conditions have been corrected.

3.02 PREPARATION

- A. Prepare substrates according to manufacturer's written instructions to ensure adhesion of resilient products.
- B. Concrete Substrates: Prepare according to ASTM F 710.
 - 1. Verify that substrates are dry and free of curing compounds, sealers, and hardeners.
 - 2. Remove substrate coatings and other substances that are incompatible with adhesives and that contain soap, wax, oil, or silicone, using mechanical methods recommended by manufacturer. Do not use solvents.
 - 3. Alkalinity and Adhesion Testing: Perform tests recommended by manufacturer. Proceed with installation only after substrates pass testing.
 - 4. Moisture Testing: Perform tests recommended by manufacturer and as follows. Proceed with installation only after substrates pass testing.
 - a. Perform anhydrous calcium chloride test, ASTM F 1869. Proceed with installation only after substrates have maximum moisture-vapor-emission rate of 3 lb of water/1000 sq. ft in 24 hours.
 - b. Perform relative humidity test using in situ probes, ASTM F 2170. Proceed with installation only after substrates have a maximum 75 relative humidity level measurement.
- C. Fill cracks, holes, and depressions in substrates with trowelable leveling and patching compound and remove bumps and ridges to produce a uniform and smooth substrate.
- D. Do not install floor tiles until they are same temperature as space where they are to be installed.
 - 1. Move resilient products and installation materials into spaces where they will be installed at least 48 hours in advance of installation.
- E. Sweep and vacuum clean substrates to be covered by resilient products immediately before installation.

3.03 FLOOR TILE INSTALLATION

- A. Comply with manufacturer's written instructions for installing floor tile.
- B. Lay out floor tiles from center marks established with principal walls, discounting minor offsets, so tiles at opposite edges of room are of equal width. Adjust as necessary to avoid using cut widths that equal less than one-half tile at perimeter.
 - 1. Lay tiles square with room axis.
- C. Match floor tiles for color and pattern by selecting tiles from cartons in the same sequence as manufactured and packaged, if so numbered. Discard broken, cracked, chipped, or deformed tiles.

1. Lay tiles with grain running in one direction.
- D. Scribe, cut, and fit floor tiles to butt neatly and tightly to vertical surfaces and permanent fixtures including built-in furniture, cabinets, pipes, outlets, and door frames.
- E. Extend floor tiles into toe spaces, door reveals, closets, and similar openings. Extend floor tiles to center of door openings.
- F. Maintain reference markers, holes, and openings that are in place or marked for future cutting by repeating on floor tiles as marked on substrates. Use chalk or other nonpermanent, nonstaining marking device.
- G. Install floor tiles on covers for telephone and electrical ducts, building expansion-joint covers, and similar items in finished floor areas. Maintain overall continuity of color and pattern between pieces of tile installed on covers and adjoining tiles. Tightly adhere tile edges to substrates that abut covers and to cover perimeters.
- H. Adhere floor tiles to flooring substrates using a full spread of adhesive applied to substrate to produce a completed installation without open cracks, voids, raising and puckering at joints, telegraphing of adhesive spreader marks, and other surface imperfections.
- I. Seamless Installation:
 1. Heat-Welded Seams: Comply with ASTM F 1516. Rout joints and heat weld with welding bead to permanently fuse sections into a seamless floor covering. Prepare, weld, and finish seams to produce surfaces flush with adjoining floor covering surfaces.

3.04 CLEANING AND PROTECTION

- A. Comply with manufacturer's written instructions for cleaning and protection of floor tile.
- B. Perform the following operations immediately after completing floor tile installation:
 1. Remove adhesive and other blemishes from exposed surfaces.
 2. Sweep and vacuum surfaces thoroughly.
 3. Damp-mop surfaces to remove marks and soil.
- C. Protect floor tile products from marks, marks, indentations, and other damage from construction operations and placement of equipment and fixtures during remainder of construction period.
- D. Floor Polish: Remove soil, visible adhesive, and surface blemishes from floor tile surfaces before applying liquid floor polish.
 1. Apply two coat(s).
- E. Cover floor tile until Substantial Completion.

END OF SECTION 09 65 19

SECTION 09 65 19.02**RECYCLED RUBBER TILE FLOORING****PART 1 - GENERAL****1.01 RELATED DOCUMENTS**

- A. Drawings and general provisions of the Contract, including General and Supplementary Conditions and Division 01 Specification Sections, apply to this Section.

1.02 SUMMARY

- A. Section Includes rubber floor tile.
 - 1. Application: Elevator cab floor
- B. Related Sections:
 - 1. Section 14 21 24 Machine Room-Less Electric Traction Passenger Elevators.

1.03 ACTION SUBMITTALS

- A. Product Data: For each type of product indicated.
- B. LEED Submittals:
 - 1. Product Data for Credit IEQ 4.1: For adhesives, sealants and chemical-bonding compounds, documentation including printed statement of VOC content.
 - 2. Product Data for Credit IEQ 4.3: For adhesives and chemical-bonding compounds, documentation including printed statement of VOC content.
 - 3. Product Data for Credit IEQ 4.3: For resilient tile flooring, documentation from an independent testing agency indicating compliance with the FloorScore Standard.
- C. Shop Drawings: For each type of floor tile. Include floor tile layouts, edges, columns, doorways, enclosing partitions, built-in furniture, cabinets, and cutouts.
 - 1. Show details of special patterns.
- D. Samples for Initial Selection: For each type of floor tile indicated.
- E. Samples for Verification: Full-size units of each color and pattern of floor tile required.
- F. Product Schedule: For floor tile. Use same designations indicated on Drawings.

1.04 INFORMATIONAL SUBMITTALS

- A. Qualification Data: For qualified Installer.

1.05 CLOSEOUT SUBMITTALS

- A. Maintenance Data: For each type of floor tile to include in maintenance manuals.

1.06 MATERIALS MAINTENANCE SUBMITTALS

- A. Furnish extra materials that match products installed and that are packaged with protective covering for storage and identified with labels describing contents.

1. Floor Tile: Furnish 1 box for every 50 boxes or fraction thereof, of each type, color, and pattern of floor tile installed.

1.07 QUALITY ASSURANCE

- A. Installer Qualifications: A qualified installer who employs workers for this Project who are competent in techniques required by manufacturer for floor tile installation indicated.
 1. Engage an installer who employs workers for this Project who are trained or certified by manufacturer for installation techniques required.
- B. Fire-Test-Response Characteristics: As determined by testing identical products according to ASTM E 648 or NFPA 253 by a qualified testing agency.
 1. Critical Radiant Flux Classification: Class I, not less than 0.45 W/sq. cm.

1.08 DELIVERY, STORAGE, AND HANDLING

- A. Store floor tile and installation materials in dry spaces protected from the weather, with ambient temperatures maintained within range recommended by manufacturer, but not less than 50 deg F or more than 90 deg F. Store floor tiles on flat surfaces.

1.09 PROJECT CONDITIONS

- A. Maintain ambient temperatures within range recommended by manufacturer, but not less than 70 deg F or more than 95 deg F, in spaces to receive floor tile during the following time periods:
 1. 48 hours before installation.
 2. During installation.
 3. 48 hours after installation.
- B. Until Substantial Completion, maintain ambient temperatures within range recommended by manufacturer, but not less than 55 deg F or more than 95 deg F.
- C. Close spaces to traffic during floor tile installation.
- D. Close spaces to traffic for 48 hours after floor tile installation.
- E. Install floor tile after other finishing operations, including painting, have been completed.

PART 2 - PRODUCTS

2.01 RECYCLED RUBBER TIRE FLOOR TILE

- A. Basis of Design: Subject to requirements, provide Expanko Reztex Rubber Tile Flooring by Roppe Corporation.
- B. Size: 24 by 24 inches.
- C. Colors and Patterns: As indicated by manufacturer's designations.

2.02 INSTALLATION MATERIALS

- A. Trowelable Leveling and Patching Compounds: Latex-modified, portland cement based or blended hydraulic-cement-based formulation provided or approved by manufacturer for applications indicated.
- B. Adhesives: Water-resistant type recommended by manufacturer to suit floor tile and substrate conditions indicated.
 1. Adhesives shall comply with the following limits for VOC content when calculated according to 40 CFR 59, Subpart D (EPA Method 24):
 - a. Rubber Floor Adhesives: Not more than 60 g/L.
 2. Adhesives shall comply with the testing and product requirements of the California Department of Health Services' "Standard Practice for the Testing of Volatile Organic Emissions from Various Sources Using Small-Scale Environmental Chambers."

PART 3 - EXECUTION

3.01 EXAMINATION

- A. Examine substrates, with Installer present, for compliance with requirements for maximum moisture content and other conditions affecting performance of the Work.
- B. Verify that finishes of substrates comply with tolerances and other requirements specified in other Sections and that substrates are free of cracks, ridges, depressions, scale, and foreign deposits that might interfere with adhesion of floor tile.
- C. Proceed with installation only after unsatisfactory conditions have been corrected.

3.02 PREPARATION

- A. Prepare substrates according to manufacturer's written instructions to ensure adhesion of resilient products.
- B. Concrete Substrates: Prepare according to ASTM F 710.
 1. Verify that substrates are dry and free of curing compounds, sealers, and hardeners.
 2. Remove substrate coatings and other substances that are incompatible with adhesives and that contain soap, wax, oil, or silicone, using mechanical methods recommended by manufacturer. Do not use solvents.
 3. Alkalinity and Adhesion Testing: Perform tests recommended by manufacturer. Proceed with installation only after substrates pass testing.
 4. Moisture Testing: Perform tests recommended by manufacturer and as follows.
 - a. Perform anhydrous calcium chloride test, ASTM F 1869. Proceed with installation only after substrates have maximum moisture-vapor-emission rate of 3 lb of water/1000 sq. ft. in 24 hours.
 - b. Perform relative humidity test using in situ probes, ASTM F 2170. Proceed with installation only after substrates have a maximum 75 relative humidity level measurement.
- C. Fill cracks, holes, and depressions in substrates with trowelable leveling and patching compound and remove bumps and ridges to produce a uniform and smooth

substrate.

- D. Do not install floor tiles until they are same temperature as space where they are to be installed.
 - 1. Move resilient products and installation materials into spaces where they will be installed at least 48 hours in advance of installation.
- E. Sweep and vacuum clean substrates to be covered by resilient products immediately before installation.

3.03 FLOOR TILE INSTALLATION

- A. Comply with manufacturer's written instructions for installing floor tile.
- B. Lay out floor tiles from center marks established with principal walls, discounting minor offsets, so tiles at opposite edges of room are of equal width. Adjust as necessary to avoid using cut widths that equal less than one-half tile at perimeter.
 - 1. Lay tiles square with room axis.
- C. Match floor tiles for color and pattern by selecting tiles from cartons in the same sequence as manufactured and packaged, if so numbered. Discard broken, cracked, chipped, or deformed tiles.
 - 1. Lay tiles with grain direction alternating in adjacent tiles (basket-weave pattern).
- D. Scribe, cut, and fit floor tiles to butt neatly and tightly to vertical surfaces and permanent fixtures including built-in furniture, cabinets, pipes, outlets, and door frames.
- E. Extend floor tiles into toe spaces, door reveals, closets, and similar openings. Extend floor tiles to center of door openings.
- F. Maintain reference markers, holes, and openings that are in place or marked for future cutting by repeating on floor tiles as marked on substrates. Use chalk or other nonpermanent, nonstaining marking device.
- G. Install floor tiles on covers for telephone and electrical ducts, building expansion-joint covers, and similar items in finished floor areas. Maintain overall continuity of color and pattern between pieces of tile installed on covers and adjoining tiles. Tightly adhere tile edges to substrates that abut covers and to cover perimeters.
- H. Adhere floor tiles to flooring substrates using a full spread of adhesive applied to substrate to produce a completed installation without open cracks, voids, raising and puckering at joints, telegraphing of adhesive spreader marks, and other surface imperfections.

3.04 CLEANING AND PROTECTION

- A. Comply with manufacturer's written instructions for cleaning and protection of floor tile.
- B. Perform the following operations immediately after completing floor tile installation:
 - 1. Remove adhesive and other blemishes from exposed surfaces.
 - 2. Sweep and vacuum surfaces thoroughly.
 - 3. Damp-mop surfaces to remove marks and soil.

- C. Protect floor tile products from mars, marks, indentations, and other damage from construction operations and placement of equipment and fixtures during remainder of construction period.
- D. Cover floor tile until Substantial Completion.

END OF SECTION 09 65 19

SECTION 09 67 23
RESINOUS COATING**PART 1 - GENERAL****1.01 RELATED DOCUMENTS**

- A. Drawings and general provisions of the Contract, including General and Supplementary Conditions and Division 01 Specification Sections, apply to this Section.

1.02 SUMMARY

- A. Section Includes:
 - 1. Industrial resinous coating systems.
- B. Related Sections:
 - 1. Division 07 Section "Joint Sealants" for sealants installed at joints in resinous coating systems.

1.03 SUBMITTALS

- A. Product Data: For each type of product indicated. Include manufacturer's technical data, application instructions, and recommendations for each resinous coating component required.
- B. LEED Submittals:
 - 1. Product Data for Credit IEQ 4.2: For liquid-applied coating components, documentation including printed statement of VOC content.
- C. Samples for Initial Selection: For each type of exposed finish required.
- D. Samples for Verification: For each resinous coating system required, 6 inches square, applied to a rigid backing by Installer for this Project.
- E. Product Schedule: For resinous coating.
- F. Installer Certificates: Signed by manufacturer certifying that installers comply with specified requirements.
- G. Material Certificates: For each resinous coating component, from manufacturer.
- H. Material Test Reports: For each resinous coating system.
- I. Maintenance Data: For resinous coating to include in maintenance manuals.

1.04 QUALITY ASSURANCE

- A. Installer Qualifications: Manufacturer's authorized representative who is trained and approved for installation of coating systems required for this Project.
 - 1. Engage an installer who is certified in writing by resinous coating manufacturer as qualified to apply resinous coating systems indicated.

- B. Source Limitations: Obtain primary resinous coating materials, including primers, resins, hardening agents, grouting coats, and topcoats, from single source from single manufacturer. Provide secondary materials, including patching and fill material, joint sealant, and repair materials, of type and from source recommended by manufacturer of primary materials.
- C. Mockups: Apply mockups to verify selections made under sample submittals and to demonstrate aesthetic effects and set quality standards for materials and execution.
 - 1. Apply full-thickness mockups on 48-inch- square floor area selected by Architect.
 - a. Include 48-inch length of integral cove base with inside and outside corner.
 - 2. Simulate finished lighting conditions for Architect's review of mockups.
 - 3. Approved mockups may become part of the completed Work if undisturbed at time of Substantial Completion.
- D. Preinstallation Conference: Conduct conference at Project site.

1.05 DELIVERY, STORAGE, AND HANDLING

- A. Deliver materials in original packages and containers, with seals unbroken, bearing manufacturer's labels indicating brand name and directions for storage and mixing with other components.

1.06 PROJECT CONDITIONS

- A. Environmental Limitations: Comply with resinous coating manufacturer's written instructions for substrate temperature, ambient temperature, moisture, ventilation, and other conditions affecting resinous coating application.
- B. Lighting: Provide permanent lighting or, if permanent lighting is not in place, simulate permanent lighting conditions during resinous coating application.
- C. Close spaces to traffic during resinous coating application and for not less than 24 hours after application unless manufacturer recommends a longer period.

PART 2 - PRODUCTS

2.01 MATERIALS

- A. VOC Content of Liquid-Applied Coating Components: Not more than 100 g/L when calculated according to 40 CFR 59, Subpart D (EPA Method 24).

2.02 INDUSTRIAL RESINOUS COATING

- A. Basis of Design: Provide Rhino Extreme FR 21-50 by Rhino Linings Corporation
- B. System Characteristics:
 - 1. Color and Pattern: As indicated by product designation listed on Finish Legend.
 - 2. Wearing Surface: Textured for slip resistance.
 - 3. Overall System Thickness: 1/16 inch minimum.
- C. System Physical Properties: Provide resinous coating system with the following minimum physical property requirements when tested according to test methods

indicated:

1. Shore Hardness: 45, plus or minus 5, per ASTM D-2240.
2. Tensile Strength: 1400-1600 per ASTM D-412.
3. Specific Gravity: 1.10 - 1.12 grams/cc per ASTM D-792.
4. Elongation: 250 - 300 percent per ASTM D-412
5. Water Absorption: 1.0 percent per ASTM D-570.
6. Flammability:
 - a. Pass per FMV-302
 - b. Pass per Cal 117
 - c. V-O per UL-94
7. Dielectric Strength: 300 volts/mil per ASTM D-149
8. Volume Resistancy: 6×10 ohm/inches per ASTM D-257
9. Dielectric Constant: 5.4 MHz per ASTM D-150
10. Dissipation Factor: 0.058 MHz per ASTM D-150
11. Cathodic Disbonding: Pass per ASTM G-8
12. Eclometer Adhesion Pull Test: Pass per ASTM D-4541

2.03 ACCESSORIES

- A. Primer: Type recommended by manufacturer for substrate and body coats indicated.
- B. Waterproofing Membrane: Type recommended by manufacturer for substrate and primer and body coats indicated.
 1. Formulation Description: High solids.
- C. Patching and Fill Material: Resinous product of or approved by resinous coating manufacturer and recommended by manufacturer for application indicated.

PART 3 - EXECUTION

3.01 PREPARATION

- A. General: Prepare and clean substrates according to resinous coating manufacturer's written instructions for substrate indicated. Provide clean, dry substrate for resinous coating application.
- B. Concrete Substrates: Provide sound concrete surfaces free of laitance, glaze, efflorescence, curing compounds, form-release agents, dust, dirt, grease, oil, and other contaminants incompatible with resinous coating.
 1. Roughen concrete substrates as follows:
 - a. Shot-blast surfaces with an apparatus that abrades the concrete surface, contains the dispensed shot within the apparatus, and recirculates the shot by vacuum pickup.
 - b. Comply with ASTM C 811 requirements unless manufacturer's written instructions are more stringent.
 2. Repair damaged and deteriorated concrete according to resinous coating manufacturer's written instructions.
 3. Verify that concrete substrates are dry and moisture-vapor emissions are within acceptable levels according to manufacturer's written instructions.

- a. Perform anhydrous calcium chloride test, ASTM F 1869. Proceed with application of resinous coating only after substrates have maximum moisture-vapor-emission rate of 3 lb of water/1000 sq. ft. of slab area in 24 hours.
 - b. Perform plastic sheet test, ASTM D 4263. Proceed with application only after testing indicates absence of moisture in substrates.
 - c. Perform relative humidity test using in situ probes, ASTM F 2170. Proceed with installation only after substrates have a maximum 75 percent relative humidity level measurement.
4. Alkalinity and Adhesion Testing: Verify that concrete substrates have pH within acceptable range. Perform tests recommended by manufacturer. Proceed with application only after substrates pass testing.
- C. Resinous Materials: Mix components and prepare materials according to resinous coating manufacturer's written instructions.
- D. Use patching and fill material to fill holes and depressions in substrates according to manufacturer's written instructions.
- E. Treat control joints and other nonmoving substrate cracks to prevent cracks from reflecting through resinous coating according to manufacturer's written instructions.

3.02 APPLICATION

- A. General: Apply components of resinous coating system according to manufacturer's written instructions to produce a uniform, monolithic wearing surface of thickness indicated.
1. Coordinate application of components to provide optimum adhesion of resinous coating system to substrate, and optimum intercoat adhesion.
 2. Cure resinous coating components according to manufacturer's written instructions. Prevent contamination during application and curing processes.
 3. At substrate expansion and isolation joints, comply with resinous coating manufacturer's written instructions.
- B. Apply primer over prepared substrate at manufacturer's recommended spreading rate.
- C. Apply reinforcing membrane to substrate cracks.
- D. Integral Cove Base and Wall Coating: Apply cove base mix to wall surfaces before applying coating. Apply according to manufacturer's written instructions and details including those for taping, mixing, priming, troweling, sanding, and topcoating of cove base. Round internal and external corners.
1. Integral Cove Base and Wall Coating: Extend to height indicated on Drawings.
- E. Apply self-leveling slurry body coats in thickness indicated for coating system.
1. Broadcast aggregates at rate recommended by manufacturer and, after resin is cured, remove excess aggregates to provide surface texture indicated.
- F. Apply troweled or screeded body coats in thickness indicated for coating system. Hand or power trowel and grout to fill voids. When cured, remove trowel marks and roughness using method recommended by manufacturer.
- G. Apply grout coat, of type recommended by resinous coating manufacturer, to fill voids

in surface of final body coat and to produce wearing surface indicated.

- H. Apply topcoats in number indicated for coating system and at spreading rates recommended in writing by manufacturer.

3.03 FIELD QUALITY CONTROL

- A. Core Sampling: At the direction of Architect and at locations designated by Architect, take one core sample per 1000 sq. ft. of resinous coating, or portion of, to verify thickness. For each sample that fails to comply with requirements, take two additional samples. Repair damage caused by coring and correct deficiencies.
- B. Material Sampling: Architect may at any time and any number of times during resinous coating application require material samples for testing for compliance with requirements.
 - 1. Owner will engage an independent testing agency to take samples of materials being used. Material samples will be taken, identified, sealed, and certified in presence of Contractor.
 - 2. Testing agency will test samples for compliance with requirements, using applicable referenced testing procedures or, if not referenced, using testing procedures listed in manufacturer's product data.
 - 3. If test results show applied materials do not comply with specified requirements, pay for testing, remove noncomplying materials, prepare surfaces coated with unacceptable materials, and reapply coating materials to comply with requirements.

3.04 PROTECTION

- A. Protect resinous coating from damage and wear during the remainder of construction period. Use protective methods and materials, including temporary covering, recommended in writing by resinous coating manufacturer.

END OF SECTION 09 67 23

SECTION 09 68 13**TILE CARPETING****PART 1 - GENERAL****1.01 RELATED DOCUMENTS**

- A. Drawings and general provisions of the Contract, including General and Supplementary Conditions and Division 01 Specification Sections, apply to this Section.

1.02 SUMMARY

- A. This Section includes carpet tile, accessory materials and installation.
- B. Related Sections include the following:
 - 1. Division 01 Section "Concrete Moisture Vapor Emission Testing" for testing materials and procedures for carpet tiles with rubber or unitary type backing adhered to concrete floor.
 - 2. Division 09 Section "Resilient Wall Base and Accessories" for resilient wall base and accessories installed with carpet.

1.03 SUBMITTALS

- A. Product Data: For each type of product indicated. Include manufacturer's written data on physical characteristics, durability, and fade resistance. Include installation methods. Include percentage of recycled content.
- B. LEED Submittals:
 - 1. Credit MR 4.1 and 4.2: Manufacturer's product data indicating percentage of recycled content.
 - 2. Credit EQ 4.1: Manufacturers' product data for adhesives and sealants, including printed statement of VOC content.
 - 3. Credit EQ 4.3: Manufacturer's product data indicating VOC content of carpet and backing.
- C. Shop Drawings: Show the following:
 - 1. Columns, doorways, enclosing walls or partitions, built-in cabinets, and locations where cutouts are required in carpet tiles.
 - 2. Existing flooring materials to be removed.
 - 3. Existing flooring materials to remain.
 - 4. Carpet tile type, color, and dye lot.
 - 5. Type of subfloor.
 - 6. Type of installation.
 - 7. Pattern of installation.
 - 8. Pattern type, location, and direction.
 - 9. Pile direction.
 - 10. Type, color, and location of insets and borders.
 - 11. Type, color, and location of edge, transition, and other accessory strips.
 - 12. Transition details to other flooring materials.

- D. Samples: For each of the following products and for each color and texture required. Label each Sample with manufacturer's name, material description, color, pattern, and designation indicated on Drawings and in schedules.
1. Carpet Tile: Full-size Sample.
 2. Exposed Edge Stripping and Accessory: 12-inch- long Samples.
- E. Product Schedule: Use same room and product designations indicated on Drawings and in schedules.
- F. Maintenance Data: For carpet tile to include in maintenance manuals specified in Division 1. Include the following:
1. Methods for maintaining carpet tile, including cleaning and stain-removal products and procedures and manufacturer's recommended maintenance schedule.
 2. Precautions for cleaning materials and methods that could be detrimental to carpet tile.

1.04 QUALITY ASSURANCE

- A. Installer Qualifications: An experienced installer who is certified by the Floor Covering Installation Board or who can demonstrate compliance with its certification program requirements.
- B. Fire-Test-Response Characteristics: Provide products with the critical radiant flux classification indicated in Part 2, as determined by testing identical products per ASTM E 648 by an independent testing and inspecting agency acceptable to authorities having jurisdiction.
- C. Product Options: Products and manufacturers named in Part 2 establish requirements for product quality in terms of appearance, construction, and performance. Other manufacturers' products comparable in quality to named products and complying with requirements may be considered. Refer to Division 1 Section "Substitutions."

1.05 DELIVERY, STORAGE, AND HANDLING

- A. General: Comply with CRI 104, Section 5, "Storage and Handling."

1.06 PROJECT CONDITIONS

- A. General: Comply with CRI 104, Section 6.1, "Site Conditions; Temperature and Humidity."
- B. Environmental Limitations: Do not install carpet tile until wet work in spaces is complete and dry, and ambient temperature and humidity conditions are maintained at the levels indicated for Project when occupied for its intended use.
- C. Do not install carpet tile over concrete slabs until slabs have cured and are sufficiently dry to bond with adhesive and concrete slabs have pH range recommended by carpet tile manufacturer.

- D. Where demountable partitions or other items are indicated for installation on top of carpet tile, install carpet tile before installing these items.
- E. Subfloor Moisture Conditions for carpet tiles with rubber or unitary type backing adhered to floor.: Moisture emission rate of not more than 3 lb/1000 sq. ft./24 hours when tested in accordance with Division 9 Section "Concrete Moisture Vapor Emission Testing."

1.07 WARRANTY

- A. General Warranty: Special warranty specified in this Article shall not deprive Owner of other rights Owner may have under other provisions of the Contract Documents and shall be in addition to, and run concurrent with, other warranties made by Contractor under requirements of the Contract Documents.
- B. Special Carpet Tile Warranty: Written warranty, signed by carpet tile manufacturer agreeing to replace carpet tile that does not comply with requirements or that fails within specified warranty period. Warranty does not include deterioration or failure of carpet tile due to unusual traffic, failure of substrate, vandalism, or abuse. Failures include, but are not limited to, more than 10 percent loss of face fiber, edge raveling, snags, runs, and delamination.
 - 1. Warranty Period: 10 years from date of Substantial Completion.

1.08 EXTRA MATERIALS

- A. Furnish extra materials described below, before installation begins, that match products installed and that are packaged with protective covering for storage and identified with labels describing contents.
 - 1. Carpet Tile: Full-size units equal to 5 percent of amount installed for each type indicated, but not less than 10 sq. yd..

PART 2 - PRODUCTS

2.01 CARPET TILE

- A. Basis of Design Products: Subject to compliance with requirements, provide Analogue by Lees or comparable products matching colors, patterns, weave, textures and density by another manufacturer.
 - 1. Recycled Content: Provide products with not less than 35 percent recycled content.
 - 2. VOC Content: Provide modular carpet products meeting or exceeding CRI Green Label Plus certification.
 - 3. Primary Backing/Backcoating: Manufacturer's standard PVC-free Underscore ES Cushion backing with TractionBack.
- B. Performance Characteristics: As follows:
 - 1. Critical Radiant Flux Classification: Not less than 0.45 W/sq. cm.
 - 2. Dry Breaking Strength: Not less than 100 lbf per ASTM D 2646.
 - 3. Colorfastness to Crocking: Not less than 4, wet and dry, per AATCC-165.

4. Colorfastness to Light: Not less than 4 after 40 AFU (AATCC fading units) per AATCC-16.
5. Antimicrobial Activity: Not less than 2-mm halo of inhibition for gram-positive bacteria; not less than 1-mm halo of inhibition for gram-negative bacteria; no fungal growth; per AATCC-174.

2.02 INSTALLATION ACCESSORIES

- A. Trowelable Leveling and Patching Compounds: Latex-modified, hydraulic-cement-based formulation provided by or recommended by carpet tile manufacturer.
- B. Adhesives: Water-resistant, mildew-resistant, nonstaining type to suit products and subfloor conditions indicated, that complies with flammability requirements for installed carpet tile and that is recommended by carpet tile manufacturer.

PART 3 - EXECUTION

3.01 EXAMINATION

- A. Examine substrates, areas, and conditions for compliance with requirements for maximum moisture content, alkalinity range, installation tolerances, and other conditions affecting carpet tile performance. Verify that substrates and conditions are satisfactory for carpet tile installation and comply with requirements specified.
- B. Concrete Subfloors: Verify that concrete slabs comply with ASTM F 710 and the following:
 1. Slab substrates are dry and free of curing compounds, sealers, hardeners, and other materials that may interfere with adhesive bond.
 - a. Determine adhesion characteristics by performing bond tests recommended by carpet manufacturer.
 - b. Determine dryness and pH characteristics by performing moisture and pH tests specified in Division 9 Section "Concrete Moisture Vapor Transmission and pH Testing" and as recommended by carpet manufacturer.
 2. Subfloor finishes comply with requirements specified in Division 3 Section "Cast-in-Place Concrete" for slabs receiving carpet.
 3. Subfloors are free of cracks, ridges, depressions, scale, and foreign deposits.
- C. Proceed with installation only after unsatisfactory conditions have been corrected.

3.02 PREPARATION

- A. General: Comply with CRI 104, Section 6.2, "Site Conditions; Floor Preparation," and carpet tile manufacturer's written installation instructions for preparing substrates indicated to receive carpet tile installation.
- B. Use trowelable leveling and patching compounds, according to manufacturer's written instructions, to fill cracks, holes, and depressions in substrates.

- C. Remove coatings, including curing compounds, and other substances that are incompatible with adhesives and that contain soap, wax, oil, or silicone, without using solvents. Use mechanical methods recommended in writing by carpet tile manufacturer.
- D. Broom and vacuum clean substrates to be covered immediately before installing carpet tile. After cleaning, examine substrates for moisture, alkaline salts, carbonation, or dust. Proceed with installation only after unsatisfactory conditions have been corrected.

3.03 INSTALLATION

- A. General: Comply with CRI 104, Section 13, "Carpet Modules (Tiles)."
- B. Installation Method:
 - 1. On Concrete: As recommended in writing by carpet tile manufacturer.
- C. Cut and fit carpet tile to butt tightly to vertical surfaces, permanent fixtures, and built-in furniture including cabinets, pipes, outlets, edgings, thresholds, and nosings. Bind or seal cut edges as recommended by carpet tile manufacturer.
- D. Extend carpet tile into toe spaces, door reveals, closets, open-bottomed obstructions, removable flanges, alcoves, and similar openings.
- E. Maintain reference markers, holes, and openings that are in place or marked for future cutting by repeating on finish flooring as marked on subfloor. Use nonpermanent, nonstaining marking device.
- F. Install pattern parallel to walls and borders.

3.04 CLEANING AND PROTECTION

- A. Perform the following operations immediately after installing carpet tile:
 - 1. Remove excess adhesive, seam sealer, and other surface blemishes using cleaner recommended by carpet tile manufacturer.
 - 2. Remove yarns that protrude from carpet tile surface.
 - 3. Vacuum carpet tile using commercial machine with face-beater element.
- B. Protect installed carpet tile to comply with CRI 104, Section 15, "Protection of Indoor Installations."
- C. Protect carpet tile against damage from construction operations and placement of equipment and fixtures during the remainder of construction period. Use protection methods indicated or recommended in writing by carpet tile manufacturer.

END OF SECTION 09 68 13

SECTION 09 91 13.10
EXTERIOR PAINTING**PART 1 - GENERAL****1.1 SUMMARY**

- A. Furnish all labor, materials, tools, equipment, and services for Exterior Painting, as indicated, in accordance with provisions of Contract Documents.
- B. Completely coordinate with work of other trades.

1.2 QUALITY ASSURANCE

- A. Definitions:
 - 1. "Paint" and "painting" refer to applied coatings.
 - 2. Mechanical work and equipment: Work included in Mechanical Specification Divisions.
 - 3. Electrical work and equipment: Work included in Electrical Specification Divisions.
- B. Work included:
 - 1. Exterior surfaces scheduled to be painted, unless indicated to be painted under other sections.
 - 2. Except for colored, split-face, patterned, ground-face, glazed, and other concrete masonry units with integral architectural finish; paint exposed exterior and on-site concrete masonry unit surfaces, including areaway walls, backside faces of parapets, screen walls, and retaining walls.
 - 3. Mechanical and electrical work:
 - a. Exterior equipment and items not completely factory finished.
- C. Powder coatings to conform to:
 - 1. American Architectural Manufacturers Association (AAMA) 2605
 - a. Color retention: 10 years: Fade = Delta E
 - b. Chalk Resistance: 10 years: Chalk = 8
 - c. Gloss Retention: 10 years: 10% Loss
 - d. Dry Film Thickness: 1.2 mils minimum
 - e. Pretreatment System: Chrome or Chrome Free
 - f. Salt Spray: 4,000 hours
 - g. Humidity: 4,000 hours
 - 2. ASTM D3451-06

1.3 SUBMITTALS

- A. Product Data:
 - 1. Manufacturer's data for each paint type to be applied indicating conformance to specifications.
- A. Samples:
 - 1. Three 216mm X 280mm 8 1/2 IN x 11 IN samples of each color and finish as noted in Drawing I-001 Interior Notes & Finish Legend.
 - 2. Gloss samples.
- B. Contract Closeout Information:
 - 1. Maintenance data.

PART 2 - PRODUCTS**2.1 ACCEPTABLE MANUFACTURERS**

- A. Provide paint as product of one manufacturer as far as possible.
- B. Powder Coating:
 - 1. Base:
 - a. Linetec
 - 2. Optional:
 - a. DuPont
 - b. PPG
- C. Paints:
 - 1. Base:
 - a. Sherwin-Williams.
 - 2. Optional:
 - a. Benjamin Moore.
 - b. Glidden Professional.
 - c. PPG Architectural Finishes.
 - d. Pratt & Lambert.
 - e. Tnemec.
- D. Other manufacturers desiring approval comply with Section 00 26 00.

2.2 MATERIALS

- 1. Gloss range: MPI Standards as measured in accordance with ASTM D523:
 - a. Gloss Level 1 (Flat): Maximum 5 at 60 degrees, maximum 10 at 85 degrees.
 - b. Gloss Level 2 (Velvet): Maximum 10 at 60 degrees, 10-35 at 85 degrees.
 - c. Gloss Level 3 (Eggshell): 10-25 at 60 degrees, 10-35 at 85 degrees.
 - d. Gloss Level 4 (Satin): 20-35 at 60 degrees, minimum 35 at 85 degrees.
 - e. Gloss Level 5 (Semi-gloss): 35-70 at 60 degrees.
 - f. Gloss Level 6 (Gloss): 70-85 at 60 degrees.
 - g. Gloss Level 7 (High gloss): More than 85 at 60 degrees.
- 2. If the gloss range is not indicated, provide top coat with a MPI Gloss Level 3 (Eggshell) finish.
- 3. Submit gloss samples for approval prior to use.
- 4. Add flatteners if necessary to achieve specified gloss.
- 5. Part 3 includes a listing of surfaces and type of paint to be applied.

PART 3 - EXECUTION**3.1 INSPECTION**

- A. Examine surfaces carefully for defects which cannot be corrected and might prevent satisfactory results.
- B. Commencing of work in a specific area constitutes acceptance of surfaces, and responsibility for performance.

3.2 SURFACES NOT TO BE PAINTED

- A. Anodized aluminum, stainless steel, chromium plate, glass, copper, bronze or similar materials.
- B. Moving parts of valves, operating units, mechanical and electrical parts, such as valve and damper operators, sending devices, motor and fan shafts.
- C. Code labels, such as UL, FM that are mylar or flat (non-embossed) plates.

1. Embossed plates and labels stamped into frames will be painted, label and information on label to be readily visible and convenient for identification by authority having jurisdiction.
- D. Equipment identification or rating plates.
 - E. Items having complete factory finish with exception of:
 1. Exterior mechanical equipment.
 2. Exterior electrical equipment.

3.3 PREPARATION - GENERAL

- A. Assure that surfaces are clean and dry.
- B. Assure that surfaces are free of foreign materials which will affect adhesion or appearance.
- C. Remove mildew and neutralize surface.
- D. Eliminate efflorescence before painting.
- E. Before painting, test surfaces with moisture meter.
- F. Paint when moisture is within paint manufacturer's acceptable limits.

3.4 PREPARATION - EXISTING SURFACES

- A. Wherever existing work is cut, patched, or added to; touch up to match new work as closely as possible.
 1. Check compatibility of new coating to previously painted surfaces by applying test patch. Allow to dry and test adhesion before continuing painting work.
- B. Put existing work scheduled for repainting in condition to provide good adhesion and to receive paint.
 1. Wash thoroughly surfaces to be repainted with abrasive kitchen cleaner or sand to manufacturer's recommendations.
 2. Remove residue from cleaning and abrading procedures.
 3. Spot prime bare areas.
- C. Where a wall or ceiling is disturbed and patched, repaint entire wall or ceiling.
- D. On surfaces to be refinished remove hardware, accessories, plates, surface mounted lighting fixtures, and similar items not to be coated, or provide protection during preparation and coating operations.
- E. Protect (and do not paint) code labels, such as UL, FM that are mylar or flat (non-embossed) plates.
 1. Embossed plates and labels stamped into frames may be painted, label and information on label to be readily visible and convenient for identification by authority having jurisdiction.

3.5 MATERIAL PREPARATION

- A. Mix and prepare materials per manufacturer's specifications.
- B. Stir, agitate or blend materials to produce a mixture of uniform density as required for application of materials.

3.6 PREPARATION - GALVANIZED METAL SURFACES AND NON-ANODIZED ALUMINUM

- A. Follow requirements of SSPC SP1.
- B. Treat surfaces with galvanized surface cleaner as recommended by primer and topcoat manufacturer.

-
- C. Non-anodized aluminum to receive a powder coating shall be clean and free of oils, soils, greases, welding scales, etc. to achieve a smooth and untarnished surface.

3.7 PREPARATION – CONCRETE AND MASONRY

- A. Repair minor defects.
- B. Remove oil from concrete by washing with xylol.
- C. Block Filler:
 - 1. Apply masonry to fill pinholes and minor surface defects, and to prime surface for topcoat.
 - 2. Apply by brush, roller or sprayer.
 - a. Where spray-applied: Back-roll with roller or squeegee.
 - 3. Minimum Nominal Thickness: 10 mil DFT.
 - a. Comply with manufacturer's recommended coverage rates for conditions encountered.
 - 4. Provide complete cover with recommended coating system.
- D. Obtain architect's approval of finish for surfaces to receive high build glazed coatings.

3.8 APPLICATION - GENERAL

- A. Paint surfaces as indicated in the drawings.
- B. Provide complete coverage and hide.
 - 1. Paint systems are to cover.
 - 2. When color or undercoats show through, apply additional coats at no additional cost until paint film is of uniform finish and color.
- C. Employ only skilled mechanics.
- D. Mix and apply as recommended by manufacturer.
- E. Install when temperature, humidity, and surface conditions are acceptable to manufacturer.
- F. If Architect so directs, do not apply succeeding coats until Architect has an opportunity to observe previous coat.
- G. Remove and protect hardware, accessories, plates, fixtures, finished work, and similar items; or provide ample in-place protection.
- H. Upon completion of painting, carefully replace removed items and/or remove protection.
- I. Apply materials under adequate illumination.
- J. Evenly spread and smoothly flow on for full, smooth cover.
- K. Assure that coats are dry before recoating.
- L. Touch up suction or hot spots in plaster, concrete block, and concrete before painting.
- M. Touch up abraded areas of shop prime coats before subsequent coats are applied.
- N. Back prime wood trim with penetrating sealer.
- O. Finish colors not indicated shall be selected by Architect from paint manufacturer's standard colors.

3.9 PROTECTION AND CLEANUP

- A. Protect adjacent work against damage by painting and finishing work.
- B. Clean, repair or replace, and repaint damaged work as directed by Architect.
- C. Provide "WET PAINT" signs.

-
- D. Remove temporary protective wrappings, after completion of operations.
 - E. Clean paint spattered surfaces.
 - F. Use care not to damage finished surfaces.
 - G. Remove surplus materials, scaffolding and debris.
 - H. Leave areas broom clean.

3.10 SCHEDULE - EXTERIOR PAINT SYSTEMS

- A. Non-Anodized Aluminum:
 - 1. Powder coating, smooth
 - a. Application shall conform to the manufacturer's instructions.
- B. Concrete:
 - 1. Elastomeric, smooth:
 - a. Sherwin Williams:
 - 1) Primer coat: Recommended by topcoat manufacturer for each substrate.
 - 2) Intermediate coat: ConFlex XL Elastomeric High Build Smooth; A5-400.
 - 3) Topcoat: ConFlex XL Elastomeric High Build Smooth; A5-400.
 - b. Glidden Professional:
 - 1) Primer coat: Recommended by topcoat manufacturer for each substrate.
 - 2) Intermediate coat: Decra-Flex 300 Elastomeric Coating; 2260.
 - 3) Topcoat: Exterior: Decra-Flex 300 Elastomeric Coating; 2260.
 - c. PPG:
 - 1) Primer coat: Recommended by topcoat manufacturer for each substrate.
 - 2) Intermediate coat: Pitt Flex Elastomeric: 4-110.
 - 3) Topcoat: Pitt Flex Elastomeric: 4-110.
 - C. Concrete block:
 - 1. Elastomeric, smooth:
 - a. Sherwin Williams:
 - 1) Primer coat: Recommended by topcoat manufacturer for each substrate.
 - 2) Intermediate coat: ConFlex XL Elastomeric High Build Smooth; A5-400.
 - 3) Topcoat: ConFlex XL Elastomeric High Build Smooth; A5-400.
 - b. Glidden Professional:
 - 1) Primer coat: Recommended by topcoat manufacturer for each substrate.
 - 2) Intermediate coat: Decra-Flex 300 Elastomeric Coating; 2260.
 - 3) Topcoat: Exterior: Decra-Flex 300 Elastomeric Coating; 2260.
 - c. PPG:
 - 1) Primer coat: Recommended by topcoat manufacturer for each substrate.
 - 2) Intermediate coat: Pitt Flex Elastomeric; 4-110.
 - 3) Topcoat: Pitt Flex Elastomeric; 4-110.
 - D. Structural steel (exposed):
 - 1. Water based urethane, Gloss Level 3 (Egg Shell):
 - a. Sherwin Williams:
 - 1) Primer coat: Recommended by topcoat manufacturer for each substrate.
 - 2) Intermediate coat: Acrolon 100 Water Based Urethane Gloss, B65-720.
 - 3) Topcoat: Acrolon 100 Water Based Urethane Gloss, B65-720.
 - a) Clear coat: Diamond-Clad Clear Coat Urethane, B65 Series.
 - b. Glidden Professional:
 - 1) Primer coat: Recommended by topcoat manufacturer for each substrate.
 - 2) Intermediate coat: Devthane UVA Aliphatic Urethane Gloss Enamel; 389.
 - 3) Topcoat: Devthane UVA Aliphatic Urethane Gloss Enamel; 389.
 - 4) Clear coat: Manufacturer recommended.
 - c. PPG:
 - 1) Primer coat: Recommended by topcoat manufacturer for each substrate.

-
- 2) Intermediate coat: Pitthane Ultra Gloss Urethane 95-812.
 - 3) Topcoat: Pitthane Ultra Gloss Urethane 95-812.
 - 4) Clear coat: Pitthane Ultra Gloss Urethane 95-812.
 - d. Tnemec:
 - 1) Primer coat: Recommended by topcoat manufacturer for each substrate.
 - 2) Second coat: Epoxy polyamide, Tnemec Series 66 High Build Epoxoline.
 - 3) Third coat: Aliphatic polyurethane, Tnemec Series 74 Endura-Shield.

PART 4 - MEASUREMENT

4.1 Measurement – No Separate measurement will be made for Work described in this Section.

PART 5 - PAYMENT

5.1 Payment – Payment for items in this Section will be incidental to the Contract lump sum cost of the Station Stops.

END OF SECTION

SECTION 09 91 13**EXTERIOR PAINTING****PART 1 - GENERAL****1.01 RELATED DOCUMENTS**

- A. Drawings and general provisions of the Contract, including General and Supplementary Conditions and Division 1 Specification Sections, apply to this Section.

1.02 SUMMARY

- A. This Section includes surface preparation and the application of paint systems on the following exterior substrates and interior substrates exposed to humid conditions:
 - 1. Concrete.
 - 2. Galvanized metal.
 - 3. Architecturally exposed structural steel, interior and exterior locations.
- B. Related Sections include the following:
 - 1. Division 5 Sections for shop priming of metal substrates with primers specified in this Section.
 - 2. Division 9 Section "Interior Painting" for surface preparation and the application of paint systems on interior substrates.

1.03 SUBMITTALS

- A. Product Data: For each type of product indicated.
- B. Samples for Verification: For each type of paint system and each color and gloss of topcoat indicated.
 - 1. Submit Samples on rigid backing, 8 inches square.
 - 2. Step coats on Samples to show each coat required for system.
 - 3. Label each coat of each Sample.
 - 4. Label each Sample for location and application area.
- C. Product List: For each product indicated, include the following:
 - 1. Cross-reference to paint system and locations of application areas. Use same designations indicated on Drawings and in schedules.
 - 2. Printout of current "MPI Approved Products List" for each product category specified in Part 2, with the proposed product highlighted.

1.04 QUALITY ASSURANCE

- A. MPI Standards:
 - 1. Products: Complying with MPI standards indicated and listed in "MPI Approved Products List."
 - 2. Preparation and Workmanship: Comply with requirements in "MPI Architectural Painting Specification Manual" for products and paint systems indicated.

- B. Mockups: Apply benchmark samples of each paint system indicated and each color and finish selected to verify preliminary selections made under sample submittals and to demonstrate aesthetic effects and set quality standards for materials and execution.
 - 1. Architect will select one surface to represent surfaces and conditions for application of each paint system specified in Part 3.
 - a. Vertical and Horizontal Surfaces: Provide samples of at least 100 sq. ft..
 - b. Other Items: Architect will designate items or areas required.
 - 2. Final approval of color selections will be based on benchmark samples.
 - a. If preliminary color selections are not approved, apply additional benchmark samples of additional colors selected by Architect at no added cost to Owner.

1.05 DELIVERY, STORAGE, AND HANDLING

- A. Store materials not in use in tightly covered containers in well-ventilated areas with ambient temperatures continuously maintained at not less than 45 deg F.
 - 1. Maintain containers in clean condition, free of foreign materials and residue.
 - 2. Remove rags and waste from storage areas daily.

1.06 PROJECT CONDITIONS

- A. Apply paints only when temperature of surfaces to be painted and ambient air temperatures are between 50 and 95 deg F.
- B. Do not apply paints in snow, rain, fog, or mist; when relative humidity exceeds 85 percent; at temperatures less than 5 deg F above the dew point; or to damp or wet surfaces.

1.07 EXTRA MATERIALS

- A. Furnish extra materials described below that are from same production run (batch mix) as materials applied and that are packaged for storage and identified with labels describing contents.
 - 1. Quantity: Furnish an additional 5 percent, but not less than 1 gal. of each material and color applied.

PART 2 - PRODUCTS

2.01 MANUFACTURERS

- A. Available Manufacturers: Subject to compliance with requirements, manufacturers offering products that may be incorporated into the Work include, but are not limited to, the following:
 - 1. Benjamin Moore & Co.
 - 2. California Paints.
 - 3. ChemRex.
 - 4. Cloverdale Paint.
 - 5. Color Wheel Paints & Coatings.
 - 6. Columbia Paint & Coatings.
 - 7. Diamond Vogel Paints.

8. Dunn-Edwards Corporation.
9. Durant Paints Inc.
10. ICI Paints.
11. Kelly-Moore Paints.
12. Kwal-Howells Paint.
13. PPG Architectural Finishes, Inc.
14. Sherwin-Williams Company (The).

2.02 PAINT, GENERAL

A. Material Compatibility:

1. Provide materials for use within each paint system that are compatible with one another and substrates indicated, under conditions of service and application as demonstrated by manufacturer, based on testing and field experience.
2. For each coat in a paint system, provide products recommended in writing by manufacturers of topcoat for use in paint system and on substrate indicated.

B. Colors: As indicated in a color schedule on Drawings.

2.03 BLOCK FILLERS

- A. Interior/Exterior Latex Block Filler: MPI #4.
- B. Epoxy Block Filler: MPI #116

2.04 PRIMERS/SEALERS

- A. Alkali-Resistant Primer: MPI #3.

2.05 METAL PRIMERS

- A. Waterborne Galvanized-Metal Primer: MPI #134.
- B. Epoxy Zinc Rich Primer: MPI #20.

2.06 EXTERIOR LATEX PAINTS

- A. Exterior Latex (Semigloss): MPI #11 (Gloss Level 5).
- B. Exterior Latex (Gloss): MPI #119 (Gloss Level 6, except minimum gloss of 65 units at 60 deg).

2.07 POLYURETHANE COATINGS

- A. Polyurethane, Two-Component, Pigmented, Gloss: MPI #72.

2.08 EXTERIOR ALKYD PAINTS

- A. Exterior Alkyd Enamel (Semigloss): MPI #94 (Gloss Level 5).
- B. Exterior Alkyd Enamel (Gloss): MPI #9 (Gloss Level 6).

2.09 QUICK-DRYING ENAMELS

- A. Quick-Drying Enamel (Semigloss): MPI #81 (Gloss Level 5).
- B. Quick-Drying Enamel (High Gloss): MPI #96 (Gloss Level 7).

2.10 TEXTURED AND HIGH-BUILD COATINGS

- A. Latex Stucco and Masonry Textured Coating: MPI #42.

2.11 EPOXY COATINGS

- A. Epoxy, Cold-Cured, Gloss: MPI #77.
- B. Epoxy, High-Build, Low Gloss: MPI #108.

2.12 LIGHT INDUSTRIAL COATINGS

- A. Exterior Light Industrial Coating, Water-Based: MPI #163

PART 3 - EXECUTION

3.01 EXAMINATION

- A. Examine substrates and conditions, with Applicator present, for compliance with requirements for maximum moisture content and other conditions affecting performance of work.
- B. Maximum Moisture Content of Substrates: When measured with an electronic moisture meter as follows:
 - 1. Concrete: 12 percent.
 - 2. Gypsum Board: 12 percent.
- C. Verify suitability of substrates, including surface conditions and compatibility with existing finishes and primers.
- D. Begin coating application only after unsatisfactory conditions have been corrected and surfaces are dry.
 - 1. Beginning coating application constitutes Contractor's acceptance of substrates and conditions.

3.02 PREPARATION

- A. Comply with manufacturer's written instructions and recommendations in "MPI Architectural Painting Specification Manual" applicable to substrates and paint systems indicated.
- B. Remove plates, machined surfaces, and similar items already in place that are not to be painted. If removal is impractical or impossible because of size or weight of item, provide surface-applied protection before surface preparation and painting.
 - 1. After completing painting operations, use workers skilled in the trades involved to reinstall items that were removed. Remove surface-applied protection if any.
 - 2. Do not paint over labels of independent testing agencies or equipment name, identification, performance rating, or nomenclature plates.
- C. Clean substrates of substances that could impair bond of paints, including dirt, oil, grease, and incompatible paints and encapsulants.
 - 1. Remove incompatible primers and reprime substrate with compatible primers as

required to produce paint systems indicated.

- D. Concrete Substrates: Remove release agents, curing compounds, efflorescence, and chalk. Do not paint surfaces if moisture content or alkalinity of surfaces to be painted exceeds that permitted in manufacturer's written instructions.
- E. Steel Substrates: Remove rust and loose mill scale. Clean using methods recommended in writing by paint manufacturer.
 - 1. For Architecturally Exposed Structural Steel, clean with a method not less than SSPC-SP6
- F. Galvanized-Metal Substrates: Remove grease and oil residue from galvanized sheet metal fabricated from coil stock by mechanical methods to produce clean, lightly etched surfaces that promote adhesion of subsequently applied paints.
- G. Exterior Gypsum Board Substrates: Do not begin paint application until finishing compound is dry and sanded smooth.

3.03 APPLICATION

- A. Apply paints according to manufacturer's written instructions.
 - 1. Use applicators and techniques suited for paint and substrate indicated.
 - 2. Paint surfaces behind movable items same as similar exposed surfaces. Before final installation, paint surfaces behind permanently fixed items with prime coat only.
- B. Tint each undercoat a lighter shade to facilitate identification of each coat if multiple coats of same material are to be applied. Tint undercoats to match color of topcoat, but provide sufficient difference in shade of undercoats to distinguish each separate coat.
- C. If undercoats or other conditions show through topcoat, apply additional coats until cured film has a uniform paint finish, color, and appearance.
- D. Apply paints to produce surface films without cloudiness, spotting, holidays, laps, brush marks, roller tracking, runs, sags, ropiness, or other surface imperfections. Cut in sharp lines and color breaks.

3.04 FIELD QUALITY CONTROL

- A. Testing of Paint Materials: Owner reserves the right to invoke the following procedure at any time and as often as Owner deems necessary during the period when paints are being applied:
 - 1. Owner will engage the services of a qualified testing agency to sample paint materials being used. Samples of material delivered to Project site will be taken, identified, sealed, and certified in presence of Contractor.
 - 2. Testing agency will perform tests for compliance of paint materials with product requirements.
 - 3. Owner may direct Contractor to stop applying paints if test results show materials being used do not comply with product requirements. Contractor shall remove noncomplying-paint materials from Project site, pay for testing, and repaint surfaces painted with rejected materials. Contractor will be required to remove rejected materials from previously painted surfaces if, on repainting with complying materials, the two paints are incompatible.

3.05 CLEANING AND PROTECTION

- A. At end of each workday, remove rubbish, empty cans, rags, and other discarded materials from Project site.
- B. After completing paint application, clean spattered surfaces. Remove spattered paints by washing, scraping, or other methods. Do not scratch or damage adjacent finished surfaces.
- C. Protect work of other trades against damage from paint application. Correct damage to work of other trades by cleaning, repairing, replacing, and refinishing, as approved by Architect, and leave in an undamaged condition.
- D. At completion of construction activities of other trades, touch up and restore damaged or defaced painted surfaces.

3.06 EXTERIOR PAINTING SCHEDULE

- A. Concrete Substrates, Nontraffic Surfaces:
 - 1. Latex System: MPI EXT 3.1A.
 - a. Prime Coat: Exterior latex matching topcoat.
 - b. Intermediate Coat: Exterior latex matching topcoat.
 - c. Topcoat: Exterior latex, gloss level as selected by Architect.
- B. Concrete Substrates, Traffic Surfaces:
 - 1. Clear Sealer System: MPI EXT 3.2G.
 - a. Prime Coat: Interior/exterior clear concrete floor sealer (solvent based).
 - b. Intermediate Coat: Interior/exterior clear concrete floor sealer (solvent based).
 - c. Topcoat: Interior/exterior clear concrete floor sealer (solvent based).
 - 2. Water-Based Clear Sealer System: MPI EXT 3.2H.
 - a. Prime Coat: Interior/exterior clear concrete floor sealer (water based).
 - b. Intermediate Coat: Interior/exterior clear concrete floor sealer (water based).
 - c. Topcoat: Interior/exterior clear concrete floor sealer (water based).
- C. Steel Substrates, other than Architecturally Exposed Structural Steel:
 - 1. Polyurethane, Pigmented Coating System: MPI EXT 5.1P
 - a. Prime Coat: Epoxy Zinc Rich Primer: MPI #20.
 - b. Intermediate Coat: Epoxy primer, MPI #77.
 - c. Topcoat: Polyurethane, two-component, pigmented, gloss, MPI #72.

D. Architecturally Exposed Structural Steel, Interior and Exterior:

1. Pigmented Polyurethane over Epoxy Zinc-Rich Primer and High-Build Epoxy System: MPI EXT 5.1G
 - d. Prime Coat: Primer, zinc-rich, epoxy, MPI #20.
 - e. Intermediate Coat: Epoxy, high-build, low gloss, MPI #108.
 - f. Topcoat: Polyurethane, two-component, pigmented, gloss (Gloss Level 6), MPI #72.

E. Galvanized-Metal Substrates:

1. Light Industrial Coating System: MPI EXT 5.3J]
 - a. Prime Coat: Water-borne primer, MPI #134
 - b. Intermediate Coat: Water-borne light Industrial coating, MPI #163
 - c. Topcoat: Water-borne light industrial coating, semi-gloss, MPI #163

END OF SECTION 09 91 13

SECTION 09 91 23**INTERIOR PAINTING****PART 1 - GENERAL****1.01 RELATED DOCUMENTS**

- A. Drawings and general provisions of the Contract, including General and Supplementary Conditions and Division 01 Specification Sections, apply to this Section.

1.02 SUMMARY

- A. This Section includes surface preparation and the application of paint systems on the following interior substrates:
1. Concrete masonry units (CMU).
 2. Steel.
 3. Galvanized metal.
 4. Aluminum (not anodized or otherwise coated).
 5. Gypsum board.
- B. Related Sections include the following:
1. Division 01 Section "Sustainable Design Requirements" for additional LEED requirements.
 2. Division 05 Sections for shop priming of metal substrates with primers specified in this Section.
 3. Division 06 Sections for shop priming carpentry with primers specified in this Section.
 4. Division 08 Sections for factory priming windows and doors with primers specified in this Section.
 5. Division 09 Section "Exterior Painting" for surface preparation and the application of paint systems on exterior substrates.

1.03 SUBMITTALS

- A. Product Data: For each type of product indicated.
- B. Samples for Initial Selection: For each type of topcoat product indicated.
- C. Samples for Verification: For each type of paint system and in each color and gloss of topcoat indicated.
1. Submit Samples on rigid backing, 8 inches square.
 2. Step coats on Samples to show each coat required for system.
 3. Label each coat of each Sample.
 4. Label each Sample for location and application area.
- D. Product List: For each product indicated, include the following:
1. Cross-reference to paint system and locations of application areas. Use same designations indicated on Drawings and in schedules.
 2. Printout of current "MPI Approved Products List" for each product category specified in Part 2, with the proposed product highlighted.

- E. LEED Submittals: For Credit EQ 4.2, manufacturers' product data for paints, including printed statement of VOC content and chemical components.

1.04 QUALITY ASSURANCE

A. MPI Standards:

1. Products: Complying with MPI standards indicated and listed in "MPI Approved Products List."
2. Preparation and Workmanship: Comply with requirements in "MPI Architectural Painting Specification Manual" for products and paint systems indicated.

B. Mockups: Apply benchmark samples of each paint system indicated and each color and finish selected to verify preliminary selections made under sample submittals and to demonstrate aesthetic effects and set quality standards for materials and execution.

1. Architect will select one surface to represent surfaces and conditions for application of each paint system specified in Part 3.
 - a. Wall and Ceiling Surfaces: Provide samples of at least 100 sq. ft..
 - b. Other Items: Architect will designate items or areas required.
2. Apply benchmark samples after permanent lighting and other environmental services have been activated.
3. Final approval of color selections will be based on benchmark samples.
 - a. If preliminary color selections are not approved, apply additional benchmark samples of additional colors selected by Architect at no added cost to Owner.

1.05 DELIVERY, STORAGE, AND HANDLING

- A. Store materials not in use in tightly covered containers in well-ventilated areas with ambient temperatures continuously maintained at not less than 45 deg F.
1. Maintain containers in clean condition, free of foreign materials and residue.
 2. Remove rags and waste from storage areas daily.

1.06 PROJECT CONDITIONS

- A. Apply paints only when temperature of surfaces to be painted and ambient air temperatures are between 50 and 95 deg F.
- B. Do not apply paints when relative humidity exceeds 85 percent; at temperatures less than 5 deg F above the dew point; or to damp or wet surfaces.

1.07 EXTRA MATERIALS

- A. Furnish extra materials described below that are from same production run (batch mix) as materials applied and that are packaged for storage and identified with labels describing contents.
1. Quantity: Furnish an additional 5 percent, but not less than 1 gal. of each material and color applied.

PART 2 - PRODUCTS

2.01 MANUFACTURERS

- A. Available Manufacturers: Subject to compliance with requirements, manufacturers offering products that may be incorporated into the Work include, but are not limited to, the following:
1. Benjamin Moore & Co.
 2. Cloverdale Paint.
 3. Color Wheel Paints & Coatings.
 4. Columbia Paint & Coatings.
 5. Diamond Vogel Paints.
 6. Dunn-Edwards Corporation.
 7. Durant Paints Inc.
 8. ICI Paints.
 9. Kelly-Moore Paints.
 10. Kwal-Howells Paint.
 11. PPG Architectural Finishes, Inc.
 12. Sherwin-Williams Company (The).

2.02 PAINT, GENERAL

- A. Material Compatibility:
1. Provide materials for use within each paint system that are compatible with one another and substrates indicated, under conditions of service and application as demonstrated by manufacturer, based on testing and field experience.
 2. For each coat in a paint system, provide products recommended in writing by manufacturers of topcoat for use in paint system and on substrate indicated.
- B. Chemical Components of Field-Applied Interior Paints and Coatings: Provide products that comply with the following limits for VOC content, exclusive of colorants added to a tint base, when calculated according to 40 CFR 59, Subpart D (EPA Method 24) and the following chemical restrictions; these requirements do not apply to primers or finishes that are applied in a fabrication or finishing shop:
1. Flat Paints and Coatings: VOC content of not more than 50 g/L.
 2. Nonflat Paints and Coatings: VOC content of not more than 150 g/L.
 3. Aromatic Compounds: Paints and coatings shall not contain more than 1.0 percent by weight of total aromatic compounds (hydrocarbon compounds containing one or more benzene rings).
 4. Restricted Components: Paints and coatings shall not contain any of the following:
 - a. Acrolein.
 - b. Acrylonitrile.
 - c. Antimony.
 - d. Benzene.
 - e. Butyl benzyl phthalate.
 - f. Cadmium.
 - g. Di (2-ethylhexyl) phthalate.
 - h. Di-n-butyl phthalate.
 - i. Di-n-octyl phthalate.
 - j. 1,2-dichlorobenzene.
 - k. Diethyl phthalate.
 - l. Dimethyl phthalate.
 - m. Ethylbenzene.

- n. Formaldehyde.
- o. Hexavalent chromium.
- p. Isophorone.
- q. Lead.
- r. Mercury.
- s. Methyl ethyl ketone.
- t. Methyl isobutyl ketone.
- u. Methylene chloride.
- v. Naphthalene.
- w. Toluene (methylbenzene).
- x. 1,1,1-trichloroethane.
- y. Vinyl chloride.

C. Colors: As indicated in a color schedule on Drawings.

2.03 BLOCK FILLERS

- A. Interior/Exterior Latex Block Filler: MPI #4.
 - 1. VOC Content: E Range of E3.
- B. Block Filler, Epoxy: MPI #116.
 - 1. VOC Content: E Range of E3.

2.04 PRIMERS/SEALERS

- A. Interior Latex Primer/Sealer: MPI #50.
 - 1. VOC Content: E Range of E3.
- B. Interior Alkyd Primer/Sealer: MPI #45.
 - 1. VOC Content: E Range of E2.

2.05 METAL PRIMERS

- A. Alkyd Anticorrosive Metal Primer: MPI #79.
 - 1. VOC Content: E Range of E2.
- B. Epoxy Primer: MPI #101
 - 1. VOC Content: E Range of E1.
- C. Waterborne Galvanized-Metal Primer: MPI #134.
 - 1. VOC Content: E Range of E3
- D. Vinyl Wash Primer: MPI #80.
 - 1. VOC Content: E Range of E3.

2.06 INTERMEDIATE COATS

- A. High-build Epoxy: MPI #108
 - 1. VOC Content: E Range of E2.

2.07 LATEX PAINTS

- A. Interior Latex (Flat): MPI #53 (Gloss Level 1).
 - 1. VOC Content: E Range of E3.
- B. Interior Latex (Low Sheen): MPI #44 (Gloss Level 2).
 - 1. VOC Content: E Range of E3.
- C. Interior Latex (Eggshell): MPI #52 (Gloss Level 3).
 - 1. VOC Content: E Range of E3.
- D. Interior Latex (Satin): MPI #43 (Gloss Level 4).
 - 1. VOC Content: E Range of E3
- E. Interior Latex (Semigloss): MPI #54 (Gloss Level 5).
 - 1. VOC Content: E Range of E3
- F. Interior Latex (Gloss): MPI #114 (Gloss Level 6, except minimum gloss of 65 units at 60 deg).
 - 1. VOC Content: E Range of E31
- G. High-Performance Architectural Latex (Low Sheen): MPI #138 (Gloss Level 2).
 - 1. VOC Content: E Range of E3
- H. High-Performance Architectural Latex (Eggshell): MPI #139 (Gloss Level 3).
 - 1. VOC Content: E Range of E3
- I. High-Performance Architectural Latex (Satin): MPI #140 (Gloss Level 4).
 - 1. VOC Content: E Range of E3
- J. High-Performance Architectural Latex (Semigloss): MPI #141 (Gloss Level 5).
 - 1. VOC Content: E Range of E3
- K. Exterior Latex (Flat): MPI #10 (Gloss Level 1).
 - 1. VOC Content: E Range of E3
- L. Exterior Latex (Semigloss): MPI #11 (Gloss Level 5).
 - 1. VOC Content: E Range of E3.
- M. Exterior Latex (Gloss): MPI #119 (Gloss Level 6, except minimum gloss of 65 units at 60 deg).
 - 1. VOC Content: E Range of E3.

2.08 ALKYD PAINTS

- A. Interior Alkyd (Eggshell): MPI #51 (Gloss Level 3).
 - 1. VOC Content: E Range of E2.
- B. Interior Alkyd (Semigloss): MPI #47 (Gloss Level 5).
 - 1. VOC Content: E Range of E2.

2.09 EPOXY COATINGS

- A. Epoxy, Cold-Cured, Gloss: MPI #77.

2.10 POLYURETHANE COATINGS

- A. Pigmented Polyurethane: MPI #72
 - 1. VOC Content: E Range of E2.

2.11 DRY FOG/FALL COATINGS

- A. Latex Dry Fog/Fall: MPI #118.
 - 1. VOC Content: E Range of E3.
- B. Waterborne Dry Fall: MPI #133.
 - 1. VOC Content: E Range of E3.
- C. Interior Alkyd Dry Fog/Fall: MPI #55.
 - 1. VOC Content: E Range of E3.

PART 3 - EXECUTION

3.01 EXAMINATION

- A. Examine substrates and conditions, with Applicator present, for compliance with requirements for maximum moisture content and other conditions affecting performance of work.
- B. Maximum Moisture Content of Substrates: When measured with an electronic moisture meter as follows:
 - 1. Concrete: 12 percent.
 - 2. Masonry (CMU): 12 percent.
 - 3. Wood: 15 percent.
 - 4. Gypsum Board: 12 percent.
- C. Verify suitability of substrates, including surface conditions and compatibility with existing finishes and primers.
- D. Begin coating application only after unsatisfactory conditions have been corrected and surfaces are dry.

1. Beginning coating application constitutes Contractor's acceptance of substrates and conditions.

3.02 PREPARATION

- A. Comply with manufacturer's written instructions and recommendations in "MPI Architectural Painting Specification Manual" applicable to substrates indicated.
- B. Remove plates, machined surfaces, and similar items already in place that are not to be painted. If removal is impractical or impossible because of size or weight of item, provide surface-applied protection before surface preparation and painting.
 1. After completing painting operations, use workers skilled in the trades involved to reinstall items that were removed. Remove surface-applied protection if any.
 2. Do not paint over labels of independent testing agencies or equipment name, identification, performance rating, or nomenclature plates.
- C. Clean substrates of substances that could impair bond of paints, including dirt, oil, grease, and incompatible paints and encapsulants.
 1. Remove incompatible primers and reprime substrate with compatible primers as required to produce paint systems indicated.
- D. Concrete Substrates: Remove release agents, curing compounds, efflorescence, and chalk. Do not paint surfaces if moisture content or alkalinity of surfaces to be painted exceeds that permitted in manufacturer's written instructions.
- E. Concrete Masonry Substrates: Remove efflorescence and chalk. Do not paint surfaces if moisture content or alkalinity of surfaces to be painted exceeds that permitted in manufacturer's written instructions.
- F. Steel Substrates: Remove rust and loose mill scale. Clean using SSPC-SP6 unless another method is recommended in writing by paint manufacturer.
- G. Galvanized-Metal Substrates: Remove grease and oil residue from galvanized sheet metal fabricated from coil stock by mechanical methods to produce clean, lightly etched surfaces that promote adhesion of subsequently applied paints.
- H. Aluminum Substrates: Remove surface oxidation.
- I. Gypsum Board Substrates: Do not begin paint application until finishing compound is dry and sanded smooth.
- J. Plaster Substrates: Do not begin paint application until plaster is fully cured and dry.
- K. Spray-Textured Ceiling Substrates: Do not begin paint application until surfaces are dry.
- L. Cotton or Canvas Insulation Covering Substrates: Remove dust, dirt, and other foreign material that might impair bond of paints to substrates.

3.03 APPLICATION

- A. Apply paints according to manufacturer's written instructions.
 1. Use applicators and techniques suited for paint and substrate indicated.

2. Paint surfaces behind movable equipment and furniture same as similar exposed surfaces. Before final installation, paint surfaces behind permanently fixed equipment or furniture with prime coat only.
 3. Paint front and backsides of access panels, removable or hinged covers, and similar hinged items to match exposed surfaces.
- B. Tint each undercoat a lighter shade to facilitate identification of each coat if multiple coats of same material are to be applied. Tint undercoats to match color of topcoat, but provide sufficient difference in shade of undercoats to distinguish each separate coat.
- C. If undercoats or other conditions show through topcoat, apply additional coats until cured film has a uniform paint finish, color, and appearance.
- D. Apply paints to produce surface films without cloudiness, spotting, holidays, laps, brush marks, roller tracking, runs, sags, ropiness, or other surface imperfections. Cut in sharp lines and color breaks.
- E. Painting Mechanical and Electrical Work: Paint items exposed in equipment rooms and occupied spaces including, but not limited to, the following:
1. Mechanical Work:
 - a. Uninsulated metal piping.
 - b. Uninsulated plastic piping.
 - c. Pipe hangers and supports.
 - d. Tanks that do not have factory-applied final finishes.
 - e. Visible portions of internal surfaces of metal ducts, without liner, behind air inlets and outlets.
 - f. Duct, equipment, and pipe insulation having cotton or canvas insulation covering or other paintable jacket material.
 - g. Mechanical equipment that is indicated to have a factory-primed finish for field painting.
 2. Electrical Work:
 - a. Switchgear.
 - b. Panelboards.
 - c. Electrical equipment that is indicated to have a factory-primed finish for field painting.

3.04 FIELD QUALITY CONTROL

- A. Testing of Paint Materials: Owner reserves the right to invoke the following procedure at any time and as often as Owner deems necessary during the period when paints are being applied:
1. Owner will engage the services of a qualified testing agency to sample paint materials being used. Samples of material delivered to Project site will be taken, identified, sealed, and certified in presence of Contractor.
 2. Testing agency will perform tests for compliance with product requirements.
 3. Owner may direct Contractor to stop applying paints if test results show materials being used do not comply with product requirements. Contractor shall remove noncomplying-paint materials from Project site, pay for testing, and repaint surfaces painted with rejected materials. Contractor will be required to remove rejected materials from previously painted surfaces if, on repainting with complying materials, the two paints are incompatible.

3.05 CLEANING AND PROTECTION

- A. At end of each workday, remove rubbish, empty cans, rags, and other discarded materials from Project site.
- B. After completing paint application, clean spattered surfaces. Remove spattered paints by washing, scraping, or other methods. Do not scratch or damage adjacent finished surfaces.
- C. Protect work of other trades against damage from paint application. Correct damage to work of other trades by cleaning, repairing, replacing, and refinishing, as approved by Architect, and leave in an undamaged condition.
- D. At completion of construction activities of other trades, touch up and restore damaged or defaced painted surfaces.

3.06 INTERIOR PAINTING SCHEDULE

- A. Concrete Substrates, Nontraffic Surfaces ad Identified on Drawings:
 - 1. Latex System: MPI INT 3.1E.
 - a. Prime Coat: Interior latex matching topcoat.
 - b. Intermediate Coat: Interior latex matching topcoat.
 - c. Topcoat: Interior latex, gloss as selected by Architect.
 - 2. Latex Over Sealer System: MPI INT 3.1A.
 - a. Prime Coat: Interior latex primer/sealer.
 - b. Intermediate Coat: Interior latex matching topcoat.
 - c. Topcoat: Interior latex, gloss as selected by Architect.
 - 3. Latex Over Latex Aggregate System: MPI INT 3.1B.
 - a. Prime Coat: Latex stucco and masonry textured coating.
 - b. Intermediate Coat: Exterior latex matching topcoat.
 - c. Topcoat: Exterior latex, gloss as selected by Architect.
 - 4. Alkyd System: MPI INT 3.1D.
 - a. Prime Coat: Interior latex primer/sealer.
 - b. Intermediate Coat: Interior alkyd matching topcoat.
 - c. Topcoat: Interior alkyd, gloss as selected by Architect.
 - 5. High-Performance Architectural Latex System: MPI INT 3.1C.
 - a. Prime Coat: Interior latex primer/sealer.
 - b. Intermediate Coat: High-performance architectural latex matching topcoat.
 - c. Topcoat: High-performance architectural latex, gloss as selected by Architect.
 - 6. Vertical Concrete Surfaces in Wash Bay: MPI INT 3.1F
 - a. Prime Coat: Epoxy, Cold-Cured, Gloss: MPI #77
 - b. Topcoat: Epoxy, Cold-Cured, Gloss: MPI #77, 2 coats
- B. Concrete Substrates, Traffic Surfaces as Identified on Drawings:

1. Latex Floor Enamel System: MPI INT 3.2A.
 - a. Prime Coat: Interior/exterior latex floor and porch paint (low gloss).
 - b. Intermediate Coat: Interior/exterior latex floor and porch paint (low gloss).
 - c. Topcoat: Interior/exterior latex floor and porch paint (low gloss).
 2. Alkyd Floor Enamel System: MPI INT 3.2B.
 - a. Prime Coat: Exterior/interior alkyd floor enamel (gloss).
 - b. Intermediate Coat: Exterior/interior alkyd floor enamel (gloss).
 - c. Topcoat: Exterior/interior alkyd floor enamel (gloss).
 3. Concrete Stain System: MPI INT 3.2E.
 - a. First Coat: Interior concrete floor stain.
 - b. Topcoat: Interior concrete floor stain.
 4. Clear Sealer System: MPI INT 3.2F.
 - a. First Coat: Interior/exterior clear concrete floor sealer (solvent based).
 - b. Topcoat: Interior/exterior clear concrete floor sealer (solvent based).
 5. Water-Based Clear Sealer System: MPI INT 3.2G.
 - a. First Coat: Interior/exterior clear concrete floor sealer (water based).
 - b. Topcoat: Interior/exterior clear concrete floor sealer (water based).
- C. CMU Substrates:
1. Latex System: MPI INT 4.2A.
 - a. Prime Coat: Interior/exterior latex block filler.
 - b. Intermediate Coat: Interior latex matching topcoat.
 - c. Topcoat: Interior latex, gloss as selected by Architect.
 2. Alkyd System: MPI INT 4.2C.
 - a. Prime Coat: Interior/exterior latex block filler.
 - b. Intermediate Coat: Interior alkyd matching topcoat.
 - c. Topcoat: Interior alkyd, gloss as selected by Architect.
 3. Alkyd Over Latex Sealer System: MPI INT 4.2N.
 - a. Prime Coat: Interior/exterior latex block filler.
 - b. Sealer Coat: Interior latex primer/sealer.
 - c. Intermediate Coat: Interior alkyd matching topcoat.
 - d. Topcoat: Interior alkyd, gloss as selected by Architect.
 4. High-Performance Architectural Latex System: MPI INT 4.2D.
 - a. Prime Coat: Interior/exterior latex block filler.
 - b. Intermediate Coat: High-performance architectural latex matching topcoat.
 - c. Topcoat: High-performance architectural latex, gloss as selected by Architect.
 5. Epoxy Coatings (Tile-like) in Wash Bay: MPI INT 4.2G
 - a. Block Filler: Epoxy: MPI #116

-
- b. Topcoat: Epoxy, Cold-Cured, Gloss: MPI #77, 2 coats
- D. Steel Substrates other than Architecturally Exposed Structural Steel:
- 1. Latex Over Alkyd Primer System: MPI INT 5.1Q.
 - a. Prime Coat: Alkyd anticorrosive metal primer.
 - b. Intermediate Coat: Interior latex matching topcoat.
 - c. Topcoat: Interior latex , gloss as selected by Architect.
 - 2. Pigmented Polyurethane over High-Build Epoxy: MPI INT 5.1G
 - a. Prime Coat: Epoxy primer.
 - b. Intermediate Coat: High-build epoxy.
 - c. Topcoat: Polyurethane.
 - 3. Alkyd System: MPI INT 5.1E.
 - a. Prime Coat: Alkyd anticorrosive metal primer.
 - b. Intermediate Coat: Interior alkyd matching topcoat.
 - c. Topcoat: Interior alkyd, gloss as selected by Architect.
- E. Galvanized-Metal Substrates:
- 1. Latex System: MPI INT 5.3A.
 - a. Prime Coat: Cementitious galvanized-metal primer.
 - b. Intermediate Coat: Interior latex matching topcoat.
 - c. Topcoat: Interior latex, gloss as selected by Architect.
 - 2. Latex Over Waterborne Primer System: MPI INT 5.3J.
 - a. Prime Coat: Waterborne galvanized-metal primer.
 - b. Intermediate Coat: Interior latex matching topcoat.
 - c. Topcoat: Interior latex, gloss as selected by Architect.
 - 3. Aluminum Paint System: MPI INT 5.3G.
 - a. Prime Coat: Cementitious galvanized-metal primer.
 - b. Intermediate Coat: Aluminum paint.
 - c. Topcoat: Aluminum paint.
 - 4. High-Performance Architectural Latex System: MPI INT 5.3M.
 - a. Application: High-traffic areas such as hollow metal doors and door frames, hand rails, guard rails, and surfaces subject to humid environment.
 - b. Prime Coat: Waterborne galvanized-metal primer.
 - c. Intermediate Coat: High-performance architectural latex matching topcoat.
 - d. Topcoat: High-performance architectural latex, gloss as selected by Architect.
- F. Gypsum Board Substrates:
- 1. Latex System: MPI INT 9.2A.
 - a. Application: Office Storage Areas
 - b. Prime Coat: Interior latex matching topcoat.
 - c. Intermediate Coat: Interior latex matching topcoat.

- d. Topcoat: Interior latex, gloss as selected by Architect.
2. High-Performance Architectural Latex System: MPI INT 9.2B.
- a. Application: All interior gypsum board substrates except as noted otherwise.
 - b. Prime Coat: Interior latex primer/sealer.
 - c. Intermediate Coat: High-performance architectural latex matching topcoat.
 - d. Topcoat: High-performance architectural latex, gloss as selected by Architect.

END OF SECTION 09 91 23

SECTION 10 11 16**MARKERBOARDS****PART 1 - GENERAL****1.01 RELATED DOCUMENTS**

- A. Drawings and general provisions of the Contract, including General and Supplementary Conditions and Division 01 Specification Sections, apply to this Section.

1.02 SUMMARY

- A. Section Includes:
 - 1. Markerboards.

1.03 DEFINITIONS

- A. Visual Display Board Assembly: Visual display surface that is factory fabricated into composite panel form, either with or without a perimeter frame; includes markerboards.
- B. Visual Display Surface: Surfaces that are used to convey information visually, including surfaces of markerboards and surfacing materials that are not fabricated into composite panel form but are applied directly to walls.

1.04 ACTION SUBMITTALS

- A. Product Data: For each type of product indicated. Include construction details, material descriptions, dimensions of individual components and profiles, and finishes for visual display surfaces.
- B. LEED Submittals:
 - 1. Product Data for Credit IEQ 4.1: For adhesives, documentation including printed statement of VOC content.
 - 2. Product Data for Credit IEQ 4.4: For composite wood products, documentation indicating that the product contains no urea formaldehyde.
- C. Shop Drawings: For visual display surfaces. Include plans, elevations, sections, details, and attachments to other work.
 - 1. Show locations of panel joints.
 - 2. Include sections of typical trim members.
- D. Samples for Initial Selection: For each type of visual display surface indicated, for units with factory-applied color finishes, and as follows:
 - 1. Actual sections of porcelain-enamel face sheet and display rail.
 - 2. Include accessory Samples to verify color selected.
- E. Samples for Verification: For each type of visual display surface indicated.
 - 1. Visual Display Surface: Not less than 8-1/2 by 11 inches , mounted on substrate indicated for final Work. Include one panel for each type, color, and texture required.

2. Trim: 6-inch- long sections of each trim profile.
3. Accessories: Full-size Sample of each type of accessory.

F. Product Schedule: For visual display surfaces. Use same designations indicated on Drawings.

1.05 INFORMATIONAL SUBMITTALS

- A. Qualification Data: For qualified Installer.
- B. Product Test Reports: Based on evaluation of comprehensive tests performed by a qualified testing agency, for surface-burning characteristics of fabrics.
- C. Warranties: Sample of special warranties.

1.06 CLOSEOUT SUBMITTALS

- A. Maintenance Data: For visual display surfaces to include in maintenance manuals.

1.07 QUALITY ASSURANCE

- A. Source Limitations: Obtain visual display surfaces from single source from single manufacturer.

1.08 DELIVERY, STORAGE, AND HANDLING

- A. Deliver factory-built visual display surfaces, including factory-applied trim where indicated, completely assembled in one piece without joints, where possible. If dimensions exceed maximum manufactured panel size, provide two or more pieces of equal length as acceptable to Architect. When overall dimensions require delivery in separate units, prefit components at the factory, disassemble for delivery, and make final joints at the site.
- B. Store visual display surfaces vertically with packing materials between each unit.

1.09 PROJECT CONDITIONS

- A. Environmental Limitations: Do not deliver or install visual display surfaces until spaces are enclosed and weathertight, wet work in spaces is complete and dry, work above ceilings is complete, and temporary HVAC system is operating and maintaining ambient temperature and humidity conditions at occupancy levels during the remainder of the construction period.

1.10 WARRANTY

- A. Special Warranty for Porcelain-Enamel Face Sheets: Manufacturer's standard form in which manufacturer agrees to repair or replace porcelain-enamel face sheets that fail in materials or workmanship within specified warranty period.
 1. Failures include, but are not limited to, the following:
 - a. Surfaces lose original writing and erasing qualities.
 - b. Surfaces exhibit crazing, cracking, or flaking.
 2. Warranty Period: Life of the building.

PART 2 - PRODUCTS

2.01 MATERIALS, GENERAL

- A. Porcelain-Enamel Face Sheet: Porcelain-enamel-clad, ASTM A 463/A 463M, Type 1, stretcher-leveled aluminized steel, with 0.024-inch uncoated thickness; with porcelain-enamel coating fused to steel at approximately 1000 deg F .
 - 1. Gloss Finish: Low gloss; dry-erase markers wipe clean with dry cloth or standard eraser. Suitable for use as projection screen.
 - a. Products: Subject to compliance with requirements, available products that may be incorporated into the Work include, but are not limited to, the following:
 - 1) Claridge Products and Equipment, Inc.; LCS Markerboard.
- B. Fiberboard: ASTM C 208.
- C. Extruded Aluminum: ASTM B 221 , Alloy 6063.
- D. Adhesives: Manufacturer's standard product that complies with the testing and product requirements of the California Department of Health Services' "Standard Practice for the Testing of Volatile Organic Emissions from Various Sources Using Small-Scale Environmental Chambers."

2.02 MARKERBOARD ASSEMBLIES

- A. Porcelain-Enamel Markerboards: Balanced, high-pressure, factory-laminated markerboard assembly of three-ply construction consisting of backing sheet, core material, and 0.021-inch- thick, porcelain-enamel face sheet with high-gloss finish.
 - 1. Manufacturers: Subject to compliance with requirements, available manufacturers offering products that may be incorporated into the Work include, but are not limited to, the following:
 - a. AARCO Products, Inc.
 - b. ADP Lemco, Inc.
 - c. Claridge Products and Equipment, Inc.
 - d. Egan Visual Inc.
 - 2. Fiberboard Core: 7/16 thick; with 0.013-inch-thick, galvanized-steel sheet backing.
 - 3. Laminating Adhesive: Manufacturer's standard, moisture-resistant thermoplastic type.

2.03 MARKERBOARD ACCESSORIES

- A. Aluminum Frames and Trim: Fabricated from not less than 0.062-inch- thick, extruded aluminum; standard size and shape.
 - 1. Factory-Applied Trim: Manufacturer's standard.
- B. Chalktray: Manufacturer's standard, continuous.
 - 1. Box Type: Extruded aluminum with slanted front, grooved tray, and cast-aluminum end closures.

2.04 FABRICATION

- A. Porcelain-Enamel Visual Display Assemblies: Laminate porcelain-enamel face sheet and backing sheet to core material under heat and pressure with manufacturer's standard flexible, waterproof adhesive.
- B. Visual Display Boards: Factory assemble visual display boards unless otherwise indicated.
 - 1. Where factory-applied trim is indicated, trim shall be assembled and attached to visual display boards at manufacturer's factory before shipment.
- C. Aluminum Frames and Trim: Fabricate units straight and of single lengths, keeping joints to a minimum. Miter corners to a neat, hairline closure.
 - 1. Where factory-applied trim is indicated, trim shall be assembled and attached to visual display units at manufacturer's factory before shipment.

2.05 GENERAL FINISH REQUIREMENTS

- A. Comply with NAAMM's "Metal Finishes Manual for Architectural and Metal Products" for recommendations for applying and designating finishes.
- B. Protect mechanical finishes on exposed surfaces from damage by applying a strippable, temporary protective covering before shipping.
- C. Appearance of Finished Work: Noticeable variations in same piece are not acceptable. Variations in appearance of adjoining components are acceptable if they are within the range of approved Samples and are assembled or installed to minimize contrast.

2.06 ALUMINUM FINISHES

- A. Clear Anodic Finish: AAMA 611, AA-M12C22A31, Class II, 0.010 mm or thicker.

PART 3 - EXECUTION

3.01 EXAMINATION

- A. Examine substrates and conditions, with Installer present, for compliance with requirements for installation tolerances, surface conditions of wall, and other conditions affecting performance of the Work.
- B. Examine walls and partitions for proper preparation and backing for visual display surfaces.
- C. Proceed with installation only after unsatisfactory conditions have been corrected.

3.02 PREPARATION

- A. Comply with manufacturer's written instructions for surface preparation.
- B. Clean substrates of substances that could impair the performance of and affect the smooth, finished surfaces of visual display boards, including dirt, mold, and mildew.
- C. Prepare surfaces to achieve a smooth, dry, clean surface free of flaking, unsound coatings, cracks, defects, projections, depressions, and substances that will impair bond between visual display surfaces and wall surfaces.

- D. Prepare recesses for sliding visual display units as required by type and size of unit.

3.03 INSTALLATION, GENERAL

- A. General: Install visual display surfaces in locations and at mounting heights indicated on Drawings, or if not indicated, at heights indicated below. Keep perimeter lines straight, level, and plumb. Provide grounds, clips, backing materials, adhesives, brackets, anchors, trim, and accessories necessary for complete installation.

3.04 INSTALLATION OF FACTORY-FABRICATED VISUAL DISPLAY BOARDS AND ASSEMBLIES

- A. Visual Display Boards: Attach concealed clips, hangers, and grounds to wall surfaces and to visual display boards with fasteners at not more than 16 inches o.c. Secure both top and bottom of boards to walls.
- B. Mounting heights: As shown on Drawings.

3.05 CLEANING AND PROTECTION

- A. Clean visual display surfaces according to manufacturer's written instructions. Attach one cleaning label to visual display surface in each room.
- B. Touch up factory-applied finishes to restore damaged or soiled areas.
- C. Cover and protect visual display surfaces after installation and cleaning.

END OF SECTION 10 11 16

SECTION 10 11 46**VISUAL DISPLAY WALL FABRICS - TACKABLE****PART 1 - GENERAL****1.01 RELATED DOCUMENTS**

- A. Drawings and general provisions of the Contract, including General and Supplementary Conditions and Division 01 Specification Sections, apply to this Section.

1.02 SUMMARY

- A. Section Includes:
 - 1. Resilient cork and linoleum composition wall coverings intended for use as a tackable surface.
 - 2. Accessories including trim, and push pins.
- B. Related Sections:
 - 1. Division 09 Section "Interior Painting" for priming wall substrate.

1.03 DEFINITIONS

- A. Visual Display Fabrics: Fabrics with surfaces that are used to convey information visually, including surfaces of markerboards, tackboards, and surfacing materials that are not fabricated into composite panel form but are applied directly to walls.

1.04 SUBMITTALS

- A. Product Data: For each type of product indicated. Include construction details, material descriptions, dimensions of individual components and profiles, and finishes for tackable wall fabrics and accessories.
- B. LEED Submittals:
 - 1. Product Data for Credit EQ 4.4: For composite wood products, documentation indicating that the product contains no urea formaldehyde.
 - 2. Product Data for Credit EQ 4.1: For adhesives, including printed statement of VOC content and chemical components.
- C. Shop Drawings: Include plans, elevations, sections, details, and attachments to other work.
 - 1. Show locations of fabric joints.
 - 2. Show locations of special-purpose graphics for tackable surfaces.
 - 3. Include sections of typical trim members.
- D. Samples for Initial Selection: For each type of tackable wall fabric indicated, for units with factory-applied color finishes, and as follows:
 - 1. Actual sections of tackable wall fabric.

2. Include accessory Samples to verify color selected.
- E. Samples for Verification: For each type of visual display surface indicated.
1. Tackable Wall Fabric: Not less than 7 by 9 inches, mounted on substrate indicated for final Work. Include one panel for each type, color, and texture required.
 2. Trim: 6-inch- long sections of each trim profile.
 3. Accessories: Full-size Sample of each type of accessory.
- F. Product Schedule: Use same designations indicated on Drawings.
- G. Product Test Reports: Based on evaluation of comprehensive tests performed by a qualified testing agency, for surface-burning characteristics of tackable wall covering.
- H. Maintenance Data: For to include in maintenance manuals.
- I. Warranties: Sample of special warranties.

1.05 QUALITY ASSURANCE

- A. Source Limitations: Obtain tackable fabrics and accessories from single source from single manufacturer.
- B. Surface-Burning Characteristics: Class B or better, as determined by testing identical products according to ASTM E 84 by a qualified testing agency. Identify products with appropriate markings of applicable testing agency.
1. Flame-Spread Index: 75 or less.
 2. Smoke-Developed Index: 450 or less.
- C. Mockups: Build mockups to verify selections made under sample submittals and to demonstrate appearance and aesthetic effects and set quality standards for installation.
1. Build mockup of typical wall area as shown on Drawings. Include accessories. Include seams in locations intended for final installation.
 2. Approved mockups may become part of the completed Work if undisturbed at time of Substantial Completion.

1.06 DELIVERY, STORAGE, AND HANDLING

- A. Store tackable wall coverings, accessories, and installation materials in dry spaces protected from the weather, with ambient temperatures maintained within range recommended by manufacturer, but not less than 68 deg F or more than 90 deg F. Store rolls upright.

1.07 PROJECT CONDITIONS

- A. Environmental Limitations: Do not deliver or install tackable wall coverings and accessories until spaces are enclosed and weathertight, wet work in spaces is complete and dry, work above ceilings is complete, and temporary HVAC system is operating and maintaining ambient temperature and humidity conditions at occupancy levels during the remainder of the construction period.

- B. Maintain temperatures within range recommended by manufacturer, but not less than 68 deg F or more than 95 deg F, in spaces to receive tackable wall covering during the following time periods:
 - 1. 72 hours before installation.
 - 2. During installation.
 - 3. 72 hours after installation.
- C. After postinstallation period, maintain temperatures within range recommended by manufacturer, but not less than 55 deg F or more than 95 deg F.

1.08 WARRANTY

- A. Special Warranty for Tackable Wall Coverings: Manufacturer's standard form in which manufacturer agrees to repair or replace tackable wall coverings that fail in materials or workmanship within specified warranty period.
 - 1. Failures include, but are not limited to, the following:
 - a. Surfaces lose original resilience.
 - b. Surfaces exhibit crazing, cracking, or flaking.
 - c. Sheet shrinks excessively (dimensional stability).
 - 2. Warranty Period: 5 years from date of Substantial Completion.

PART 2 - PRODUCTS

2.01 MATERIALS, GENERAL

- A. Extruded Aluminum: ASTM B 221, Alloy 6063.

2.02 TACKABLE WALL COVERINGS

- A. Product: Subject to compliance with requirements, provide walltalkers; a division of RJF International Corporation; tac-wall.
- B. Description: A uniformly colored, resilient, homogeneous, tackable, linoleum surface consisting of linseed oil, granulated cork, rosin binders, and dry pigments calendared onto natural burlap backing. Color shall extend through thickness of material. Sheet material shall be dimensionally stable as installed.
 - 1. Roll Width: 72 inch.
 - 2. Roll Length: Approximately 95 lineal foot.
 - 3. Sheet Thickness (Gauge): 1/4 inch.
 - 4. Minimum Bending Radius (Flexibility): 2-3/4 inch.
- C. Adhesive: Mildew-resistant, nonstaining, strippable adhesive, for use with tackable wall covering and substrate application, as recommended in writing by wall covering manufacturer, and with a VOC content of 50 g/L or less when calculated according to 40 CFR 59, Subpart D (EPA Method 24).
- D. Joint Sealant: Tackable wall covering manufacturer's recommended acrylic sealant.

1. Color: As selected by Architect from manufacturer's full range.

E. Primer/Sealer: Mildew-resistant primer/sealer complying with requirements in Division 09 Section "Interior Painting" and recommended in writing by wall covering manufacturer for intended substrate.

2.03 VISUAL DISPLAY WALL COVERING ACCESSORIES

A. Aluminum Frames and Trim: Fabricated from not less than 0.062-inch- thick, extruded aluminum; standard size and shape.

1. Field-Applied Trim: Manufacturer's standard, screw-on trim with Phillips flat-head screws.

2.04 FABRICATION

A. Aluminum Frames and Trim: Fabricate units straight and of single lengths, keeping joints to a minimum. Miter corners to a neat, hairline closure.

2.05 GENERAL FINISH REQUIREMENTS

A. Comply with NAAMM's "Metal Finishes Manual for Architectural and Metal Products" for recommendations for applying and designating finishes.

B. Protect mechanical finishes on exposed surfaces from damage by applying a strippable, temporary protective covering before shipping.

C. Appearance of Finished Work: Noticeable variations in same piece are not acceptable. Variations in appearance of adjoining components are acceptable if they are within the range of approved Samples and are assembled or installed to minimize contrast.

2.06 ALUMINUM FINISHES

A. Clear Anodic Finish: AAMA 611, AA-M12C22A31, Class II, 0.010 mm or thicker.

PART 3 - EXECUTION

3.01 EXAMINATION

A. Examine substrates and conditions, with Installer present, for compliance with requirements for installation tolerances, surface conditions of wall, and other conditions affecting performance of the Work.

B. Examine walls and partitions for proper preparation and backing for tackable wall coverings.

C. Proceed with installation only after unsatisfactory conditions have been corrected.

3.02 PREPARATION

A. Comply with manufacturer's written instructions for surface preparation.

- B. Clean substrates of substances that could impair the performance of and affect the smooth, finished surfaces of tackable wall covering, including dirt, mold, and mildew.
- C. Prepare surfaces to achieve a smooth, dry, clean surface free of flaking, unsound coatings, cracks, defects, projections, depressions, and substances that will impair bond between visual display wall covering and wall surfaces.
 - 1. Prime wall surfaces indicated to receive tackable wall coverings and as recommended in writing by primer/sealer manufacturer and wall covering manufacturer.
 - 2. Prepare surfaces to receive tackable wall coverings and test for moisture according to requirements specified in Division 09 Section "Wall Coverings."
 - 3. Prepare substrates indicated to receive visual display wall covering as required by manufacturer's written instructions to achieve a smooth, dry, clean, structurally sound surface that is uniform in color.
 - a. Moisture Content: Maximum of 5 percent when tested with an electronic moisture meter.
 - b. Plaster: Allow new plaster to cure. Neutralize areas of high alkalinity. Prime with primer as recommended in writing by primer/sealer manufacturer and wall covering manufacturer.
 - c. Metals: If not factory primed, clean and apply metal as recommended in writing by primer/sealer manufacturer and wall covering manufacturer.
 - d. Gypsum Board: Prime with primer as recommended in writing by primer/sealer manufacturer and wall covering manufacturer.
 - e. Painted Surfaces: Treat areas susceptible to pigment bleeding.

3.03 INSTALLATION, GENERAL

- A. General: Install tackable wall coverings and accessories in locations and at mounting heights indicated on Drawings, or if not indicated, at heights indicated below. Keep perimeter lines straight, level, and plumb. Provide grounds, clips, backing materials, adhesives, brackets, anchors, trim, and accessories necessary for complete installation.
 - 1. Mounting Height: 36 inches above finished floor to top of marker tray.

3.04 INSTALLATION OF TACKABLE WALL COVERING

- A. General: Comply with visual display wall covering manufacturers' written installation instructions.
- B. Cut sheets to size including a few inches of overage. Allow sheets to lay flat for at least 24 hours prior to the application. Mark roll direction and hanging sequence on the backside of each sheet.
- C. Back roll each sheet prior to the installation to release curl memory.
- D. Install seams horizontal and level, with lowest seam 36 inches above finished floor. Hang sheets in sequence as cut from the roll, do not reverse sheets. to ensure color matching.
- E. Double cut seams, with no gaps or overlaps. Remove air bubbles, wrinkles, blisters,

and other defects.

- F. Scribe, cut, and fit material to butt tightly to adjacent surfaces, built-in casework, and permanent fixtures and pipes.
- G. Trowel apply adhesive with a 1/16 inch square notch trowel to substrate receiving the sheet. Apply adhesive only in area receiving a single sheet.
- H. Apply sheet to substrate, roll firmly into adhesive to ensure positive contact and to remove air bubbles. Work from top to bottom, then side to side.
- I. Remove adhesive residue immediately after each sheet is hung with a mild soap and water solution, and a soft cloth or sponge.
- J. After installation, clean visual display wall covering according to manufacturer's written instructions. Remove excess adhesive at finished seams, perimeter edges, and adjacent surfaces.

3.05 INSTALLATION OF ACCESSORIES

- A. Field-Applied Aluminum Trim: Attach trim over edges of visual display wall covering with fasteners at not more than 24 inches o.c. Provide straight, single-length units. Keep joints to a minimum. Miter corners to a neat, hairline closure.
 - 1. Attach marker trays to wall with fasteners at not more than 12 inches o.c.

3.06 CLEANING AND PROTECTION

- A. Clean visual display surfaces according to manufacturer's written instructions. Attach one cleaning label to visual display surface in each room.
- B. Touch up factory-applied finishes to restore damaged or soiled areas.
- C. Cover and protect visual display surfaces after installation and cleaning.

END OF SECTION 10 11 46

SECTION 10 14 00**TRAFFIC SIGNAGE****PART I - GENERAL****1.1 SUMMARY****A. Description**

1. This Work includes the furnishing and installation of new signs, sign posts, parking meter posts, foundations and associated materials. It includes the removal of existing signs as shown on the Design Drawings and as specified herein.
2. Traffic signs shall conform to the requirements of local jurisdiction, the Missouri Department of Transportation (MODOT) Specifications, and the Manual on Uniform Traffic Control Devices (MUTCD), except as modified herein and specified on the Design Drawings. MODOT or the local jurisdiction's specifications shall apply based upon ownership of the roadway. If there is a conflict, the more stringent specification will apply.
3. Existing traffic signs shall be removed and salvaged in accordance with the requirements of the local jurisdiction or MODOT Specifications, except as modified herein and specified on the Design Drawings.

1.2 REFERENCES

<u>Sponsor</u>	<u>Number</u>	<u>Subject</u>
FHWA		Manual on Uniform Traffic Control Devices (MUTCD)
MODOT		Traffic Signs

1.3 SUBMITTALS AND INFORMATION TO BE RETAINED

- A. Submittals shall be made in accordance with the requirements of the Project Quality Plan, except as modified herein.
- B. Retain the following in accordance with KCMO's CM/GC General Conditions.
 1. Final Signing Design and layout.
 2. A certificate of compliance with specifications, detailed shop drawings, and wiring diagrams for the blankout signs and accessories.
 3. All manufacturer's warranties, guarantees, instruction sheets and parts lists.
- C. Submit three sets of drawings for overhead structures for prefabrication approval. Allow 14 calendar days for approval.

1.4 QUALITY ASSURANCE/QUALITY CONTROL

Quality control shall be in accordance with the requirements of the Project Quality Plan, except as modified herein.

1.5 DELIVERY HANDLING AND STORAGE

Materials shall be delivered to the site in undamaged condition and stored off the ground in a well-drained location protected from damage, easily accessible for inspection and handling.

PART II - PRODUCTS

2.1 MATERIALS

- A. Traffic signs, sign posts, foundations and associated materials shall conform to the requirements of the local jurisdiction, and MODOT Specifications and the Design Drawings.
- B. All signs, sign posts, foundations and associated materials shall be furnished by the Contractor.
- C. Reflectivity of the signs shall be in accordance with MUTCD and MODOT Specifications.
- D. Blankout (Interactive) Signs – A real time interactive sign stating “Train Coming”, Turn Prohibition or other appropriate message when activated, and blank when not activated, shall be placed where warranted, including but not limited to:
 - 1. Train and vehicles share the same physical space, for example a shared left turn lane.
 - 2. Vehicles will cross the train track for a turning movement.
 - 3. Driveway egress point which crosses Streetcar transit without protection.
 - 4. Unsignalized or stop controlled intersections.
 - 5. In combination with pedestrian signals if Streetcar station is to be used as a refuge.
 - 6. Any signal controlled movement that is activated by a Streetcar vehicle.

These signs shall be activated prior to the arrival of a train.

PART III - EXECUTION

3.1 SIGN INSTALLATION

- A. All traffic signs shown in the plans shall be furnished and installed by the Contractor in accordance with the requirements of the local jurisdiction, MODOT Specification, and the MUTCD, except as modified herein and specified on the Design Drawings.
- B. The Contractor shall mark on the Site the location for the proposed signs shown on the Design Drawings and shall conduct a Construction Design Review prior to installation. The Contractor shall not install any signs without written statement of no objection from the Engineer.
- C. The Contractor shall coordinate with the local jurisdiction or MODOT, 30 days prior to the installation of signs on the traffic signal mast-arms.
- D. The Contractor shall install signs as indicated on the Design Drawings.

- E. A ¾" stainless steel band with a 12-gauge insert plate painted with a semi-gloss black paint shall be used to place signs on OCS poles.
- F. Signs shall be covered securely with a durable material if erected before stated condition exists.

3.2 OVERHEAD CONTACT SYSTEM (OCS) POLE ISLAND

- A. The Contractor shall place 3" x 6" self adhesive yellow reflective High Angularity Diamond Grade sheeting on a 3" x 6" x 1/8" thick aluminum plate and adhere the plate to the OCS island with an outside adhesive.

3.3 REMOVAL AND SALVAGE OF EXISTING SIGNS

- A. Existing traffic signs shall be removed and salvaged in accordance with the requirements of MODOT Specifications, except as modified herein. The Contractor shall verify ownership of signs, and salvage and return signs to the respective owner per their specification.
- B. Existing signs that will conflict with the regulation of traffic and parking through construction and final configuration shall be removed or covered until the sign is again valid.

3.4 SIGN REPLACEMENT

The Contractor shall replace all local jurisdiction or MODOT signs that are removed during construction in accordance with local jurisdiction or MODOT standards.

PART IV - MEASUREMENT

4.1 Measurement

- A. The quantities of accepted work will be measured in the following units. All measurements will be plan measure except for authorized changes.
 - 1. Sign Removal (Posts) EA (Each)
 - 2. Sign Panel Removal EA
 - 3. Furnish & Install Signs SF (Square Foot)
 - 4. Posts Linear Foot LF (Linear Foot)
 - 5. Salvage and Install Signs EA
 - 6. Salvage and Reinstall Post EA
 - 7. Install City Furnished Signs EA

PART V - PAYMENT

5.1 Payment

Payment will be made at the respective unit or lump-sum price listed in the proposal and shall be full compensation for all labor, materials, and equipment necessary to complete the respective unit in place. There will be no separate measurement or payment for any item of

work not specifically identified and listed in the proposal, and all such work shall be considered a subsidiary item with all costs pertaining thereto included in the prices for other items listed in the proposal. At the Engineer's option, partial payment may be made for any lump sum item listed in the proposal, providing that the Contractor is diligently and satisfactorily pursuing full completion of such partially complete item in accordance with the approved job progress schedule.

END OF SECTION

SECTION 10 14 19**DIMENSIONAL LETTER SIGNAGE****PART 1 - GENERAL****1.01 RELATED DOCUMENTS**

- A. Drawings and general provisions of the Contract, including General and Supplementary Conditions and Division 01 Specification Sections, apply to this Section.

1.02 SUMMARY

- A. Section Includes:
 - 1. Cutout dimensional characters.
- B. Application: Exterior building signage.

1.03 ACTION SUBMITTALS

- A. Product Data: For each type of product.
- B. LEED Submittals:
 - 1. Product Certificates for Credit MR 5: For products and materials required to comply with requirements for regionally manufactured materials. Include statement indicating cost for each regionally manufactured material.
 - a. Include statement indicating location of manufacturer and distance to Project for each regionally manufactured material.
- C. Shop Drawings: For dimensional letter signs.
 - 1. Include fabrication and installation details and attachments to other work.
 - 2. Show sign mounting heights, locations of supplementary supports to be provided by others, and accessories.
 - 3. Show message list, typestyles, graphic elements, and layout for each sign at least half size.
- D. Samples for Initial Selection: For each type of sign assembly, exposed component, and exposed finish.
 - 1. Include representative Samples of available typestyles and graphic symbols.
- E. Samples for Verification: For each type of sign assembly showing all components and with the required finish(es), in manufacturer's standard size unless otherwise indicated and as follows:
 - 1. Dimensional Characters: Full-size Sample of each type of dimensional character.
 - 2. Exposed Accessories: Full-size Sample of each accessory type.
- F. Sign Schedule: Use same designations specified or indicated on Drawings or in a sign schedule.

1.04 INFORMATIONAL SUBMITTALS

- A. Qualification Data: For Installer and manufacturer.
- B. Sample Warranty: For special warranty.

1.05 CLOSEOUT SUBMITTALS

- A. Maintenance Data: For signs to include in maintenance manuals.

1.06 QUALITY ASSURANCE

- A. Installer Qualifications: An entity that employs installers and supervisors who are approved by manufacturer.

1.07 WARRANTY

- A. Special Warranty: Manufacturer agrees to repair or replace components of signs that fail in materials or workmanship within specified warranty period.
 - 1. Failures include, but are not limited to, the following:
 - a. Deterioration of finishes beyond normal weathering.
 - b. Separation or delamination of sheet materials and components.
 - 2. Warranty Period: Five years from date of Substantial Completion.

PART 2 - PRODUCTS

2.01 DIMENSIONAL LETTER SIGNS, GENERAL

- A. Regional Materials: Dimensional letter signs shall be manufactured within 500 miles of Project site.

2.02 DIMENSIONAL CHARACTERS

- A. Cutout Characters  Insert drawing designation : Characters with uniform faces; square-cut, smooth, eased edges; precisely formed lines and profiles; and as follows:
 - 1. Manufacturers: Subject to compliance with requirements, available manufacturers offering products that may be incorporated into the Work include, but are not limited to, the following:
 - a. ACE Sign Systems, Inc.
 - b. APCO Graphics, Inc.
 - c. A. R. K. Ramos Signage Systems.
 - d. ASI Sign Systems, Inc.
 - e. Charleston Industries, Inc.
 - f. Diskey Sign Company.
 - g. Gemini Incorporated.
 - h. InPro Corporation.
 - i. Matthews International Corporation; Bronze Division.
 - j. Metal Arts; Division of L & H Mfg. Co.
 - k. Metallic Arts.
 - l. Nelson-Harkins Industries.
 - m. Southwell Company (The).
 - n. Steel Art Company.

2. Character Material: Sheet or plate aluminum
3. Character Height: As indicated.
4. Thickness: Manufacturer's standard for size of character
5. Finishes:
 - a. Baked-Enamel or Powder-Coat Finish: Match Architect's sample.
 - b. Overcoat: Manufacturer's standard baked-on clear coating.
 - c. Painted Edges: Paint edges of acrylic characters with laminated metal facing as recommended in writing by manufacturer.
6. Mounting: Projecting studs.

2.03 DIMENSIONAL CHARACTER MATERIALS

- A. Aluminum Sheet and Plate: [ASTM B 209](#), alloy and temper recommended by aluminum producer and finisher for type of use and finish indicated.
- B. Aluminum Extrusions: [ASTM B 221](#), alloy and temper recommended by aluminum producer and finisher for type of use and finish indicated.

2.04 ACCESSORIES

- A. Fasteners and Anchors: Manufacturer's standard as required for secure anchorage of signage, noncorrosive and compatible with each material joined, and complying with the following:
 1. Use concealed fasteners and anchors unless indicated to be exposed.
 2. For exterior exposure, furnish stainless-steel or hot-dip galvanized devices unless otherwise indicated.
 3. Exposed Metal-Fastener Components, General:
 - a. Fabricated from same basic metal and finish of fastened metal unless otherwise indicated.
 - b. Fastener Heads: For nonstructural connections, use [flathead] [or] [oval countersunk] [Insert shape] screws and bolts with tamper-resistant [Allen-head] [spanner-head] [or] [one-way-head] [Insert slot design] slots unless otherwise indicated.
 4. Sign Mounting Fasteners:
 - a. Projecting Studs: Threaded studs with sleeve spacer, welded or brazed to back of sign material, screwed into back of sign assembly, or screwed into tapped lugs cast integrally into back of cast sign material, unless otherwise indicated.
- B. Bituminous Paint: Cold-applied asphalt emulsion complying with ASTM D 1187.

2.05 FABRICATION

- A. General: Provide manufacturer's standard sign assemblies according to requirements indicated.
 1. Preassemble signs and assemblies in the shop to greatest extent possible. Disassemble signs and assemblies only as necessary for shipping and handling limitations. Clearly mark units for reassembly and installation; apply markings in locations concealed from view after final assembly.
 2. Mill joints to a tight, hairline fit. Form assemblies and joints exposed to weather

- to resist water penetration and retention.
3. Comply with AWS for recommended practices in welding and brazing. Provide welds and brazes behind finished surfaces without distorting or discoloring exposed side. Clean exposed welded and brazed connections of flux, and dress exposed and contact surfaces.
 4. Conceal connections if possible; otherwise, locate connections where they are inconspicuous.
 5. Internally brace signs for stability and for securing fasteners.
 6. Provide rebates, lugs, and brackets necessary to assemble components and to attach to existing work. Drill and tap for required fasteners. Use concealed fasteners where possible; use exposed fasteners that match sign finish.
 7. Castings: Fabricate castings free of warp, cracks, blowholes, pits, scale, sand holes, and other defects that impair appearance or strength. Grind, wire brush, sandblast, and buff castings to remove seams, gate marks, casting flash, and other casting marks before finishing.
- B. Brackets: Fabricate brackets, fittings, and hardware for bracket-mounted signs to suit sign construction and mounting conditions indicated. Modify manufacturer's standard brackets as required.
1. Aluminum Brackets: Factory finish brackets with baked-enamel or powder-coat finish [to match sign-background color] [to match Architect's sample] [Insert requirement] color unless otherwise indicated.
 2. Stainless-Steel Brackets: Factory finish brackets [to match sign background] [to match Architect's sample] [with No. 4] [Insert finish] finish unless otherwise indicated.

2.06 GENERAL FINISH REQUIREMENTS

- A. Protect mechanical finishes on exposed surfaces from damage by applying a strippable, temporary protective covering before shipping.
- B. Appearance of Finished Work: Noticeable variations in same piece are not acceptable. Variations in appearance of adjoining components are acceptable if they are within the range of approved Samples and are assembled or installed to minimize contrast.
- C. Organic, Anodic, and Chemically Produced Finishes: Apply to formed metal after fabrication but before applying contrasting polished finishes on raised features unless otherwise indicated.

2.07 ALUMINUM FINISHES

- A. Baked-Enamel or Powder-Coat Finish: AAMA 2603 except with a minimum dry film thickness of 1.5 mils. Comply with coating manufacturer's written instructions for cleaning, conversion coating, and applying and baking finish.

PART 3 - EXECUTION

3.01 EXAMINATION

- A. Examine substrates, areas, and conditions, with Installer present, for compliance with requirements for installation tolerances and other conditions affecting performance of signage work.
- B. Verify that sign-support surfaces are within tolerances to accommodate signs without gaps or irregularities between backs of signs and support surfaces unless otherwise

indicated.

- C. Proceed with installation only after unsatisfactory conditions have been corrected.

3.02 INSTALLATION

- A. General: Install signs using mounting methods indicated and according to manufacturer's written instructions.

1. Install signs level, plumb, true to line, and at locations and heights indicated, with sign surfaces free of distortion and other defects in appearance.
2. Before installation, verify that sign surfaces are clean and free of materials or debris that would impair installation.
3. Corrosion Protection: Coat concealed surfaces of exterior aluminum in contact with grout, concrete, masonry, wood, or dissimilar metals, with a heavy coat of bituminous paint.

- B. Mounting Methods:

1. Projecting Studs: Using a template, drill holes in substrate aligning with studs on back of sign. Remove loose debris from hole and substrate surface.
 - a. Masonry Substrates: Fill holes with adhesive. Leave recess space in hole for displaced adhesive. Place spacers on studs, place sign in position, and push until spacers are pinched between sign and substrate, embedding the stud ends in holes. Temporarily support sign in position until adhesive fully sets.
 - b. Thin or Hollow Surfaces: Place spacers on studs, place sign in position with spacers pinched between sign and substrate, and install washers and nuts on stud ends projecting through opposite side of surface, and tighten.
2. Through Fasteners: Drill holes in substrate using predrilled holes in sign as template. Countersink holes in sign if required. Place sign in position and flush to surface. Install through fasteners and tighten.
3. Back Bar and Brackets: Remove loose debris from substrate surface and install backbar or bracket supports in position so that signage is correctly located and aligned.
4. Adhesive: Clean bond-breaking materials from substrate surface and remove loose debris. Apply linear beads or spots of adhesive symmetrically to back of sign and of suitable quantity to support weight of sign after cure without slippage. Keep adhesive away from edges to prevent adhesive extrusion as sign is applied and to prevent visibility of cured adhesive at sign edges. Place sign in position, and push to engage adhesive. Temporarily support sign in position until adhesive fully sets.

3.03 ADJUSTING AND CLEANING

- A. Remove and replace damaged or deformed characters and signs that do not comply with specified requirements. Replace characters with damaged or deteriorated finishes or components that cannot be successfully repaired by finish touchup or similar minor repair procedures.
- B. Remove temporary protective coverings and strippable films as signs are installed.

- C. On completion of installation, clean exposed surfaces of signs according to manufacturer's written instructions, and touch up minor nicks and abrasions in finish. Maintain signs in a clean condition during construction and protect from damage until acceptance by Owner.

END OF SECTION 10 14 19

SECTION 10 14 23**PANEL SIGNAGE****PART 1 - GENERAL****1.01 RELATED DOCUMENTS**

- A. Drawings and general provisions of the Contract, including General and Supplementary Conditions and Division 01 Specification Sections, apply to this Section.

1.02 SUMMARY**A. Section Includes:**

1. Panel signs.
2. Room-identification signs.
3. Field-applied, vinyl-character signs.

B. Related Requirements:

1. Section 01 50 00 "Temporary Facilities and Controls" for temporary Project identification signs and for temporary information and directional signs.
2. Section 22 05 53 "Identification for Plumbing Piping and Equipment" for labels, tags, and nameplates for plumbing systems and equipment.
3. Section 23 05 53 "Identification for HVAC Piping and Equipment" for labels, tags, and nameplates for HVAC systems and equipment.
4. Section 26 05 53 "Identification for Electrical Systems" for labels, tags, and nameplates for electrical equipment.
5. Section 26 51 00 "Interior Lighting" for illuminated, self-luminous, and photoluminescent exit sign units.

1.03 DEFINITIONS

- A. Accessible: In accordance with the accessibility standard.

1.04 COORDINATION

- A. Furnish templates for placement of sign-anchorage devices embedded in permanent construction by other installers.
- B. Furnish templates for placement of electrical service embedded in permanent construction by other installers.

1.05 ACTION SUBMITTALS

- A. Product Data: For each type of product.

B. LEED Submittals:

1. Product Certificates for Credit MR 5: For products and materials required to comply with requirements for regionally manufactured materials. Include statement indicating cost for each regionally manufactured material.
 - a. Include statement indicating location of manufacturer and distance to Project for each regionally manufactured material.

2. Product Data for Credit IEQ 4.1: For adhesives, documentation including printed statement of VOC content.
- C. Shop Drawings: For panel signs.
1. Include fabrication and installation details and attachments to other work.
 2. Show sign mounting heights, locations of supplementary supports to be provided by others, and accessories.
 3. Show message list, typestyles, graphic elements, including raised characters and Braille, and layout for each sign at least half size.
 4. Show locations of electrical service connections.
 5. Include diagrams for power, signal, and control wiring.
- D. Samples for Initial Selection: For each type of sign assembly, exposed component, and exposed finish.
1. Include representative Samples of available typestyles and graphic symbols.
- E. Samples for Verification: For each type of sign assembly showing all components and with the required finish(es), in manufacturer's standard size unless otherwise indicated and as follows:
1. Panel Signs: [Full-size Sample] [Not less than 12 inches square, including corner] [Insert size].
 2. Room-Identification Signs: [Full-size Sample] [Insert size].
 3. Field-Applied, Vinyl-Character Signs: [Full-size Sample of characters on glass] [Insert requirement].
 4. Variable Component Materials: [Full-size Sample] [8-inch Sample] [Insert size] of each base material, character (letter, number, and graphic element) in each exposed color and finish not included in Samples above.
 5. Exposed Accessories: [Full-size Sample] [Half-size Sample] [Insert size] of each accessory type.
- F. Sign Schedule: Use same designations specified or indicated on Drawings or in a sign schedule.
- G. Delegated-Design Submittal: For [signs indicated in "Performance Requirements" Article] [Insert sign designations].
1. Include structural analysis calculations for signs indicated to comply with design loads; signed and sealed by the qualified professional engineer responsible for their preparation.

1.06 INFORMATIONAL SUBMITTALS

- A. Qualification Data: For [Installer] [and] [manufacturer].
- B. Sample Warranty: For special warranty.

1.07 CLOSEOUT SUBMITTALS

- A. Maintenance Data: For signs to include in maintenance manuals.

1.08 QUALITY ASSURANCE

- A. Installer Qualifications: [Manufacturer of products] [An entity that employs installers and supervisors who are trained and approved by manufacturer].

1.09 FIELD CONDITIONS

- A. Field Measurements: Verify locations of anchorage devices and electrical service embedded in permanent construction by other installers by field measurements before fabrication, and indicate measurements on Shop Drawings.

1.10 WARRANTY

- A. Special Warranty: Manufacturer agrees to repair or replace components of signs that fail in materials or workmanship within specified warranty period.
1. Failures include, but are not limited to, the following:
 - a. Deterioration of finishes beyond normal weathering.
 - b. Deterioration of embedded graphic image.
 - c. Separation or delamination of sheet materials and components.
 2. Warranty Period: Five <Insert number> years from date of Substantial Completion.

PART 2 - PRODUCTS

2.01 PANEL SIGNS, GENERAL

- A. Regional Materials: Panel signs shall be manufactured within 500 miles of Project site.

2.02 PERFORMANCE REQUIREMENTS

- A. Thermal Movements: For exterior signs, allow for thermal movements from ambient and surface temperature changes.
1. Temperature Change: 120 deg F, ambient; 180 deg F, material surfaces <Insert temperature change>.
- B. Accessibility Standard: Comply with applicable provisions in the U.S. Architectural & Transportation Barriers Compliance Board's ADA-ABA Accessibility Guidelines for Buildings and Facilities and ICC A117.1 for signs.

2.03 SIGNS

- A. Manufacturers: Subject to compliance with requirements, available manufacturers offering products that may be incorporated into the Work include, but are not limited to, the following:
1. Ace Sign Systems, Inc.
 2. Advance Corporation; Braille-Tac Division.
 3. Allen Industries, Inc.
 4. Allen Markings International.
 5. APCO Graphics, Inc.
 6. ASE, Inc.
 7. ASI Sign Systems, Inc.
 8. Best Sign Systems Inc.
 9. Bunting Graphics, Inc.
 10. Clarke Systems.
 11. Diskey Sign Company.
 12. Fossil Industries, Inc.

13. InPro Corporation.
14. Mohawk Sign Systems.
15. Nelson-Harkins Industries.
16. Poblocki Sign Company, LLC.
17. Seton Identification Products.
18. Supersine Company (The); Division of Stamp-Rite, Inc.
19. Vista System.
20. Vomar Products, Inc.

- B. Panel Sign Insert drawing designation: Sign with smooth, uniform surfaces; with message and characters having uniform faces, sharp corners, and precisely formed lines and profiles; and as follows:
1. Basis-of-Design Product: Indicated on Drawings Insert manufacturer's name; product name or designation.
 2. Solid-Sheet Sign and Returns, Returns, and Back: Aluminum Brass Bronze Copper Steel Stainless-steel Acrylic Fiberglass PVC Insert material sheet with finish specified in "Surface Finish and Applied Graphics" Subparagraph below and as follows:
 - a. Thickness: As indicated Manufacturer's standard for size of sign 0.060 inch 0.080 inch 0.125 inch 0.25 inch Insert dimension.
 - b. Surface-Applied Graphics: Applied vinyl film baked enamel or powder coat paint photo image Insert requirement.
 - c. Etched and Filled Graphics: Sign face etched or routed to receive enamel-paint infill.
 - d. Inset, Cutout Characters: Sign face routed to receive push-through acrylic graphics flush with slightly projecting from the sign panel.
 3. Laminated Aluminum-Sheet Sign: Aluminum sheet laminated to both sides of acrylic phenolic Insert material core sheet with painted edges.
 - a. Composite-Sheet Thickness: As indicated Manufacturer's standard for size of sign 0.125 inch 0.25 inch Insert dimension.
 - b. Surface-Applied Graphics: Applied vinyl film paint photo image Insert requirement.
 4. Laminated-Sheet Sign: Photopolymer Sandblasted polymer Insert material face sheet with raised graphics laminated over subsurface graphics to acrylic phenolic Insert material backing sheet to produce composite sheet.
 - a. Composite-Sheet Thickness: As indicated Manufacturer's standard for size of sign 0.125 inch 0.25 inch Insert dimension.
 - b. Surface-Applied Graphics: Applied vinyl film paint photo image Insert requirement.
 - c. Subsurface Graphics: Reverse halftone or dot-screen image Reverse etch image Snap-in changeable insert beneath removable face sheet Slide-in changeable insert Insert requirement.
 5. Composite Phenolic-Core Sign: Solid phenolic panel core with integral subsurface graphic image covered with integral, polymeric face layer.
 - a. Composite-Sheet Thickness: As indicated Manufacturer's standard for size of sign 0.5 inch 1 inch Insert dimension.
 6. Laminated Polycarbonate-Sheet Sign: Polycarbonate face sheet laminated to each side of phenolic Insert material base sheet to produce composite sheet.

- a. Composite-Sheet Thickness: [As indicated] [Manufacturer's standard for size of sign] [0.125 inch] [0.25 inch] <Insert dimension>.
 - b. Surface-Applied Graphics: Applied [vinyl film] [paint] [photo image] <Insert requirement>.
 - c. Subsurface Graphics: [Reverse halftone or dot-screen image] [Reverse etch image] <Insert requirement>.
7. Engraved Plastic-Laminate Sign: Plastic-laminate face laminated to contrasting phenolic core to produce composite sheet.
- a. Composite-Sheet Thickness: [As indicated] [Manufacturer's standard for size of sign] [0.125 inch] [0.25 inch] <Insert dimension>.
 - b. Engraved Graphics: Characters engraved through plastic-laminate face sheet to expose contrasting phenolic core.
 - c. Plastic-Laminate Color and Pattern: [As indicated by manufacturer's designation] [As selected by Architect from manufacturer's full range] <Insert color and pattern>.
 - d. Core Color: Manufacturer's standard [dark color] <Insert color>.
8. Sign-Panel Perimeter: Finish edges smooth.
- a. Edge Condition, Vertical Edges, Horizontal Edges: [As indicated] [Square cut] [Beveled] [Bullnosed] <Insert requirement>.
 - b. Corner Condition in Elevation: [As indicated] [Square] [Rounded to radius indicated] <Insert requirement>.
9. Frame: [Entire perimeter] [Horizontal retainers] [Vertical retainers] [to hold changeable sign panel] <Insert description>.
- a. Material: [Aluminum] [Brass] [Bronze] [Steel] [Stainless steel] [PVC] <Insert material>.
 - b. Material Thickness: <Insert dimension>.
 - c. Frame Depth: [As indicated] <Insert dimension>.
 - d. Profile: [Square] [Beveled] [Rounded] <Insert requirement>.
 - e. Corner Condition in Elevation: [Square] [Mitered] [Rounded to radius indicated] <Insert requirement>.
 - f. Finish and Color: [Mill] [Painted, matte black color] [Match Architect's sample] [As selected by Architect from manufacturer's full range] <Insert requirement>.
10. Mounting: [As indicated] [Manufacturer's standard method for substrates indicated] [Surface mounted to wall] [Projecting from wall] [Suspended] [Aluminum bracket] [Stainless-steel bracket] <Insert requirement> with [concealed anchors] [countersunk flathead through fasteners] [adhesive] [two-face tape] [hook-and-loop tape] [or] [magnetic tape].
11. Surface Finish and Applied Graphics:
- a. Integral Metal Finish: [Mill] [Antique oxidized] [As indicated by manufacturer's designation] [Match Architect's sample] [As selected by Architect from full range of industry finishes] <Insert finish>.
 - b. Integral Aluminum Finish: [Clear anodized] [Light bronze anodized] [Medium bronze anodized] [Match Architect's sample] [Anodized color as selected by Architect from full range of industry colors and color densities] <Insert finish>.
 - c. Integral Stainless-Steel Finish: [No. 4] [No. 8] [Match Architect's sample] [As selected by Architect from full range of industry finishes] <Insert description>.
 - d. Integral [Acrylic] [Fiberglass] [PVC] Sheet Color: [As indicated by manufacturer's designation] [Match Architect's sample] [As selected by

- e. Architect from full range of industry colors. <Insert color>.
- e. Baked-Enamel or Powder-Coat Finish and Graphics: Manufacturer's standard, in color [as indicated by manufacturer's designation] [matching Architect's sample] [as selected by Architect from manufacturer's full range] <Insert color>.
- f. Painted Finish and Graphics: Manufacturer's standard, factory-applied [exterior-grade sign paint] [acrylic polyurethane] <Insert requirement>, in color [as indicated by manufacturer's designation] [matching Architect's sample] [as selected by Architect from manufacturer's full range] <Insert color>.
- g. Photo-Image Graphics: Manufacturer's standard [black-and-white] [multicolor], [600-dpi] <Insert value> halftone or dot-screen image.
- h. Overcoat: [Manufacturer's standard baked-on clear coating] <Insert requirement>.
12. Text and Typeface: [Accessible raised characters and Braille] [Times Roman] [typeface as indicated by manufacturer's designation] [typeface matching Architect's sample] [typeface as selected by Architect from manufacturer's full range] [and] [variable content as scheduled] <Insert requirement>. Finish raised characters to contrast with background color, and finish Braille to match background color.]
13. Flatness Tolerance: Sign panel shall remain flat or uniformly curved under installed conditions as indicated and within a tolerance of plus or minus [1/16 inch] <Insert dimension> measured diagonally from corner to corner.
- C. Room-Identification Sign <Insert drawing designation>: Sign with smooth, uniform surfaces; with message and characters having uniform faces, sharp corners, and precisely formed lines and profiles; and as follows:
1. Basis-of-Design Product: [Indicated on Drawings] <Insert manufacturer's name; product name or designation>.
 2. Laminated-Sheet Sign: [Photopolymer] [Sandblasted polymer] <Insert material> face sheet with raised graphics laminated [over subsurface graphics] to [acrylic] [phenolic] <Insert material> backing sheet to produce composite sheet.
 - a. Composite-Sheet Thickness: [As indicated] [Manufacturer's standard for size of sign] [0.125 inch] [0.25 inch] <Insert dimension>.
 - b. Surface-Applied Graphics: Applied [vinyl film] [paint] [photo image] <Insert requirement>.
 - c. Subsurface Graphics: [Reverse halftone or dot-screen image] [Reverse etch image] [Snap-in changeable insert beneath removable face sheet] [Slide-in changeable insert] <Insert requirement>.
 - d. Color(s): [Match Architect's sample] [As selected by Architect from manufacturer's full range] <Insert requirement>.
 3. Sign-Panel Perimeter: Finish edges smooth.
 - a. Edge Condition: [As indicated] [Square cut] [Beveled] [Bullnosed] <Insert requirement>.
 - b. Corner Condition in Elevation: [As indicated] [Square] [Rounded to radius indicated] <Insert requirement>.
 4. Frame: [Aluminum] <Insert material>.
 - a. Material Thickness: <Insert dimension>.
 - b. Frame Depth: [As indicated] [Convex-curved frame to receive removable face sheet and changeable subsurface graphics] <Insert dimension>.
 - c. Profile: [Square] [Beveled] [Rounded] <Insert requirement>.

- d. Corner Condition in Elevation: [Square] [Mitered] [Rounded to radius indicated] <Insert requirement>.
 - e. Finish and Color: [Mill] [Painted, matte black color] [Match Architect's sample] [As selected by Architect from manufacturer's full range] <Insert requirement>.
5. Mounting: [Manufacturer's standard method for substrates indicated] [Surface mounted to wall] with [concealed anchors] [countersunk flathead through fasteners] [adhesive] [two-face tape] [hook-and-loop tape] [or] [magnetic tape].
 6. Text and Typeface: [Accessible raised characters and Braille] [Times Roman] [typeface as indicated by manufacturer's designation] [typeface matching Architect's sample] [typeface as selected by Architect from manufacturer's full range] [and] [variable content as scheduled] <Insert requirement>. Finish raised characters to contrast with background color, and finish Braille to match background color.

2.04 FIELD-APPLIED, VINYL-CHARACTER SIGNS

- A. Field-Applied, Vinyl-Character Sign <Insert drawing designation>: Prespaced characters die cut from [3- to 3.5-mil] <Insert dimensions> thick, weather-resistant vinyl film with release liner on the back and carrier film on the front for on-site alignment and application.
 1. Manufacturers: Subject to compliance with requirements, [provide products by the following] [provide products by one of the following] [available manufacturers offering products that may be incorporated into the Work include, but are not limited to, the following]:
 2. Basis-of-Design Product: Subject to compliance with requirements, provide [product indicated on Drawings] <Insert manufacturer's name>; product name or designation > or comparable product by one of the following:
 - a. Allen Markings International.
 - b. APCO Graphics, Inc.
 - c. ASI Sign Systems, Inc.
 - d. Best Sign Systems Inc.
 - e. Mohawk Sign Systems.
 - f. Nelson-Harkins Industries.
 - g. Seton Identification Products.
 - h. <Insert manufacturer's name>.
 3. Size: [As indicated] [As scheduled] <Insert requirement>.
 4. Substrate: [As indicated] [As scheduled] [Glass] [Doors] [Walls] <Insert substrate>.
 5. Text and Font: [As indicated] [As scheduled] <Insert requirement>.

2.05 PANEL-SIGN MATERIALS

- A. Aluminum Sheet and Plate: [ASTM B 209](#), alloy and temper recommended by aluminum producer and finisher for type of use and finish indicated.
- B. Aluminum Extrusions: [ASTM B 221](#), alloy and temper recommended by aluminum producer and finisher for type of use and finish indicated.
- C. Brass Sheet (Yellow Brass): [ASTM B 36/B 36M](#), [alloy recommended by manufacturer and finisher for finish indicated] [lead-free alloy recommended by manufacturer and finisher for finish indicated] [Alloy UNS No. C26000 (yellow brass)] <Insert requirement>.

- D. Bronze Plate: ASTM B 36/B 36M, [alloy recommended by manufacturer and finisher for finish indicated] [lead-free alloy recommended by manufacturer and finisher for finish indicated] [Alloy UNS No. C22000 (commercial bronze)] [Insert requirement].
- E. Copper Sheet: ASTM B 152/B 152M.
- F. Steel Materials:
1. Metallic-Coated Steel Sheet: ASTM A 653/A 653M, [G90] [Insert coating designation] coating, either commercial or forming steel.
 2. Steel Sheet: [Uncoated, cold-rolled, ASTM A 1008/A 1008M, commercial steel, Type B, exposed] [or] [electrolytic zinc-coated, ASTM A 879/A 879M, Coating Designation 08Z, with steel-sheet substrate according to ASTM A 1008/A 1008M, commercial steel, exposed].
 3. Steel Members Fabricated from Plate or Bar Stock: ASTM A 529/A 529M or ASTM A 572/A 572M, 42,000-psi minimum yield strength.
 4. For steel exposed to view on completion, provide materials having flat, smooth surfaces without blemishes. Do not use materials whose surfaces exhibit pitting, seam marks, roller marks, rolled trade names, or roughness.
- G. Stainless-Steel Sheet: ASTM A 240/A 240M or ASTM A 666, [Type 304,] [Type 316,] stretcher-leveled standard of flatness.
- H. Acrylic Sheet: ASTM D 4802, category as standard with manufacturer for each sign, Type UVF (UV filtering).
- I. Polycarbonate Sheet: ASTM C 1349, Appendix X1, Type II (coated, mar-resistant, UV-stabilized polycarbonate), with coating on both sides.
- J. Fiberglass Sheet: Multiple laminations of glass-fiber-reinforced polyester resin with UV-light stable, colorfast, nonfading, weather- and stain-resistant, colored polyester gel coat, and with manufacturer's standard finish.
- K. PVC Sheet: Manufacturer's standard, UV-light stable, PVC plastic.
- L. Plastic-Laminate Sheet: NEMA LD 3, general-purpose HGS grade, 0.048-inch nominal thickness.
- M. Vinyl Film: UV-resistant vinyl film of nominal thickness indicated, with pressure-sensitive, permanent adhesive on back; die cut to form characters or images as indicated and suitable for exterior applications.
- N. Paints and Coatings for Sheet Materials: Inks, dyes, and paints that are recommended by manufacturer for optimum adherence to surface and are UV and water resistant for colors and exposure indicated.

2.06 ACCESSORIES

- A. Fasteners and Anchors: Manufacturer's standard as required for secure anchorage of signage, noncorrosive and compatible with each material joined, and complying with the following:
1. Use concealed fasteners and anchors unless indicated to be exposed.
 2. For exterior exposure, furnish [nonferrous-metal] [stainless-steel] [or] [hot-dip galvanized] [Insert requirement] devices unless otherwise indicated.
 3. Exposed Metal-Fastener Components, General:
 - a. Fabricated from same basic metal and finish of fastened metal unless

- otherwise indicated.
- b. Fastener Heads: For nonstructural connections, use flathead or oval countersunk insert shape screws and bolts with tamper-resistant Allen-head, spanner-head, or one-way-head insert slot design slots unless otherwise indicated.
4. Sign Mounting Fasteners:
 - a. Concealed Studs: Concealed (blind), threaded studs welded or brazed to back of sign material or screwed into back of sign assembly, unless otherwise indicated.
 - b. Projecting Studs: Threaded studs with sleeve spacer, welded or brazed to back of sign material or screwed into back of sign assembly, unless otherwise indicated.
 - c. Through Fasteners: Exposed metal fasteners matching sign finish, with type of head indicated, installed in predrilled holes.
 5. Inserts: Furnish inserts to be set by other trades into concrete or masonry work.
- B. Adhesives: As recommended by sign manufacturer and with a VOC content of 70 g/L or less for adhesives used inside the weatherproofing system and applied on-site when calculated according to 40 CFR 59, Subpart D (EPA Method 24).
 - C. Adhesives: As recommended by sign manufacturer and that comply with the testing and product requirements of the California Department of Health Services' "Standard Practice for the Testing of Volatile Organic Emissions from Various Sources Using Small-Scale Environmental Chambers."
 - D. Two-Face Tape: Manufacturer's standard high-bond, foam-core tape, 0.045 inch thick, with adhesive on both sides.
 - E. Hook-and-Loop Tape: Manufacturer's standard two-part tape consisting of hooked part on sign back and looped side on mounting surface.
 - F. Magnetic Tape: Manufacturer's standard magnetic tape with adhesive on one side.
 - G. Bituminous Paint: Cold-applied asphalt emulsion complying with ASTM D 1187.

2.07 FABRICATION

- A. General: Provide manufacturer's standard sign assemblies according to requirements indicated.
 1. Preassemble signs and assemblies in the shop to greatest extent possible. Disassemble signs and assemblies only as necessary for shipping and handling limitations. Clearly mark units for reassembly and installation; apply markings in locations concealed from view after final assembly.
 2. Mill joints to a tight, hairline fit. Form assemblies and joints exposed to weather to resist water penetration and retention.
 3. Comply with AWS for recommended practices in welding and brazing. Provide welds and brazes behind finished surfaces without distorting or discoloring exposed side. Clean exposed welded and brazed connections of flux, and dress exposed and contact surfaces.
 4. Conceal connections if possible; otherwise, locate connections where they are inconspicuous.
 5. Internally brace signs for stability and for securing fasteners.
 6. Provide rebates, lugs, and brackets necessary to assemble components and to attach to existing work. Drill and tap for required fasteners. Use concealed

fasteners where possible; use exposed fasteners that match sign finish.

- B. **Surface-Engraved Graphics:** Machine engrave characters and other graphic devices into panel surface indicated to produce precisely formed copy, incised to uniform depth.
1. **Engraved Metal:** Fill engraved graphics with manufacturer's standard baked enamel.
 2. **Engraved Opaque Acrylic Sheet:** Fill engraved graphics with manufacturer's standard enamel.
 3. **Face-Engraved Clear Acrylic Sheet:** Fill engraved copy with manufacturer's standard enamel. Apply manufacturer's standard opaque background color coating to back face of acrylic sheet.
 4. **Engraved Plastic Laminate:** Engrave through exposed face ply of plastic-laminate sheet to expose contrasting core ply.
- C. **Subsurface-Applied Graphics:** Apply graphics to back face of clear face-sheet material to produce precisely formed image. Image shall be free of rough edges.
- D. **Subsurface-Engraved Graphics:** Reverse engrave back face of clear face-sheet material. Fill resulting copy with manufacturer's standard enamel. Apply opaque manufacturer's standard background color coating over enamel-filled copy.
- E. **Shop- and Subsurface-Applied Vinyl:** Align vinyl film in final position and apply to surface. Firmly press film from the middle outward to obtain good bond without blisters or fishmouths.
- F. **Signs with Changeable Message Capability:** Fabricate signs to allow insertion of changeable messages as follows:
1. For snap-in changeable inserts beneath removable face sheet, furnish one suction or other device to assist in removing face sheet. Furnish initial changeable insert. [Subsequent changeable inserts are by Owner] [Furnish two blank inserts for each sign for Owner's use] [Insert requirement].
 2. For slide-in changeable inserts, fabricate slot without burrs or constrictions that inhibit function. Furnish initial changeable insert. [Subsequent changeable inserts are by Owner] [Furnish two blank inserts for each sign for Owner's use] [Insert requirement].
 3. For frame to hold changeable sign panel, fabricate frame without burrs or constrictions that inhibit function. Furnish initial sign panel. [Subsequent changeable sign panels are by Owner] [Insert requirement].
- G. **Brackets:** Fabricate brackets, fittings, and hardware for bracket-mounted signs to suit sign construction and mounting conditions indicated. Modify manufacturer's standard brackets as required.
1. **Aluminum Brackets:** Factory finish brackets with baked-enamel or powder-coat finish [to match sign-background color] [to match Architect's sample] [Insert requirement] color unless otherwise indicated.
 2. **Stainless-Steel Brackets:** Factory finish brackets [to match sign background] [to match Architect's sample] [with No. 4] [Insert finish] finish unless otherwise indicated.

2.08 GENERAL FINISH REQUIREMENTS

- A. Protect mechanical finishes on exposed surfaces from damage by applying a strippable, temporary protective covering before shipping.

- B. Appearance of Finished Work: Noticeable variations in same piece are not acceptable. Variations in appearance of adjoining components are acceptable if they are within the range of approved Samples and are assembled or installed to minimize contrast.
- C. Directional Finishes: Run grain with long dimension of each piece and perpendicular to long dimension of finished trim or border surface unless otherwise indicated.
- D. Organic, Anodic, and Chemically Produced Finishes: Apply to formed metal after fabrication but before applying contrasting polished finishes on raised features unless otherwise indicated.

2.09 ALUMINUM FINISHES

- A. Clear Anodic Finish: AAMA 611, [Class I, 0.018 mm] [Class II, 0.010 mm] or thicker.
- B. Color Anodic Finish: AAMA 611, [Class I, 0.018 mm] [Class II, 0.010 mm] or thicker.
- C. Baked-Enamel or Powder-Coat Finish: AAMA 2603 except with a minimum dry film thickness of 1.5 mils. Comply with coating manufacturer's written instructions for cleaning, conversion coating, and applying and baking finish.

2.10 METALLIC-COATED STEEL FINISHES

- A. Surface Preparation: Clean surfaces of oil and other contaminants. Use cleaning methods that do not leave residue. After cleaning, apply a conversion coating compatible with the organic coating to be applied over it. Clean welds, mechanical connections, and abraded areas and apply galvanizing repair paint, complying with SSPC-Paint 20, to comply with ASTM A 780/A 780M.
- B. Factory Prime Finish: After cleaning and pretreating, apply an air-dried primer compatible with the organic coating to be applied over it.
- C. Baked-Enamel or Powder-Coat Finish: After cleaning and pretreating, apply manufacturer's standard two-coat, baked-on finish consisting of prime coat and thermosetting topcoat to a minimum dry film thickness of 2 mils.

2.11 STEEL FINISHES

- A. Surface Preparation: Remove mill scale and rust, if present, from uncoated steel, and prepare for coating according to coating manufacturer's written instructions.
 - 1. For Baked-Enamel or Powder-Coat Finish: After cleaning, apply a conversion coating compatible with the organic coating to be applied over it.
- B. Factory Prime Finish: After surface preparation and pretreatment, apply manufacturer's standard, fast-curing, lead- and chromate-free, universal primer.
- C. Baked-Enamel or Powder-Coat Finish: After cleaning and pretreating, apply manufacturer's standard two-coat, baked-on finish consisting of prime coat and thermosetting topcoat to a minimum dry film thickness of 2 mils.

2.12 STAINLESS-STEEL FINISHES

- A. Surface Preparation: Remove tool and die marks and stretch lines, or blend into finish.
- B. Polished Finishes: Grind and polish surfaces to produce uniform finish, free of cross

scratches.

1. When polishing is completed, passivate and rinse surfaces. Remove embedded foreign matter and leave surfaces chemically clean.
2. Directional Satin Finish: No. 4.
3. Dull Satin Finish: No. 6.
4. Reflective, Directional Polish: No. 7.
5. Mirrorlike Reflective, Nondirectional Polish: No. 8.

PART 3 - EXECUTION

3.01 EXAMINATION

- A. Examine substrates, areas, and conditions, with Installer present, for compliance with requirements for installation tolerances and other conditions affecting performance of signage work.
- B. Verify that sign-support surfaces are within tolerances to accommodate signs without gaps or irregularities between backs of signs and support surfaces unless otherwise indicated.
- C. Verify that anchor inserts are correctly sized and located to accommodate signs.
- D. Verify that electrical service is correctly sized and located to accommodate signs.
- E. Proceed with installation only after unsatisfactory conditions have been corrected.

3.02 INSTALLATION

- A. General: Install signs using mounting methods indicated and according to manufacturer's written instructions.
 1. Install signs level, plumb, true to line, and at locations and heights indicated, with sign surfaces free of distortion and other defects in appearance.
 2. Install signs so they do not protrude or obstruct according to the accessibility standard.
 3. Before installation, verify that sign surfaces are clean and free of materials or debris that would impair installation.
 4. Corrosion Protection: Coat concealed surfaces of exterior aluminum in contact with grout, concrete, masonry, wood, or dissimilar metals, with a heavy coat of bituminous paint.
- B. Room-Identification Signs and Other Accessible Signage: Install in locations on walls as indicated and according to accessibility standard. Insert requirement.
- C. Mounting Methods:
 1. Concealed Studs: Using a template, drill holes in substrate aligning with studs on back of sign. Remove loose debris from hole and substrate surface.
 - a. Masonry Substrates: Fill holes with adhesive. Leave recess space in hole for displaced adhesive. Place sign in position and push until flush to surface, embedding studs in holes. Temporarily support sign in position until adhesive fully sets.
 - b. Thin or Hollow Surfaces: Place sign in position and flush to surface, install washers and nuts on studs projecting through opposite side of surface, and tighten.

2. Projecting Studs: Using a template, drill holes in substrate aligning with studs on back of sign. Remove loose debris from hole and substrate surface.
 - a. Masonry Substrates: Fill holes with adhesive. Leave recess space in hole for displaced adhesive. Place spacers on studs, place sign in position, and push until spacers are pinched between sign and substrate, embedding the stud ends in holes. Temporarily support sign in position until adhesive fully sets.
 - b. Thin or Hollow Surfaces: Place spacers on studs, place sign in position with spacers pinched between sign and substrate, and install washers and nuts on stud ends projecting through opposite side of surface, and tighten.
 3. Through Fasteners: Drill holes in substrate using predrilled holes in sign as template. Countersink holes in sign if required. Place sign in position and flush to surface. Install through fasteners and tighten.
 4. Brackets: Remove loose debris from substrate surface and install backbar or bracket supports in position so that signage is correctly located and aligned.
 5. Adhesive: Clean bond-breaking materials from substrate surface and remove loose debris. Apply linear beads or spots of adhesive symmetrically to back of sign and of suitable quantity to support weight of sign after cure without slippage. Keep adhesive away from edges to prevent adhesive extrusion as sign is applied and to prevent visibility of cured adhesive at sign edges. Place sign in position, and push to engage adhesive. Temporarily support sign in position until adhesive fully sets.
 6. Two-Face Tape: Clean bond-breaking materials from substrate surface and remove loose debris. Apply tape strips symmetrically to back of sign and of suitable quantity to support weight of sign without slippage. Keep strips away from edges to prevent visibility at sign edges. Place sign in position, and push to engage tape adhesive.
 7. Hook-and-Loop Tape: Clean bond-breaking materials from substrate surface and remove loose debris. Apply sign component of two-part tape strips symmetrically to back of sign and of suitable quantity to support weight of sign without slippage; push to engage tape adhesive. Keep tape strips **0.250 inch** **<Insert dimension>** away from edges to prevent visibility at sign edges when sign is initially installed or reinstalled. Apply substrate component of tape to substrate in locations aligning with tape on back of sign; push and rub well to fully engage tape adhesive to substrate.
 8. Magnetic Tape: Clean bond-breaking materials from substrate surface and remove loose debris. Apply tape strips symmetrically to back of sign and of suitable quantity to support weight of sign without slippage. Keep strips away from edges to prevent visibility at sign edges. Place sign in position.
 9. Shim-Plate Mounting: Provide **1/8-inch**- thick, concealed aluminum shim plates with predrilled and countersunk holes, at locations indicated, and where other direct mounting methods are impractical. Attach plate with fasteners and anchors suitable for secure attachment to substrate. Attach signs to plate using **<Insert mounting method>** method specified above.
- D. Field-Applied, Vinyl-Character Signs: Clean and dry substrate. Align sign characters in final position before removing release liner. Remove release liner in stages, and apply and firmly press characters into final position. Press from the middle outward to obtain good bond without blisters or fishmouths. Remove carrier film without disturbing applied vinyl film.
- E. Signs Mounted on Glass: Provide opaque sheet matching sign material and finish onto opposite side of glass to conceal back of sign.

3.03 ADJUSTING AND CLEANING

- A. Remove and replace damaged or deformed signs and signs that do not comply with specified requirements. Replace signs with damaged or deteriorated finishes or components that cannot be successfully repaired by finish touchup or similar minor repair procedures.
- B. Remove temporary protective coverings and strippable films as signs are installed.
- C. On completion of installation, clean exposed surfaces of signs according to manufacturer's written instructions, and touch up minor nicks and abrasions in finish. Maintain signs in a clean condition during construction and protect from damage until acceptance by Owner.

END OF SECTION 10 14 23

SECTION 10 14 53**TRAFFIC SIGNS****PART I - GENERAL****1.1 SUMMARY****A. Description**

1. This Work includes the furnishing and installation of new signs, sign posts, parking meter posts, foundations and associated materials as shown on the Design Drawings, Chapter 3 of the Kansas City Traffic Operations Manual and specified herein. It includes the removal of existing signs as shown on the Design Drawings and as specified herein.
2. Traffic signs shall conform to KCMO requirements, the Missouri (MO) Standard Specification for Highway Construction, Division 900, and the Manual on Uniform Traffic Control Devices (MUTCD), except as modified herein and specified on the Design Drawings. Specifications shall apply based upon ownership of the roadway. If there is a conflict, the more stringent specification will apply.
3. Existing traffic signs shall be removed and salvaged in accordance with the requirements Chapter 3 of the Kansas City Traffic Operations Manual, except as modified herein and specified on the Design Drawings.

1.2 REFERENCES

<u>Sponsor</u>	<u>Number</u>	<u>Subject</u>

MoDOT	900	Standard Plans for Highway Construction – Traffic Control Devices

1.3 SUBMITTALS AND INFORMATION TO BE RETAINED

- A. Submittals shall be made in accordance with the requirements of the Project Quality Plan, except as modified herein.
- B. Retain the following in accordance with KCMO's General Conditions.
 1. Final Signing Design and layout.
 2. A certificate of compliance with specifications, detailed shop drawings, and wiring diagrams for the blankout signs and accessories.
 3. All manufacturer's warranties, guarantees, instruction sheets and parts lists.

1.4 QUALITY ASSURANCE/QUALITY CONTROL

Quality control shall be in accordance with the requirements of the Project Quality Plan, except as modified herein.

1.5 DELIVERY HANDLING AND STORAGE

Materials shall be delivered to the site in undamaged condition and stored off the ground in a well-drained location protected from damage, easily accessible for inspection and handling. Reflective services shall not be allowed to come in contact with dirt, water or debris.

PART II - PRODUCTS

2.1 MATERIALS

A. All signs, sign posts, foundations and associated materials shall be furnished by the Contractor.

B. Sign Face and Sign Legend Materials

1. All signs, markers and delineators shall be fabricated with using ASTM reflective sign sheeting Type IX or Type XI, except as specified below:
2. Sign face material for all warning signs, yellow markers, yellow delineators, shall be fluorescent yellow in color using ASTM sign sheeting Type IX or Type XI reflective sheeting. Type IX or XI sheeting shall be warranted for a minimum of seven (7) years.
3. Splicing of reflective sheeting shall not be permitted on signs or panels with dimensions up to and including 48 inches in height or width. All sheeting joints shall be vertical, and the fabricator shall use the least number of seams possible. Roller applied or reverse screened sheeting may be butt-jointed with a gap not to exceed 1/32 inch. Color matching of adjacent sheets of reflective sheeting comprising a sign shall be accomplished without a noticeable difference in color. No borders shall be spliced other than the splice of the tangent border to the corner radius. EC film shall never be spliced.
4. The City will require the manufacturer's warranty to cover the loss of retroreflectivity, colorfastness, cracking and other conditions inherent to the sheeting, including inks and overlay film that causes ineffectiveness in meeting the intended use.

If the sheeting color does not meet the color specifications of ASTM D 4956-09, Table 11 during the warranty period, the City will consider the sheeting to have lost colorfastness.

Submit applicable warranties for retroreflective sheeting to the Department. Ensure that the City of Kansas City is named the obligee on manufacturer warranties.

Retroreflective sheeting shall maintain a minimum of 70% of the factory retroreflectivity value during the warranty period.

C. Traffic signs, sign posts, foundations and associated materials shall conform to KCMO requirements, and MO Specification Division 900, Section 903, and the Design Drawings.

1. All signposts on the project shall be 10-foot long, 2-3/8" diameter, 16-gauge steel posts. A breakaway feature is NOT required.
2. All sign posts shall have a domed galvanized pole cap affixed to the top of the post.
3. All signposts, clamp brackets and post caps shall have a black powder coat finish.

D. Blankout (Interactive) Signs – A real time interactive sign stating "Train Coming", Turn Prohibition or other appropriate message when activated, and blank when not activated, shall be placed where warranted, including but not limited to:

1. Train and vehicles share the same physical space, for example a shared left turn lane.
2. Vehicles will cross the train track for a turning movement.
3. Driveway egress point which crosses Streetcar transit without protection.
4. Unsignalized or stop controlled intersections.
5. In combination with pedestrian signals if Streetcar station is to be used as a refuge.
6. Any signal controlled movement that is activated by a Streetcar vehicle.

These signs shall be activated prior to the arrival of a train.

PART III - EXECUTION

3.1 SIGN INSTALLATION

- A. Traffic signs shall be furnished and installed in accordance with KCMO requirements, the MO Specifications, Division 900, and the MUTCD, except as modified herein and specified on the Design Drawings.
- B. The Contractor shall mark on the Site the location for the proposed signs shown on the Design Drawings and shall conduct a Construction Design Review prior to installation. The Contractor shall not install any signs without written statement of no objection from the Engineer.
- C. The Contractor shall coordinate with KCMO 30 days prior to the installation of signs on the traffic signal mast-arms.
- D. The Contractor shall install signs as indicated on the Design Drawings.
- E. A 3/4" stainless steel band with a 12-gauge insert plate shall be used to place signs on OCS, signal or lighting standards. This plate shall be painted with a semi-gloss black paint when affixed to standards that are also painted black.
- F. Signs shall be covered securely with a durable material if erected before stated condition exists.
- G. A fabrication sticker shall be provided and affixed on back side of each new sign panel by the sign fabricator. On rectangular panels the sticker shall be placed on the lower right hand corner of the panel. On diamond-shaped panels the sticker shall be placed on the right corner of the panel.

1. The sticker shall contain the Fabricator's name and address, the twelve months of the year, and the current and following 4 years (last two digits of each year).
2. The month and year of fabrication may be indicated either by punching out the appropriate month and year prior to placement on the panel or by blocking out the appropriate month and year on the screen prior to applying the black ink so that the month and year of fabrication will not be displayed.

3.2 OVERHEAD CONTACT SYSTEM (OCS) POLE ISLAND

- A. The Contractor shall place 3" x 6" self adhesive yellow reflective Type IX or XI sheeting on a 3" x 6" x 1/8" thick aluminum plate and adhere the plate to the OCS island with an outside adhesive.

3.3 REMOVAL AND SALVAGE OF EXISTING SIGNS

- A. Existing traffic signs shall be removed and salvaged in accordance with the requirements of the MO Specifications, Division 900, except as modified herein. The Contractor shall verify ownership of signs, and salvage and return signs to the respective owner per their specification.
- B. Existing signs that will conflict with the regulation of traffic and parking through construction and final configuration shall be removed or covered until the sign is again valid.
- C. For all signs being removed or salvaged, the Contractor shall remove all existing bracketing and mounting hardware. New bracketing and mounting hardware shall be utilized when reinstalling a salvaged sign panel.

3.4 SIGN REPLACEMENT

The Contractor shall utilize new bracketing and mounting hardware when reinstalling a salvaged sign panel.

END OF SECTION

SECTION 10 21 13**SOLID-POLYMER TOILET COMPARTMENTS****PART 1 - GENERAL****1.01 RELATED DOCUMENTS**

- A. Drawings and general provisions of the Contract, including General and Supplementary Conditions and Division 01 Specification Sections, apply to this Section.

1.02 SUMMARY

- A. Section Includes solid-polymer toilet compartments configured as toilet enclosures and urinal screens.
- B. Related Sections:
 - 1. Section 10 28 00 "Toilet, Bath, and Laundry Accessories" for toilet tissue dispensers, grab bars, purse shelves, and similar accessories.

1.03 ACTION SUBMITTALS

- A. Product Data: For each type of product indicated. Include construction details, material descriptions, dimensions of individual components and profiles, and finishes.
- B. Shop Drawings: For toilet compartments. Include plans, elevations, sections, details, and attachments to other work.
 - 1. Show locations of cutouts for compartment-mounted toilet accessories.
 - 2. Show locations of reinforcements for compartment-mounted grab bars.
 - 3. Show locations of centerlines of toilet fixtures.
- C. Samples for Initial Selection: For each type of unit indicated. Include Samples of hardware and accessories involving material and color selection.
- D. Samples for Verification: For the following products, in manufacturer's standard sizes unless otherwise indicated:
 - 1. Each type of material, color, and finish required for units, prepared on 6-inch-square Samples of same thickness and material indicated for Work.
 - 2. Each type of hardware and accessory.

1.04 INFORMATIONAL SUBMITTALS

- A. Product Certificates: For each type of toilet compartment, from manufacturer.

1.05 CLOSEOUT SUBMITTALS

- A. Maintenance Data: For toilet compartments to include in maintenance manuals.

1.06 QUALITY ASSURANCE

- A. Comply with requirements in GSA's CID-A-A-60003, "Partitions, Toilets, Complete."
- B. Surface-Burning Characteristics: As determined by testing identical products according to ASTM E 84, or another standard acceptable to authorities having

jurisdiction, by a qualified testing agency. Identify products with appropriate markings of applicable testing agency.

1. Flame-Spread Index: 25 or less.
2. Smoke-Developed Index: 450 or less.

- C. Regulatory Requirements: Comply with applicable provisions in the U.S. Architectural & Transportation Barriers Compliance Board's "Americans with Disabilities Act (ADA) and Architectural Barriers Act (ABA) Accessibility Guidelines for Buildings and Facilities" and ICC/ANSI A117.1 for toilet compartments designated as accessible.

1.07 PROJECT CONDITIONS

- A. Field Measurements: Verify actual locations of toilet fixtures, walls, columns, ceilings, and other construction contiguous with toilet compartments by field measurements before fabrication.

PART 2 - PRODUCTS

2.01 MATERIALS

- A. Aluminum Castings: ASTM B 26/B 26M.
- B. Aluminum Extrusions: [ASTM B 221](#).
- C. Brass Castings: ASTM B 584.
- D. Brass Extrusions: ASTM B 455.
- E. Steel Sheet: Commercial steel sheet for exposed applications; mill phosphatized and selected for smoothness.
1. Electrolytically Zinc Coated: ASTM A 879/A 879M, [01Z](#).
 2. Hot-Dip Galvanized: ASTM A 653/A 653M, either hot-dip galvanized or galvanized.
- F. Stainless-Steel Sheet: ASTM A 666, Type 304, stretcher-leveled standard of flatness.
- G. Stainless-Steel Castings: ASTM A 743/A 743M.
- H. Zamac: ASTM B 86, commercial zinc-alloy die castings.
- I. Adhesives: Manufacturer's standard product that complies with the testing and product requirements of the California Department of Health Services' "Standard Practice for the Testing of Volatile Organic Emissions from Various Sources Using Small-Scale Environmental Chambers."

2.02 SOLID-POLYMER UNITS

- A. Basis-of-Design Product: Subject to compliance with requirements, provide solid polymer toilet partitions by Hadrian Manufacturing Inc.
- A. Toilet-Enclosure Style: Overhead braced.
- B. Urinal-Screen Style: Wall hung flat panel.
- C. Door, Panel, Screen, and Pilaster Construction: Solid, high-density polyethylene

(HDPE panel material, not less than 1 inch thick, seamless, with eased edges and with homogenous color and pattern throughout thickness of material.

1. Integral Hinges: Configure doors and pilasters to receive integral hinges.
 2. Color and Pattern: as selected by Architect from manufacturer's full range.
- D. Pilaster Shoes and Sleeves (Caps): Manufacturer's standard design; polymer or stainless steel.
1. Polymer Color and Pattern: Matching pilaster.
- E. Urinal-Screen Post: Manufacturer's standard post design of 1-3/4-inch- square, aluminum tube with satin finish; with shoe and sleeve (cap) matching that on the pilaster.
- F. Brackets (Fittings):
1. Stirrup Type: Ear or U-brackets, stainless steel.
 2. Full-Height (Continuous) Type: Manufacturer's standard design; polymer or extruded aluminum.
 - a. Polymer Color and Pattern: Matching panel.

1.02 ACCESSORIES

- A. Hardware and Accessories: Manufacturer's standard design, heavy-duty operating hardware and accessories.
1. Material: Stainless steel.
 2. Hinges: Manufacturer's standard paired, self-closing type that can be adjusted to hold doors open at any angle up to 90 degrees.
 3. Latch and Keeper: Manufacturer's standard surface-mounted latch unit designed for emergency access and with combination rubber-faced door strike and keeper. Provide units that comply with regulatory requirements for accessibility at compartments designated as accessible.
 4. Coat Hook: Manufacturer's standard combination hook and rubber-tipped bumper, sized to prevent in-swinging door from hitting compartment-mounted accessories.
 5. Door Bumper: Manufacturer's standard rubber-tipped bumper at out-swinging doors.
 6. Door Pull: Manufacturer's standard unit at out-swinging doors that complies with regulatory requirements for accessibility. Provide units on both sides of doors at compartments designated as accessible.
- B. Overhead Bracing: Manufacturer's standard continuous, extruded-aluminum head rail with antigrip profile and in manufacturer's standard finish.
- C. Anchorages and Fasteners: Manufacturer's standard exposed fasteners of stainless steel or chrome-plated steel or brass, finished to match the items they are securing, with theft-resistant-type heads. Provide sex-type bolts for through-bolt applications. For concealed anchors, use stainless steel, hot-dip galvanized steel, or other rust-resistant, protective-coated steel.

1.03 FABRICATION

- A. Overhead-Braced Units: Provide manufacturer's standard corrosion-resistant supports, leveling mechanism, and anchors at pilasters to suit floor conditions. Provide shoes at pilasters to conceal supports and leveling mechanism.

- B. Urinal-Screen Posts: Provide manufacturer's standard corrosion-resistant anchoring assemblies with leveling adjustment at bottoms of posts. Provide shoes and sleeves (caps) at posts to conceal anchorage.
- C. Door Size and Swings: Unless otherwise indicated, provide 24-inch- wide, in-swinging doors for standard toilet compartments and 36-inch- wide, out-swinging doors with a minimum 32-inch- wide, clear opening for compartments designated as accessible.

PART 2 - EXECUTION

2.01 INSTALLATION

- A. General: Comply with manufacturer's written installation instructions. Install units rigid, straight, level, and plumb. Secure units in position with manufacturer's recommended anchoring devices.
 - 1. Maximum Clearances:
 - a. Pilasters and Panels: 1/2 inch.
 - b. Panels and Walls: 1 inch.
 - 2. Stirrup Brackets: Secure panels to walls and to pilasters with no fewer than three brackets attached at midpoint and near top and bottom of panel.
 - a. Locate wall brackets so holes for wall anchors occur in masonry or tile joints.
 - b. Align brackets at pilasters with brackets at walls.
- B. Overhead-Braced Units: Secure pilasters to floor and level, plumb, and tighten. Set pilasters with anchors penetrating not less than 1-3/4 inches into structural floor unless otherwise indicated in manufacturer's written instructions. Secure continuous head rail to each pilaster with no fewer than two fasteners. Hang doors to align tops of doors with tops of panels, and adjust so tops of doors are parallel with overhead brace when doors are in closed position.
- C. Urinal Screens: Attach with anchoring devices to suit supporting structure. Set units level and plumb, rigid, and secured to resist lateral impact.

2.02 ADJUSTING

- A. Hardware Adjustment: Adjust and lubricate hardware according to hardware manufacturer's written instructions for proper operation. Set hinges on in-swinging doors to hold doors open approximately 30 degrees from closed position when unlatched. Set hinges on out-swinging doors to return doors to fully closed position.

END OF SECTION 10 21 13

SECTION 10 26 13**STAINLESS STEEL CORNER GUARDS****PART 1 - GENERAL****1.01 RELATED DOCUMENTS**

- A. Drawings and general provisions of the Contract, including General and Supplementary Conditions and Division 01 Specification Sections, apply to this Section.

1.02 SUMMARY

- A. This Section includes stainless steel corner guards.

1.03 SUBMITTALS

- A. Product data.
- B. Shop Drawings: Show locations, extent, and installation details of each corner guard component. Show methods of attachment to adjoining construction.
- C. Samples for Verification: For the following products, showing the full range of finish variations expected in each corner guard component. Prepare Samples from the same material to be used for the Work.
 - 1. Wall and Corner Guards: 12-inch- long Samples of each type of corner guard component required.

1.04 QUALITY ASSURANCE

- A. Installer Qualifications: An experienced installer who has completed installation of corner guard components similar in material, design, and extent to that indicated for this Project and whose work has resulted in construction with a record of successful in-service performance.
- B. Manufacturer Qualifications: A firm experienced in manufacturing corner guard components similar to those required for this Project and with a record of successful in-service performance.
- C. Source Limitations: Obtain each finish, and type of corner guard component from a single source with resources to provide components of consistent quality in appearance and physical properties.

1.05 DELIVERY, STORAGE, AND HANDLING

- A. Store corner guards in original undamaged packages and containers inside a well-ventilated area protected from weather, moisture, soiling, extreme temperatures, and humidity.

1.06 PROJECT CONDITIONS

- A. Environmental Limitations: Do not install corner guard components until the space is enclosed and weatherproof and ambient temperature within the building is maintained at not less than 70 deg F for not less than 72 hours before beginning installation.

PART 2 - PRODUCTS

2.01 MANUFACTURERS

- A. Available Manufacturers: Subject to compliance with requirements, manufacturers offering corner guard products that may be incorporated into the Work include, but are not limited to, the following:
1. Balco, Inc.
 2. Construction Specialties, Inc.
 3. IPC Door and Wall Protection Systems, Inc.
 4. Pawling Corporation.

2.02 MATERIALS

- A. Stainless-Steel Plate: Type 304, minimum 0.0625 inch.
- B. Fasteners: Provide nonmagnetic stainless-steel metal screws, bolts, and other fasteners. Use theftproof fasteners where exposed to view.

2.03 CORNER GUARDS

- A. Stainless-Steel Corner Guards: Paper-covered, satin-finish, 0.0625-inch minimum, stainless-steel sheet corner guards. Provide 90-degree turn, unless otherwise indicated; and formed edges.
1. Wing Size: 4-1/2 by 4-1/2 inches.
 2. Mounting Method: Countersunk screws with mounting holes 8 inches o.c.
 3. Corner Radius: 1/8 inch.
 4. Height: 4-feet unless indicated otherwise.

2.04 FABRICATION

- A. General: Fabricate corner guards to comply with requirements indicated for design, dimensions, details, finish, and member sizes, including thicknesses of components.
- B. Provide surfaces free of wrinkles, chips, dents, uneven coloration, and other imperfections.
- C. Anchors: Provide wall anchors for connecting corner guards to other construction.
- D. Provide inserts and other anchoring devices for connecting components to concrete or masonry. Fabricate anchoring devices to withstand imposed loads. Coordinate anchoring devices with the supporting structure.

2.05 FINISHES, GENERAL

- A. Comply with NAAMM's "Metal Finishes Manual for Architectural and Metal Products" for recommendations for applying and designating finishes.
- B. Protect mechanical finishes on exposed surfaces from damage by applying a strippable, temporary covering before shipping.

2.06 STAINLESS-STEEL FINISHES

- A. Finish: Directional satin, No. 6 Bright annealed.

PART 3 - EXECUTION

3.01 EXAMINATION

- A. Examine areas and conditions in which corner guard components will be installed.
 - 1. Complete finishing operations, including painting, before installing corner guard components.
- B. Proceed with installation only after unsatisfactory conditions have been corrected.

3.02 PREPARATION

- A. General: Before installation, clean substrate to remove dust, debris, and loose particles.

3.03 INSTALLATION

- A. Install corner guard components level, plumb, and true to line without distortions.
 - 1. Do not use materials with stains or other defects that might be visible in the finished Work.

3.04 CLEANING

- A. General: Clean metal components according to the manufacturer's written instructions.
- B. Remove surplus materials, rubbish, and debris, resulting from installation, on completion of work and leave installation areas in neat, clean condition.

END OF SECTION 10 26 13

SECTION 10 28 13**COMMERCIAL TOILET ACCESSORIES****PART 1 - GENERAL****1.01 SUMMARY****A. Section Includes:**

1. Public-use washroom accessories.
2. Under lavatory guards.

B. Related Sections:

1. Section 08 83 00 "Mirrors" for frameless mirrors.
2. Section 09 30 00 "Tiling" for ceramic toilet and bath accessories.

1.02 SUBMITTALS**A. Product Data:** For each type of product indicated. Include the following:

1. Construction details and dimensions.
2. Anchoring and mounting requirements, including requirements for cutouts in other work and substrate preparation.
3. Material and finish descriptions.
4. Features that will be included for Project.
5. Manufacturer's warranty.

B. Samples: Full size, for each accessory item to verify design, operation, and finish requirements.

1. Approved full-size Samples will be returned and may be used in the Work.

C. Product Schedule: Indicating types, quantities, sizes, and installation locations by room of each accessory required.

1. Identify locations using room designations indicated.
2. Identify products using designations indicated.

D. Warranty: Sample of special warranty.**E. Maintenance Data:** For toilet and bath accessories to include in maintenance manuals.**1.03 QUALITY ASSURANCE****A. Source Limitations:** For products listed together in the same Part 2 articles, obtain products from single source from single manufacturer.**B. Electrical Components, Devices, and Accessories:** Listed and labeled as defined in NFPA 70, by a qualified testing agency, and marked for intended location and application.**1.04 COORDINATION****A. Coordinate** accessory locations with other work to prevent interference with clearances required for access by people with disabilities, and for proper

installation, adjustment, operation, cleaning, and servicing of accessories.

- B. Deliver inserts and anchoring devices set into concrete or masonry as required to prevent delaying the Work.

1.05 WARRANTY

- A. Special Mirror Warranty: Manufacturer's standard form in which manufacturer agrees to replace mirrors that develop visible silver spoilage defects and that fail in materials or workmanship within specified warranty period.

1. Warranty Period: 15 years from date of Substantial Completion.

PART 2 - PRODUCTS

2.01 MANUFACTURERS

- A. Basis of Design: Subject to requirements, provide accessories by the following:

1. Toilet and Bath Accessories: Bobrick.
2. Underlavatory Guards: Truebro, Inc.

- B. Products: Subject to compliance with requirements, provide one of the products indicated for each designation in the Toilet and Bath Accessory Schedule at the end of Part 3.

2.02 MATERIALS

- A. Stainless Steel: ASTM A 666, Type 304, with No. 4 finish (satin), in 0.0312-inch minimum nominal thickness, unless otherwise indicated.
- B. Brass: ASTM B 19, leaded and unleaded flat products; ASTM B 16, rods, shapes, forgings, and flat products with finished edges; ASTM B 30, castings.
- C. Sheet Steel: ASTM A 366/A 366M, cold rolled, commercial quality, 0.0359-inch minimum nominal thickness; surface preparation and metal pretreatment as required for applied finish.
- D. Galvanized Steel Sheet: ASTM A 653/A 653M, G60.
- E. Galvanized Steel Mounting Devices: ASTM A 153/A 153M, hot-dip galvanized after fabrication.
- F. Fasteners: Screws, bolts, and other devices of same material as accessory unit, tamper and theft resistant when exposed, and of galvanized steel when concealed.

2.03 FABRICATION

- A. General: Names or labels are not permitted on exposed faces of accessories. On interior surface not exposed to view or on back surface of each accessory, provide printed, waterproof label or stamped nameplate indicating manufacturer's name and product model number.
- B. Recessed Toilet Accessories: Unless otherwise indicated, fabricate units of all-welded construction, without mitered corners. Hang doors and access panels with full-length, stainless-steel hinge. Provide anchorage that is fully concealed when

unit is closed.

- C. Keys: Provide universal keys for internal access to accessories for servicing and resupplying. Provide minimum of six keys to Authority's representative.

PART 3 - EXECUTION

3.01 INSTALLATION

- A. Install accessories according to manufacturers' written instructions, using fasteners appropriate to substrate indicated and recommended by unit manufacturer. Install units level, plumb, and firmly anchored in locations and at heights indicated.
- B. Install grab bars to withstand a downward load of at least 250 lbf, when tested according to method in ASTM F 446.

3.02 ADJUSTING AND CLEANING

- A. Adjust accessories for unencumbered, smooth operation and verify that mechanisms function properly. Replace damaged or defective items.
- B. Remove temporary labels and protective coatings.
- C. Clean and polish exposed surfaces according to manufacturer's written recommendations.

3.03 TOILET AND BATH ACCESSORY SCHEDULE

- | | |
|--|-----------------|
| A. Recessed convertible paper towel dispenser and waste receptacle | Bobrick B-43944 |
| B. Automatic lavatory-mounted soap dispenser | Bobrick B-826 |
| C. Surface-mounted soap dispenser | Bobrick B-4112 |
| D. Reversible solid phenolic folding shower seat | Bobrick B-5181 |
| E. Recessed seat-cover dispenser, sanitary napkin disposal and toilet tissue dispenser | Bobrick B-3574 |
| F. Recessed seat-cover dispenser, sanitary napkin disposal and toilet tissue dispenser | Bobrick B-3574 |
| G. Partition-mounted seat-cover dispenser, sanitary napkin disposal, and toilet tissue dispenser | Bobrick B-3571 |
| H. Surface-mounted seat-cover and toilet tissue dispenser | Bobrick B-3479 |
| I. Extra-heavy-duty shower curtain rod | Bobrick B-6074 |
| J. Stainless steel shower curtain hook | Bobrick 204-1 |
| K. Vinyl shower curtain | Bobrick 204-2 |
| L. Glass mirror with stainless steel angle frame | Bobrick B-290 |

M. Utility shelf with mop/broom holders and rag hooks	Bobrick B-239
N. Heavy-duty clothes hook with concealed mounting hooks	Bobrick B-2116
O. Folding utility shelf	Bobrick B-287
P. Folding Utility Shelf	Bobrick B-287
Q. 18"-1 ½" diameter stainless steel grab bars with snap flange	Bobrick B-6806
R. 36"-1 ½" diameter stainless steel grab bars with snap flange	Bobrick B-6806
S. 42"-1 ½" diameter stainless steel grab bars with snap flange	Bobrick B-6806
T. Two-wall shower/tub compartment grab bar	Bobrick B-68616.99
U. Surface-mounted seat-cover dispenser	Bobrick B-4221
V. Surface-mounted sanitary napkin disposal	Bobrick B-254
W. Surface-mounted sanitary napkin disposal	Bobrick B-270
X. Partition-mounted dual-sided multi-roll toilet tissue dispenser	Bobrick B-386
Y. Recessed sanitary napkin disposal and toilet tissue dispenser	Bobrick B-3094
Z. Recessed multi-roll toilet tissue dispenser	Bobrick B-4388
AA. Surface-mounted multi-roll toilet tissue dispenser	Bobrick B-4288
AB. Interchangeable receptacle	Bobrick 368-60
AC. Under-lavatory guards	Lav Guard2
AD. Convertible universal roll paper towel module	Bobrick 3974-50

END OF SECTION 10 28 13

SECTION 10 41 16**FIRE DEPARTMENT KEY BOX****PART 1 - GENERAL****1.01 RELATED DOCUMENTS**

- A. Drawings and general provisions of the Contract, including General and Supplementary Conditions and Division 01 Specification Sections, apply to this Section.

1.02 SUMMARY

- A. This Section includes recessed Fire Department key storage box ("knox box").
- B. Related Sections: The following Sections contain requirements that may relate to this Section:
 - 1. Division 7 Section "Joint Sealants" for sealant applied to joint between key box and mounting substrate.

1.03 SUBMITTALS

- A. Product Data: For each type of product indicated.

1.04 COORDINATION

- A. Coordinate installation of anchorages and recessed mount for key storage box. Furnish setting drawings, templates, and directions for installing anchorages, including sleeves, concrete inserts, anchor bolts, and items with integral anchors, that are to be embedded in concrete or masonry. Deliver such items to Project site in time for installation.
- B. Key Storage Box: Locate boxes where indicated on Drawings and position as required by local Fire Department.

PART 2 - PRODUCTS**2.01 FIRE DEPARTMENT KEY STORAGE BOX**

- A. General: Heavy-duty, UL Rated, high-security, factory finish metal box designed to store keys for Fire Department access.
- B. Basis of Design Product: Subject to compliance with the requirements provide Knox Company; Knox Box 3200 Series or comparable product by another manufacturer acceptable to Authorities Having Jurisdiction.
 - 1. Mounting: Recessed mounted.
 - 2. Size: Approximately 5-inches high by 4-inches wide by 3-1/4-inches deep.
 - 3. Door Type: Lift-off.
 - 4. Color. Black.

2.02 ACCESSORIES

- A. Recessed Mounting Kit: Steel box assembly with integral box mounting bolts and concrete or masonry anchors, designed to recess storage box. Provide only kits supplied by manufacturer of storage box.

PART 3 - EXECUTION

3.01 EXAMINATION

- A. Examine substrates, areas, and conditions, with Installer present, for compliance with requirements for installation tolerances, critical dimensions, and other conditions affecting performance.
- B. Proceed with installation only after unsatisfactory conditions have been corrected.

3.02 INSTALLATION

- A. Recessed Mounting: Incorporate recessed mounting kit into masonry or concrete wall during wall construction. Install key box in recessed mount after walls are substantially completed and cleaned.
- B. Apply elastomeric sealant to top and side joints between key box and mounting substrate in accordance with requirements of Section 07920 Joint Sealants. Leave bottom joint open for drainage.

3.03 ADJUSTING AND CLEANING

- A. Confirm that box doors engage accurately and securely without forcing or binding.
- B. After completing installation of exposed, factory-finished boxes, inspect exposed finishes and repair damaged finishes.

END OF SECTION 10 41 16

SECTION 10 44 13**PORTABLE FIRE EXTINGUISHER CABINETS****PART 1 - GENERAL****1.01 RELATED DOCUMENTS**

- A. Drawings and general provisions of the Contract, including General and Supplementary Conditions and Division 01 Specification Sections, apply to this Section.

1.02 SUMMARY

- A. Section Includes fire protection cabinets for portable fire extinguishers.
- B. Related Sections:
 - 1. Section 09 91 13 "Exterior Painting" for field painting fire protection cabinets.
 - 2. Section 10 14 00 "Signage" for directional signage to out-of-sight fire extinguishers and cabinets.
 - 3. Section 10 44 16 "Portable Multipurpose Dry-Chemical Fire Extinguishers."
 - 4. Section 26 51 00 "Interior Lighting" for fire extinguisher location lights.

1.03 ACTION SUBMITTALS

- A. Product Data: For each type of product indicated. Include construction details, material descriptions, dimensions of individual components and profiles, and finishes for fire protection cabinets.
 - 1. Fire Protection Cabinets: Include roughing-in dimensions, details showing mounting methods, relationships of box and trim to surrounding construction, door hardware, cabinet type, trim style, and panel style.
- B. Shop Drawings: For fire protection cabinets. Include plans, elevations, sections, details, and attachments to other work.
- C. Samples for Initial Selection: For each type of fire protection cabinet indicated.
- D. Samples for Verification: For each type of exposed finish required, prepared on Samples of size indicated below:
 - 1. Size: **6 by 6 inches** square.
- E. Product Schedule: For fire protection cabinets. Coordinate final fire protection cabinet schedule with fire extinguisher schedule to ensure proper fit and function.

1.04 CLOSEOUT SUBMITTALS

- A. Maintenance Data: For fire protection cabinets to include in maintenance manuals.

1.05 QUALITY ASSURANCE

- A. Fire-Rated, Fire Protection Cabinets: Listed and labeled to comply with requirements in ASTM E 814 for fire-resistance rating of walls where they are installed.
- B. Electrical Components, Devices, and Accessories: Listed and labeled as defined in NFPA 70, by a qualified testing agency, and marked for intended location and

application.

1.06 COORDINATION

- A. Coordinate size of fire protection cabinets to ensure that type and capacity of fire extinguishers indicated are accommodated.
- B. Coordinate sizes and locations of fire protection cabinets with wall depths.

1.07 SEQUENCING

- A. Apply vinyl lettering on field-painted, fire protection cabinets after painting is complete.

PART 2 - PRODUCTS

2.01 MATERIALS

- A. Cold-Rolled Steel Sheet: ASTM A 1008/A 1008M, Commercial Steel (CS), Type B.
- B. Aluminum: Alloy and temper recommended by aluminum producer and manufacturer for type of use and finish indicated, and as follows:
 - 1. Sheet: [ASTM B 209](#).
 - 2. Extruded Shapes: [ASTM B 221](#).
- C. Clear Float Glass: ASTM C 1036, Type I, Class 1, Quality q3, 3 mm thick.

2.02 FIRE PROTECTION CABINET

- A. Cabinet Type: Suitable for fire extinguisher.
 - 1. Products: Subject to compliance with requirements, available products that may be incorporated into the Work include, but are not limited to, the following:
 - a. Fire End & Croker Corporation;
 - b. J. L. Industries, Inc., a division of Activar Construction Products Group;
 - c. Kidde Residential and Commercial Division, Subsidiary of Kidde plc;
 - d. Larsen's Manufacturing Company;
 - e. Modern Metal Products, Division of Technico Inc.;
 - f. Moon-American;
 - g. Potter Roemer LLC;
 - h. Watrous Division, American Specialties, Inc.;
- B. Cabinet Construction: Nonrated.
- C. Cabinet Material: Steel sheet.
- D. Recessed Cabinet: Cabinet box recessed in walls of sufficient depth to suit style of trim indicated.
 - 1. Trimless with Concealed Flange: Surface of surrounding wall finishes flush with exterior finished surface of cabinet frame and door, without overlapping trim

attached to cabinet. Provide recessed flange, of same material as box, attached to box to act as drywall bead.

- E. Semirecessed Cabinet: Cabinet box partially recessed in walls of sufficient depth to suit style of trim indicated; with one-piece combination trim and perimeter door frame overlapping surrounding wall surface with exposed trim face and wall return at outer edge (backbend). Provide where walls are of insufficient depth for recessed cabinets but are of sufficient depth to accommodate semirecessed cabinet installation.
 - 1. Square-Edge Trim: 1-1/4- to 1-1/2-inch backbend depth.
- F. Cabinet Trim Material: Same material and finish as door.
- G. Door Material: Aluminum sheet.
- H. Door Style: Fully glazed panel with frame.
- I. Door Glazing: Clear float glass.
- J. Door Hardware: Manufacturer's standard door-operating hardware of proper type for cabinet type, trim style, and door material and style indicated.
 - 1. Provide manufacturer's standard.
 - 2. Provide manufacturer's standard hinge permitting door to open 180 degrees.
- K. Accessories:
 - 1. Mounting Bracket: Manufacturer's standard steel, designed to secure fire extinguisher to fire protection cabinet, of sizes required for types and capacities of fire extinguishers indicated, with plated or baked-enamel finish.
 - 2. Break-Glass Strike: Manufacturer's standard metal strike, complete with chain and mounting clip, secured to cabinet.
 - 3. Lettered Door Handle: One-piece, cast-iron door handle with the word "FIRE" embossed into face.
 - 4. Door Lock: Cam lock that allows door to be opened during emergency by pulling sharply on door handle.
 - 5. Identification: Lettering complying with authorities having jurisdiction for letter style, size, spacing, and location. Locate as directed by Architect.
 - a. Identify fire extinguisher in fire protection cabinet with the words "FIRE EXTINGUISHER."
 - 1) Location: Applied to cabinet glazing.
 - 2) Application Process: Pressure-sensitive vinyl letters.
 - 3) Lettering Color: Red.
 - 4) Orientation: Vertical.
 - 6. Alarm: Manufacturer's standard alarm that actuates when fire protection cabinet door is opened and that is powered by low voltage, complete with transformer.
- L. Finishes:
 - 1. Aluminum: Baked enamel or powder coat.

2.03 FABRICATION

- A. Fire Protection Cabinets: Provide manufacturer's standard box (tub) with trim, frame, door, and hardware to suit cabinet type, trim style, and door style indicated.

1. Weld joints and grind smooth.
 2. Provide factory-drilled mounting holes.
 3. Prepare doors and frames to receive locks.
 4. Install door locks at factory.
- B. Cabinet Doors: Fabricate doors according to manufacturer's standards, from materials indicated and coordinated with cabinet types and trim styles selected.
1. Fabricate door frames with tubular stiles and rails and hollow-metal design, minimum **1/2 inch** thick.
 2. Fabricate door frames of one-piece construction with edges flanged.
 3. Miter and weld perimeter door frames.
- C. Cabinet Trim: Fabricate cabinet trim in one piece with corners mitered, welded, and ground smooth.

2.04 GENERAL FINISH REQUIREMENTS

- A. Comply with NAAMM's "Metal Finishes Manual for Architectural and Metal Products" for recommendations for applying and designating finishes.
- B. Protect mechanical finishes on exposed surfaces of fire protection cabinets from damage by applying a strippable, temporary protective covering before shipping.
- C. Finish fire protection cabinets after assembly.
- D. Appearance of Finished Work: Noticeable variations in same piece are not acceptable. Variations in appearance of adjoining components are acceptable if they are within the range of approved Samples and are assembled or installed to minimize contrast.

2.05 ALUMINUM FINISHES

- A. Baked-Enamel or Powder-Coat Finish: AAMA 2603 except with a minimum dry film thickness of **1.5 mils**. Comply with coating manufacturer's written instructions for cleaning, conversion coating, and applying and baking finish.
1. Color and Gloss: As selected by Architect from manufacturer's full range.

2.06 STEEL FINISHES

- A. Baked-Enamel or Powder-Coat Finish: Immediately after cleaning and pretreating, apply manufacturer's standard two-coat, baked-on finish consisting of prime coat and thermosetting topcoat. Comply with coating manufacturer's written instructions for applying and baking to achieve a minimum dry film thickness of **2 mils**.
1. Color and Gloss: As selected by Architect from manufacturer's full range.

PART 3 - EXECUTION

3.01 EXAMINATION

- A. Examine walls and partitions for suitable framing depth and blocking where recessed and semirecessed cabinets will be installed.
- B. Proceed with installation only after unsatisfactory conditions have been corrected.

3.02 PREPARATION

- A. Prepare recesses for recessed and semirecessed fire protection cabinets as required by type and size of cabinet and trim style.

3.03 INSTALLATION

- A. General: Install fire protection cabinets in locations and at mounting heights indicated
- B. Fire Protection Cabinets: Fasten cabinets to structure, square and plumb.
 - 1. Unless otherwise indicated, provide recessed fire protection cabinets. If wall thickness is not adequate for recessed cabinets, provide semirecessed fire protection cabinets.
 - 2. Provide inside latch and lock for break-glass panels.
 - 3. Fasten mounting brackets to inside surface of fire protection cabinets, square and plumb.
- C. Identification: Apply vinyl lettering at locations indicated.

3.04 ADJUSTING AND CLEANING

- A. Remove temporary protective coverings and strippable films, if any, as fire protection cabinets are installed unless otherwise indicated in manufacturer's written installation instructions.
- B. Adjust fire protection cabinet doors to operate easily without binding. Verify that integral locking devices operate properly.
- C. On completion of fire protection cabinet installation, clean interior and exterior surfaces as recommended by manufacturer.
- D. Touch up marred finishes, or replace fire protection cabinets that cannot be restored to factory-finished appearance. Use only materials and procedures recommended or furnished by fire protection cabinet and mounting bracket manufacturers.
- E. Replace fire protection cabinets that have been damaged or have deteriorated beyond successful repair by finish touchup or similar minor repair procedures.

END OF SECTION 10 44 13

SECTION 10 44 16**PORTABLE MULTIPURPOSE DRY-CHEMICAL FIRE EXTINGUISHERS****PART 1 - GENERAL****1.01 RELATED DOCUMENTS**

- A. Drawings and general provisions of the Contract, including General and Supplementary Conditions and Division 01 Specification Sections, apply to this Section.

1.02 SUMMARY

- A. Section includes portable, hand-carried, multipurpose dry-chemical in container type fire extinguishers and mounting brackets for fire extinguishers.
- B. Related Sections:
 - 1. Section 10 44 13 "Fire Extinguisher Cabinets."

1.03 ACTION SUBMITTALS

- A. Product Data: For each type of product indicated. Include rating and classification, material descriptions, dimensions of individual components and profiles, and finishes for fire extinguisher and mounting brackets.
- B. Product Schedule: For fire extinguishers. Coordinate final fire extinguisher schedule with fire protection cabinet schedule to ensure proper fit and function.

1.04 INFORMATIONAL SUBMITTALS

- A. Warranty: Sample of special warranty.

1.05 CLOSEOUT SUBMITTALS

- A. Operation and Maintenance Data: For fire extinguishers to include in maintenance manuals.

1.06 QUALITY ASSURANCE

- A. NFPA Compliance: Fabricate and label fire extinguishers to comply with NFPA 10, "Portable Fire Extinguishers."
- B. Fire Extinguishers: Listed and labeled for type, rating, and classification by an independent testing agency acceptable to authorities having jurisdiction.
 - 1. Provide fire extinguishers approved, listed, and labeled by FMG.

1.07 COORDINATION

- A. Coordinate type and capacity of fire extinguishers with fire protection cabinets to ensure fit and function.

1.08 WARRANTY

- A. Special Warranty: Manufacturer's standard form in which manufacturer agrees to repair or replace fire extinguishers that fail in materials or workmanship within

specified warranty period.

1. Failures include, but are not limited to, the following:
 - a. Failure of hydrostatic test according to NFPA 10.
 - b. Faulty operation of valves or release levers.
2. Warranty Period: Six years from date of Substantial Completion.

PART 2 - PRODUCTS

2.01 PORTABLE, HAND-CARRIED FIRE EXTINGUISHERS

- A. Fire Extinguishers: Type, size, and capacity for each fire protection cabinet and mounting bracket indicated.
 1. Manufacturers: Subject to compliance with requirements, available manufacturers offering products that may be incorporated into the Work include, but are not limited to, the following:
 - a. Amerex Corporation.
 - b. J. L. Industries, Inc.; a division of Activar Construction Products Group.
 - c. Larsen's Manufacturing Company.
 - d. Potter Roemer LLC.
 2. Valves: Manufacturer's standard.
 3. Handles and Levers: Manufacturer's standard.
 4. Instruction Labels: Include pictorial marking system complying with NFPA 10, Appendix B and bar coding for documenting fire extinguisher location, inspections, maintenance, and recharging.
- B. Multipurpose Dry-Chemical Type in Steel Container, Bracket Mounted: UL-rated 4-A:60-B:C, 10-lb nominal capacity, with monoammonium phosphate-based dry chemical in enameled-steel container.

2.02 MOUNTING BRACKETS

- A. Mounting Brackets for 10 lb. Fire Extinguishers: Manufacturer's standard steel, designed to secure fire extinguisher to wall or structure, of sizes required for types and capacities of fire extinguishers indicated, with plated or black baked-enamel finish.
 1. Manufacturers: Subject to compliance with requirements, provide products by same manufacturer supplying fire extinguishers.
- B. Identification: Lettering complying with authorities having jurisdiction for letter style, size, spacing, and location. Locate as indicated by Architect.
 1. Identify bracket-mounted fire extinguishers with the words "FIRE EXTINGUISHER" in red letter decals applied to mounting surface.
 - a. Orientation: Vertical.

PART 3 - EXECUTION

3.01 EXAMINATION

- A. Examine fire extinguishers for proper charging and tagging.
 - 1. Remove and replace damaged, defective, or undercharged fire extinguishers.
- B. Proceed with installation only after unsatisfactory conditions have been corrected.

3.02 INSTALLATION

- A. General: Install fire extinguishers and mounting brackets in locations indicated and in compliance with requirements of authorities having jurisdiction.
 - 1. Mounting Brackets: 54 inches above finished floor to top of fire extinguisher.
- B. Mounting Brackets: Fasten mounting brackets to surfaces, square and plumb, at locations indicated.

3.03 CLEANING

- A. Construction Waste Management and Disposal: Comply with Waste Management Plan required under Division 01 Section "Construction Waste Management And Disposal."

END OF SECTION 10 44 16

SECTION 10 51 13

STANDARD METAL LOCKERS

PART 1 - GENERAL

1.01 RELATED DOCUMENTS

- A. Drawings and general provisions of the Contract, including General and Supplementary Conditions and Division 01 Specification Sections, apply to this Section.

1.02 SUMMARY

- A. Section Includes Standard metal lockers, knock-down type, and locker benches.

1.03 SUBMITTALS

- A. Product Data: For each type of product indicated. Include construction details, material descriptions, dimensions of individual components and profiles, and finishes for each type of metal locker.
- B. Shop Drawings: For metal lockers. Include plans, elevations, sections, details, and attachments to other work.
 - 1. Show locker trim and accessories.
 - 2. Include locker identification system and numbering sequence.
- C. Samples for Initial Selection: For units with factory-applied color finishes.
- D. Samples for Verification: For metal lockers and locker benches in manufacturer's standard sizes.
- E. Qualification Data: For qualified Installer.
- F. Maintenance Data: For adjusting, repairing, and replacing locker doors and latching mechanisms to include in maintenance manuals.
- G. Warranty: Sample of special warranty.

1.04 QUALITY ASSURANCE

- A. Installer Qualifications: Manufacturer's authorized representative who is trained and approved for installation of units required for this Project.
- B. Source Limitations: Obtain metal lockers, locker benches and accessories from single source from single manufacturer.
- C. Regulatory Requirements: Provide lockers and locker benches that comply with the U.S. Architectural & Transportation Barriers Compliance Board's "Americans with Disabilities Act (ADA) and Architectural Barriers Act (ABA) Accessibility Guidelines for Buildings and Facilities".
- D. Preinstallation Conference: Conduct conference at Project site.

1.05 DELIVERY, STORAGE, AND HANDLING

- A. Do not deliver metal lockers until spaces to receive them are clean, dry, and ready for

their installation.

1.06 PROJECT CONDITIONS

- A. Field Measurements: Verify actual dimensions of recessed openings by field measurements before fabrication.

1.07 COORDINATION

- A. Coordinate sizes and locations of framing, blocking, furring, reinforcements, and other related units of work specified in other Sections to ensure that metal lockers can be supported and installed as indicated.

1.08 WARRANTY

- A. Special Warranty: Manufacturer's standard form in which manufacturer agrees to repair or replace components of metal lockers that fail in materials or workmanship, excluding finish, within specified warranty period.
 - 1. Failures include, but are not limited to, the following:
 - a. Structural failures.
 - b. Faulty operation of latches and other door hardware.
 - 2. Damage from deliberate destruction and vandalism is excluded.
 - 3. Warranty Period for Knocked-Down Metal Lockers: Two years from date of Substantial Completion.

PART 2 - PRODUCTS

2.01 MATERIALS

- A. Cold-Rolled Steel Sheet: ASTM A 1008/A 1008M, Commercial Steel (CS), Type B, suitable for exposed applications.
- B. Metallic-Coated Steel Sheet: ASTM A 653/A 653M, Commercial Steel (CS), Type B; with A60 zinc-iron, alloy (galvannealed) coating designation.
- C. Steel Tube: ASTM A 500, cold rolled.
- D. Fasteners: Zinc- or nickel-plated steel, slotless-type, exposed bolt heads; with self-locking nuts or lock washers for nuts on moving parts.
- E. Anchors: Material, type, and size required for secure anchorage to each substrate.
 - 1. Provide nonferrous-metal or hot-dip galvanized anchors and inserts for corrosion resistance.
 - 2. Provide toothed-steel or lead expansion sleeves for drilled-in-place anchors.

2.02 STANDARD METAL LOCKERS

- A. Basis-of-Design Product: Subject to compliance with requirements, provide Penco Products, Inc.; Vanguard Lockers or comparable product by one of the following:
 - 1. Art Metal Products.
 - 2. ASI Storage Solutions Inc.
 - 3. DeBourgh Mfg. Co.

4. List Industries Inc.
 5. Lyon Workspace Products.
 6. Republic Storage Systems Company.
 7. Tennsco Corp.
- B. Locker Arrangement and Size: As indicated on Drawings.
- C. Material: Metallic-coated steel sheet.
- D. Body: Assembled by riveting or bolting body components together. Fabricate from unperforated steel sheet as follows:
1. Tops, Bottoms, and Intermediate Dividers: 0.024-inch nominal thickness, with single bend at sides.
 2. Backs and Sides: 0.024-inch nominal thickness, with full-height, double-flanged connections.
 3. Shelves: 0.024-inch nominal thickness, with double bend at front and single bend at sides and back. Two shelves in each locker, including one lower shelf for boots.
- E. Frames: Channel formed; fabricated from 0.060-inch nominal-thickness steel sheet; lapped and factory welded at corners; with top and bottom main frames factory welded into vertical main frames. Form continuous, integral door strike full height on vertical main frames.
- F. Doors: One piece; fabricated from 0.060-inch nominal-thickness steel sheet; formed into channel shape with double bend at vertical edges and with right-angle single bend at horizontal edges.
1. Doors less than 12 inches wide may be fabricated from 0.048-inch nominal-thickness steel sheet.
 2. Doors for box lockers less than 15 inches wide may be fabricated from 0.048-inch nominal-thickness steel sheet.
 3. Reinforcement: Manufacturer's standard reinforcing angles, channels, or stiffeners for doors more than 15 inches wide; welded to inner face of doors.
 4. Stiffeners: Manufacturer's standard full-height stiffener fabricated from 0.048-inch nominal-thickness steel sheet; welded to inner face of doors.
 5. Door Style: Vented panel as follows:
 - a. Louvered Vents: No fewer than six louver openings at top and bottom for single-tier lockers.
- G. Hinges: Welded to door and attached to door frame with no fewer than two factory-installed rivets per hinge that are completely concealed and tamper resistant when door is closed; fabricated to swing 180 degrees.
1. Knuckle Hinges: Steel, full loop, five or seven knuckles, tight pin; minimum 2 inches high. Provide no fewer than three hinges for each door more than 42 inches high.
- H. Projecting Door Handle and Latch: Finger-lift latch control designed for use with padlocks; positive automatic latching, chromium plated; pry and vandal resistant.
1. Latch Hooks: Equip doors 48 inches and higher with three latch hooks; fabricated from 0.105-inch nominal-thickness steel sheet; welded or riveted to full-height door strikes; with resilient silencer on each latch hook.

2. Latching Mechanism: Manufacturer's standard, rattle-free latching mechanism and moving components isolated to prevent metal-to-metal contact, and incorporating a prelocking device that allows locker door to be locked while door is open and then closed without unlocking or damaging lock or latching mechanism.
- I. Equipment: Equip each metal locker with identification plate, shelf, 3 single-prong wall hooks, and 1 coat rod, unless otherwise indicated on Drawings.
 - J. Accessories:
 1. Continuous Zee Base: Fabricated from manufacturer's standard thickness, but not less than 0.060-inch nominal-thickness steel sheet.
 - a. Height: 4 inches.
 2. Recess Trim: Fabricated from 0.048-inch nominal-thickness steel sheet.
 3. Filler Panels: Fabricated from manufacturer's standard thickness, but not less than 0.036-inch nominal-thickness steel sheet.
 4. Finished End Panels: Fabricated from 0.024-inch nominal-thickness steel sheet.
 - K. Finish: Baked enamel or powder coat.
 1. Color(s): As selected by Architect from manufacturer's full range.

2.03 LOCKER BENCHES

- A. Provide bench units with overall assembly height of 17-1/2 inches.
- B. Bench Tops: Manufacturer's standard one-piece units, with rounded corners and edges.
 1. Size: Minimum 9-1/2 inches wide by 1-1/4 inches thick except provide minimum 20-inch- wide tops where accessible benches are indicated.
 2. Laminated clear hardwood with one coat of clear sealer on all surfaces and one coat of clear lacquer on top and sides.
- C. Fixed Pedestals: Manufacturer's standard supports, with predrilled fastener holes for attaching bench top and anchoring to floor, complete with fasteners and anchors, and as follows:
 1. Tubular Steel: 1-1/2-inch- diameter steel tubing threaded on both ends, with standard pipe flange at top and bell-shaped cast-iron base; with baked-enamel or powder-coat finish; anchored with exposed fasteners.
 - a. Color: Match metal lockers.

2.04 FABRICATION

- A. Fabricate metal lockers square, rigid, and without warp and with metal faces flat and free of dents or distortion. Make exposed metal edges safe to touch and free of sharp edges and burrs.
 1. Form body panels, doors, shelves, and accessories from one-piece steel sheet unless otherwise indicated.
 2. Provide fasteners, filler plates, supports, clips, and closures as required for complete installation.

- B. Fabricate each metal locker with an individual door and frame; individual top, bottom, and back; and common intermediate uprights separating compartments. Factory weld frame members of each metal locker together to form a rigid, one-piece assembly.
- C. Knocked-Down Construction: Fabricate metal lockers using nuts, bolts, screws, or rivets for nominal assembly at Project site.
- D. Accessible Lockers: Fabricate as follows:
 - 1. Locate bottom shelf no lower than 15 inches above the floor.
 - 2. Where hooks, coat rods, or additional shelves are provided, locate no higher than 48 inches above the floor.
- E. Hooks: Manufacturer's standard ball-pointed type, aluminum or steel; zinc plated.
- F. Coat Rods: Fabricated from 1-inch diameter steel, chrome finished.
- G. Identification Plates: Manufacturer's standard, etched, embossed, or stamped aluminum plates, with numbers and letters at least 3/8 inch high.
- H. Continuous Base: Formed into channel or zee profile for stiffness, and fabricated in lengths as long as practical to enclose base and base ends of metal lockers; finished to match lockers.
- I. Recess Trim: Fabricated with minimum 2-1/2-inch face width and in lengths as long as practical; finished to match lockers.
- J. Filler Panels: Fabricated in an unequal leg angle shape; finished to match lockers. Provide slip-joint filler angle formed to receive filler panel.
- K. Finished End Panels: Designed for concealing unused penetrations and fasteners, except for perimeter fasteners, at exposed ends of nonrecessed metal lockers; finished to match lockers.
 - 1. Provide one-piece panels for double-row (back-to-back) locker ends.

2.05 STEEL SHEET FINISHES

- A. Factory finish steel surfaces and accessories except chrome-plated surfaces.
- B. Baked-Enamel Finish: Immediately after cleaning, pretreating, and phosphatizing, apply manufacturer's standard thermosetting baked-enamel finish. Comply with paint manufacturer's written instructions for application, baking, and minimum dry film thickness.
- C. Powder-Coat Finish: Immediately after cleaning and pretreating, electrostatically apply manufacturer's standard, baked-polymer, thermosetting powder finish. Comply with resin manufacturer's written instructions for application, baking, and minimum dry film thickness.

PART 3 - EXECUTION

3.01 EXAMINATION

- A. Examine walls, floors, and support bases, with Installer present, for compliance with requirements for installation tolerances and other conditions affecting performance of the Work.
- B. Prepare written report, endorsed by Installer, listing conditions detrimental to performance of the Work.
- C. Proceed with installation only after unsatisfactory conditions have been corrected.

3.02 INSTALLATION

- A. General: Install level, plumb, and true; shim as required, using concealed shims.
 - 1. Anchor locker runs at ends and at intervals recommended by manufacturer, but not more than 36 inches o.c. Using concealed fasteners, install anchors through backup reinforcing plates, channels, or blocking as required to prevent metal distortion.
 - 2. Anchor single rows of metal lockers to walls near top of lockers and to floor.
 - 3. Anchor back-to-back metal lockers to floor.
- B. Knocked-Down Metal Lockers: Assemble with standard fasteners, with no exposed fasteners on door faces or face frames.
- C. Equipment and Accessories: Fit exposed connections of trim, fillers, and closures accurately together to form tight, hairline joints, with concealed fasteners and splice plates.
 - 1. Attach hooks with at least two fasteners.
 - 2. Attach door locks on doors using security-type fasteners.
 - 3. Identification Plates: Identify metal lockers with identification indicated on Drawings.
 - a. Attach plates to each locker door, near top, centered, with at least two aluminum rivets.
 - 4. Attach recess trim to recessed metal lockers with concealed clips.
 - 5. Attach filler panels with concealed fasteners. Locate filler panels where indicated on Drawings.
 - 6. Attach finished end panels with fasteners only at perimeter to conceal exposed ends of nonrecessed metal lockers.
- D. Fixed Locker Benches: Provide no fewer than two pedestals for each bench, uniformly spaced not more than 72 inches apart. Securely fasten tops of pedestals to undersides of bench tops, and anchor bases to floor.

3.03 ADJUSTING, CLEANING, AND PROTECTION

- A. Clean, lubricate, and adjust hardware. Adjust doors and latches to operate easily without binding.
- B. Protect metal lockers from damage, abuse, dust, dirt, stain, or paint. Do not permit use during construction.
- C. Touch up marred finishes, or replace metal lockers that cannot be restored to factory-finished appearance. Use only materials and procedures recommended or furnished by locker manufacturer.

END OF SECTION 10 51 13

SECTION 10 56 00**STORAGE EQUIPMENT****PART 1 - GENERAL**

The General Provisions of the Contract, including General and Special Conditions and the requirements of Division 1, apply to the Work in this Section.

1.01 WORK INCLUDED

- A. Equipment items as listed below by Equipment Identifier:
1. 1106 Cabinet, five drawer, 33 inches, underbench (Ref. Part 2.01)
 2. 1140 Cabinet, flammable materials, large (Ref. Part 2.02)
 3. 1185 Cabinet, storage, shop (Ref. Part 2.03)
 4. 1200 Cart, parts (Ref. Part 2.04)
 5. 1455 Rack, bulk storage (Ref. Part 2.05)
 6. 1545 Rack, pallet, high bay (Ref. Part 2.06)
 7. 1688 Shelving unit, 18 inches (Ref. Part 2.07)
 8. 1698 Shelving unit, 18 inches, with six drawers (Ref. Part 2.08)
- B. Installation of equipment with labor, services, and incidentals necessary for complete and operational equipment installation.
- C. Utilities to be roughed in at location recommended by manufacturer.

1.02 QUALITY ASSURANCE

- A. Equipment shall be produced by a manufacturer of established reputation with a minimum of five years experience supplying specified equipment.

1.03 SUBMITTALS

- A. Product Data:
1. Submit Product Data in accordance with Division 1 - General Requirements of these specifications.
 2. Restrict submitted material to pertinent data. For instance, do not include manufacturer's complete catalog when pertinent information is contained on a single page.
 3. Additional costs resulting from substitution of products other than those specified, including drawing changes and construction, will be at the expense of the contractor.
- B. Operations and Maintenance Manual:
1. Submit Operations and Maintenance Manuals in accordance with Division 1- General Requirements of these specifications.
 2. Provide complete parts, operating, and maintenance manual covering equipment at time of installation.

3. Description of system and components.
4. Schematic diagrams of electrical, plumbing, and compressed air system.
5. Manufacturer's printed operating instructions.
6. Printed listing of periodic preventive maintenance items and recommended frequency to validate warranties. Failure to provide maintenance information will indicate that preventive maintenance is not a condition for validation of warranties.

1.04 PRODUCT SUBSTITUTIONS

- A. Follow requirements specified in Division 1 - General Requirements.
- B. Additional costs resulting from substitution of products other than those specified, by model number, including drawing changes and construction, will be at the expense of the Contractor.
- C. Substitution Approval: Prior to delivery or installation, submittals for each equipment item by Equipment Identifier shall be provided in accordance with Division 1 - General Requirements. Acceptance will be based on the technical requirements herein as determined by Owner and Architect.

1.05 WARRANTY

- A. Warrant work specified herein for one year from substantial completion against defects in materials, functions, and workmanship.
- B. Warranty shall include materials and labor necessary to correct defects.
- C. Defects shall include, but not be limited to noisy, rough or substandard operation; loose, damaged, and missing parts; and abnormal deterioration of finish. Defects shall not include damage due to neglect, misuse, or situations resulting from non-performance of a manufacturer's recommended preventive maintenance schedule.
- D. Submit warranties in accordance with Division 1 - General Requirements of these specifications.
- E. All parts shall be readily available locally in the United States.

1.06 PRODUCT DELIVERY, STORAGE, AND HANDLING

- A. Deliver equipment in manufacturer's containers, appropriately packaged and/or crated for protection during domestic shipment and storage in humid and/or dusty conditions.
- B. Indelibly label all containers, including those contained in others, on outside with item description(s) per title and Equipment Identifier of this specification.
- C. Provide equipment and material specified complete in one shipment for each equipment item. Split or partial shipments are not permissible.

1.07 BUY AMERICA COMPLIANCE

- A. The Contractor shall comply with the applicable Buy America requirements set forth in 49 U.S.C. 5323(j) and the applicable regulations in 49 C.F.R. Part 661, as amended. If the Contractor procures any capital items with Federal funds, it is the Contractor's responsibility to obtain the Buy America certification required under such regulations.
- B. Reference Division 1 for Buy America provisions.

PART 2 - PRODUCTS**2.01 CABINET, FIVE DRAWER, 33 INCHES, UNDERBENCH**
Equipment Identifier: 1106

- A. Manufacturer's Reference:
 - 1. Prime manufacturer: Specifications are based on equipment identified herein by manufacturer's name and model to establish minimal acceptable standards of quality, features, performance, and construction.
 - a. Eupto, Tatamy, PA (610) 253-2775
 - b. Model: 4433 with accessories
 - 2. Alternate manufacturers: Contingent upon compliance with these specifications and documentation requirements set forth in SUBMITTALS, equipment produced by other manufacturers, including the following, may be considered as equal.
 - a. Lyon Metal Products, Inc., Aurora, IL (708) 892-8941
 - b. Stanley Storage Systems, Allentown, PA (610) 797-6600
- B. Capacities/Dimensions:
 - 1. Overall dimensions, nominal:
 - a. Width: 30 inches
 - b. Depth: 27-3/4 inches
 - c. Height: 33-1/2 inches
 - 2. Quantity of drawers: Six
 - 3. Drawer capacity: 400 pounds each (minimum)
 - 4. Drawer dimensions:
 - 5. Usable width: 25-1/8 inches
 - a. Usable depth: 25-1/8 inches
 - b. Drawer usable height (drawers numbered top to bottom):
 - 1) Drawers 1: 3 inches
 - 2) Drawer 2-4: 4-1/2 inches
 - 3) Drawer 5 and 6: 6 inches

4) Drawer 5: 7 inches

C. Features/Performance/Construction:

1. Cabinet shall be heavy gauge channel formed sheet steel with mountings permitting installation of various height drawers, front columns with drilled and tapped bolt holes.
2. Base design shall include front and rear forklift openings of ample strength to permit moving of fully loaded cabinet. Front base plate shall be provided. Base shall be drilled for bolting to the floor.
3. Drawer suspension shall be designed for total interchangeability for all drawer heights. Sealed steel roller bearing system shall permit full drawer extension at rated capacity without sagging.
4. Drawers and trays shall be fabricated of smooth sheet metal with partition and divider mounting hole grid punched on 3/4 inch centers. Drawer walls shall be slotted on 3/4 inch centers for mounting dividers and partitions.
5. Drawer pulls shall be nominal 3/4 drawer width with 1 inch high label holder provided with paper labels and protective vinyl shields and end caps.
6. Drawer dividers shall have a minimum of 12 divided sections.
7. Drawer heights shall be available in front heights of 3 to 12 inches in not over 1-1/2 inch increments.
8. Provide seismic bracing and anchorage to meet any local, state, and national codes and provisions.

D. Accessories: Drawer divider sets

1. Equipto No. 4133F10, one each
2. Equipto No. 4135F20, two each
3. Equipto No. 4134F15, three each

E. Finish: Phosphate primer covered by durable enamel in Owner's choice of manufacturer's standard colors

2.02 CABINET, FLAMMABLE MATERIALS, LARGE
Equipment Identifier: 1140

A. Manufacturer's Reference:

1. Prime manufacturer: Specifications are based on equipment identified herein by manufacturer's name and model to establish acceptable standards of quality, performance, features, and construction.
 - a. Equipto, Tatamy, PA (610) 253-2775
 - b. Model: FSC 45S
2. Alternate manufacturers: *Contingent upon compliance with these specifications* and documentation requirements set forth in SUBMITTALS, equipment produced by other manufacturers, including the following, *may* be considered as equal.

- a. Lyon Metal Products, Inc., Aurora, IL (630) 892-8941
- b. Justrite Manufacturing Co., Des Plaines, IL (847) 298-9250

B. Capacities/Dimensions:

1. Storage capacity: Up to nine each, 5 gallon containers
2. Overall dimensions, nominal:
 - a. Width: 43 inches
 - b. Depth: 18 inches
 - c. Height: 65 inches
3. Shipping weight, nominal: 353 pounds

C. Features/Performance/Construction:

1. Cabinet shall comply with NFPA combustible liquids Code No. 30 and OSHA safety requirements.
2. Construction shall consist of double wall 18 gauge sheet steel with 2 inch air space between inner and outer walls.
3. Cabinet shall have a 2 inch pan-type bottom.
4. Two screened flame arrester vents per cabinet, one each at left side bottom and right side top, shall be threaded for and provided with 2 inch NPT steel plugs.
5. Leveling feet shall be provided at all four corners.
6. Electrical grounding attachments shall be provided on each side.
7. A spring-loaded fusible link with 160 degree F melting point shall actuate self closing double swinging doors mounted with full-length piano hinges. Doors shall be provided with three-point latch mechanism and key lock.
8. Two each adjustable shelves shall be provided between 5-3/8 inches from top and 7-5/16 inches from bottom on 1-5/8 inch centers.
9. Provide seismic bracing and anchorage to meet any local, state, and national codes and provisions.

D. Finish: Durable enamel in safety sun yellow with "FLAMMABLE - KEEP FIRE AWAY" in minimum 4 inch bright red letters across doors

2.03 CABINET, STORAGE, SHOP

Equipment Identifier: 1185

A. Manufacturer's Reference:

1. Prime manufacturer: Specifications are based on equipment identified herein by manufacturer's name and model to establish minimal acceptable standards of quality, features, performance, and construction.
 - a. Equipto, Tatamy, PA (610) 253-2775
 - b. Model: 1710
2. Alternate manufacturers: *Contingent upon compliance with these specifications* and documentation requirements set forth in SUBMITTALS,

equipment produced by other manufacturers, including the following, *may* be considered as equal.

- a. Lyon Metal Products, Inc., Aurora, IL (630) 892-8941
- b. Republic Storage Systems, Canton, OH (216) 438-5800

B. Capacities/Dimensions:

1. Shelf capacity: 200 pounds per shelf (minimum)
2. Overall dimensions:
 - a. Width: 36 inches
 - b. Depth: 18 inches
 - c. Height: 78 inches
 - d. Space remaining 4 shelves evenly, approximately 15 inches center to center

C. Features/Performance/Construction:

1. Four shelves, flanged, constructed of 18 gauge steel. Shelf adjustments on maximum 2 inch centers without removing fasteners.
2. Doors shall have a three-point locking system with factory key-lockable handle. Doors shall open a full 180 degrees and be flush mounted when closed with latching actuated cast steel handle.
3. Each door shall be hinged on three welded heavy-duty steel pin hinges.
4. Back, front, and sides shall be flush with no bolt heads on front or sides.
5. Provide seismic bracing and anchorage to meet any local, state, and national codes and provisions.

D. Finish: Durable enamel in Owner's choice of manufacturer's standard colors

2.04 CART, PARTS

Equipment Identifier: 1200

A. Manufacturer's Reference:

1. Prime manufacturer: Specifications are based on equipment identified herein by manufacturer's name and model to establish minimal acceptable standards of quality, features, performance, and construction.
 - a. Pucel Enterprises, Inc., Cleveland, OH (216) 881-4604
 - b. Model: 2448-DT-3-P
2. Alternate manufacturers: *Contingent upon compliance with these specifications* and documentation requirements set forth in SUBMITTALS, equipment produced by other manufacturers, including the following, *may* be considered as equal.
 - a. Hodge Manufacturing Co., Springfield, MA (413) 781-6800
 - b. Equipto, Tatamy, PA (610) 253-2775

B. Capacities/Dimensions:

1. Cart capacity: 1,000 pounds (minimum)
2. Overall dimensions:
 - a. Width: 24 inches
 - b. Length: 48 inches
 - c. Height: 32-1/2 inches

C. Features/Performance/Construction:

1. Cart and shelves shall be constructed of 12 gauge steel.
2. Shelves shall be tray style with a clearance between shelves of 10 inches.
3. Casters shall be phenolic with two casters rigid and two casters swivel. Casters shall be able to accommodate 1,000 pounds.

D. Finish: Durable enamel in Owner's choice of manufacturer's standard colors

2.05 RACK, BULK STORAGE
Equipment Identifier: 1455

A. Manufacturer's Reference:

1. Prime manufacturer: Specifications are based on equipment identified herein by manufacturer's name and model to establish acceptable standards of quality, performance, features, and construction.
 - a. Equipto, Tatamy, PA (610) 253-2775
 - b. Model: 1028D62S (starter unit) and/or 1028D62A (add-on unit) and Accessories
2. Alternate manufacturers: *Contingent upon compliance with these specifications* and documentation requirements set forth in SUBMITTALS, equipment produced by other manufacturers, including the following, *may* be considered as equal.
 - a. Lyon Metal Products Inc., Aurora, IL (630) 892-8941
 - b. Republic Storage Systems, Canton, OH (216) 438-5800

B. Capacities/Dimensions:

1. Beams:
 - a. Capacity: 2,630 pounds per pair of beams
 - b. Dimensions:
 - 1) Length: 72 inches
 - 2) Width: 3-1/2 inches
 - 3) Depth: 2 inches overall front to back
 - c. Number of beams per rack section: Eight total (four pairs)

2. Uprights:
 - a. Capacity: 8,900 pounds per upright
 - b. Dimensions:
 - 1) Width: 1-5/8 inches
 - 2) Depth, nominal: 24 inches
 - 3) Height: 96 inches
 - c. Number of uprights per rack section: Two minimum
 3. Overall dimensions, nominal:
 - a. Length: 72 inches
 - b. Width: 24 inches
 - c. Height: 96 inches
 4. Weight: 220 pounds
- C. Features/Performance/Construction:
1. Beams:
 - a. Construction: Beams shall be solid shaped welded heavy gauge steel with heavy beam clips MIG-welded to beam ends.
 - b. Attachment: Beam clips shall have three beam hooks each for insertion into upright slots.
 2. Supports: Tie bars for each pair of beams shall fit into slots in beams. There shall be a minimum of two supports provided for each pair of beams.
 3. Uprights:
 - a. Construction: Upright posts shall be heavy duty 1-5/8 by 1-13/16 inch welded 16 gauge steel with tubular steel cross and diagonal members.
 - b. Adjustment: Upright posts shall have tapered slots on 1-1/2 inch centers for vertical beam adjustment
 4. Decking:
 - a. Construction: Decking shall be 18 gauge corrugated shaped steel.
 - b. Capacity: Decking shall have a capacity of 2,778 pounds but load is limited to support capacity of beams and uprights.
 5. Provide seismic bracing and anchorage to meet any local, state, and national codes and provisions.

- D. Accessories:
1. Anchors: Floor, for seismic bracing, Equipto No. 190317A, four per starter unit, two per add on unit
- E. Finish: Durable enamel in Owner's choice of manufacturer's standard colors
- 2.06 RACK, PALLET, HIGH BAY
Equipment Identifier: 1545
- A. Manufacturer's Reference:
1. Prime manufacturer: Specifications are based on equipment identified herein by manufacturer's name and model to establish acceptable standards of quality, performance, features, and construction.
 - a. Lyon Metal Products, Inc., Aurora, IL (630) 892-8941
 - b. Model: Uprights U0619242, Beams B6500108, and Decking WD5242L
 2. Alternate manufacturers: *Contingent upon compliance with these specifications* and documentation requirements set forth in SUBMITTALS, equipment produced by other manufacturers, including the following, *may* be considered as equal.
 - a. Unarco Materials Handling, Springfield, TN (800) 862-7271
 - b. Lista, Holliston, MA (508) 429-1350
- B. Capacities/Dimensions:
1. Beams:
 - a. Minimum capacity: 4,900 pounds per pair of beams
 - b. Dimensions:
 - 1) Length: 108 inches
 - 2) Thickness: 4-3/10 inches
 - c. Installed beam height from finished floor:
 - 1) Top beams: 192 inches
 - 2) Remaining four beam levels: 36 inch spacing
 - 3) Verify beam heights with Owner prior to installation
 2. Uprights:
 - a. Capacity: 29,055 pounds per pair of uprights
 - b. Dimensions:
 - 1) Thickness: 3 inches wide by 3 inches deep
 - 2) Depth: 42 inches
 - 3) Height: 192 inches

3. Decking:
 - a. Width: 52 inches
 - b. Depth: 42 inches
 - c. Number of channels: Three
 - d. Capacity: 2,500 pounds
 - e. Panels per shelf: Two
 4. Overall dimensions, nominal:
 - a. Width: 108 inches
 - b. Depth: 42 inches
 - c. Height: 192 inches
- C. Features/Performance/Construction:
1. Beams:
 - a. Construction: Beams shall be welded, step-type, heavy gauge steel box channel.
 - b. Attachment: High tensile studs, four each on each end shall engage tapered keyhole slots in uprights. Integral safety catch automatically snaps and locks into place when beam is properly seated.
 2. Uprights:
 - a. Construction: Continuously MIG welded, heavy gauge steel box section uprights shall have deep channel cross and diagonal K-brace members.
 - b. Adjustment: Tapered keyhole slots on 2 inch centers shall be provided for vertical beam adjustments.
 - c. Base plate: Heavy gauge steel shall be LAP welded to upright with holes for anchoring to floor.
 - d. Row ends: An extra upright frame shall be provided to finish each row as indicated on equipment drawings.
 3. Decking:
 - a. Wire mesh: Continuously MIG welded, 2-1/2 by 4 inches by 6 gauge
 - b. Support channels: 13 gauge steel
 4. Provide seismic bracing and anchorage to meet any local, state, and national codes and provisions.
- D. Finish: Durable enamel in Owner's choice of manufacturer's standard colors

2.07 SHELVING UNIT, 18 INCHES

Equipment Identifier: 1688

A. Manufacturer's Reference:

1. Prime manufacturer: Specifications are based on equipment identified herein by manufacturer's name and model to establish minimal acceptable standards of quality, features, performance, and construction.
 - a. Equipto, Tatamy, PA (610) 253-2775
 - b. Model: 773-8S shelving unit (with 773-8A add on and accessories)
2. Alternate manufacturers: *Contingent upon compliance with these specifications* and documentation requirements set forth in SUBMITTALS, equipment produced by other manufacturers, including the following, *may* be considered as equal.
 - a. Lyon Metal Products, Inc., Aurora, IL (630) 892-8941
 - b. Stanley Vidmar, Allentown, PA (610) 797-6600

B. Capacities/Dimensions:

1. Number of shelves: Eight
2. Shelf capacity: 1,000 pounds per shelf
3. Overall dimensions, nominal:
 - a. Width: 36 inches (72 inches with add on)
 - b. Depth: 18 inches
 - c. Height: 84 inches
4. Installed height from finished floor, nominal:
 - a. Bottom shelf: 4-1/2 inches
 - b. Top shelf: 84 inches
 - c. Space remaining bottom six shelves evenly, approximately 12 inches center to center, and the top two shelves 10-1/2 inches center to center
5. Weight: 170 pounds

C. Features/Performance/Construction:

1. Shelf construction shall be double flange 18 gauge steel and double flanged box-formed edges on all four sides.
2. Uprights shall be double flanged uprights with tapered bracket slots punched on 1-1/2 inch centers for vertical shelf adjustment.
3. Shelf fastening shall consist of slip-in shelf brackets which reinforce and securely lock shelf into place in all four corners.
4. Units shall share common end panels with adjoining units. Back-to-back units shall be joined with common upright joints.

-
5. Provide seismic bracing and anchoring to meet any local, state, and national codes and provisions.
- D. Accessories:
1. Anchors: Floor, for seismic bracing, Equipto No. 190317A, four per starter unit, two per add-on unit
- E. Finish: Durable enamel in owner's choice of manufacturer's standard colors
- 2.08 SHELIVING UNIT, 18 INCHES, WITH SIX DRAWERS
Equipment Identifier: 1698
- A. Manufacturer's Reference:
1. Prime manufacturer: Specifications are based on equipment identified herein by manufacturer's name and model to establish minimal acceptable standards of quality, features, performance, and construction.
 - a. Equipto, Tatamy, PA (610) 253-2775
 - b. Model: 4205DN
 2. Alternate manufacturers: *Contingent upon compliance with these specifications* and documentation requirements set forth in SUBMITTALS, equipment produced by other manufacturers, including the following, *may* be considered as equal.
 - a. Lyon Metal Products, Inc., Aurora, IL (630) 892-8941
 - b. Lista International Corp., Holliston, MA (508) 429-1350
- B. Capacities/Dimensions:
1. Number of shelves: Four total
 2. Number of drawers: Six total
 3. Shelf capacity: 1,000 pounds per shelf
 4. Drawer capacity: 200 pounds per drawer (minimum)
 5. Overall dimensions, nominal:
 - a. Width: 36 inches
 - b. Depth: 18 inches
 - c. Height: 84 inches
 6. Drawer dimensions, nominal:
 - a. Width: 36 inches
 - b. Depth: 18 inches
 - c. Height: 6 inches
 7. Installed shelf height from finished floor, nominal (shelves numbered one through four, top to bottom):
 - a. Shelf one: 74 inches

- b. Shelf two: 62 inches
 - c. Shelf three: 50 inches
 - d. Shelf four: 4-1/2 inches
 - e. Shelf height: 12 inches
- C. Features/Performance/Construction:
- 1. Shelf construction shall be double flange 18 gauge steel with box-formed edges on all four sides with front and rear shelf edge reinforced channels.
 - 2. Uprights shall be double flanged uprights with tapered bracket slots punched on 1-1/2 inch centers for vertical shelf adjustment.
 - 3. Shelf fastening shall consist of slip-in shelf brackets which reinforce and securely lock shelf into place in all four corners.
 - 4. Units shall share common end panels with adjoining units or common back panels when installed back-to-back. Back-to-back units shall be joined with common upright joints.
 - 5. Rolling drawers shall be 22 gauge steel with side and back of drawer to be punched with slots to accommodate vertical partitions and dividers. Drawer roller guides to be bolted front to back at uprights.
 - 6. Shelves to be installed above and below banks of drawers.
 - 7. Provide seismic bracing and anchorage to meet any local, state, and national codes and provisions.
- D. Accessories: Drawer, 36 inches wide, six per unit, with dividers
- E. Finish: Durable enamel in owner's choice of manufacturer's standard colors

PART 3 - EXECUTION

3.01 INSPECTION

- A. Coordinate location of rough-in work and utility stub-outs to assure match with equipment to be installed.
- B. Inspect delivered equipment for damage from shipping and exposure to weather. Compare delivered equipment with packing lists and specifications to assure receipt of all equipment items and specified accessories.

3.02 INSTALLATION

- A. Perform work under direct supervision of Foreman of Construction Superintendent with authority to coordinate installation of scheduled equipment with Architect or designated representative.
- B. Install equipment in accordance with plans, shop drawings, and manufacturer's instructions:
 - 1. Positioning: Place equipment in accordance with any noted special positioning requirements generally level (or slight slope as required by instructions), plumb, and at right angles to adjacent work.

2. Fitting: Where field cutting or trimming is necessary, perform in a neat, accurate, professional manner without damaging equipment or adjacent work.
 3. Anchorage: Attach equipment as directed by Architect or designated representative. Installation fasteners shall be installed to avoid scratching or damaging adjacent surfaces.
- C. Upon completion of work, finish surfaces shall be free of tool marks, scratches, blemishes, and stains.

3.03 TESTING

- A. After final installation is complete and prior to authorizing payment, specified equipment shall be checked with specifications in the presence of the Architect or designated representative using acceptance procedures provided by the manufacturer.

3.04 CLEANUP

- A. Touch-up damage to painted finishes.
- B. Wipe and clean equipment of any oil, grease, and solvents, and make ready for use.
- C. Clean area around equipment installation and remove packing and installation debris from job site.
- D. Notify Architect or designated representative for acceptance inspection.

END OF SECTION

SECTION 11 11 00**VEHICLE SERVICE EQUIPMENT****PART 1 - GENERAL**

The General Provisions of the Contract, including General and Special Conditions and the requirements of Division 1, apply to the Work in this Section.

1.01 WORK INCLUDED

- A. Equipment items as listed below by Equipment Identifier:
1. 2161 Compressor, air, receiver mounted, 10 HP duplex (Ref. Part 2.1)
 2. 2228 Dryer, air, refrigerated, 100 CFM (Ref. Part 2.2)
 3. 7520 Pump, air piston, 10:1 ratio (GO) (Ref. Part 2.3)
 4. 7540 Pump, diaphragm, used fluid evacuation (UGO) (Ref. Part 2.4)
 5. 7700 Reel banks, general (Ref. Part 2.5)
 6. 7720 Reel bank (CA, GO) (Ref. Part 2.6)
 7. 7960 Tank, double wall, cube, 280 gallon (GO, UGO) (Ref. Part 2.7)
 8. 7999 Receiver, used oil, 25 gallon (Ref. Part 2.8)
- B. Roughing-in installation of equipment, and final connection of utilities, with labor, services, and incidentals necessary for complete and operational equipment installation.

1.02 REFERENCES

- A. ASME Code for Unfired Pressure Vessels

1.03 QUALITY ASSURANCE

- A. Manufacturer's Representative:
1. Installation: Provide a qualified manufacturer's representative at site to supervise work related to equipment installation, check out, and start up.
 2. Training: Provide a qualified manufacturer's representative to provide training to Owner's maintenance personnel in operation and maintenance of specified equipment.

1.04 SUBMITTALS

- A. Product Data:
1. Submit Product Data in accordance with Division 1 - General Requirements of these specifications.
 2. Restrict submitted material to pertinent data. For instance, do not include manufacturer's complete catalog when pertinent information is contained on a single page.
- B. Operations and Maintenance Manual:

1. Submit Operations and Maintenance Manuals in accordance with Division 1- General Requirements of these specifications.
 2. Provide complete parts, operating, and maintenance manual covering equipment at time of installation.
 3. Description of system and components.
 4. Schematic diagrams of electrical, plumbing, and compressed air system.
 5. Manufacturer's printed operating instructions.
 6. Printed listing of periodic preventive maintenance items and recommended frequency to validate warranties. Failure to provide maintenance information will indicate that preventive maintenance is not a condition for validation of warranties.
- C. Shop Drawings: Submit Shop Drawings in accordance with of Division 1 - General Requirements of these specifications.
- D. Include certified data for each unit and accessory system indicating the following:
1. Air compressor performance curves at summer design condition
 2. Intercooler performance at summer design condition
 3. Air dryer performance at 38 degrees F, dew point at 175 PSIG
 4. Indicate components, assembly, dimensions, weights and loadings, required clearances, location and size of field connections, intake air filter outline, blow-off silencer outline, main motor drive data, aftercoolers, control panel, and electrical pneumatic schematics.

1.05 PRODUCT SUBSTITUTIONS

- A. Follow requirements specified in Division 1 - General Requirements.
- B. Additional costs resulting from substitution of products other than those specified, by model number, including drawing changes and construction, will be at the expense of the Contractor.
- C. Substitution Approval: Prior to delivery or installation, submittals for each equipment item by Equipment Identifier shall be provided in accordance with Division 1 - General Requirements. Acceptance will be based on the technical requirements herein as determined by Owner and Architect.

1.06 WARRANTY

- A. Warrant work specified herein for one year from substantial completion against defects in materials, functions, and workmanship.
- B. Warranty shall include materials and labor necessary to correct defects.
- C. Defects shall include, but not be limited to noisy, rough or substandard operation; loose, damaged, and missing parts; and abnormal deterioration of finish. Defects shall not include damage due to neglect, misuse, or situations resulting from non-performance of a manufacturer's recommended preventive maintenance schedule.

1.07 PRODUCT DELIVERY, STORAGE, AND HANDLING

- A. Deliver equipment in manufacturer's containers, appropriately packaged and/or crated for protection during domestic shipment and storage in humid and/or dusty conditions.
- B. Indelibly label all containers, including those contained in others, on outside with item description(s) per title and Equipment Identifier of this specification.
- C. Provide equipment and material specified complete in one shipment for each equipment item. Split or partial shipments are not permissible.

1.08 LABELING

- A. Manufacturer shall securely attach in a prominent location, on each major item of equipment, a non-corrosive nameplate showing manufacturer's name, address, model number, serial number, and pertinent utility or operating data.
- B. All electrical equipment and materials shall be new and shall be listed by Underwriter's Laboratories, Inc. (UL) in categories for which standards have been set by that agency and labeled as such in the manufacturer's plant.
- C. Provide air receivers meeting requirements of ASME Code for Unfired Pressure Vessels and carry ASME approval stamp.

1.09 BUY AMERICA COMPLIANCE

- A. The Contractor shall comply with the applicable Buy America requirements set forth in 49 U.S.C. 5323(j) and the applicable regulations in 49 C.F.R. Part 661, as amended. If the Contractor procures any capital items with Federal funds, it is the Contractor's responsibility to obtain the Buy America certification required under such regulations.
- B. Reference Division 1 for Buy America compliance.

PART 2 - PRODUCTS**2.01 COMPRESSOR, AIR, RECEIVER MOUNTED, 10 HP DUPLEX**
Equipment Identifier: 2161

- A. Manufacturer's Reference:
 - 1. Prime manufacturer: Specifications are based on equipment identified herein by manufacturer's name and model to establish acceptable standards of quality, performance, features, and construction.
 - a. Champion, Princeton, IL (815) 875-3321
 - b. Model: HR10D-25 with accessories (Reference Sheet Q750 Air Compressor Detail)
 - 2. Alternate manufacturers: *Contingent upon compliance with these specifications* and documentation requirements set forth in SUBMITTALS,

equipment produced by other manufacturers, including the following, *may* be considered as equal.

- a. Ingersoll Rand, Davidson, NC (704) 896-4000
 - b. Quincy Compressor, Quincy, IL (217) 222-7700
- B. General Description: Provide duplex compressor unit consisting of air-cooled motor compressors (10 HP), air receiver, after cooler, pressure reducing station, spring isolators and operating controls.
- C. Capacities/Dimensions:
1. Motors: 10 HP, two each
 2. Receiver: 200 to 250 gallons
 3. Rating: 175 PSIG
 4. Speed: 740 RPM
 5. Displacement: 86.2 CFM each
 6. Delivery: 69.6 CFM each
 7. Bore diameters: 4-5/8 and 2-1/2 inches
 8. Stroke: 3 inches
 9. Number of cylinders: Four
 10. Output valve: 3/4 inch NPT(F)
 11. Overall dimensions:
 - a. Width: 88 inches
 - b. Depth: 29 inches
 - c. Height: 62 inches
 12. Boltdown dimensions:
 - a. Length: 55 inches
 - b. Width: 27 inches
 13. Weight (approximate): 1,730 pounds
- D. Features/Performance/Construction:
1. Compressor construction:
 - a. Construct compressor unit with cast iron housing and head, heat treated forged steel or ductile iron shaft, aluminum alloy connection rods, aluminum pistons with lubricated carbon steel rings, high-strength alloy suction and discharge valves. Statically and dynamically balance rotating parts.
 - b. Mount motor and compressor on one-piece ribbed cast iron or welded steel base with provision for V-belt adjustment.
 2. After cooler:
 - a. Provide air compressor with air after cooler suitable for operation under 135 PSIG working pressure.

- b. Provide a belt guard style after cooler mounted on the compressor belt guard, with automatic condensate trap and automatic float drain.
 - c. After cooler capacity to cool discharge air to within 25 degrees F of ambient air temperature with compressors operating at specified capacity.
 3. Air receiver:
 - a. Provide vertical or horizontal receiver stamped ASME rated for working pressure of 200 PSIG. Flange or screw inlet and outlet connections, welded steel construction.
 - b. Fittings to include adjustable pressure regulator, safety valve, pressure gauge, drain cock, and automatic pneumatic tank drain.
 4. Pressure reducing valve:
 - a. Provide pressure reducing stations complete with automatic reducing valve and bypass, and low pressure side relief valve and gauge.
 - b. Compressor shall be provided with automatic start/stop capacity controls. In addition, provide centrifugal unloading to ensure for an unloaded compressor at start-up.
 - c. Valve capacity suitable to compressor reduce pressure from 50 PSI to 180 PSI. Pressure reducing valve to be adjustable upward from reduced pressure.
 - d. Provide valves with bronze or semi-steel bodies with stainless steel springs, stems, and seats.
- E. Controls:
 1. Pressure switch to cutout at 100 PSI with minimum differential of 20 PSI.
 2. Compressor regulation through a lead-lag switch.
 3. Provide electrical automatic alternation. In the event one compressor fails, another compressor automatically maintains air pressure.
- F. Accessories:
 1. Magnetic Starter
 2. Vibration isolators, Model No. VI
 3. Automatic pneumatic tank drain, Model No. ATDP
 4. Oil monitor, Model No. LOLM
 5. Air-cooled aftercooler, Model No. ACAC (x2)
 6. Condensation Filter, Model No. CFF170A
- A. Utility Requirements:
 1. Electrical: 460 VAC, 3 phase, 10 HP per motor (20 HP total)
- B. Finish: Durable enamel in manufacturer's standard color

2.02 DRYER, AIR, REFRIGERATED, 100 CFM
Equipment Identifier: 2228

A. Manufacturer's Reference:

1. Prime manufacturer: Specifications are based on equipment identified herein by manufacturer's name and model to establish minimal acceptable standards of quality, features, performance, and construction.
 - a. Champion, Princeton, IL (815) 875-3321
 - b. Model: CRN100 (Reference Sheet Q750 Air Dryer Detail)
2. Alternate manufacturers: *Contingent upon compliance with these specifications* and documentation requirements set forth in SUBMITTALS, equipment produced by other manufacturers, including the following, *may* be considered as equal.
 - a. Ingersoll Rand, Davidson, NC (704) 896-4000
 - b. Quincy Compressors, Quincy, IL (217) 222-7000

B. Capacities/Dimensions:

1. Capacity:
 - a. 38 degrees F: 100 CFM
 - b. 50 degrees F: 130 CFM
2. Overall dimensions:
 - a. Width: 29 inches
 - b. Depth: 20 inches
 - c. Height: 38 inches
3. Drain connection: 1 inch NPT(F)
4. Air connection: 1 inch NPT(M)
5. Maximum working pressure: 232 PSIG (Level 1 controller standard)
6. Weight: 251 pounds

C. Features/Performance/Construction:

1. Provide refrigerated air dryer of self-contained mechanical refrigeration type complete with heat exchanger, refrigeration compressor, moisture removal trap, internal wiring and piping, and full refrigerant charge.
2. Provide air inlet and outlet connections at same level and factory insulated.
3. Heat exchangers to consist of air-to-air and refrigerant-to-air coils. Provide centrifugal type moisture separator located at discharge of heat exchanger. Provide heat exchangers with automatic control system to bypass refrigeration system on low or no load condition.

4. Refrigeration unit of hermetically sealed type to operate continuously to maintain specified 35 degree F dew point. House unit in steel cabinet provided with access door and panel for maintenance and inspection.
 5. Provide dryer with air inlet temperature gauge, air inlet pressure gauge, ON/OFF switch, high temperature LED, status indicators, refrigerant gauge, and Level 1 controller.
 6. Provide seismic bracing and anchorage to meet any local, state, and national codes and provisions.
- D. Utility Requirements:
1. 120 VAC, 1 phase, 1/2 HP
- E. Finish: Durable enamel in manufacturer's standard color
- 2.03 PUMP, AIR PISTON 10:1 RATIO (GO)
Equipment Identifier: 7520
- A. Manufacturer's Reference:
1. Prime manufacturer: Specifications are based on equipment identified by manufacturer's name and model to establish acceptable standard of quality, performance, features and construction.
 - a. Graco, Inc., Minneapolis, MN (612) 623-6000
 - b. Model: Fire-Ball 225853 (Reference Sheet Q750 Tank Mounted Piston Pump Detail)
 2. Alternate manufacturers: *Contingent upon compliance with these specifications* and documentation requirements set forth in SUBMITTALS, equipment produced by other manufacturers, including the following, *may* be considered as equal.
 - a. Balcrank Corporation, Weaverville, NC (828) 645-4261
 - b. Lincoln Industrial Corporation, St. Louis, MO (314) 679-4200
- B. Capacities/Dimensions:
1. Maximum fluid pressure: 1,800 PSI
 2. Air motor diameter: 4-1/4 inches
 3. Operating range: 40 to 180 PSI
 4. Continuous duty flow rate: 3 to 4 GPM
 5. Air consumption (approximate) at 100 PSI: 32 CFM
 6. Air inlet: 1/2 inch NPT (F)
 7. Material outlet: 3/4 inch NPT(F)
 8. Material inlet: 1-1/2 inch NPT(F)
- C. Features/Performance/Construction:
1. Provide pneumatic operated piston pump operable with maximum air pressure of 180 PSI.

2. Provide with complete assembly, including adapters for mounting on storage tanks, combination air filter, regulator, pressure gauge, lubricator, air and product valves, and hose and fitting kit suitable for product.
3. Air motor shall be a non-corrosive design with no metal-to-metal contact compatible with product being delivered.
4. Provide thermal relief valves for the pumping system.
5. Provide connection from pump back to product tank for proper drain back of fluid in piping riser line and pump.
6. Provide compressed air runaway valve before product fluid pump to eliminate unregulated fluid flow in the event of a product pipe break.

D. Accessories:

1. Air regulator, 1/2 inch: Graco No. 104266
2. Pressure gauge: Graco No. 100906
3. Low level cut off: Graco No. 203688

E. Utility Requirements:

1. Compressed air: 100 PSI, 32 CFM, provide filter, regulator, and valves

2.04 PUMP, DIAPHRAGM, USED FLUID EVACUATION (UGO)
Equipment Identifier: 7540

A. Manufacturer's Reference:

1. Prime manufacturer: Specifications are based on equipment identified by manufacturer's name and model to establish acceptable standards of quality, performance, features and construction.
 - a. Graco, Inc., Minneapolis, MN (612) 623-6000
 - b. Model: 647016 with accessories (Reference Sheet Q750 Pump for Used Oil Detail)
2. Alternate manufacturers: *Contingent upon compliance with these specification* and documentation requirements set forth in SUBMITTALS, equipment produced by other manufacturers, including the following, *may* be considered as equal.
 - a. Balcrank Corporation, Weaverville, NC (828) 645-4261
 - b. Lincoln Industrial Corporation, St. Louis, MO (314) 679-4300

B. Capacities/Dimensions:

1. Products: Used gear oil
2. Pump ratio: 1:1
3. Maximum air pressure: 125 PSI
4. Maximum fluid outlet pressure: 100 PSI
5. Free flow rate: 50 GPM
6. Continuous duty delivery: 2.4 GPM
7. Air consumption (approximate): 67 CFM

8. Air inlet: 1/2 inch NPT(F)
9. Fluid outlet: 1 inch NPT(M)
10. Fluid inlet: 1 inch NPT(M)
11. Regulator: 1/2 inch NPT(F)
12. Filter: 1/2 inch NPT(F)

C. Features/Performance/Construction:

1. Diaphragm pump shall provide 125 PSI air pressure for pump size and capacity as scheduled.
2. Pump shall be provided in complete assembly, including accessories for mounting on walls or adjacent to storage tanks as scheduled, combination air filter, regulator, coupler, nipple, air valve, wall bracket, relief kit, relief valves, wire and clamp, hose kit, adapter kit, and dual inlet manifold suitable for this product.
3. Materials: Compatible with product being shelved.
4. Pump shall handle oil, hydraulic oil, automatic transmission fluid, anti-freeze, windshield washer fluid, water, or fuel.
5. Pump shall have a tank monitoring system that shuts off the pump via solenoid valve when the used fluid tank is full.
6. Monitoring system shall notify users with a strobe light and an audible alarm system.
7. Audible alarm shall be a minimum of 250 milliamps.

D. Accessories:

1. Wall bracket accessory kit, Graco Model No. 24C637
2. Regulator/filter assembly: 1/2 inch NPT(f), Graco Model No. 246947 and appropriate fittings and hoses for a complete and operable installation
3. Fluid installation kit, Graco Model No. 240685, includes swivel union, 4 foot coupled fluid hose, short nipple, y-strainer, 10 foot coupled fluid hose, ball valve, elbow, and nipple
4. Drum adapter kit, Graco Model No. 240832, includes elbow, nipple, valve, male and female camlock couplers
5. Grounding wire and clamp, Graco Model No. 238909
6. Quick connect air coupler, 1/2 inch NPT, Graco Model No. 110199
7. Quick connect air nipple, 1/2 inch NPT, Graco Model No. 110196
8. Air muffler, Graco Model No. 112182
9. Tank monitoring system:
 - a. Manufacturer: BJ Enterprises, (800) 457-0749
 - b. Tank monitoring system power supply: BJE Model No. 007-7575, with strobe light, one each
 - c. Preferred option: Solenoid valve should be located on the main level. Run separate compressed air piping to the pump.
 - d. Solenoid valve: BJE Model No. 007SV-7580, one each
10. Provide label "USED GEAR OIL" on pump to identify product (minimum 1 inch lettering)

E. Utility Requirements:

1. Electrical: 120 VAC, 2 A, standard grounded receptacle
2. Compressed air: 125 PSI, 67 CFM, 1/2 inch NPT(F), provide filter, regulator, and valves

2.05 REEL BANKS, GENERAL
Equipment Identifier: 7700

A. Manufacturer's Reference:

1. Prime manufacturer: Specifications are based on equipment identified by manufacturer's name and model to establish acceptable standards of quality, performance, features and construction.
 - a. Graco, Inc., Minneapolis, MN (612) 623-6000
 - b. Model: HSL56B (CA), HSM65B (GO)
2. Alternate manufacturers: *Contingent upon compliance with these specification* and documentation requirements set forth in SUBMITALS equipment produced by other manufacturers, including the following, *may be considered as equal*.
 - a. Lincoln, A Pentair Company, St. Louis, MO (314) 679-4200
 - b. Balcrank Corporation, Weaverville, NC (828) 645-4261

B. Capacities/Dimensions:

1. Overall reel dimensions, nominal:
 - a. Reels (CA, GO):
 - 1) Width: 8-1/2 inches
 - 2) Height: 25-3/4 inches
 - 3) Reel diameter: 20 inches
2. Reel fluid inlet:
 - a. Air: 1/2 inch NPT(M)
 - b. Chassis grease: 3/8 inch NPT(M)
 - c. Other commodities: 1/2 inch NPT(M)
3. Hose:
 - a. Compressed Air:
 - 1) Length: 65 feet
 - 2) Inside diameter: 3/8 inch
 - 3) Working pressure: 180 PSI
 - b. Gear oil:
 - 1) Length: 50 feet
 - 2) Inside diameter: 1/2 inch

- 3) Working pressure: 1,500 PSI
 - c. Other commodities:
 - 1) Length: 50 feet
 - 2) Inside diameter: 1/2 inch
 - 3) Working pressure: 1,000 PSI
- C. Features/Construction:
1. Construction: Frames, discs, and drum shall be fabricated of heavy gauge steel.
 2. Double pedestal arm: Reel frame shall have double pedestal arms that are welded and gusseted.
 3. Hose guide arm: Reel hose guide arm shall be adjustable with nylon rollers on all four sides of roller assembly at hose opening.
 4. Ball stop: Adjustment of hose extension length shall be permitted by ball stop.
 5. Rewind mechanism: Reel spring shall be enclosed and fastened to reel drum with a reinforcing clip.
 6. Bearings and ratchet latch: Reel shall have permanently lubricated bearings and extra large ratchet latch with audible hose position lock.
 7. Hose covers and tubes: Chassis grease hose shall have Buna-N tube and Buna-N PVC cover. All other commodity hoses shall have Buna N nitrile tube with nitrile PVC cover.
 8. Delivery kits: Each commodity hose shall be fitted with the dispensing control as listed.
 - a. Compressed air (CA): Quick disconnect air coupler with necessary adapter fitting, Industrial Interchange Series 3/8 inch female
 - b. Gear oil (GO): Electronic in-line style english metered totalizing dispenser set to dispense(up to 5 GPM) in pints to 0.01 increments, Graco No. 255352
- D. Accessories:
1. Inlet hose kit: Each commodity reel shall be fitted with the inlet hose kit as listed.
 - a. Compressed air: 1/2 inch ID by 24 inches, medium pressure hose and fittings, rated for 2,000 PSI, Graco No. 218549, one each
 - b. Other commodities: 1/2 inch ID by 24 inches, medium pressure hose and fittings, rated for 2,000 PSI, Graco No. 218549, one each
 - c. Mounting bracket: Graco No. 204741
 - d. Mounting channel: Holds two reels, Graco No. 24A220; Six reel, Graco No. 24A222
 - e. Ball stop: Graco No. 218341, one for each reel

2. Identification labels: Each commodity reel shall have a 3/4 by 4-1/4 inch metal identification label indicating the commodity, attached adjacent to each hose guide arm roller assembly. Label kits including label and mounting hardware as listed for each commodity. Note: Label is listed before ().
 - a. Compressed air (CA): Graco No. 218675
 - b. Gear lube (GO): Graco No. 218672
 - E. Utility Requirements: Contractor shall provide process piping from product pumps to point of connection for each reel specified herein.
 - F. Finish: Durable enamel in manufacturer's standard color
- 2.06 REEL BANK (CA, GO)
Equipment Identifier: 7720
- A. Reel bank shall consist of one each (CA) reel and one each (GO) reel as delineated in part 2.05 REEL BANKS, GENERAL of this specification section.
 - B. Reference Sheet Q750 for details.
- 2.07 TANK, DOUBLE WALL, CUBE, 280 GALLON (GO, UGO)
Equipment Identifier: 7960
- A. Manufacturer's Reference:
 1. Prime manufacturer: Specifications are based on equipment identified herein by manufacturer's name and model to establish minimum acceptable standards of quality, features, performance, and construction.
 - a. Containment Solutions, Conroe, TX (936) 756-7731
 - b. Model: LC280DW (Reference Sheet EQS.500 for Details)
 2. Alternate manufacturers: *Contingent upon compliance with these specifications* and documentation requirements set forth in SUBMITTALS, equipment produced by other manufacturers, including the following, *may* be considered as equal.
 - a. Dynafab Corporation, Houston, TX (281) 590-5467
 - b. Highland Tank & Mfg. Co., Stoystown, PA (814) 893-5701
 - B. Capacities/Dimensions:
 1. Overall dimensions:
 - a. Length: 58 inches
 - b. Width: 34 inches
 - c. Height: 49 inches
 2. Capacity: 280 gallons

C. Features/Performance/Construction:

1. Above ground used oil collection and fluid storage systems shall be constructed in accordance with national, state, and locally recognized *Above Ground Storage Tank* standards, including: Uniform Fire Code, Nation Fire Protection Association 30, 30A, and 31, Underwriters Laboratory Standard 142-for single wall tanks.
2. The components of the system shall be assembled and tested at the factory and shall be covered under warranty.
3. The above ground double wall tank shall be designed and UL listed as an atmospheric tank with a maximum working pressure of one PSI.
4. The primary and secondary storage tanks shall have passed a proof of design hydrostatic pressure test of 25 PSI.
5. The above ground double wall tank shall be equipped with nine NPT openings including two for primary and secondary emergency venting as required by UL-142.
6. Primary tank enclosure:
 - a. Primary storage tank shall be rectangular in design and constructed with ASTM A-569 or A-36 carbon steel with continuous welds. Tank shall be equipped with lifting lugs.
 - b. Primary storage tank shall be constructed and pressure tested (minimum 3 to 5 PSI) in accordance with UL-142 standards and carry the appropriate marking.
 - c. Tank enclosure shall be supported by two 4-inch high steel support feet channels with internal anchoring holes to maintain ground clearance.
7. Secondary tank enclosure:
 - a. Secondary storage tank shall be a rectangular design constructed with ASTM A-569 or A-36 carbon steel with continuous welds and listed by Underwriters Laboratories as secondary containment.
 - b. Secondary enclosure shall provide a minimum of 110 percent secondary containment.
 - c. Secondary enclosure shall be equipped with a 2 inch monitoring port and a 4 or 6 or 8 inch emergency vent port as required by Underwriters Laboratories.
 - d. Secondary storage tank shall be constructed and pressure tested (minimum 3 to 5 PSI) in accordance with UL-142 standards and carry the appropriate marking.
8. Installation of tank shall include seismic bracing and anchoring to meet all local, state, and federal codes and provisions.

D. Accessories:

1. Double float tank gauge that is calibrated by gallons or inches (Scully or equal)
2. Venting:

-
- a. Primary: 4 inches NPT(M)
 - b. Secondary: 4 inches NPT(M)
- 3. Spill box: 7 gallon, welded to tank
 - 4. Used oil tanks:
 - a. Tank monitoring system with high level detection and alarm siren: Model No. 007, BJ Enterprises (800) 457-0749
 - b. Electrical requirements: 120 VAC, 20 A, standard grounded receptacle
- E. Finish: Durable enamel in manufacturer's standard color
- 2.08 RECEIVER, USED OIL, 25 GALLON
Equipment Identifier: 7999
- A. Manufacturer's Reference:
- 1. Prime manufacturer: Specifications are based on equipment identified herein by manufacturer's name and model to establish minimal acceptable standards of quality, features, performance, and construction.
 - a. Graco, Inc., Minneapolis, MN (612) 623-6000
 - b. Model: 238866
 - 2. Alternate manufacturers: *Contingent upon compliance with these specifications* and documentation requirements set forth in SUBMITTALS, equipment produced by other manufacturers, including the following, *may* be considered as equal.
 - a. Balcrank Corporation, Weaverville, NC (828) 645-4261
 - b. Lincoln, A Pentair Company, St. Louis, MO (314) 679-4200
- B. Capacities/Dimensions:
- 1. Capacity: 25 gallons
 - 2. Dimensions:
 - a. Length: 24 inches
 - b. Width: 24 inches
 - c. Height: 45 to 72 inches
 - d. Fluid inlet/inspection port size: 3 inch (76 millimeter) buttress
 - e. Fluid outlet fitting size: 3/4 inch NPT
 - f. Collection funnel size: 22 by 24 inches
- C. Features/Performance/Construction:
- 1. The unit shall be constructed of heavy duty, durable UV-stabilized polymer.
 - 2. The unit shall include a gravity feed drain valve and a quick disconnect method of suction-evacuation from the top of the unit.

3. The unit shall be mounted on semi-pneumatic, synthetic rubber wheels and polyurethane front casters.
 4. The unit shall contain a funnel assembly capable of extending to 72 inches.
 5. The unit shall be dent, rust, and corrosion resistant.
- D. Finish: UV-stabilized polymer complete with necessary markings to readily identify contents.

PART 3 - EXECUTION

3.01 INSPECTION

- A. Coordinate location of rough-in work and utility stub-outs to assure match with equipment to be installed.
- B. Inspect equipment for damage from shipping and exposure to weather. Compare delivered equipment with packing lists and specifications to assure receipt of all equipment items and specified accessories.

3.02 INSTALLATION

- A. Perform work under direct supervision of Foreman of Construction Superintendent with authority to coordinate installation of scheduled equipment with Architect.
- B. Install equipment in accordance with plans, shop drawings, and manufacturer's instructions:
 1. Positioning: Place equipment in accordance with any noted special positioning requirements generally level (or slight slope as required by instructions), plumb, and at right angles to adjacent work.
 2. Fitting: Where field cutting or trimming is necessary, perform in a neat, accurate, professional manner without damaging equipment or adjacent work.
 3. Anchorage: Attach equipment as detailed or directed by Architect or designated representative. Installation fasteners shall be installed to avoid scratching or damaging adjacent surfaces.
 4. Air compressor and dryer system:
 - a. Install compressor unit on concrete foundation with sole plates and isolators. Level, grout, and bolt in place.
 - b. Make air cock and drain connection on horizontal casing.
 - c. Install line size ball valve and anti-return valve on compressor discharge.
 - d. Install replaceable cartridge type filter silencer of adequate capacity for each compressor.
 - e. Install condensate filter between compressor and dryer
 - f. Connect condensate drains to nearest floor drain.
 - g. Install valved bypass around air dryer. Factory insulate inlet and outlet connections.

- h. Install takeoffs to outlets from top of main with shutoff valve after takeoff.
- 5. Fluid storage tanks:
 - a. Tank shall be seismically braced and anchored to meet all local, state, and federal codes and provisions.
 - b. Used oil tank shall be vented to the outside of the building.
 - c. Remove support feet channels prior to final installation.
- C. Upon completion of work, finish surfaces shall be free of tool marks, scratches, blemishes, and stains.

3.03 TESTING

- A. After final connections are made and prior to authorizing payment, specified equipment shall be tested for compliance with specifications in the presence of the Architect or designated representative using acceptance procedures provided by the manufacturer.

3.04 CLEANUP

- A. Touch-up damage to painted finishes.
- B. Wipe and clean equipment of any oil, grease, and solvents, and make ready for use.
- C. Clean area around equipment installation and remove packing and installation debris from job site.
- D. Notify Architect or designated representative for acceptance inspection.

3.05 TRAINING

- A. Direct the technical representative to provide specified hours of training to designated Owner's maintenance personnel in operation and maintenance of the following equipment. Coordinate, with Owner, training schedule and list of personnel to be trained.
 - 1. 2161 Compressor, air, receiver mounted, 10 HP duplex; 1 hour (minimum)
 - 2. 2228 Dryer, air, refrigerated, 100 CFM; 1 hour (minimum)
 - 3. 7520 Pump, air piston, 10:1 ratio (GO) ; 1 hour (minimum)
 - 4. 7540 Pump, diaphragm, used fluid evacuation (UGO) ; 1 hour (minimum)
 - 5. 7700 Reel banks, general; 1 hour (minimum)
 - 6. 7720 Reel bank (CA, GO) ; 1 hour (minimum)
 - 7. 7960 Tank, double wall, cube, 280 gallon (GO, UGO) ; 1 hour (minimum)
 - 8. 7999 Receiver, used oil, 25 gallon; .5 hour (minimum)

- B. Obtain, from technical representative, a list of Owner's personnel trained in equipment operations and maintenance.

END OF SECTION 11 11 00

SECTION 11 11 26**VEHICLE WASH EQUIPMENT****PART 1 - GENERAL**

The General Provisions of the Contract, including General and Special Conditions and the requirements of Division 1, apply to the Work in this Section.

1.01 WORK INCLUDED**A. Equipment items as listed below by Equipment Identifier:**

1. 3720 Washer, high pressure/hot water, NG, 8 GPM (Ref. Part 2.01)
2. 3810 Washer, walk-around, vehicle (Ref. Part 2.02)
3. 3941 Recycling system, water (Ref. Part 2.03)

B. Installation:

1. General Contractor shall provide final connection of equipment to all utilities, including disconnects, floor, piping and conduit structures, with labor services and incidentals necessary for complete and operational equipment installation.
2. Manufacturer's Representative shall provide piping, wiring, and switching between equipment and roughed-in utilities and equipment connections. Installer is responsible for all system wiring and plumbing for a complete operation of wash equipment after installation.
3. General Contractor shall coordinate all washer features which interface with building systems that are required beyond the roughed-in utilities and equipment disconnects between wash equipment components with the manufacturer before construction of building and approval of the manufacturer's shop drawings.

1.02 QUALITY ASSURANCE**A. Experience:** Equipment shall be produced by a manufacturer of established reputation with a minimum of 5 years experience supplying specified equipment.**B. Manufacturer's Representative:**

1. Installation: Provide a qualified manufacturer's representative at site to supervise work related to equipment installation, check out, and start up.
2. Training: Provide technical representative to provide training to Owner's maintenance personnel in operation and maintenance of specified equipment.
3. Service: Provide a qualified manufacturer's representative to respond within 24 hours of a malfunction with the equipment during the warranty period.

1.03 SUBMITTALS

- A. Product Data: Submit Product Data in accordance with Division 1 of these specifications.
- B. Operations and Maintenance Manual:
 - 1. Submit Operations and Maintenance Manuals in accordance with Division 1- General Requirements of these specifications.
 - 2. Provide complete parts, operating, and maintenance manual covering equipment at time of installation.
 - 3. Description of system and components.
 - 4. Schematic diagrams of electrical, plumbing, and compressed air system.
 - 5. Manufacturer's printed operating instructions.
 - 6. Printed listing of periodic preventive maintenance items and recommended frequency to validate warranties. Failure to provide maintenance information will indicate that preventive maintenance is not a condition for validation of warranties.
- C. Shop Drawings: Submit Shop Drawings in accordance with Division 1.

1.04 PRODUCT SUBSTITUTIONS

- A. Follow requirements specified in Division 1 - General Requirements.
- B. Additional costs resulting from substitution of products other than those specified, by model number, including drawing changes and construction, will be at the expense of the Contractor.
- C. Substitution Approval: Prior to delivery or installation, submittals for each equipment item by Equipment Identifier shall be provided in accordance with Division 1 - General Requirements. Acceptance will be based on the technical requirements herein as determined by Owner and Architect.

1.05 WARRANTY

- A. Warranty work against defects in materials, functions and workmanship specified herein shall be good for 1 year from substantial completion.
- B. Warranty shall include materials and labor necessary to correct defects.
- C. Defects shall include, but not be limited to noisy, rough or substandard operation; loose, damaged, and missing parts; and abnormal deterioration of finish. Defects shall not include damage due to neglect, misuse, or situations resulting from non-performance of a manufacturer's recommended preventive maintenance schedule.
- D. Submit warranties in accordance with Division 1 - General Requirements of these specifications.
- E. All parts shall be readily available locally in the United States.

1.06 PRODUCT DELIVERY, STORAGE, AND HANDLING

- A. Deliver equipment in manufacturer's containers, appropriately packaged and/or crated for protection during domestic shipment and storage in humid and/or dusty conditions.
- B. Indelibly label all containers, including those contained in others, on outside with item description(s) per title and Equipment Identifier of this specification.
- C. Provide equipment and materials specified complete in one shipment for each equipment item. Split or partial shipments are not permissible.

1.07 LABELING

- A. Manufacturer shall securely attach in a prominent location, on each major item of equipment, a non-corrosive nameplate showing manufacturer's name, address, model number, serial number, and pertinent utility or operating data.
- B. Label all piping in vehicle wash and water reclaim systems as to its function and flow directions.
- C. All electrical equipment and materials shall be new and shall be listed by Underwriter's Laboratories, Inc. (UL) in categories for which standards have been set by that agency and labeled as such in the manufacturer's plant.

1.08 BUY AMERICA COMPLIANCE

- A. The Contractor shall comply with the applicable Buy America requirements set forth in 49 U.S.C. 5323(j) and the applicable regulations in 49 C.F.R. Part 661, as amended. If the Contractor procures any capital items with Federal funds, it is the Contractor's responsibility to obtain the Buy America certification required under such regulations.
- B. Reference Division 1 for Buy America compliance.

PART 2 - PRODUCTS

2.01 WASHER, HIGH PRESSURE/HOT WATER, NG, 8 GPM Equipment Identifier: 3720

- A. Manufacturer's Reference:
 - 1. Prime manufacturer: Specifications are based on equipment identified herein by manufacturer's name and model to establish minimum acceptable standards of quality, features, performance, and construction.
 - a. The Hotsy Corporation, Camas, WA (360) 833-1600
 - b. Model: 5735SS (stationary unit) with Accessories
 - 2. Alternate manufacturers: Contingent upon compliance with these specifications and documentation requirements set forth in SUBMITTALS, equipment produced by other manufacturers, including the following, may be considered as equal.

- a. Landa, Inc., Camas, WA (800) 547-8672
 - b. Alkota Cleaning Systems, Inc., Alcester, SD (605) 934-2222
- B. Capacities/Dimensions:
1. Operating pressure: 3,000 PSI
 2. Maximum discharge capacity: 7.8 GPM
 3. Overall dimensions:
 - a. Length: 51 inches
 - b. Width: 31 inches
 - c. Height: 63.4 inches
 4. Shipping weight: 1,260 pounds
- C. Features/Performance/Construction:
1. Burner: NG fired, 720,450 BTU/hr, AGA-listed gas controls, ring type with aspirating spuds, natural draft.
 2. All open flames and fire rings shall be mounted at minimum of 18 inches above the finished floor.
 3. Heating coil: vertically-fired; 1 inch OD, hydrostatic-pressure tested; 14,900 PSI burst-rated.
 4. Water pump: Triplex water pump with positive displacement, ceramic plungers, brass manifold, and oil bath crankcase.
 5. Fabrication: Welded angle iron frame shall have heavy gauge tank and cabinet.
 6. Piping: Supplier shall provide piping (schedule 80) from high-pressure wash unit to each trigger gun wand for a complete and operable system.
 7. Manufacturer shall supply all necessary soap system equipment including piping, fittings, distribution hose, and connections for a complete and operable soap distribution system.
 8. Shall control over run time, auto start/stop and shut down functionality.
 9. Trigger Gun Location: Manufacturer shall supply trigger gun, scabbard, hose reel, and push button starter at each location shown on drawings.
- D. Controls: Adjustable temperature controller, safety pressure relief valve, pressure switch, ON/OFF electric motor switch with overload protection, unloader, water heater switch, detergent valve and automatic, non-contaminating float valve.
- E. Accessories:
1. Trigger gun: Hotsy Model No. 87512350, one each per trigger gun location, two total
 2. 50 foot hose assembly: Hotsy Model No. 87391210, one each per trigger gun location, two total
 3. 36 inch wand: Hotsy Model No. 87112690, one each per trigger gun location, two total
 4. Nozzle: Hotsy Model No. 799021, one each per trigger gun location, two total

5. Quick coupler: Hotsy Model No. 844850, one each per trigger gun location, two total
6. Reel: 6 inch hose with 360 degree range, Hotsy Model No. 87504780, one each trigger gun location, two total
7. Soap solenoid and switch: Hotsy Model No. 89169880, one each per trigger gun location, two total
8. Remote starter: Hotsy Model No. 89169890, one each per trigger gun location, two total
9. Replacement nozzle: Pack of four, 4-1/2 millimeter with quick disconnect, Hotsy Model No. 87087140, one pack per trigger gun, two packs total
10. Draft diverter: Type "B", 12 inches, Hotsy Model No. 87177300, one each
11. Powershine Plus[®] detergent: 55 gallon container, Hotsy Model No. 89051800, one each
12. Hotsy scabbard for trigger gun, wall mounted: Hotsy Model No. 722B, one each per trigger gun location, two total

F. Utility Requirements:

1. Electrical: 460 VAC, 3 phase, 20 HP, 21 A
2. Plumbing:
 - a. Water: 3/4 inch to supply, 40 to 60 PSI, 7.8 GPM minimum (regulate water supply if greater than 60 PSI)
 - b. Natural gas: 3/4 inch NPT to supply 720,450 BTU at equipment
3. Mechanical:
 - a. Stack size: 10 inches with draft diverter

G. Finish: Durable enamel in manufacturer's standard color

2.02 WASHER, WALK-AROUND, VEHICLE
Equipment Identifier: 3810

A. Manufacturer's Reference:

1. Prime manufacturer: Specifications are based on equipment identified herein by manufacturer's name and model to establish minimum acceptable standards of quality, features, performance, and construction.
 - a. Bitimec, Greenwich, CT (203) 637-1900
 - b. Model: 626-LX
2. Alternate manufacturers: *Contingent upon compliance with these specifications* and documentation requirements set forth in SUBMITTALS, equipment produced by other manufacturers, including the following, *may* be considered as equal.
 - a. Awash System Corp., Niagara Falls, NY (800) 265-7405

B. Capacities/Dimensions:

1. Overall dimensions:
 - a. Length: 42 inches
 - b. Width: 48 inches
 - c. Height: 180 inches
 2. Capacity:
 - a. 110 gallons
 3. Weight:
 - a. Empty: 1,188 pounds (approximately)
 - b. Full: 2,112 pounds (approximately)
- C. Features/Performance/Construction:
1. The unit base and frame shall be manufactured of stainless steel and be void of all corrosion prone materials. All painted (powder coated) surfaces shall also be stainless steel.
 2. Drive System:
 - a. Battery: Industrial set of four in-line 6V deep cycle tubular.
 - b. Traction: 24V-DC motor operated drive wheel under base shall be centrally located and spring loaded for maximum operating ease, traction, and maneuverability.
 - c. Brush: 1KW (1.25HP) 24V electric DC Drive Motor
 3. Brush Inclination (tilt) System:
 - a. The unit shall be equipped with a 'brush only' inclination mechanism operated by 24V motor on a stainless steel guide. Inclination shall be push button controlled from both operating sides and have extra precise, smooth travel.
 - b. The unit shall be capable of continuous tilting throughout the entire wash cycle. When in a tilt position, the 'brush only' shall be tilted. The base and water shield must remain in the 90 degree upright position in order to guarantee stability and avoid machine frame from approaching/hitting/damaging the vehicle being washed.
 4. Brush:
 - a. Brush Fiber Type: Diamond/Star shaped, designed to channel water, to reduce friction and eliminate scratching. Diameter shall be 0.8 mm (other available diameter are 0.5 mm or 1.2 mm)
 - b. Brush fibers shall be feathered at the ends.
 - c. Brush fiber assembly shall be on a corrosion proof main shaft, riveted in replaceable segments max 12 inches high, in order to allow minimal replacement cost in case of partial damage.

-
5. Water Tank: The unit shall be totally autonomous and shall include a water tank of roll-molded-plastic.
 6. Wheels: Caster wheels shall be extreme service grade (8 inch of 10 inch size as required). Wheel bearings shall be sealed and turntable bearings shall include greasing apparatus for long life and smooth operation.
 7. Safety:
 - a. Automatic hands free stopping when operator releases controls.
 - b. Safety switches on brush, water pump, and detergent pump. Safety switches must include a release to be pushed for the switch to engage. Safety switches shall be able to be engaged with one single finger motion, but only deliberately.
 - c. The unit shall automatically reduce travel speed by 50 percent when brush rotation or water pump are engaged.
 8. Rinse: the unit shall have two sets of nozzles along the entire height of the brush, each capable of effecting a 180 degree spray pattern on vehicles.
- D. Controls: There shall be dual operating controls affording operator full unobstructed visibility for working in TWO directions. All machine power functions shall be operable from either set of controls.
- E. Utility Requirements:
1. Electrical: 120 VAC, 1 phase
- F. Finish: Durable enamel in manufacturer's standard color
- 2.03 RECYCLING SYSTEM, WATER
Equipment Identifier: 3941
- A. Manufacturer's Reference:
1. Prime manufacturer: Specifications are based on equipment identified herein by manufacturer's name and model to establish minimal acceptable standards of quality, features, performance, and construction.
 - a. Cascade Engineering Inc., Colorado Springs, CO (719) 684-8168
 - b. Model: WRS 32 with accessories
 2. Alternate manufacturers: *Contingent upon compliance with these specifications* and documentation requirements set forth in SUBMITTALS, equipment produced by other manufacturers *may* be considered as equal.
 - a. Landa, Inc., Camas, WA (360) 833-9100
 - b. Oil Trap Environmental, Tumwater, WA (800) 943-6495
- B. General Description:

1. System shall be integrated with functioning of the high-pressure washer within the wash equipment room, and the activities taking place in the adjacent wash bay.
2. System shall accept used wash-water and related materials via the catch basin in the wash bay and the truck wash. Used wash-water shall then, through a series of filters and treated with reagents to kill bacteria and odors, neutralize pH, be recycled and returned to a storage tank, awaiting re-use on demand by high-pressure washer.
3. System shall automatically refill the recycled water storage tank as demanded by use from the high-pressure washer. Any immediate demand that cannot be met by the system shall be made up for by the water supply of the facility.

C. Capacities/Dimensions:

1. Entire unit:
 - a. Width: 90 inches
 - b. Depth: 38 inches
 - c. Height: 51 inches
 - d. Weight: 800 pounds
 - e. Flow rate: 8 gallons per minute (12,000 gallons per day)
 - f. Makeup water: 100 PSI maximum pressure
 - g. Coagulant Tank: 120 gallons
 - h. Separator tank: 120 gallons
 - i. Storage tank: 120 gallons

D. Features/Performance/Construction:

1. Discharge pump shall have high head centrifugal pump with thermally protected motor. The pump shall provide pressurized water flow to pressure washer and other uses.
2. Inlet strainer shall be large size with stainless screen in corrosion resistant plastic housing.
3. Filter system shall be two 20 inch long 20 micron filter cartridges for final polishing.
4. Sludge collection system shall be three large, disposable fabric socks.
5. Storage tanks shall be polypropylene unitized construction.
6. Oil-water separator shall possess an oil skimmer for surface removal of oils directly to a waste-oil container.
7. Unit shall be constructed about a steel platform frame.
8. Recycle feed pump shall be self priming centrifugal cast iron with thermally protected motor. Pump shall be controlled with a float switch in the collection pit. Suction line strainer and foot valve shall be included.
9. Piping between all tanks shall be schedule 80 PVC piping.
10. System shall possess a sludge disposal system for the collection of solid wastes. Wastewater from this system shall flow directly back into the catch basin.
11. Reagent metering pumps shall be mounted in a fiberglass enclosure and include the following pumps:

- a. Electronic controlled diaphragm pumps with stroke rate and stroke length controls.
 - b. Automatic degassing head on oxidizer and pH adjust pump.
 - c. Coagulant pump with manual bleed.
12. Manufacturer shall supply all necessary system requirements including piping, fittings, distribution hose, and connections for a complete and operable wash-water recycling and re-distribution system.
- E. Controls:
1. Controls shall be unit mounted within a waterproof NEMA 4 rated enclosure. Control panel shall monitor and control the filtering, re-circulating, and sludge-dumping functions. Operational lights and heavy-duty switches shall accompany each control panel function, and controls shall be clearly labeled.
 2. Switches shall include power, feed pump, coagulant pump, oxidizer pump, pH adjuster pump, makeup water, and manual drain.
 3. Controller for pH shall have a digital display.
- F. Accessories:
1. Oil skimmer system: No. OS-3-E-L
 2. Ozone treatment: No. OZ 20 Ozone Generator System
 3. Graduated reagent containers:
 - a. Cascade aqua balance down kit: No. 1604
 - b. Cascade oxipower kit: No. 1605
 - c. Cascade coagulant 721 55 gallons with drum: No. 1202
 4. Additional oxidizer injector for the truck wash pit.
- G. Utility Requirements:
1. Electrical: 120 VAC, 1 phase, 15 A
 - a. Recycle feed pump: 1/2 HP
 - b. Discharge pump: 1/2 HP
 2. Plumbing:
 - a. Machine inlet: 1 1/2 inch NPT
 - b. Treated water outlet: 3/4 inch NPT
 - c. Drain line: 1 inch NPT
 - d. Make up water: 1/2 inch NPT
- H. Finish:
1. Steel frame: Hot dip galvanized. Owner's choice of manufacturer's supplied colors.

PART 3 - EXECUTION**3.01 INSPECTION**

- A. Coordinate location of rough-in work and utility stub-outs to assure match with equipment to be installed.
- B. Inspect delivered equipment for damage from shipping and exposure to weather. Compare delivered equipment with packing lists and specifications to assure receipt of all equipment items and specified accessories.
- C. Report in writing to the Architect, any damaged, missing or incomplete scheduled equipment, and improper rough-in work or utility stub-outs.

3.02 INSTALLATION

- A. Manufacturer's representative shall be responsible for complete operational equipment installation.
- B. Perform work under direct supervision of Foreman of Construction Superintendent with authority to coordinate installation of scheduled equipment with Architect or designated representative.
- C. Install equipment in accordance with plans, shop drawings, and manufacturer's instructions:
 - 1. Positioning: Place equipment in accordance with any noted special positioning requirements generally level (or slight slope as required by instructions), plumb, and at right angles to adjacent work.
 - 2. Fitting: Where field cutting or trimming is necessary, perform in a neat, accurate, professional manner without damaging equipment or adjacent work.
 - 3. Anchorage: Attach equipment as directed by Architect or designated representative. Installation fasteners shall be installed to avoid scratching or damaging adjacent surfaces.
 - 4. Upon completion of work, finish surfaces shall be free of tool marks, scratches, blemishes, and stains.
- D. Manufacturer shall provide an initial fill of all soap and solution tanks with the recommended brand of chemicals. A list of all recommended chemicals shall be provided to the owner.

3.03 TESTING

- A. After final connections are made and prior to authorizing payment, specified equipment shall be tested for compliance with specification in the presence of the Architect or designated representative using acceptance procedures provided by the manufacturer.
- B. Equipment shall not damage vehicles, including mirrors, windshield wipers and windows, or equipment itself.

- C. Malfunctions during testing shall be corrected within 5 days and re-tested. Malfunctions during second testing shall be corrected within 5 days and re-tested.
- D. Inadequate Performance: If equipment fails third test, Owner may elect to have all specified Equipment removed from site at no cost or obligation to Owner.
- E. All damage to the machine that is incurred as a result of the test shall be the responsibility of the manufacturer/supplier.

3.04 CLEANUP

- A. Touch-up damage to painted finishes.
- B. Wipe and clean equipment of any oil, grease and solvents, and make ready for use.
- C. Clean area around equipment installation and remove packing or installation debris from job site.
- D. Notify Architect or designated representative for acceptance inspection.

3.05 TRAINING

- A. Direct the technical representative to provide specified hours of training to designated Owner's maintenance personnel in *operation and maintenance* of the following equipment. Coordinate, with Owner, training schedule and list of personnel to be trained.
 - 1. 3720 Washer, high pressure, hot water, NG, 8 GPM; 2 hours (minimum)
 - 2. 3810 Washer, walk-around, vehicle; 4 hours (minimum)
 - 3. 3941 Recycling system, water; 2 hours (minimum)
- B. Obtain, from technical representative, a list of Owner's personnel trained in equipment operations and maintenance.

END OF SECTION 11 11 26

SECTION 11 11 29**SHOP EQUIPMENT****PART 1 - GENERAL**

The General Provisions of the Contract, including General and Special Conditions and the requirements of Division 1, apply to the Work in this Section.

1.01 WORK INCLUDED

- A. Equipment items as listed below by Equipment Identifier:
 - 1. 2090 Buffer/grinder, 10 inches, with dust collector (Ref. Part 2.01)
 - 2. 2191 Crimper, fittings/hose, electric/hydraulic (Ref. Part 2.02)
 - 3. 2220 Drill press, variable speed, 20 inches (Ref. Part 2.03)
 - 4. 2832 Vise, swivel base, 5 inches (Ref. Part 2.04)
 - 5. 3085 Cabinet, abrasive blast, with dust collector (Ref. Part 2.05)
 - 6. 5404 Forklift, electric, 4,000 pounds (Ref. Part 2.06)
 - 7. 5909 Cart, sanding (Ref. Part 2.07)
- B. Roughing-in, installation of equipment, and final connection of utilities, with labor, services, and incidentals necessary for complete and operational equipment installation.
- C. Piping, wiring, and switching between equipment and utilities.

1.02 QUALITY ASSURANCE

- A. Equipment shall be produced by a manufacturer of established reputation with a minimum of five years experience supplying specified equipment.
- B. Manufacturer's Representative:
 - 1. Installation: Provide a qualified manufacturer's representative at site to supervise work related to equipment installation, check out, and start up.
 - 2. Training: Provide technical representative to provide training to Owner's maintenance personnel in operation and maintenance of specified equipment.

1.03 SUBMITTALS

- A. Product Data:
 - 1. Submit Product Data in accordance with Division 1 - General Requirements of these specifications.
 - 2. Restrict submitted material to pertinent data. For instance, do not include manufacturer's complete catalog when pertinent information is contained on a single page.
- B. Operations and Maintenance Manual:

1. Submit Operations and Maintenance Manuals in accordance with Division 1- General Requirements of these specifications.
 2. Provide complete parts, operating, and maintenance manual covering equipment at time of installation.
 3. Description of system and components.
 4. Schematic diagrams of electrical, plumbing, and compressed air system.
 5. Manufacturer's printed operating instructions.
 6. Printed listing of periodic preventive maintenance items and recommended frequency to validate warranties. Failure to provide maintenance information will indicate that preventive maintenance is not a condition for validation of warranties.
- C. Shop Drawings:
1. Submit Shop Drawings in accordance with of Division 1 - General Requirements of these specifications.
 2. Submit site specific installation drawings and procedures.

1.04 PRODUCT SUBSTITUTIONS

- A. Follow requirements specified in Division 1 - General Requirements.
- B. Additional costs resulting from substitution of products other than those specified, by model number, including drawing changes and construction, will be at the expense of the Contractor.
- C. Substitution Approval: Prior to delivery or installation, submittals for each equipment item by Equipment Identifier shall be provided in accordance with Division 1 - General Requirements. Acceptance will be based on the technical requirements herein as determined by Owner and Architect.

1.05 WARRANTY

- A. Warrant work specified herein for one year from substantial completion against defects in materials, functions, and workmanship.
- B. Warranty shall include materials and labor necessary to correct defects.
- C. Defects shall include, but not be limited to noisy, rough or substandard operation; loose, damaged, and missing parts; and abnormal deterioration of finish.
- D. Submit warranties in accordance with Division 1 - General Requirements of these specifications.
- E. All parts shall be readily available locally in the United States.

1.06 PRODUCT DELIVERY, STORAGE, AND HANDLING

- A. Deliver equipment in manufacturer's containers, appropriately packaged and/or crated for protection during domestic shipment and storage in humid and/or dusty conditions.

- B. Indelibly label all containers, including those contained in others, on outside with item description(s) per title and Equipment Identifier of this specification.
- C. Provide equipment and materials specified complete in one shipment for each equipment item. Split or partial shipments are not permissible.

1.07 LABELING

- A. Manufacturer shall securely attach in a prominent location, on each major item of equipment, a non-corrosive nameplate showing manufacturer's name, address, model number, serial number, and pertinent utility or operating data.
- B. All electrical equipment and materials shall be new and shall be listed by Underwriter's Laboratories, Inc. (UL) in categories for which standards have been set by that agency and labeled as such in the manufacturer's plant.

1.08 BUY AMERICA COMPLIANCE

- A. The Contractor shall comply with the applicable Buy America requirements set forth in 49 U.S.C. 5323(j) and the applicable regulations in 49 C.F.R. Part 661, as amended. If the Contractor procures any capital items with Federal funds, it is the Contractor's responsibility to obtain the Buy America certification required under such regulations.
- B. Reference Division 1 for Buy America provisions.

PART 2 - PRODUCTS

2.01 BUFFER/GRINDER, 10 INCHES, WITH DUST COLLECTOR Equipment Identifier: 2090

- A. Manufacturer's Reference:
 - 1. Prime manufacturer: Specifications are based on equipment identified herein by manufacturer's name and model to establish minimal acceptable standards of quality, features, performance, and construction.
 - a. Cincinnati Electrical Tool, Inc., Cleves, OH (513) 941-5000
 - b. Model: 602-201-8 with Accessories
 - 2. Alternate manufacturers: *Contingent upon compliance with these specifications* and documentation requirements set forth in SUBMITTALS, equipment produced by other manufacturers, including the following, *may* be considered as equal.
 - a. Delta Machinery, Jackson, TN (800) 223-7278
 - b. Baldor, Fort Smith, AR (501) 646-4711
- B. Capacities/Dimensions:
 - 1. Motor:

-
- a. Grinder: 1,800 RPM
 - b. Fan: 3,600 RPM
2. Wheel(s):
 - a. Diameter: 10 inches
 - b. Thickness: 1-1/4 inch
 - c. Bore: 7/8 inch
 3. Distance between wheels: 17-5/8 inches
 4. Height to center of spindle: 40-3/8 inches
 5. Overall dimensions (nominal):
 - a. Width: 32 inches
 - b. Depth: 27 inches
 - c. Height: 70 inches
 6. Weight: 660 pounds
- C. Features/Performance/Construction:
1. Motor shall be totally enclosed, direct drive motor rated for continuous service, with permanently lubricated ball bearings.
 2. Wheel shall consist of one medium grit wheel and one general purpose wire wheel.
 3. Wheel guards shall be adjustable for wheel wear and shall include adjustable work rests and spark breakers.
 4. Light bulbs associated with illuminated eye shields shall be controlled by push button magnetic starter for buffer/grinder.
 5. Quenching pot shall be mounted on pedestal that supports grinder.
 6. Dust collector shall be enclosed with fan and motor in clean air chamber. External bag type dust collectors are not acceptable.
- D. Controls: Push button magnetic starter, Cincinnati No. 000-533 shall have "On/Off" push button switch; motor thermal overload and under voltage protection.
- E. Accessories:
1. Eye shields, Cincinnati No. 000-133, shall be an illuminated set of two per grinder.
- F. Utility Requirements:
1. Grinder motor: 460 VAC, 3 phase, 1 HP
 2. Fan motor: 460 VAC, 3 phase, 1 HP
- G. Finish: Durable enamel in manufacturer's standard color
- 2.02 CRIMPER, FITTINGS/HOSE, ELECTRIC/HYDRAULIC
Equipment Identifier: 2191

- A. Manufacturer's Reference:
1. Prime manufacturer: Specifications are based on equipment identified herein by manufacturer's name and model to establish acceptable standards of quality, performance, features, and construction.
 - a. The Gates Rubber Co., Denver, CO (303) 744-1911
 - b. Model: PC 707 with Accessories
 2. Alternate manufacturers; *Contingent upon compliance with these specifications* and documentation requirements set forth in SUBMITTALS, equipment produced by other manufacturers, including the following, *may* be considered as equal.
 - a. Weatherhead Dana Corporation, Toledo, OH (419) 891-2800
 - b. Parker Hannifin Corporation, Cleveland, OH (216) 896-3000
- B. Capacities/Dimensions:
1. Capacity: 3/16 inch inside dimension fiber braid through 1-1/4 inch wire hose
 2. Crimper dimensions, nominal:
 - a. Width: 12 inches
 - b. Depth: 13 inches
 - c. Height: 27 inches
 3. Overall Weight: 188 pounds
 4. Pump dimensions, nominal:
 - a. Length: 25 inches
 - b. Width: 12 inches
 - c. Height: 12 inches
 5. Pump operation pressure: 0 to 4,900 PSI
 6. Pump reservoir capacity: 10 cubic inches
 7. Pump weight: 70 pounds
- C. Features/Performance/Construction:
1. Pump shall be hydraulic operated pump.
 2. Pump shall be capable of delivering high volume of oil at low pressure for fast transversion.
 3. Crimper shall be able to crimp most hydraulic hoses from low pressure return lines to extremely high pressure spirals.
 4. Crimper shall crimp straight and bent tube stems, 45 degree and 90 degree block types.
- D. Accessories:
1. Die sets:

-
- a. 731, No. 7482-0931
 - b. 732, No. 7482-0932
 - c. 733, No. 7482-0933
 - d. 734, No. 7482-0934
 - e. 737, No. 7482-0937
 - 2. Power source: No. 7481-0023
 - E. Utility Requirements:
 - 1. Electrical: 120 VAC, 1 phase, 1 HP
 - F. Finish: Durable enamel in manufacturer's standard colors
- 2.03 DRILL PRESS, VARIABLE SPEED, 20 INCHES
Equipment Identifier: 2220
- A. Manufacturer's Reference:
 - 1. Prime manufacturer: Specifications are based on equipment identified herein by manufacturer's name and model to establish acceptable standards of quality, performance, features, and construction.
 - a. Clausing Industrial, Kalamazoo, MI (269) 345-7155
 - b. Model: 2277
 - 2. Alternate manufacturers: *Contingent upon compliance with these specifications* and documentation requirements set forth in SUBMITTALS, equipment produced by other manufacturers, including the following, *may* be considered as equal.
 - a. WMH Tool Group/Jet/Wilton, La Vergne, TN (615) 793-8900
 - b. Dake Machine Tools, Grand Haven, MI (800) 937-3253
 - B. Capacities/Dimensions:
 - 1. Speed: 150 to 2,000 RPM
 - 2. Overall dimensions, nominal:
 - a. Length: 22 inches
 - b. Width: 36 inches
 - c. Height: 66 inches
 - 3. Working dimensions:
 - a. Chuck to table: 33 inches
 - b. Chuck to base: 43 inches
 - 4. Table working surface:
 - a. Width: 22 inches
 - b. Depth: 19-1/2 inches

- c. Tilt range: 90 degrees to left and right
 - 5. Base working surface:
 - a. Width: 15-1/2 inches
 - b. Depth: 13 inches
 - 6. Capacities:
 - a. Spindle: 3MT, 1.74 inches
 - b. Spindle travel: 6-1/2 inches
 - c. Drill to center of circle: 20 inch diameter
 - d. Hand feed: 1.25 inch diameter
 - e. Column: Ground steel, 4 inches diameter and 1/2 inch wall thickness
- C. Features/Performance/Construction:
 - 1. Speed control shall permit positive speed changing while machine is running and hold speed setting constant under all load conditions.
 - 2. Belt drive shall remain aligned and automatically maintain full power transmission to spindle at all times.
 - 3. Work table shall have slots, side ledges, and machined front apron with mounting holes shall be provided for clamping of work with mounting holes.
 - 4. Tilt table shall have scale to provide accurate readings to 90 degrees right and left with index pin at level and 45 degrees left and right positions.
 - 5. Table lock shall have expanding bushing to provide rigid positioning of tables at any angle.
 - 6. Hand gear crank shall be provided for table adjustment.
 - 7. Safety features shall include self-ejecting chuck key and completely enclosed drive belt and pulleys.
 - 8. Motor shall be totally enclosed fan-cooled (TEFC):
 - a. Power cord shall have three-wire grounding cord with three-prong plug.
- D. Controls:
 - 1. Push-button switch shall include shrouded START button and protruding STOP button. Switches and other electrical controls shall meet applicable National Electrical Code requirements.
 - 2. Depth control shall be self-locking adjustable feed depth stop.
 - 3. Function controls shall provide manual speed selection and feed via knobbed spoked wheels.
- E. Accessories:
 - 1. Chuck: Clausing Model No. 1897
 - 2. Arbor adapter: Clausing Model No. 1898

- F. Utility Requirements: 460 VAC, 3 phase, 1.5 HP
- 2.04 VISE, COMBINATION, SWIVEL BASE, 5 INCHES
Equipment Identifier: 2832
- A. Manufacturer's Reference:
1. Prime manufacturer: Specifications are based on equipment identified herein by manufacturer's name and model to establish minimal acceptable standards of quality, features, performance, and construction.
 - a. WMH Tool Group/Jet/Wilton, La Vergne, TN (615) 793-8900
 - b. Model: 1755, stock number 63200
 2. Alternate manufacturers: *Contingent upon compliance with these specifications* and documentation requirements set forth in SUBMITTALS, equipment produced by other manufacturers, including the following, *may* be considered as equal.
 - a. Ridgid Tool Co., Elyria, OH (216) 323-5581
 - b. Milwaukee Tool and Equipment Co., Milwaukee, WI (414) 645-0200
- B. Capacities/Dimensions:
1. Jaw width: 5-1/2 inches
 2. Jaw opening: 5 inches
 3. Throat depth: 3-3/4 inches
 4. Overall dimensions, nominal:
 - a. Length: 17-1/4 inches
 - b. Width: 9 inches
 - c. Height: 9-1/2 inches
 5. Weight: 51.55 pounds
 6. Pipe capacity: 1/4 to 3 inches diameter
- C. Features/Performance/Construction:
1. Slide bar shall be machined steel and be oil port operable in machined channel.
 2. Base shall swivel 360 degrees and have locking device.
 3. Construction shall be semi-steel cast body and have hardened steel nut and screw.
 4. Jaws shall have replaceable facings.
- 2.05 CABINET, ABRASIVE BLAST, WITH DUST COLLECTOR
Equipment Identifier: 3085
- A. Manufacturer's Reference:

1. Prime manufacturer: Specifications are based on equipment identified herein by manufacturer's name and model to establish acceptable standards of quality, performance, features, and construction.
 - a. Trinity Tool Company, Fraser, MI (586) 296-5900
 - b. Model: Master 36/BP with Accessories
 2. Alternate manufacturers: *Contingent upon compliance with these specifications and documentation requirements set forth in SUBMITTALS, equipment produced by other manufacturers, including the following, may be considered as equal.*
 - a. Blast-It-All Division, Larry Hess and Associates, Inc., Salisbury, NC (704) 637-3300
 - b. Wheelabrator Corporation, La Grange, GA (706) 884-6884
- B. Capacities/Dimensions:
1. Cabinet:
 - a. Dimensions:
 - 1) Width: 38 inches
 - 2) Depth: 25 inches
 - 3) Height: 64 inches
 - b. Interior dimensions:
 - 1) Width: 36 inches
 - 2) Depth: 24 inches
 - 3) Height: 23 inches
 - c. Side door: 17 by 11 inches
 - d. Flip up top: 36 by 13 inches
 - e. Viewing window: 12 by 24 inches
 2. Dust collector:
 - a. Motor: 1,700 RPM
 - b. Vacuum rating: 100 CFM
 - c. Abrasive capacity: 2 gallons, minimum
 - d. Dimensions:
 - 1) Diameter: 15 inches
 - 2) Height: 54 inches
 3. Equipment dimensions including dust collector:
 - a. Width: 60 inches
 - b. Depth: 25 inches
 - c. Height: 64 inches

4. Weight: 300 pounds
- C. Features/Performance/Construction:
1. Media type: Unit shall utilize glass bead and sand for dry blast media.
 2. Cabinet: Blast cabinet shall be fabricated of 14 gauge welded steel.
 3. Gloves: Heavyweight rubber gloves shall be attached to 8 inch armhole ports, two each.
 4. Viewing window: Safety glass window shall be easily removable by loosening window frames.
 5. Lighting: Interior cabinet lighting shall be provided with fluorescent tubes.
 6. Air system: Unit shall be equipped with air pressure regulator and gauge.
 7. Doors:
 - a. Flip up top: Unit shall provide one flip up top door.
 - b. Side: Unit shall provide one side door.
 8. Dust collector:
 - a. Construction: Dust collector shall be fabricated of 14 gauge steel.
 - b. Motor: Unit shall be equipped with motor and impeller on clean air side.
 - c. Filter bags: Unit shall utilize filter bags with 8 square feet of total surface area.
 9. Orifice: Standard equipment for suction feed type media gun shall include a 5/16 inch ID orifice.
 10. Blow off: Unit shall be provided with a pushbutton controlled valve at the media gun.
 11. Nozzle: Nozzle and air jet shall be tungsten carbide.
 12. Nozzle mount bracket: Unit shall be provided with bracket for nozzle.
 13. Foot valve: Blasting control shall be provided by spring actuated 3 way air foot valve.
 14. Floor: Unit shall be equipped with 1/8 inch expanded steel recessed floor with a carbon screen cover.
 15. Air connection: Air connection shall be 3/8 inch female connection to regulator.
- D. Controls: ON/OFF toggle switch for lighting and dust collector. Electrical controls and switching shall meet all National Electrical Code requirements.
- E. Accessories:
1. Filter bags: Dust collector replacement filter bags, Trinco No. 2-000-30, six each
 2. Nozzle: 5/16 inch ID, Trinco No. 2-000-71, one each
- F. Utility Requirements:
1. Electrical: 120 VAC, 1-1/3 HP, 1.6 A
 2. Compressed air: 3/8 inch, 85 PSI at 30 CFM

G. Finish: Durable enamel in manufacturer's standard color

2.06 FORK LIFT, ELECTRIC, 4,000 POUNDS
Equipment Identifier: 5404

A. Manufacturer's Reference:

1. Prime manufacturer: Specifications are based on equipment identified herein by manufacturer's name and model to establish minimal acceptable standards of quality, features, performance, and construction.
 - a. Clark Material Handling Company, Lexington, KY (859) 422-6400
 - b. Model: NPR 20
2. Alternate manufacturers: *Contingent upon compliance with these specifications* and documentation requirements set forth in SUBMITTALS, equipment produced by other manufacturers, including the following, *may* be considered as equal.
 - a. Hyster Company, Danville, IL (252)561-7104
 - b. Mitsubishi Forklifts, Houston, TX (713) 365-1000

B. Capacities/Dimensions:

1. Rated capacity: 4,000 pounds
2. Power: 24/36 volt
3. Overall dimensions:
 - a. Width: 40-1/4 inches
 - b. Length: 70-1/4 inches
 - c. Height: 95 to 258 inches
 - d. Turning radius: 66-1/2 inches
4. Weight: 6,940 pounds
5. Mast dimensions/capacities:
 - a. 24 inch load center
 - b. Fork length: 48.1 inches

C. Features/Performance/Construction:

1. Unit shall contain a battery with 6 hour rate maximum.
2. Unit shall have urethane tires.
3. Unit shall have automatic, spring applied parking brake
4. Unit shall have hydraulic assist, variable steering.
5. Unit shall have a service brake consisting of a drum and shoe.
6. Drive motor and steer/auxiliary motor shall be controlled by transistor, infinite.

D. Utilities Requirements:

1. Electrical: 460 VAC, 3 phase, 30 A, provide dedicated circuit

2.07 CART, SANDING

Equipment Identifier: 5909

A. Manufacturer's Reference:

1. Prime manufacturer: Specifications are based on equipment identified herein by manufacturer's name and model to establish minimal acceptable standards of quality, features, performance, and construction.
 - a. U.S. Train Products, Marietta, GA (770) 953-9224
 - b. Model: USTP MSR 600 Mobile Sand Refilling System
2. Alternate manufacturers: *Contingent upon compliance with these specifications* and documentation requirements set forth in SUBMITTALS, equipment produced by other manufacturers, including the following, *may* be considered as equal.

B. Capacities/Dimensions:

1. Overall dimensions:
 - a. Width: 126 inches
 - b. Depth: 75 inches
 - c. Height: 44 inches

C. Features/Performance/Construction:

1. Multiple operating modes:
 - a. Automatic Refill-Cycle with "Auto-Shut-off"
 - b. Manual Refill-Cycle
 - c. Vehicle Reload Setup Cycle
2. Industrial onboard computer and system controller
3. Heavy duty command and operation controls
4. Wireless communication interface (IP) to upload/download operating data
5. 600 liter sand container with certified filling pressure vessel
6. Heavy duty industrial vacuum, filtration and air compressor system
7. High-efficient onboard air compressor with reservoir
8. Sand filling pistol for dustless filling process
9. Sufficient to fill approximately 1000-1200 liters of brake sand during an 8 hour shift
10. Extra-wide tires for better yard operation
11. Welded constructed system housing and component enclosure

D. Accessories:

1. Shop battery charging station, Model No. USTP MSR-9001, one each
2. Bag slitting funnel, Model No. USTP MSR-1010, one each

- E. Utility Requirements:
 - 1. Electrical: 120 VAC, 1 phase, 30 amps, 60 hertz
- F. Finish: Durable enamel in manufacturer's standard color

PART 3 - EXECUTION

3.01 INSPECTION

- A. Coordinate location of rough-in work and utility stub-outs to assure match with equipment to be installed.
- B. Inspect delivered equipment for damage from shipping and exposure to weather.
- C. Compare delivered equipment with packing lists and specifications to assure receipt of all equipment items.

3.02 INSTALLATION

- A. Perform work under direct supervision of Foreman of Construction Superintendent with authority to coordinate installation of scheduled equipment with Architect or designated representative.
- B. Install equipment in accordance with plans, shop drawings, and manufacturer's instructions:
 - 1. Positioning: Place equipment in accordance with any noted special positioning requirements generally level (or slight slope as required by instructions), plumb, and at right angles to adjacent work.
 - 2. Fitting: Where field cutting or trimming is necessary, perform in a neat, accurate, professional manner without damaging equipment or adjacent work.
 - 3. Anchorage: Attach equipment as directed by Architect or designated representative. Installation fasteners shall be installed to avoid scratching or damaging adjacent surfaces.
- C. Upon completion of work, finish surfaces shall be free of tool marks, scratches, blemishes, and stains.

3.03 TESTING

- A. After final connections are made and prior to authorizing payment, specified equipment shall be tested for compliance with specifications in the presence of the Architect or designated representative using acceptance procedures provided by the manufacturer.

3.04 CLEANUP

- A. Touch-up damage to painted finishes.

- B. Wipe and clean equipment of any oil, grease, and solvents, and make ready for use.
- C. Clean area around equipment installation and remove packing and installation debris from job site.
- D. Notify Architect or designated representative for acceptance inspection.

3.05 TRAINING

- A. Direct the technical representative to provide specified hours of training to designated Owner's maintenance personnel in operation and maintenance of the following equipment. Coordinate, with Owner, training schedule and list of personnel to be trained.
 - 1. 2090 Buffer/grinder, 10 inches, with dust collector; .5 hours (minimum)
 - 2. 2191 Crimper, fittings/hose, electric/hydraulic; .5 hours (minimum)
 - 3. 2220 Drill press, variable speed, 20 inches; .5 hours (minimum)
 - 4. 3085 Cabinet, abrasive blast, with dust collector; 1 hours (minimum)
 - 5. 5404 Forklift, electric, 4,000 pounds; 1 hours (minimum)
- B. Obtain, from technical representative, a list of Owner's personnel trained in equipment operations and maintenance.

END OF SECTION 11 11 29

SECTION 11 31 00**RESIDENTIAL APPLIANCES****PART 1 - GENERAL****1.01 RELATED DOCUMENTS**

- A. Drawings and general provisions of the Contract, including General and Supplementary Conditions and Division 1 Specification Sections, apply to this Section.

1.02 SUMMARY

- A. This Section includes the following:
 - 1. Dishwashers.
 - 2. Refrigeration appliances
- B. Related Sections include the following:
 - 1. Division 6 Section "Interior Architectural Woodwork" for custom-made cabinets and plastic-laminate tops that receive residential appliances.
 - 2. Division 22 Section "Plumbing Piping" for water distribution piping, drainage and vent piping connections to residential appliances.
 - 3. Division 22 Section "Plumbing Fixtures" for kitchen sinks, and waste disposers.
 - 4. Division 26 electrical sections for services and connections to residential appliances.

1.03 SUBMITTALS

- A. Product Data: For each type of product indicated. Include operating characteristics, dimensions of individual appliances, and finishes for each appliance.
- B. Samples for Verification: For all products with factory-applied finishes, prepared on Samples of size indicated below.
 - 1. Size: 12 x 12 inches
- C. Appliance Schedule: For appliances. Use same designations indicated on Drawings.
- D. Manufacturer Certificates: Signed by manufacturers certifying that products comply with requirements.
- E. Product Test Reports: Based on evaluation of comprehensive tests performed by manufacturer and witnessed by a qualified testing agency, for each product.
- F. Research/Evaluation Reports: For each product.
- G. Maintenance Data: For each product to include in maintenance manuals.
- H. Warranties: Special warranties specified in this Section.

1.04 QUALITY ASSURANCE

- A. **Manufacturer Qualifications:** A qualified manufacturer. Maintain, within 25 miles of Project site, a service center capable of providing training, parts, and emergency maintenance repairs.
- B. **Source Limitations:** Obtain residential appliances through one source from a single manufacture.
 - 1. To the greatest extent possible, provide appliances by a single manufacturer for entire Project.
- C. **Regulatory Requirements:** Comply with provisions of the following product certifications:
 - 1. **NFPA:** Provide electrical appliances listed and labeled as defined in NFPA 70, Article 100, by a testing agency acceptable to authorities having jurisdiction, and marked for intended use.
 - 2. **UL and NEMA:** Provide electrical components required as part of residential appliances that are listed and labeled by UL and that comply with applicable NEMA standards.
 - 3. **NAECA:** Provide residential appliances that comply with NAECA standards.
- D. **Regulatory Requirements, Accessibility:** Where residential appliances are indicated to comply with accessibility requirements, comply with the U.S. Architectural & Transportation Barriers Compliance Board's "Americans with Disabilities Act (ADA), Accessibility Guidelines for Buildings and Facilities (ADAAG)."
 - 1. **Operable Parts:** Provide controls with forward reach no higher than 48 inches above the floor, horizontal front reach no more than 25 inches, horizontal side reach no more than 24 inches, and that do not require tight grasping, pinching, or twisting of the wrist and that operate with a force of not more than 5 lbf.
- E. **AHAM Standards:** Provide appliances that comply with the following AHAM standards:
 - 1. **Dishwashers:** AHAM DW-DW1.
- F. **Energy Ratings:** Provide residential appliances that carry labels indicating energy-cost analysis (estimated annual operating costs) and efficiency information as required by the FTC Appliance Labeling Rule.
 - 1. Provide appliances that qualify for the EPA/DOE ENERGY STAR product labeling program.
- G. **Preinstallation Conference:** Conduct conference at Project site to comply with requirements in Division 1 Section "Project Management and Coordination."

1.05 WARRANTY

- A. **Special Warranties:** Manufacturer's standard form in which manufacturer of each appliance specified agrees to repair or replace residential appliances or components that fail in materials or workmanship within specified warranty period.

1. Dishwasher: 10-year warranty for in-home service against deterioration of tub and door liner.
2. Refrigerator/Freezer, Sealed System: Full warranty including parts and labor for on-site service on the product.
 - a. Warranty Period for Sealed Refrigeration System: Five years from date of Substantial Completion.
 - b. Warranty Period for Other Components: Two years from date of Substantial Completion.

PART 2 - PRODUCTS

2.01 MANUFACTURERS

- A. In other Part 2 articles where titles below introduce lists, the following requirements apply to product selection:
 1. Available Products: Subject to compliance with requirements, products that may be incorporated into the Work include, but are not limited to, products specified.
 2. Products: Subject to compliance with requirements, provide one of the products specified.
 3. Basis-of-Design Product: The design for each residential appliance is based on the product named. Subject to compliance with requirements, provide either the named product or a comparable product by one of the other manufacturers specified.

2.02 CLEANING APPLIANCES

- A. Dishwasher
 1. Basis-of-Design Product: Subject to compliance with requirements, provide Model #: GSD4060DSS by General Electric Company or comparable product by one of the following:
 - a. BOSCH, BSH Home Appliances Corporation;.
 - b. KitchenAid.
 - c. Whirlpool Corporation.
 2. Type: Under the counter, operable at water pressures from 15 to 120 psi.
 3. Dimensions: 24 inches wide x depth indicated on Drawings.
 4. Tub and Door Liner: Manufacturer's standard.
 - a. Detergent Dispenser: Sealed detergent and automatic rinsing-aid dispensers in door liner.
 5. Rack System: Nylon-coated sliding dish racks, with removable cutlery basket.
 6. Operation: Four wash cycles with hot-air and heat-off drying cycle options.
 7. Controls: Solid-state, electronic, press-to-start type.
 8. Front Panel: Manufacturer's standard.
 9. Appliance Color: Stainless Steel.
 10. Standard features include the following:

- a. Waste food disposer.
- b. Self-cleaning food-filter system.
- c. Hot-water booster heater for 160 deg F wash water with incoming water at 100 deg F.

11. Capacity:

- a. Place Settings: Eight .
- b. Water Consumption for Full Load: 3.2 gal.

2.03 REFRIGERATOR/FREEZERS

A. Refrigerator/Freezer Two-door refrigerator/freezer with freezer on top and complying with AHAM HRF-1.

1. Basis-of-Design Product: Subject to compliance with requirements, provide Model #: GTZ18GCESS by General Electric Company or comparable product by one of the following:
 - a. BOSCH, BSH Home Appliances Corporation;.
 - b. KitchenAid.
 - c. Whirlpool Corporation.
2. Type: Freestanding.
3. Dimensions:
 - a. Width: 30 inches
 - b. Depth: 32-3/8 inches.
 - c. Height: 66-7/8 inches
4. Storage Capacity:
 - a. Refrigeration Compartment Volume: 13.89 cu. ft.
 - b. Freezer Volume: 4.22 cu. ft.
 - c. Shelf Area: Two adjustable glass shelves.
5. General Features:
 - a. Built-in water filtration system.
 - b. Dual refrigeration systems.
 - c. Separate temperature controls for each compartment.
6. Refrigerator Features:
 - a. Interior light in refrigeration compartment.
 - b. Compartment Storage: 3 total clear storage drawers, 2 with humidity control.
 - c. Door Storage: Modular compartments.
7. Freezer Features: One freezer compartment.
 - a. Automatic defrost.
 - b. Interior light in freezer compartment.

- c. Automatic icemaker and storage bin.
- 8. Energy Performance, ENERGY STAR: Provide appliances that qualify for the EPA/DOE ENERGY STAR product labeling program.
- 9. Appliance Color/Finish: Stainless steel.

1.01 FINISHES, GENERAL

- A. Comply with NAAMM's "Metal Finishes Manual for Architectural and Metal Products" for recommendations for applying and designating finishes.
- B. Protect mechanical finishes on exposed surfaces from damage by applying a strippable, temporary protective covering before shipping.
- C. Finish: Provide appliances with manufacturer's standard finish as selected by Architect.

PART 2 - EXECUTION

2.01 EXAMINATION

- A. Examine conditions, with Installer present, for compliance with requirements for installation tolerances and other conditions affecting performance of work.
- B. Examine roughing-in for piping systems to verify actual locations of piping connections before equipment installation.
- C. Proceed with installation only after unsatisfactory conditions have been corrected.

2.02 INSTALLATION, GENERAL

- A. General: Comply with manufacturer's written instructions.
- B. Utilities: Refer to Divisions 22 and 26 for plumbing and electrical requirements.

2.03 CLEANING AND PROTECTION

- A. Test each item of residential appliances to verify proper operation. Make necessary adjustments.
- B. Verify that accessories required have been furnished and installed.
- C. Remove packing material from residential appliances and leave units in clean condition, ready for operation.

2.04 DEMONSTRATION

- A. Engage a factory-authorized service representative to train Owner's maintenance personnel to adjust, operate, and maintain residential appliances. Refer to Division 1 Section "Closeout Procedures."

END OF SECTION 11 31 00

SECTION 12 24 13
ROLLER WINDOW SHADES**PART 1 - GENERAL****1.01 RELATED DOCUMENTS**

- A. Drawings and general provisions of the Contract, including General and Supplementary Conditions and Division 01 Specification Sections, apply to this Section.

1.02 SUMMARY**A. Section Includes:**

- 1. Manually operated roller shades with single rollers.

B. Related Requirements:

- 1. Section 06 10 53 "Miscellaneous Rough Carpentry" for wood blocking and grounds for mounting roller shades and accessories.
- 2. Section 07 92 00 "Joint Sealants" for sealing the perimeters of installation accessories for light-blocking shades with a sealant.

1.03 SUBMITTALS**A. Product Data:** For each type of product.

- 1. Include styles, material descriptions, construction details, dimensions of individual components and profiles, features, finishes, and operating instructions for roller shades.

B. Shop Drawings: Show fabrication and installation details for roller shades, including shadeband materials, their orientation to rollers, and their seam and batten locations.**C. Samples:** For each exposed product and for each color and texture specified, **10 inches** long.**D. Samples for Initial Selection:** For each type and color of shadeband material.

- 1. Include Samples of accessories involving color selection.

E. Samples for Verification: For each type of roller shade.

- 1. Shadeband Material: Not less than **10 inches** square. Mark inside face of material if applicable.
- 2. Roller Shade: Full-size operating unit, not less than **16 inches** wide by **36 inches** long for each type of roller shade indicated.
- 3. Installation Accessories: Full-size unit, not less than **10 inches** long.

F. Roller-Shade Schedule: Use same designations indicated on Drawings.**G. Qualification Data:** For Installer.**H. Product Certificates:** For each type of shadeband material, signed by product manufacturer.

- I. Product Test Reports: For each type of shadeband material, for tests performed by manufacturer and witnessed by a qualified testing agency
- J. Maintenance Data: For roller shades to include in maintenance manuals.

1.04 QUALITY ASSURANCE

- A. Installer Qualifications: Fabricator of products.

1.05 DELIVERY, STORAGE, AND HANDLING

- A. Deliver roller shades in factory packages, marked with manufacturer, product name, and location of installation using same designations indicated on Drawings.

1.06 FIELD CONDITIONS

- A. Environmental Limitations: Do not install roller shades until construction and finish work in spaces, including painting, is complete and dry and ambient temperature and humidity conditions are maintained at the levels indicated for Project when occupied for its intended use.
- B. Field Measurements: Where roller shades are indicated to fit to other construction, verify dimensions of other construction by field measurements before fabrication and indicate measurements on Shop Drawings. Allow clearances for operating hardware of operable glazed units through entire operating range. Notify Architect of installation conditions that vary from Drawings. Coordinate fabrication schedule with construction progress to avoid delaying the Work.

PART 2 - PRODUCTS

2.01 MANUFACTURERS

- A. Basis-of-Design Product: Subject to compliance with requirements, provide EcoVeil shades by MechoShade Systems, Inc. or comparable product by one of the following:
 - 1. Draper Inc.
 - 2. Hunter Douglas Contract.
 - 3. Lutron Electronics Co., Inc.
 - 4. Nysan Solar Control Inc.; Hunter Douglas Company.
- B. Source Limitations: Obtain roller shades from single source from single manufacturer.

2.02 MANUALLY OPERATED SHADES WITH SINGLE ROLLERS

- A. Chain-and-Clutch Operating Mechanisms: With continuous-loop bead chain and clutch that stops shade movement when bead chain is released; permanently adjusted and lubricated.
 - 1. Bead Chains: Manufacturer's standard.
 - a. Loop Length: Full length of roller shade.
 - b. Limit Stops: Provide upper and lower ball stops.
 - c. Chain-Retainer Type: Clip, jamb mount
- B. Rollers: Extruded-aluminum tubes of diameters and wall thicknesses required to accommodate operating mechanisms and weights and widths of shadebands

indicated without deflection. Provide with permanently lubricated drive-end assemblies and idle-end assemblies designed to facilitate removal of shadebands for service.

1. Roller Drive-End Location: Right side of inside face of shade.
 2. Direction of Shadeband Roll: Regular, from back of roller.
 3. Shadeband-to-Roller Attachment: Manufacturer's standard method.
- C. Mounting Hardware: Brackets or endcaps, corrosion resistant and compatible with roller assembly, operating mechanism, installation accessories, and mounting location and conditions indicated.
- D. Roller-Coupling Assemblies: Coordinated with operating mechanism and designed to join up to three inline rollers into a multiband shade that is operated by one roller drive-end assembly.
- E. Shadebands:
1. Shadeband Material: Light-filtering fabric.
 2. Shadeband Bottom (Hem) Bar: Steel or extruded aluminum.
 - a. Type: Enclosed in sealed pocket of shadeband material.
 - b. Color and Finish: As indicated on Finish Legend.
- F. Installation Accessories:
1. Front Fascia: Aluminum extrusion that conceals front and underside of roller and operating mechanism and attaches to roller endcaps without exposed fasteners.
 - a. Shape: L-shaped.
 - b. Height: Manufacturer's standard height required to conceal roller and shadeband when shade is fully open, but not less than 4 inches.
 2. Exposed Headbox: Rectangular, extruded-aluminum enclosure including front fascia, top and back covers, endcaps, and removable bottom closure.
 - a. Height: Manufacturer's standard height required to enclose roller and shadeband when shade is fully open, but not less than 4 inches.
 3. Endcap Covers: To cover exposed endcaps.
 4. Recessed Shade Pocket: Rectangular, extruded-aluminum enclosure designed for recessed ceiling installation; with front, top, and back formed as one piece, end plates, and removable bottom closure panel.
 - a. Height: Manufacturer's standard height required to enclose roller and shadeband when shade is fully open, but not less than height indicated on Drawings.
 - b. Provide pocket with lip at lower edge to support acoustical ceiling panel.
 5. Installation Accessories Color and Finish: As selected from manufacturer's full range.

2.03 SHADEBAND MATERIALS

- A. Shadeband Material Flame-Resistance Rating: Comply with NFPA 701. Testing by a qualified testing agency. Identify products with appropriate markings of applicable testing agency.

- B. Light-Filtering Fabric: Woven fabric, stain and fade resistant.
 - 1. Source: Roller-shade manufacturer.
 - 2. Type: Woven PVC-coated fiberglass and PVC-coated polyester
 - 3. Weave: Mesh.
 - 4. Orientation on Shadeband: Railroaded
 - 5. Openness Factor: 10 percent.
 - 6. Color: As indicated on Finish Legend.
- C. Light-Blocking Fabric: Opaque fabric, stain and fade resistant.
 - 1. Source: Roller-shade manufacturer.
 - 2. Type: Fiberglass textile with PVC film bonded to both sides.
 - 3. Orientation on Shadeband: Railroaded.
 - 4. Features: Washable.
 - 5. Color: As indicated on Finish Legend

2.04 ROLLER-SHADE FABRICATION

- A. Product Safety Standard: Fabricate roller shades to comply with WCMA A 100.1, including requirements for flexible, chain-loop devices; lead content of components; and warning labels.
- B. Unit Sizes: Fabricate units in sizes to fill window and other openings as follows, measured at 74 deg F:
 - 1. Between (Inside) Jamb Installation: Width equal to jamb-to-jamb dimension of opening in which shade is installed less 1/4 inch per side or 1/2-inch total, plus or minus 1/8 inch. Length equal to head-to-sill or -floor dimension of opening in which shade is installed less 1/4 inch, plus or minus 1/8 inch.
 - 2. Outside of Jamb Installation: Width and length as indicated, with terminations between shades of end-to-end installations at centerlines of mullion or other defined vertical separations between openings.
- C. Shadeband Fabrication: Fabricate shadebands without battens or seams to extent possible except as follows:
 - 1. Railroaded Materials: Railroad material where material roll width is less than the required width of shadeband and where indicated. Provide battens and seams as required by railroaded material to produce shadebands with full roll-width panel(s) plus, if required, one partial roll-width panel located at top of shadeband.

PART 3 - EXECUTION

3.01 EXAMINATION

- A. Examine substrates, areas, and conditions, with Installer present, for compliance with requirements for installation tolerances, operational clearances, and other conditions affecting performance of the Work.
- B. Proceed with installation only after unsatisfactory conditions have been corrected.

3.02 ROLLER-SHADE INSTALLATION

- A. Install roller shades level, plumb, and aligned with adjacent units according to manufacturer's written instructions.

1. Opaque Shadebands: Located so shadeband is not closer than 2 inches to interior face of glass. Allow clearances for window operation hardware.

3.03 ADJUSTING

- A. Adjust and balance roller shades to operate smoothly, easily, safely, and free from binding or malfunction throughout entire operational range.

3.04 CLEANING AND PROTECTION

- A. Clean roller-shade surfaces after installation, according to manufacturer's written instructions.
- B. Provide final protection and maintain conditions, in a manner acceptable to manufacturer and Installer, that ensure that roller shades are without damage or deterioration at time of Substantial Completion.
- C. Replace damaged roller shades that cannot be repaired, in a manner approved by Architect, before time of Substantial Completion.

END OF SECTION 12 24 13

SECTION 12 36 16**STAINLESS STEEL COUNTERTOPS****PART 1 - GENERAL****1.01 RELATED DOCUMENTS**

- A. Drawings and general provisions of the Contract, including General and Supplementary Conditions and Division 1 Specification Sections, apply to this Section.

1.02 SUMMARY

- A. Section Includes:
 - 1. Stainless-steel countertops
- B. Applications: Refer to Drawings for locations.
- C. Related Sections include the following:
 - 1. Division 06 Section "Miscellaneous Carpentry" for wood blocking for anchoring countertops.
 - 2. Division 06 Section "Interior Architectural Woodwork" for plastic-laminate and solid-surfacing material countertops.
 - 3. Division 09 Section "Gypsum Plaster" for reinforcements in metal-framed plaster partitions for anchoring countertops.
 - 4. Division 09 Section "Gypsum Board Assemblies" for reinforcements in metal-framed gypsum board partitions for anchoring countertops

1.03 SUBMITTALS

- A. Product Data: For each type of product indicated.
- B. Shop Drawings: For metal countertops Include plans, elevations, sections, details, and attachments to other work.
 - 1. Indicate locations of blocking and reinforcements required for installing countertops
 - 2. Indicate hardware locations.
 - 3. Indicate locations of and clearances from adjacent walls, doors, windows, other building components, and equipment.
 - 4. Indicate locations of seams in stainless-steel countertops.
- C. Samples for Initial Selection: For factory-applied finishes.
- D. Samples for Verification: Full-size units of each type of exposed hardware indicated.

1.04 QUALITY ASSURANCE

- A. Source Limitations: Obtain countertopsthrough one source from a single manufacturer.
- B. Preinstallation Conference: Conduct conference at Project site to comply with requirements in Division 1 Section "Project Management and Coordination."

1.05 DELIVERY, STORAGE, AND HANDLING

- A. Protect finished surfaces during handling and installation with protective covering of polyethylene film or other suitable material.

1.06 COORDINATION

- A. Coordinate layout and installation of framing and reinforcements for support of countertops

PART 2 - PRODUCTS

2.01 MATERIALS

- A. Stainless-Steel Sheet: ASTM A 666, Type 304, stretcher-leveled standard of flatness.
- B. Minimum Nominal Stainless-Steel Thicknesses for countertops:
 - 1. Countertops: 0.0500 inch.
 - 2. Shelves: 0.0375 inch except 0.0500 inch for unreinforced shelves more than 36 inches long.
 - 3. Miscellaneous Components: 0.0375 inch minimum.

2.02 FABRICATION

- A. General: Assemble and finish units at point of manufacture. Perform assembly on precision jigs to provide units that are square. Reinforce units with angles, gussets, and channels.
- B. Adjustable Shelves: Front, back, and ends formed down, with edges returned horizontally at front and back to form reinforcing channels.
- C. Filler Strips: Provide as needed to close spaces between cabinets and walls, ceilings, and indicated equipment. Fabricate from same material and with same finish as countertops with hemmed or flanged edges.

2.03 STAINLESS-STEEL FINISH

- A. Grind and polish surfaces to produce uniform, directionally textured finish, free of cross scratches and matching No. 4 finish. Run grain with long dimension of each piece.
- B. When polishing is completed, passivate and rinse surfaces. Remove embedded foreign matter and leave surfaces chemically clean.

2.04 STAINLESS-STEEL COUNTERTOPS

- A. Countertops: Provide units with smooth surfaces in uniform plane free of defects. Ease exposed edges and corners. Provide front and end overhang of 1 inch over base cabinets.
 - 1. Stainless-Steel Sheet: ASTM A 666, Type [304] [316], not less than 0.0625-inch nominal thickness, with No. 4 satin finish.
 - 2. Extend top down 1 inch at edges with a 1/2-inch return flange under frame. Apply heavy coating of heat-resistant, sound-deadening mastic to undersurface.
 - 3. Form backsplash coved to and integral with top surface.
 - 4. Provide rolled edge, unless otherwise indicated.

5. Provide raised (marine) edge around perimeter of countertops containing sinks; pitch two ways to sink to provide drainage without channeling or grooving.
 6. Reinforce underside of countertop with channels or use thicker metal sheet where necessary to insure rigidity without deflection.
 7. Weld shop-made joints, and grind and polish surfaces to produce uniform, directionally textured finish, free of cross scratches. When polishing is completed, passivate and rinse surfaces. Remove embedded foreign matter and leave surfaces chemically clean.
 8. Where field-made joints are permitted, provide welded joints.
 9. Where field-made joints are required, provide hairline butt-joints mechanically bolted through continuous channels welded to underside at edges of joined ends. Keep field jointing to a minimum.
 10. Where stainless-steel sinks or cup sinks occur in stainless-steel countertops, factory weld into one integral unit, grind welds smooth, polish, passivate, and rinse.
- B. Shelves: Made from stainless-steel sheet, ASTM A 666, Type [304] [316], not less than 0.050-inch nominal thickness, with No. 4 satin finish. Fold [down] [up] front edge 3/4 inch; fold up back edge 3 inches. Provide integral stiffening brackets, formed by folding up ends 3/4 inch and welding to upturned [back edge] [front and back edges]. Weld shop-made joints, grind smooth, and finish.
- C. Sinks: Provide sizes indicated or metal medical casework manufacturer's closest standard size of equal or greater volume, as approved by Architect.
1. Stainless-Steel Sheet: ASTM A 666, Type [304] [316], not less than 0.050-inch nominal thickness. Fabricate with corners rounded and coved to at least 5/8-inch radius. Slope sink bottoms to outlet. Provide double-wall construction for sink partitions with top edge rounded to at least 1/2-inch diameter. Provide continuous butt-welded joints, grind smooth, and polish surfaces to produce nondirectional finish, free of scratches. When polishing is completed, passivate and rinse surfaces. Remove embedded foreign matter and leave surfaces chemically clean.
 2. Provide factory punchings for fittings.
 3. Provide with stainless-steel strainers and tailpieces, NPS 1-1/2, unless otherwise indicated.
 4. Where indicated, provide stainless-steel overflow of standard beehive or open-top design with separate stainless-steel strainer. Height 2 inches less than sink depth.
 5. Apply 1/8-inch-thick coating of heat-resistant, sound-deadening mastic to undersink surfaces.

PART 3 - EXECUTION

3.01 EXAMINATION

- A. Examine areas, with Installer present, for compliance with requirements for installation tolerances, location of reinforcements, and other conditions affecting performance of metal medical casework.
1. Proceed with installation only after unsatisfactory conditions have been corrected.

3.02 INSTALLATION OF SHELVING

- A. Install level, plumb, and true; shim as required, using concealed shims. Where metal shelves abut other finished work, apply filler strips and scribe for accurate fit, with

fasteners concealed where practical.

- B. Install hardware uniformly and precisely

3.03 INSTALLATION OF COUNTERTOPS

- A. Abut top and edge surfaces in one true plane with flush hairline joints and with internal supports placed to prevent deflection. Locate joints only where shown on Shop Drawings.
- B. Field Jointing: Provide flush welded joints in tops. Grind and polish surfaces to produce uniform, directionally textured finish, free of cross scratches. When polishing is completed, passivate and rinse surfaces. Remove embedded foreign matter and leave surfaces chemically clean.
- C. Field Jointing: Provide flush hairline joints in tops using adhesives and fasteners recommended by manufacturer. Prepare edges to be joined in shop so Project-site processing of top and edge surfaces is not required. Locate field-made joints only where indicated.
- D. Fastening: Secure countertops to cabinets with Z-type fasteners or equivalent, using two or more fasteners at each cabinet front, end, and back.
- E. Provide chemical-resistant, permanently elastic sealing compound for closures at junctures of top, curb, and splash, with walls as recommended by manufacturer for materials involved.

3.04 CLEANING AND PROTECTING

- A. Clean finished surfaces, touch up as required, and remove or refinish damaged or soiled areas to match original factory finish, as approved by Architect.
- B. Protect countertop surfaces during construction with 6-mil plastic or other suitable water-resistant covering. Tape to underside of countertop at minimum of 48 inches o.c.

END OF SECTION 12 36 16

SECTION 12 48 16**ENTRANCE FLOOR GRILLES****PART 1 - GENERAL****1.01 RELATED DOCUMENTS**

- A. Drawings and general provisions of the Contract, including General and Supplementary Conditions and Division 01 Specification Sections, apply to this Section.

1.02 SUMMARY

- A. This Section includes recessed foot grilles and frames.
- B. Related Sections include the following:
 - 1. Division 03 Section "Cast-in-Place Concrete" for slab depression grouting and filling for recessed foot grilles and frames.

1.03 PERFORMANCE REQUIREMENTS

- A. Structural Performance: Provide foot grilles and frames capable of withstanding the following loads and stresses:
 - 1. Uniform floor load min 300 lbf/sq. ft..
 - 2. Wheel load min 400 lb per wheel.

1.04 SUBMITTALS

- A. Product Data: Include construction details, material descriptions, dimensions of individual components and profiles, and finishes for foot grilles and frames.
- B. Shop Drawings: Show the following:
 - 1. Divisions between grille sections.
 - 2. Perimeter floor moldings.
- C. Samples for Verification: For each type of product indicated.
 - 1. Foot Grille: 12-inch- square assembled sections.
 - 2. Frame Members: 12-inch- long Sample of each type and color.
- D. Maintenance Data: For foot grilles and frames to include in maintenance manuals.

1.05 QUALITY ASSURANCE

- A. Source Limitations: Obtain foot grilles and frames through one source from a single manufacturer.
- B. Accessibility Requirements: Provide installed foot grilles that comply with Section 4.5 in the U.S. Architectural & Transportation Barriers Compliance Board's "Americans with Disabilities Act (ADA), Accessibility Guidelines for Buildings and Facilities (ADAAG)."

1.06 PROJECT CONDITIONS

- A. Field Measurements: Indicate measurements on Shop Drawings.

1.07 COORDINATION

- A. Coordinate size and location of recesses in concrete to receive foot grilles and frames where applicable.

PART 2 - PRODUCTS

2.01 MANUFACTURERS

- A. Basis-of-Design Product: Subject to compliance with requirements, provide the products indicated below or a comparable product by one of the following:
 1. ARDEN Architectural Specialties, Inc.
 2. Balco, Inc.
 3. Pawling Corporation; Architectural Products Division.

2.02 MATERIALS

- A. Aluminum Sheet: ASTM B 209, alloy and temper recommended by aluminum producer and finisher for type of use and finish indicated, and with not less than strength and durability properties of Alloy 5005-H15.
- B. Extruded Aluminum: ASTM B 221, Alloy 6061-T6 or Alloy 6063-T5, T6, or T52 as standard with manufacturer. Coat surface of frame in contact with cementitious materials with manufacturer's standard protective coating.

2.03 FOOT GRILLES

- A. General: Provide manufacturer's standard foot-grille assemblies consisting of treads of type and profile indicated, interlocked or joined together by cross members, and with support legs (if any) and other components needed to produce a complete installation.
- B. Aluminum Foot Grilles Foot Grille:
 1. Basis of Design: Provide Pedimat M1 by C/S Group, with extruded members, with carpet insert treads, and as follows:
 - a. Tread Rails: Extruded-aluminum tread rails with extruded-aluminum frame.
 - b. Tread Rail Spacing: 1-1/2 inches o.c. with 1/8- to 3/16-inch wide openings between treads.
 - 1) Aluminum Finish: Anodized
 - c. Top Surface: Carpet insert.
 - 1) Refer to Drawings for carpet style and color
 - d. Grille Size: As indicated on Drawings.
- C. Lockdown: Hidden.

2.04 FRAMES

- A. Provide manufacturer's standard frames of size and style for grille type, for permanent recessed installation in subfloor, complete with installation anchorages and accessories. Unless otherwise indicated, fabricate frame of same material and finish as grilles.

2.05 SUPPORT SYSTEM

- A. Level Bed Applications: Provide manufacturer's standard, vinyl cushion support system.

2.06 FABRICATION

- A. Shop fabricate foot grilles to greatest extent possible in sizes as indicated. Unless otherwise indicated, provide each grille as a single unit; do not exceed manufacturer's recommended maximum sizes for units that are removed for maintenance and cleaning. Where joints in grilles are necessary, space symmetrically and away from normal traffic lanes.
- B. Fabricate frame members in single lengths or, where frame dimensions exceed maximum available lengths, provide minimum number of pieces possible, with hairline joints equally spaced and pieces spliced together by straight connecting pins.

2.07 FINISHES, GENERAL

- A. Comply with NAAMM's "Metal Finishes Manual for Architectural and Metal Products" for recommendations for applying and designating finishes.
- B. Protect mechanical finishes on exposed surfaces from damage by applying a strippable, temporary protective covering before shipping.

2.08 ALUMINUM FINISHES

- A. Finish designations prefixed by AA comply with the system established by the Aluminum Association for designating aluminum finishes.
- B. Class I, Clear Anodic Finish: AA-M12C22A41 (Mechanical Finish: nonspecular as fabricated; Chemical Finish: etched, medium matte; Anodic Coating: Architectural Class I, clear coating 0.018 mm or thicker) complying with AAMA 611.

PART 3 - EXECUTION

3.01 EXAMINATION

- A. Examine substrates and floor conditions for compliance with requirements for location, size, minimum recess depth, and other conditions affecting installation of foot grilles and frames.
- B. Examine roughing-in for drainage piping systems to verify actual locations of piping connections before foot grille and frame and drain pan installation.
- C. Proceed with installation only after unsatisfactory conditions have been corrected.

3.02 INSTALLATION

- A. Install recessed foot grilles and frames to comply with manufacturer's written instructions at locations indicated and with top of foot grilles and frames in

relationship to one another and to adjoining finished flooring as recommended by manufacturer. Set foot-grille tops at height for most effective cleaning action. Coordinate top of foot-grille surfaces with doors that swing across grilles to provide clearance under door.

3.03 PROTECTION

- A. After completing frame installations, provide temporary filler of plywood or fiberboard in foot-grille recesses and cover frames with plywood protective flooring. Maintain protection until construction traffic has ended and Project is near Substantial Completion.

END OF SECTION 12 48 16

SECTION 12 93 00**SITE FURNISHINGS****PART 1 - GENERAL****1.1. RELATED DOCUMENTS**

- A. Drawings and general provisions of the Contract, including General and Supplementary Conditions and Division 01 Specification Sections, apply to this Section.

1.2. SUMMARY

- A. This Section includes the following:
1. Seating.
 2. Bicycle Racks.
 3. Trash Receptacles.
- B. Related Sections include the following:
1. Division 03 Section "Cast-in-Place Concrete" for installation of anchor bolts in concrete footings.
 2. Division 31 Section "Earth Moving" for excavation for installation of concrete footings.

1.3. SUBMITTALS

- A. Product Data: For each type of product indicated.
- B. LEED Submittals:
1. Product Data for Credit MR 4.1 and Credit MR 4.2: For products having recycled content, documentation indicating percentages by weight of postconsumer and preconsumer recycled content.
 - a. Include statement indicating costs for each product having recycled content.
 2. Product Data for Credits MR 5.1 and 5.2 - Local/Regional Materials:
 - a. Indicate location of manufacturing facility, including name, address, and distance between manufacturing facility and the project site. Provide manufacturer's documentation indicating location where the base materials were extracted, mined, quarried, harvested, etc. and the distance between this location and the project site. Also include material costs, excluding cost of installation.
- C. Samples for Initial Selection: For units with factory-applied color finishes.
- D. Samples for Verification: For each type of exposed finish required, prepared on Samples of size indicated below.
1. Size: Not less than 6-inch- long linear components and 4-inch- square sheet components.
 2. Full Size: Bench.

- E. Product Schedule: For site furnishings. Use same designations indicated on Drawings.
- F. Maintenance Data: For site furnishings to include in maintenance manuals.

1.4. QUALITY ASSURANCE

- A. Source Limitations: Obtain each type of site furnishing(s) through one source from a single manufacturer.

PART 2 - PRODUCTS

2.1. MATERIALS

- A. Recycled Content of Steel and Aluminum Products: Provide products with an average recycled content of steel or aluminum products so postconsumer recycled content plus one-half of preconsumer recycled content is not less than 25 percent..
- B. Anchors, Fasteners, Fittings, and Hardware: Manufacturer's standard, corrosion-resistant-coated or noncorrodible materials; commercial quality, tamperproof, vandal and theft resistant, concealed, recessed, and capped or plugged.
 - 1. Angle Anchors: For inconspicuously bolting legs of site furnishings to below-grade substrate; extent as indicated.
- C. Nonshrink, Nonmetallic Grout: Premixed, factory-packaged, nonstaining, noncorrosive, nongaseous grout complying with ASTM C 1107; recommended in writing by manufacturer, for exterior applications.
- D. Erosion-Resistant Anchoring Cement: Factory-packaged, nonshrink, nonstaining, hydraulic-controlled expansion cement formulation for mixing with potable water at Project site to create pourable anchoring, patching, and grouting compound; resistant to erosion from water exposure without needing protection by a sealer or waterproof coating; recommended in writing by manufacturer, for exterior applications.

2.2. SEATING

- A. Basis-of-Design Product: Subject to compliance with requirements, provide:
 - 1. Landscape Forms
 - a. Model: Melville Bench.
 - b. Style: Backless.
 - c. Mounting: Surface mount.
 - d. Option: No dividers.
 - e. Seat panel material: Aluminum.
 - f. Color: Olive.

2.3. TRASH RECEPTACLES

- A. Basis-of-Design Product: Subject to compliance with requirements, provide:
 - 1. Landscape Forms
 - a. Model: Poe.
 - b. Style: Side-opening.
 - c. Mounting: Surface mount.
 - d. Option: Lock.
 - e. Color: Olive.

2.4. BICYCLE RACKS

- A. Basis-of-Design Product: Subject to compliance with requirements, provide:
 - 1. Landscape Forms
 - a. Model: Key.
 - b. Mounting: Embedded.
 - c. Color: Red.

2.5. FINISHES, GENERAL

- A. Comply with NAAMM's "Metal Finishes Manual for Architectural and Metal Products" for recommendations for applying and designating finishes.
- B. Appearance of Finished Work: Variations in appearance of abutting or adjacent pieces are acceptable if they are within one-half of the range of approved Samples. Noticeable variations in the same piece are not acceptable. Variations in appearance of other components are acceptable if they are within the range of approved Samples and are assembled or installed to minimize contrast.

2.6. ALUMINUM FINISHES

- A. Baked-Enamel, Powder-Coat Finish: Manufacturer's standard, baked, polyester, powder-coat finish complying with finish manufacturer's written instructions for surface preparation, including pretreatment, application, baking, and minimum dry film thickness.

PART 3 - EXECUTION**3.1. EXAMINATION**

- A. Examine areas and conditions, with Installer present, for compliance with requirements for correct and level finished grade, mounting surfaces, installation tolerances, and other conditions affecting performance.
 - 1. Proceed with installation only after unsatisfactory conditions have been corrected.

3.2. INSTALLATION, GENERAL

- A. Comply with manufacturer's written installation instructions unless more stringent requirements are indicated. Complete field assembly of site furnishings where required.
- B. Unless otherwise indicated, install site furnishings after landscaping and paving have been completed.
- C. Install site furnishings level, plumb, true, and securely anchored and positioned at locations indicated on Drawings.

3.3. CLEANING

- A. After completing site furnishing installation, inspect components. Remove spots, dirt, and debris. Repair damaged finishes to match original finish or replace component.

END OF SECTION

SECTION 12 93 00**BENCHES****PART 1 - GENERAL****1.1 SUMMARY**

- A. This Section includes custom benches to be provided at specific stations per drawings.

1.2 SUBMITTALS

- A. Product Data: Include sealed drawings by a structural engineer licensed in the State of Missouri, construction details, material descriptions, dimensions of individual components and profiles, finishes, actual tamper proof canopy anchors, field-assembly requirements, and installation details.
- a. Sealed drawings shall include calculations, description of members sizes, and connection details designed to withstand a 250lb per lineal foot (LF) load along the outside edge of the bench with a maximum deflection of ¼" per LF.

1.3 QUALITY ASSURANCE

- A. Provide a full scale mock-up of the bench for review and approval for the method assembly and finish treatments.

PART 2 - PRODUCTS**2.1 MANUFACTURERS**

- A. The contractor shall fabricate the custom bench as indicated in the drawings.

2.2 MATERIALS

- A. Seat and back panels:
Wood: Ipe with natural, smooth finish
- B. Frame:
1. Supports: Stainless steel, honed finish
- C. Anchor(s) shall be stainless steel and have tamperproof heads and shall be provided and installed by contractor per Contract Drawings.

PART 3 - EXECUTION**3.1 EXAMINATION**

- A. Examine areas and conditions, with Installer present, for compliance with requirements for correct and level finished grade, mounting surfaces, installation tolerances, and other conditions affecting performance.

3.2 INSTALLATION, GENERAL

- A. Contractor shall determine means of assembly and installation. Complete field assembly of benches, where required.
- B. Install benches level, plumb, true, and securely anchored at locations indicated on Drawings.

3.3 CLEANING

- A. After completing installation, inspect components. Remove spots, dirt, and debris from surrounding surfaces and finishes. Repair damaged finishes to match original finish or replace component.

PART 4 - MEASUREMENT

- 4.1 Measurement** – No Separate measurement will be made for Work described in this Section.

PART 5 - PAYMENT

- 5.1 Payment** – Payment for items in this Section will be incidental to the Contract lump sum cost of the Station Stops.

END OF SECTION

SECTION 12 93 43**PRECAST CONCRETE SITE BENCHES****PART 1 - GENERAL****1.1 RELATED DOCUMENTS**

- A. Drawings and general provisions of the Contract, including General and Supplementary Conditions and Division 01 Specification Sections, apply to this Section.

1.2 SUMMARY

- A. Section Includes precast concrete seating blocks.
- B. Related Sections:
 - 1. Division 31 Section "Earth Moving" for excavation and compacted subgrade.

1.3 ACTION SUBMITTALS

- A. Product Data: For materials other than water.
 - 1. For precast concrete units, include construction details, material descriptions, dimensions of individual units and profiles, and finishes.
- B. LEED Submittals:
 - 1. Product Data for Credit MR 4.1 and Credit MR 4.2 – Recycled Content: For products having recycled content, documentation indicating percentages by weight of postconsumer and preconsumer recycled content.
 - a. Include statement indicating costs for each product having recycled content.
 - 2. Product Data for Credits MR 5.1 and 5.2 - Local/Regional Materials:
 - a. Indicate location of manufacturing facility, including name, address, and distance between manufacturing facility and the project site. Provide manufacturer's documentation indicating location where the base materials were extracted, mined, quarried, harvested, etc. and the distance between this location and the project site. Also include material costs, excluding cost of installation.
- C. Shop Drawings: Show fabrication and installation details for precast concrete units. Include dimensions, details of reinforcement and anchorages if any, and indication of finished faces.
 - 1. Include site plans showing layout of units and locations of joints and finished faces.
- D. Samples for Initial Selection: For concrete color and textured finish.
- E. Samples for Verification: For each color and texture required, 8 to 12 inches square.

- F. Full-Size Samples: One precast unit required.
 - 1. Make available for Architect's review at Project site.
 - 2. Approved Samples may be installed in the Work.

1.4 INFORMATIONAL SUBMITTALS

- A. Qualification Data: For manufacturer.
- B. Material Test Reports: For each mix required to produce precast concrete, based on testing according to ASTM C 1364, including test for resistance to freezing and thawing.
 - 1. Provide test reports based on testing within previous two years for products of similar size, thickness, and volume.

1.5 QUALITY ASSURANCE

- A. Manufacturer Qualifications: A qualified manufacturer of precast concrete units similar to those indicated for this Project, that has sufficient production capacity to manufacture required units, and is a plant certified by the Cast Stone Institute, the Architectural Precast Association, or the Precast/Prestressed Concrete Institute for Group A, Category AT.
- B. Source Limitations for Precast Concrete: Obtain precast concrete units through single source from single manufacturer.

1.6 DELIVERY, STORAGE, AND HANDLING

- A. Coordinate delivery of precast concrete to avoid delaying the Work and to minimize the need for on-site storage.
- B. Pack, handle, and ship precast concrete units in suitable packs or pallets.
 - 1. Lift with wide-belt slings; do not use wire rope or ropes that might cause staining. Move precast concrete units, if required, using dollies with wood supports or provide protection in the form of padding to facilitate skid lifting through recessed grooves provided in cast unit.
 - 2. Store precast concrete units on wood skids or pallets with nonstaining, waterproof covers, securely tied. Arrange to distribute weight evenly and to prevent damage to units.

PART 2 - PRODUCTS

2.1 PRECAST CONCRETE MATERIALS

- A. General: Comply with ASTM C 1364 and the following:
- B. Portland Cement: ASTM C 150, Type I or Type III, containing not more than 0.60 percent total alkali when tested according to ASTM C 114.
- C. Coarse Aggregates: Recycled concrete complying with ASTM C 33; gradation and colors as needed to produce required precast concrete textures and colors.
- D. Fine Aggregates: Natural sand or crushed stone complying with ASTM C 33, gradation and colors as needed to produce required precast concrete textures and colors.
- E. Exposed Seeded Aggregate:

1. Aggregate Size: 3/8 inch nominal.
 2. Product: Charcoal angular granite.
- F. Color Pigment: ASTM C 979, synthetic mineral-oxide pigments or colored water-reducing admixtures; color stable, nonfading, and resistant to lime and other alkalis.
- G. Admixtures: Use only admixtures specified or approved in writing by Architect.
1. Do not use admixtures that contain more than 0.1 percent water-soluble chloride ions by mass of cementitious materials. Do not use admixtures containing calcium chloride.
 2. Use only admixtures that are certified by manufacturer to be compatible with cement and other admixtures used.
 3. Air-Entraining Admixture: ASTM C 260. Add to mixes for units exposed to the exterior at manufacturer's prescribed rate to result in an air content of 4 to 6 percent, except do not add to zero-slump concrete mixes.
 4. Water-Reducing Admixture: ASTM C 494/C 494M, Type A.
 5. Water-Reducing, Retarding Admixture: ASTM C 494/C 494M, Type D.
 6. Water-Reducing, Accelerating Admixture: ASTM C 494/C 494M, Type E.
- H. Reinforcement: Deformed steel bars complying with ASTM A 615/A 615M, Grade 60. Use galvanized or epoxy-coated reinforcement when covered with less than 1-1/2 inches of precast concrete material.
1. Epoxy Coating: ASTM A 775/A 775M.
 2. Galvanized Coating: ASTM A 767/A 767M.

2.2 PRECAST CONCRETE UNITS

- A. Manufacturers: Subject to compliance with requirements, provide products by one of the following available manufacturers offering products that may be incorporated into the Work include, but are not limited to, the following:
1. xxxxxxxx.
- B. Regional Materials: Precast concrete units shall be manufactured within 500 miles of Project site from aggregates that have been extracted, harvested, or recovered, as well as manufactured, within 500 miles of Project site.
- C. Provide precast concrete units complying with ASTM C 1364 using either the vibrant dry tamp or wet-cast method.
1. Provide units that are resistant to freezing and thawing as determined by laboratory testing according to ASTM C 666/C 666M, Procedure A, as modified by ASTM C 1364.
- D. Fabrication Tolerances:
1. Variation in Cross Section: Do not vary from indicated dimensions by more than 1/8 inch.
 2. Variation in Length: Do not vary from indicated dimensions by more than 1/360 of the length of unit or 1/8 inch, whichever is greater, but in no case by more than 1/4 inch.
 3. Warp, Bow, and Twist: Not to exceed 1/360 of the length of unit or 1/8 inch, whichever is greater.
 4. Location of Grooves, False Joints, Holes, and Similar Features: Do not vary from indicated position by more than 1/8 inch on formed surfaces of units and 3/8 inch on unformed surfaces.

- E. Cure units as follows:
1. Cure units in enclosed moist curing room at 95 to 100 percent relative humidity and temperature of 100 deg F for 12 hours or 70 deg F for 16 hours.
 2. Keep units damp and continue curing to comply with one of the following:
 - a. No fewer than five days at mean daily temperature of 70 deg F or above.
 - b. No fewer than six days at mean daily temperature of 60 deg F or above.
 - c. No fewer than seven days at mean daily temperature of 50 deg F or above.
 - d. No fewer than eight days at mean daily temperature of 45 deg F or above.
- F. Acid etch units after curing to remove cement film from surfaces to be exposed to view.
- G. Polish and grind one long vertical face to reveal seeded aggregates. Finish shall be consistent, smooth, and created glossy appearance differentiating face from remaining non-polished faces.
- H. Concrete Mixture/Finish: Match initial sample provided by Architect to Precast Manufacturer, use following as reference only:
1. Ingredients per cubic yard:
 - a. Color – DCS #2703 Black 2.72#
 - b. Cement – White – 680#
 - c. Aggregate – Canyon Grey 1 – 1700#
 - d. Sand – Light Gray Sand – 12500#

PART 3 - EXECUTION

3.1 EXAMINATION

- A. Examine substrates and conditions, with Installer present, for compliance with requirements for installation tolerances and other conditions affecting performance of work.
- B. Proceed with installation only after unsatisfactory conditions have been corrected.

3.2 INSTALLATION TOLERANCES

- A. Variation from Plumb: Do not exceed 1/8 inch in 10 feet, 1/4 inch in 20 feet, or 1/2 inch maximum.
- B. Variation from Level: Do not exceed 1/8 inch in 10 feet, 1/4 inch in 20 feet, or 1/2 inch maximum.
- C. Variation in Plane between Adjacent Surfaces (Lipping): Do not vary from flush alignment with adjacent units or adjacent surfaces indicated to be flush with units by more than 1/8 inch, except where variation is due to warpage of units within tolerances specified.

3.3 ADJUSTING AND CLEANING

- A. Remove and replace stained and otherwise damaged units and units not matching approved Samples. Precast concrete may be repaired if methods and results are approved by Architect.

- B. Replace units in a manner that results in precast concrete matching approved Samples, complying with other requirements, and showing no evidence of replacement.
- C. Construction Waste Management And Disposal: Comply with Waste Management Plan required under Division 01 Section "Construction Waste Management And Disposal."

END OF SECTION

SECTION 13 13 50
STATION PLATFORMS**PART I - GENERAL****1.1 SUMMARY**

- A. Description
1. Work of this Section includes, but is not limited to construction of all elements of the station platforms.
- B. Related Sections
1. Section 03 11 10 – Concrete Formwork
 2. Section 03 15 10 – Concrete Flatwork
 3. Section 03 20 10 – Concrete Reinforcement
 4. Section 03 25 10 – Concrete Joint Control
 5. Section 03 31 05 – Structural Concrete
 6. Section 03 35 10 – Concrete Finishing
 7. Section 03 39 00 – Concrete Curing
 8. Section 05 05 05 – Galvanic Corrosion Protection
 9. Section 05 12 00 – Structural Steel Framing
 10. Section 05 12 13 – Architecturally Exposed Structural Steel
 11. Section 05 50 00 – Metal Fabrications
 12. Section 05 50 13 – Steel Railings
 13. Section 05 58 00 – Sheet Metal Panels
 14. Section 05 73 13 – Glass Railings
 15. Section 07 92 13 – Exterior Joint Sealants
 16. Section 08 81 00 – Glass and Glazing
 17. Section 08 84 00 – Plastic Glazing
 18. Section 09 61 13 – Cast in Place Tactile Warning Surface Tiles
 19. Section 09 91 13.10 – Exterior Painting
 20. Section 12 93 10 – Benches
 21. Section 26 05 19 – Low-Voltage Electrical Power
 22. Section 26 05 26 – Grounding and Bonding for Electrical Systems
 23. Section 26 05 33 – Raceways and Boxes for Electrical Systems
 24. Section 26 05 43 – Underground Ducts
 25. Section 26 05 53 – Identification for Electrical Systems
 26. Section 26 27 26 – Wiring Devices
 27. Section 26 28 16 – Enclosed Switches and Circuit Breakers
 28. Section 26 56 10 – Station Stop Lighting
 29. Section 31 23 16.16 – Structural Excavation and Backfill
 30. Section 32 11 00 – Aggregate Base Course

1.2 SUBMITTALS AND INFORMATION TO BE RETAINED

- A. Submittals shall be made in accordance with the requirements of the Project Quality Plan, except as modified herein.
- B. As indicated in the Related Sections listed in this Section, Paragraph 1.1.B.

1.3 QUALITY ASSURANCE/QUALITY CONTROL

- A. Quality assurance/quality control shall be in accordance with the Quality Plan and the General Provisions, except as modified herein.
- B. As indicated in the Related Sections listed in this Section, Paragraph 1.1.B
- C. To minimize construction problems, wherever possible, the Contractor shall complete work of an initial platform item of work before beginning fabrication and work on the remaining platform items; i.e., structural framing, canopy sheet metal panels, railings, foundations, irrigation sprinkling, lighting, heat tracing, etc.

1.4 DELIVERY, STORAGE AND HANDLING

As indicated in the Related Sections listed in this Section, Paragraph 1.1.B.

PART II - PRODUCTS**2.1 MATERIALS**

As indicated in the Design Drawings and/or Related Sections listed in this Section, Paragraph 1.1.B.

2.2 FABRICATION

As indicated in the Design Drawings and/or Related Sections listed in this Section, Paragraphs 1.1.B.

PART III - EXECUTION**3.1 PREPARATION**

As indicated in the Design Drawings and/or Related Sections listed in this Section, Paragraph 1.1.B.

3.2 INSTALLATION

As indicated in the Design Drawings and/or Related Sections listed in this Section, Paragraph 1.1.B.

3.3 FIELD QUALITY CONTROL

As indicated in the Related Sections listed in this Section, Paragraph 1.1.B.

3.4 ADJUSTING AND CLEANING

As indicated in the Related Sections listed in this Section, Paragraph 1.1.B.

3.5 PROTECTION

As indicated in the Related Sections listed in this Section, Paragraph 1.1.B.

PART 4 - MEASUREMENT

- 4.1 Measurement** – No Separate measurement will be made for Work described in this Section.

PART 5 - PAYMENT

5.1 Payment – Payment for items in this Section will be a lump sum cost for each Station Stop location.

END OF SECTION

SECTION 14 21 44**MACHINE ROOM-LESS ELECTRIC TRACTION ELEVATORS**

PART 1 - GENERAL

1.01 RELATED DOCUMENTS

- A. Drawings and general provisions of the Contract, including General and Supplementary Conditions and Division 01 Specification Sections, apply to this Section.

1.02 SUMMARY

- A. This Section includes machine room-less (MRL) electric traction service elevators.
- B. Related Sections include the following:
 - 1. Division 03 Section "Cast-in-Place Concrete" for setting sleeves, inserts, and anchoring devices in concrete.
 - 2. Division 04 Section "Unit Masonry Assemblies" for setting sleeves, inserts, and anchoring devices in masonry and for grouting elevator entrance frames installed in masonry walls.
 - 3. Division 05 Section "Structural Steel" for the following:
 - a. Attachment plates, angle brackets, and other preparation of structural steel for fastening guide-rail brackets.
 - b. Hoist beams.
 - c. Structural-steel shapes for subsills that are part of steel frame.
 - 4. Division 05 Section "Metal Fabrications" for the following:
 - a. Attachment plates and angle brackets for supporting guide-rail brackets.
 - b. Divider beams.
 - c. Hoist beams.
 - d. Structural-steel shapes for subsills.
 - e. Pit ladders.
 - f. Cants in hoistways made from steel sheet.
 - 5. Division 09 painting Sections for field painting of hoistway entrance doors and frames.
 - 6. Division 26 Sections for electrical service for elevators to and including fused disconnect switches at control room door and standby power source, transfer switch, and connection from auxiliary contacts in transfer switch to controller.
 - 7. Division 27 Section "Communications Horizontal Cabling" for telephone service for elevators.
 - 8. Division 28 Section "Access Control" for security access system equipment used to restrict elevator use.
 - 9. Division 28 Section "Fire Detection and Alarm" for smoke detectors in elevator lobbies to initiate emergency recall operation and heat detectors in shafts and control rooms to disconnect power from elevator equipment before sprinkler activation and for connection to elevator controllers.

1.03 DEFINITIONS

- A. Definitions in ASME A17.1 apply to work of this Section.
- B. Defective Elevator Work: Operation or control system failure, including excessive

malfunctions; performances below specified ratings; excessive wear; unusual deterioration or aging of materials or finishes; unsafe conditions; need for excessive maintenance; abnormal noise or vibration; and similar unusual, unexpected, and unsatisfactory conditions.

- C. Service Elevator: A passenger elevator that is also used to carry freight.

1.04 SUBMITTALS

- A. Product Data: Include capacities, sizes, performances, operations, safety features, finishes, and similar information. Include product data for the following:
1. Car enclosures and hoistway entrances.
 2. Operation, control, and signal systems.
- B. Shop Drawings: Show plans, elevations, sections, and large-scale details indicating service at each landing, control room layout, coordination with building structure, relationships with other construction, and locations of equipment and signals. Include large-scale layout of car control station and standby power operation control panel. Indicate variations from specified requirements, maximum dynamic and static loads imposed on building structure at points of support, and maximum and average power demands.
- C. Samples for Initial Selection: For finishes involving color selection.
- D. Samples for Verification: For exposed finishes of cars, hoistway doors and frames, and signal equipment; 3-inch-square Samples of sheet materials; and 4-inch lengths of running trim members.
- E. Manufacturer Certificates: Signed by elevator manufacturer certifying that hoistway, pit, and control room layout and dimensions, as shown on Drawings, and electrical service, as shown and specified, are adequate for elevator system being provided.
- F. Qualification Data: For Installer.
- G. Operation and Maintenance Data: For elevators to include in emergency, operation, and maintenance manuals.
1. In addition to items specified in Division 01 Section "Operation and Maintenance Data," include diagnostic and repair information available to manufacturer's and Installer's maintenance personnel.
- H. Inspection and Acceptance Certificates and Operating Permits: As required by authorities having jurisdiction for normal, unrestricted elevator use.
- I. Warranty: Special warranty specified in this Section.
- J. Continuing Maintenance Proposal: Service agreement specified in this Section.

1.05 QUALITY ASSURANCE

- A. Installer Qualifications: Elevator manufacturer or manufacturer's authorized representative who is trained and approved for installation of units required for this Project.
- B. Source Limitations: Obtain elevators, including machine room-less electric traction passenger elevators specified in another Division 14 Section, through one source from a single manufacturer.

1. Provide major elevator components, including driving machines, controllers, signal fixtures, door operators, car frames, cabs, and entrances, manufactured by a single manufacturer.
- C. Regulatory Requirements: Comply with ASME A17.1.
 1. Effective peak velocity acceleration (A_v) for Project's location is less than 0.10 (seismic risk zones 0 and 1)
 2. Elevator importance factor is 1.0.
- D. Accessibility Requirements: Comply with Section 407 in ICC A117.1.
- E. Fire-Rated Hoistway Entrance Assemblies: Door and frame assemblies complying with NFPA 80 that are listed and labeled by a testing and inspecting agency acceptable to authorities having jurisdiction, for fire-protection ratings indicated, based on testing at as close to neutral pressure as possible according to NFPA 252.

1.06 DELIVERY, STORAGE, AND HANDLING

- A. Deliver, store, and handle materials, components, and equipment in manufacturer's protective packaging.
- B. Store materials, components, and equipment off of ground, under cover, and in a dry location. Handle according to manufacturer's written recommendations to prevent damage, deterioration, or soiling.

1.07 COORDINATION

- A. Coordinate installation of sleeves, block outs, elevator equipment with integral anchors, and other items that are embedded in concrete or masonry for elevator equipment. Furnish templates, sleeves, elevator equipment with integral anchors, and installation instructions and deliver to Project site in time for installation.
- B. Coordinate sequence of elevator installation with other work to avoid delaying the Work.
- C. Coordinate locations and dimensions of other work relating to electric traction elevators including pit ladders, sumps, and floor drains in pits; entrance subsills; and electrical service, electrical outlets, lights, and switches in pits.

1.08 WARRANTY

- A. Special Manufacturer's Warranty: Manufacturer's standard form in which manufacturer agrees to repair, restore, or replace defective elevator work within specified warranty period.
 1. Warranty Period: One year from date of Substantial Completion.

1.09 MAINTENANCE SERVICE

- A. Initial Maintenance Service: Beginning at Substantial Completion, provide one year's full maintenance service by skilled employees of elevator Installer. Include monthly preventive maintenance, repair or replacement of worn or defective components, lubrication, cleaning, and adjusting as required for proper elevator operation at rated speed and capacity. Provide parts and supplies same as those used in the manufacture and installation of original equipment.

1. Perform maintenance, including emergency callback service, during normal working hours.
2. Include 24-hour-per-day, 7-day-per-week emergency callback service.
 - a. Response Time: Two hours or less.
- B. Continuing Maintenance Proposal: Provide a continuing maintenance proposal from Installer to Owner with terms, conditions, and obligations as set forth in, and in same form as, "Draft of Elevator Maintenance Agreement" at end of this Section, starting on date initial maintenance service is concluded.

PART 2 - PRODUCTS

2.01 MANUFACTURERS

- A. Basis of Design: Subject to requirements, provide EcoSpace Machine Room-less Elevator by KONE.

2.02 SYSTEMS AND COMPONENTS

- A. General: Provide manufacturer's standard elevator systems. Where components are not otherwise indicated, provide standard components published by manufacturer as included in standard preengineered elevator systems and as required for complete system.
- B. Elevator Machines: At manufacturer's option, provide either variable-voltage, variable-frequency, ac-type or variable-voltage, dc-type hoisting machines. Provide solid-state power converters.
- C. Fluid for Oil Buffers: If oil buffers are used, use only fire-resistant hydraulic fluid containing antioxidant, anticorrosive, antifoaming, and metal-passivating additives.
 1. Available Product: Subject to compliance with requirements, a product that may be incorporated into the Work includes, but is not limited to, "Hydro Safe (FR)" by Hydro Safe Oil Division, Inc.
- D. Inserts: Furnish required concrete and masonry inserts and similar anchorage devices for installing guide rails, machinery, and other components of elevator work where installation of devices is specified in another Section.
- E. Car Frame and Platform: Welded steel units.
- F. Guides: Provide roller guides at top and bottom of car and counterweight frames.

2.03 OPERATION SYSTEMS

- A. General: Provide manufacturer's standard microprocessor operation system as required to provide type of operation system indicated.
- B. Auxiliary Operations: In addition to primary operation system features, provide the following operational features for elevators where indicated:
 1. Standby Power Operation: On activation of standby power, car is returned to a designated floor and parked with doors open. Car can be manually put in service on standby power, either for return operation or for regular operation, by switches in control panel located at main lobby. Manual operation causes automatic operation to cease.

2. Battery-Powered Lowering: If power fails and car is at a floor, it remains at that floor, opens its doors, and shuts down. If car is between floors, it is lowered to the next floor below, opens its doors, and shuts down. System includes rechargeable battery and automatic recharging system.
 3. Automatic Dispatching of Loaded Car: When car load exceeds 80 percent of rated capacity, doors will begin closing.
 4. Nuisance Call Cancel: When car calls exceed a preset number while car load is less than a predetermined weight, all car calls are canceled. Preset number of calls can be adjusted.
- C. Security Features: Provide the following security features, where indicated. Security features shall not affect emergency firefighters' service.
1. Card-Reader Operation: System uses card readers at car control stations to authorize calls. Security system determines which landings and at what times calls require authorization by card reader. Provide required conductors in traveling cable and panel in control room for interconnecting card readers, other security access system equipment, and elevator controllers. Allow space as indicated for card reader in car.
 - a. Security access system equipment is specified in Division 28 Section "Access Control."
 - b. Security access system equipment is not in the Contract.
 2. Keyswitch Operation: Push buttons are activated and deactivated by security keyswitches at car control stations and hall push-button stations. Key is removable only in deactivated position.
 3. Keypad Operation: Allows each landing to be restricted or unrestricted. When a restricted landing button is pressed, a "Restricted Floor" lamp lights and remains lit until landing access code has been entered into a keypad or predetermined time period has elapsed. Car calls for restricted landings do not register until landing access code is entered into keypad within predetermined time period after landing button is pressed.
 - a. Access codes are programmed at each car operating panel using a security keyswitch. Keypad operation can be activated and deactivated by security keyswitch at main landing.
 4. Car-to-Lobby Feature: Feature, activated by keyswitch at main lobby, that causes car to return immediately to lobby and open doors for inspection. On deactivation by keyswitch, calls registered before keyswitch activation are completed and normal operation is resumed.

2.04 DOOR REOPENING DEVICES

- A. Infrared Array: Provide door reopening devices with uniform array of 36 or more microprocessor-controlled, infrared light beams projecting across car entrance. Interruption of one or more of the light beams shall cause doors to stop and reopen.
- B. Nudging Feature: After car doors are prevented from closing for predetermined adjustable time, through activating door reopening device, a loud buzzer shall sound and doors shall begin to close at reduced kinetic energy.

2.05 FINISH MATERIALS

- A. General: Provide the following materials for exposed parts of elevator car enclosures, car doors, hoistway entrance doors and frames, and signal equipment as indicated.

- B. Cold-Rolled Steel Sheet: ASTM A 1008/A 1008M, commercial steel, Type B, exposed, matte finish.
- C. Hot-Rolled Steel Sheet: ASTM A 1011/A 1011M, commercial steel, Type B, pickled.
- D. Stainless-Steel Sheet: ASTM A 240/A 240M, Type 304.
- E. Stainless-Steel Bars: ASTM A 276, Type 304.
- F. Stainless-Steel Tubing: ASTM A 554, Grade MT 304.
- G. Bronze Plate and Sheet: ASTM B 36/B 36M, Alloy UNS No. C28000 (muntz metal).
- H. Bronze Extrusions: ASTM B 455, Alloy UNS No. C38500 (architectural bronze).
- I. Bronze Tubing: ASTM B 135, Alloy UNS No. C23000 (red brass, 85 percent copper).
- J. Aluminum Extrusions: ASTM B 221, Alloy 6063.
- K. Nickel Silver Extrusions: ASTM B 151/B 151M, Alloy UNS No. C74500 or No. C77600.

2.06 CAR ENCLOSURES

- A. General: Provide enameled-steel car enclosures to receive removable wall panels, with car roof, access doors, power door operators, and ventilation.
 - 1. Provide standard railings complying with ASME A17.1 on car tops where required by ASME A17.1.
 - 2. Provide finished car including materials and finishes specified below.

2.07 HOISTWAY ENTRANCES

- A. General: Provide manufacturer's standard horizontal-sliding, door-and-frame hoistway entrances complete with track systems, hardware, sills, and accessories. Provide frame size and profile to coordinate with hoistway wall construction.
 - 1. Where gypsum board wall construction is indicated, provide self-supporting frames with reinforced head sections.
- B. Materials and Fabrication: Provide manufacturer's standards, but not less than the following:
 - 1. Enameled-Steel Frames: Formed from cold-rolled or hot-rolled steel sheet. Provide with factory-applied enamel finish; colors as selected by Architect from manufacturer's full range.
 - 2. Steel Subframes: Formed from cold-rolled or hot-rolled steel sheet with factory-applied enamel finish or corrosion-inhibiting primer. Fabricate to receive applied finish as indicated.
 - 3. Stainless-Steel Frames: Formed from stainless-steel sheet.
 - 4. Stainless-Steel Doors: Flush, hollow-metal construction; fabricated from stainless-steel sheet or by laminating stainless-steel sheet to exposed faces and edges of enameled cold-rolled steel doors using adhesive that fully bonds metal to metal without telegraphing or oil-canning.
 - 5. Sight Guards: Provide sight guards on doors matching door edges.
 - 6. Sills: Extruded metal, with grooved surface, 1/4 inch thick.
 - 7. Nonshrink, Nonmetallic Grout: Factory-packaged, nonstaining, noncorrosive, nongaseous grout complying with ASTM C 1107.

2.08 SIGNAL EQUIPMENT

- A. General: Provide Kone KSS 370 signalization.
- B. Emergency Communication System: Provide system that complies with ASME A17.1 and the U.S. Architectural & Transportation Barriers Compliance Board's "Americans with Disabilities Act (ADA), Accessibility Guidelines for Buildings and Facilities (ADAAG)." On activation, system dials preprogrammed number of monitoring station and identifies elevator location to monitoring station. System provides two-way voice communication without using a handset and provides visible signals that indicate when system has been activated and when monitoring station has responded. System is contained in flush-mounted cabinet, with identification, instructions for use, and battery backup power supply.
- C. Firefighters' Two-Way Telephone Communication Service: Provide flush-mounted cabinet in each car and required conductors in traveling cable for firefighters' two-way telephone communication service specified in Division 28 Section "Fire Detection and Alarm."

2.09 ELEVATORS

- A. Elevator Description:
 - 1. Elevator No. 1
 - 2. Type: Gearless traction.
 - 3. Machine Location: Hoistway; no machine room is provided.
 - 4. Rated Load: 2500 lb.
 - 5. Rated Speed: 150 fpm.
 - 6. Operation System: Selective collective automatic operation.
 - 7. Auxiliary Operations:
 - a. Standby power operation.
 - b. Battery-powered lowering.
 - c. Earthquake Emergency Operation: Comply with requirements in ASME A17.1.
 - d. Nuisance call cancel.
 - 8. Security Features: Keyswitch operation.
 - 9. Dual Car Control Stations: Provide two car control stations; equip only one with required keyswitches if any.
 - 10. Car Enclosures:
 - a. Inside Width: 80 inches from side wall to side wall.
 - b. Inside Depth: 60 inches from back wall to front wall (return panels).
 - c. Inside Height: 88 inches to underside of ceiling.
 - d. Front Walls (Return Panels): Satin stainless steel, No. 4 finish.
 - e. Car Fixtures: Satin stainless steel, No. 4 finish.
 - f. Side and Rear Wall Panels: Metal finish, 6312 Mercury Stria.
 - g. Reveals: Polished stainless steel, No. 8 finish.
 - h. Door Faces (Interior): Satin stainless steel, No. 4 finish.
 - i. Door Sills: Nickel silver, polished.
 - j. Ceiling: Type LF 94.
 - k. Handrails: 3 inch flat stainless steel bar.
 - l. Floor : Refer to Section 09 65 19 "Rubber Tile Flooring."
 - 11. Hoistway Entrances: As follows:

- a. Width: 48 inches.
- b. Height: 96 inches.
- c. Type: Two-speed side sliding.
- d. Frames: Satin stainless steel, No. 4 finish.
- e. Doors: Satin stainless steel, No. 4 finish.
- f. Sills: Aluminum, mill finish.
- g. Hall Fixtures: Satin stainless steel, No. 4 finish.
- h. Type: Single-speed side sliding.
- i. Fire-Protection Rating: 1 hour.
- j. Frames Satin stainless steel, No. 4 finish.
- k. Doors Satin stainless steel, No. 4 finish.
- l. Sills: Nickel silver, polished.

12. Additional Requirements:

- a. Provide inspection certificate in each car, mounted under acrylic cover with frame made from satin stainless steel, No. 4 finish.
- b. Provide blanket hooks and one complete set(s) of full-height protective blankets.

PART 3 - EXECUTION

3.01 EXAMINATION

- A. Examine elevator areas, with Installer present, for compliance with requirements for installation tolerances and other conditions affecting performance. Examine hoistways, hoistway openings, pits, and control rooms as constructed; verify critical dimensions; and examine supporting structure and other conditions under which elevator work is to be installed.
 1. Proceed with installation only after unsatisfactory conditions have been corrected.

3.02 INSTALLATION

- A. Comply with manufacturer's written instructions.
- B. Welded Construction: Provide welded connections for installing elevator work where bolted connections are not required for subsequent removal or for normal operation, adjustment, inspection, maintenance, and replacement of worn parts. Comply with AWS standards for workmanship and for qualifications of welding operators.
- C. Sound Isolation: Mount rotating and vibrating equipment on vibration-isolating mounts designed to minimize transmission of vibrations to structure and thereby minimize structure-borne noise from elevator system.
- D. Lubricate operating parts of systems, including ropes, as recommended by manufacturers.
- E. Alignment: Coordinate installation of hoistway entrances with installation of elevator guide rails for accurate alignment of entrances with car. Where possible, delay final adjustment of sills and doors until car is operable in shaft. Reduce clearances to minimum, safe, workable dimension at each landing.
- F. Leveling Tolerance: 1/8 inch, up or down, regardless of load and direction of travel.
- G. Set sills flush with finished floor surface at landing. Fill space under sill solidly with

nonshrink, nonmetallic grout.

H. Locate hall signal equipment for elevators as follows, unless otherwise indicated:

1. Place hall lanterns either above or beside each hoistway entrance.
2. Mount hall lanterns at a minimum of 72 inches above finished floor.

3.03 FIELD QUALITY CONTROL

- A. Acceptance Testing: On completion of elevator installation and before permitting use (either temporary or permanent) of elevators, perform acceptance tests as required and recommended by ASME A17.1 and by governing regulations and agencies.
- B. Operating Test: Load elevator to rated capacity and operate continuously for 30 minutes over full travel distance, stopping at each level and proceeding immediately to the next. Record temperature rise of elevator machine during 30-minute test period. Record failure to perform as required.
- C. Advise Owner, Architect, and authorities having jurisdiction in advance of dates and times tests are to be performed on elevators.

3.04 PROTECTION

- A. Temporary Use: Limit temporary use for construction purposes to one elevator. Comply with the following requirements for each elevator used for construction purposes:
 1. Provide car with temporary enclosure, either within finished car or in place of finished car, to protect finishes from damage.
 2. Provide strippable protective film on entrance and car doors and frames.
 3. Provide padded wood bumpers on entrance door frames covering jambs and frame faces.
 4. Provide other protective coverings, barriers, devices, signs, and procedures as needed to protect elevator and elevator equipment.
 5. Do not load elevators beyond their rated weight capacity.
 6. Engage elevator Installer to provide full maintenance service. Include preventive maintenance, repair or replacement of worn or defective components, lubrication, cleaning, and adjusting as necessary for proper elevator operation at rated speed and capacity. Provide parts and supplies same as those used in the manufacture and installation of original equipment.
 7. Engage elevator Installer to restore damaged work, if any, so no evidence remains of correction. Return items that cannot be refinished in the field to the shop, make required repairs and refinish entire unit, or provide new units as required.

3.05 DEMONSTRATION

- A. Engage a factory-authorized service representative to train Owner's maintenance personnel to operate, adjust, and maintain elevator(s). Refer to Division 01 Section "Demonstration and Training."
- B. Check operation of elevator with Owner's personnel present and before date of Substantial Completion. Determine that operation systems and devices are functioning properly.

- C. Check operation of elevator with Owner's personnel present not more than one month before end of warranty period. Determine that operation systems and devices are functioning properly.

END OF SECTION 14 21 44

SECTION 14 45 00**VEHICLE LIFTS****PART 1 - GENERAL**

The General Provisions of the Contract, including General and Special Conditions and the requirements of Division 1, apply to the Work in this Section.

1.01 WORK INCLUDED

- A. Equipment items as listed below by Equipment Identifier:
 - 1. 5432 Lift, parts, 3,000 pounds (Ref. Part 2.01)
 - 2. 5876 Lift, portable, electric (set of 8) (Ref. Part 2.02)
 - 3. 5881 Lift, table, bogie (Ref. Part 2.03)
 - 4. 5950 Turntable, truck assembly (Ref. Part 2.04)
- B. Roughing-in, installation of equipment, and final connection of utilities, with labor, services, and incidentals necessary for complete and operational equipment installation.
- C. Piping, wiring, and switching between equipment and utilities.

1.02 QUALITY ASSURANCE

- A. Experience: Equipment shall be produced by a manufacturer of established reputation with a minimum of five years experience supplying specified equipment.
- B. Quality standards shall meet or exceed ISO-9001 and be certified by the Automotive Lift Institute (ALI).
- C. Manufacturer's Representative:
 - 1. Installation: Provide a qualified manufacturer's representative at site to supervise work related to equipment installation, check out, and start up.
 - 2. Training: Provide technical representative to provide training to Owner's maintenance personnel in operation and maintenance of specified equipment.
 - 3. Quality standards shall meet or exceed ISO-9001.

1.03 SUBMITTALS

- A. Product Data: Submit Product Data in accordance with Division 1 of these specifications.
- B. Operations and Maintenance Manual:

1. Submit Operations and Maintenance Manuals in accordance with Division 1- General Requirements of these specifications.
 2. Provide complete parts, operating, and maintenance manual covering equipment at time of installation.
 3. Description of system and components.
 4. Schematic diagrams of electrical, plumbing, and compressed air system.
 5. Manufacturer's printed operating instructions.
 6. Printed listing of periodic preventive maintenance items and recommended frequency to validate warranties. Failure to provide maintenance information will indicate that preventive maintenance is not a condition for validation of warranties.
- C. Shop Drawings:
1. Submit Shop Drawings in accordance with Division 1 - General Requirements.
 2. Submit site specific installation drawings and procedures.

1.04 PRODUCT SUBSTITUTIONS

- A. Follow requirements specified in Division 1 - General Requirements.
- B. Additional costs resulting from substitution of products other than those specified, by model number, including drawing changes and construction, will be at the expense of the Contractor.
- C. Substitution Approval: Prior to delivery or installation, submittals for each equipment item by Equipment Identifier shall be provided in accordance with Division 1 - General Requirements. Acceptance will be based on the technical requirements herein as determined by Owner and Architect.

1.05 WARRANTY

- A. Warrant work specified herein for one year from substantial completion against defects in materials, functions, and workmanship.
- B. Warranty shall include materials and labor necessary to correct defects.
- C. Defects shall include, but not be limited to noisy, rough or substandard operation; loose, damaged, and missing parts; and abnormal deterioration of finish. Defects shall not include damage due to neglect, misuse, or situations resulting from non-performance of a manufacturer's recommended preventive maintenance schedule.
- D. Submit warranties in accordance with Division 1 - General Requirements of these specifications.
- E. All parts shall be readily available locally in the United States.

1.06 PRODUCT DELIVERY, STORAGE, AND HANDLING

- A. Deliver equipment in manufacturer's containers, appropriately packaged and/or crated for protection during domestic shipment and storage in humid and/or dusty conditions.
- B. Indelibly label all containers, including those contained in others, on outside with item description(s) per title and Equipment Identifier of this specification.

1.07 LABELING

- A. Manufacturer shall securely attach in a prominent location, on each major item of equipment, a non-corrosive nameplate showing manufacturer's name, address, model number, serial number, and pertinent utility or operating data.
- B. Manufacturer shall securely attach the ALI label of the Automotive Lift Institute.
- C. All electrical equipment and materials shall be new and shall be listed by Underwriter's Laboratories, Inc. (UL) in categories for which standards have been set by that agency and labeled as such in the manufacturer's plant.

1.08 BUY AMERICA COMPLIANCE

- A. The Contractor shall comply with the applicable Buy America requirements set forth in 49 U.S.C. 5323(j) and the applicable regulations in 49 C.F.R. Part 661, as amended. If the Contractor procures any capital items with Federal funds, it is the Contractor's responsibility to obtain the Buy America certification required under such regulations.
- B. Reference Division 1 for Buy America provisions.

PART 2 - PRODUCTS

2.01 LIFT, PARTS, 3,000 POUNDS Equipment identifier: 5432

- A. Manufacturer's Reference:
 - 1. Prime manufacturer: Specifications are based on equipment identified herein by manufacturer's name and model to establish minimal acceptable standards of quality, features, performance, and construction.
 - a. Pflow Industries, Inc., Milwaukee, WI, 53209, (414) 352-9000
 - b. Model: Series M VRC
 - 2. Alternate manufacturers: Contingent upon compliance with these specifications and documentation requirements set forth in SUBMITTALS, equipment produced by other manufacturers, including the following, may be considered as equal.
- B. Capacity/Dimensions:
 - 1. Capacity: The vertical reciprocating lift shall be rated at a live load capacity of 3,000 pounds.

2. Operating levels: Four
3. Operating configuration: Cantilever
4. Speed: The vertical reciprocating lift shall have a lifting speed of 25 to 30 feet per minute when loaded to capacity.
5. Vertical travel: 14 feet 6 inches
6. Lift platform: The vertical reciprocating lift platform, also known as usable carriage, shall have steel deck plate and 48 inches high welded handrails and kick plates on non-operating ends and safety chains with snap hooks on operating ends.
7. Effective carriage length: 72 inches
8. Effective carriage width: 42 inches
9. Load height: 84 inches
10. Minimum high welded handrail height: 48 inches
11. Overall lift height (with 3 inch minimum clearance): 28 feet

C. Features/Performance/Construction:

1. Support columns: The vertical reciprocating lift shall have a minimum of two, 6-inch wide, roll formed support columns.
2. Deflection under load: When loaded to rated capacity, no portion of the vertical reciprocating lift shall exhibit permanent deformations.
3. Lifting means:
 - a. Raising and lowering of the carriage shall be provided a chain over sprocket with common drive shaft connected to an efficient helical gear reducer assembly. The lifting chain shall be in a guidance assembly.
4. Safety cams: Safety cams shall be mounted on the platform and connected directly to the lifting chains. The cams shall prevent the platform from falling more than 6 inches if tension is lost in the chains.
5. Signs: "NO RIDER" signs shall be provided. Lettering shall be a minimum of two inches high for visibility.

D. Electric motor:

1. Motor horsepower shall be sized for the rated live load specified speed.
2. All motors are three phase and shall be designed for continuous duty at ambient temperatures from 32 degrees to 102 degrees Fahrenheit.
3. The motor shall not automatically restart when the overload device is reset.
4. The motor shall be equipped with a heavy duty, fast-acting, fail safe industrial brake to ensure the brake will hold in case of power failure.

E. Controls:

1. Controls
 - a. Each operating floor level shall be equipped with a momentary contact push button control station with call, send, and mushroom style e-stop operators for manual control of lift operation.

- b. An internally pre-wired, National Electrical Manufacturers Association (NEMA) Type 12 rated main control panel shall be provided with step-down transfer reversing motor starter, overload relay, instantaneous current sensing jam relay, inrush bypass timer, field wiring terminal block, and positive acting brake contacts.
 - c. The VRC shall be equipped with a travel limit switch to control positioning of the VRC platform.
 - d. Chain tension safety device: Monitors each chain and shuts off motor while engaging brake in the event of a slack, taut, or broken chain.
- F. Utility Requirements:
- 1. Electrical: 460 VAC, 3 phase, 7.5 HP
 - a. All motors shall be designed for continuous duty at ambient temperatures from 32 degrees to 102 degrees F.
 - G. Finish: Paint with standard Pflow Blue industrial enamel. Prior to painting, all dirt, mill scale, oil, and grease shall be removed from carbon steel surfaces by a combination of brushing, wiping, and use of solvents.
- 2.02 LIFT, PORTABLE, ELECTRIC (set of 8)
Equipment Identifier: 5876
- A. Manufacturer's Reference:
- 1. Prime manufacturer: Specifications are based on equipment identified herein by manufacturer's name and model to establish minimal acceptable standards of quality, features, performance, and construction.
 - a. Macton/Joyce Corp., Oxford, CT (203) 267-1500
 - b. Model: Hi-Lift 10 Ton (set of 8)
 - 2. Alternate manufacturers: Contingent upon compliance with these specifications and documentation required set forth in Submittals, equipment produced by other manufacturers *may* be considered as equal.
 - a. Whiting Corp., Harvey, IL (708) 587-2100
- B. Capacities/Dimensions:
- 1. Overall dimensions:
 - a. Width: 31-1/2 inches
 - b. Depth: 42 inches
 - c. Height: 130 inches
 - 2. Screw diameter: 3-5/16 inches

3. Motor: 3 HP, each; total of 24 HP
4. Lift capacities: 10 tons each, 50 ton total
5. Lifting speed: 9 inches per minute
6. Effective lift: 70 inches
7. Minimum height: 6 inches

C. Features/Performance/Construction:

1. Base of lift shall be of steel construction.
2. Lifting carriage shall be guided by four (4) steel rollers within two (2) C shaped beam sections rollers that have anti-friction bearing lubrication for the life of the roller.
3. All lifts shall be designed for portability. This shall be accomplished by mounting the lifts on wheels that are deployed when the lift is at the full down position. The rear wheel shall be a steering wheel and controlled by a handle. When lifting, the lifts shall rest on the shop floor entirely on a base plate of sufficient design to carry the rated load.
4. Load bearing nut shall be made of bronze and shall followed by a steel safety nut. In the event of failure of the bronze load nut, the load is secured by the steel. A limit switch shall monitor the gap between the load-bearing nut and the safety nut.
5. Dual limit switches shall be located at the travel extremes of the lifting nut. The first limit switch is for primary operation and provides a signal for the PLC. The second switch is for over travel and is hard wired to the motor starter for the particular lift.
6. Manufacturer to verify with contractor the height of OCS wire prior to setting lift limit switches. Leave 12 inches from OCS wire to pantograph (to prevent vehicle from hitting OCS wire).
7. Four thermal protection relays (one per motor) shall be provided to protect the motors against short circuits and overload.
8. A programmable controller shall monitor the up and down motion of the lifting carriages and shall fault the system when the height difference reaches 1 inch and stop all the lifts.

D. Controls: The control system shall incorporate a set of eight lifts. Each set of eight lifts shall have one primary lift and seven secondary lifts.

1. Lift shall be equipped with NEMA 12 panel construction with heavy duty NEMA rated starters and push-button operation.
 - a. One "UP" push button (dead-man, constant pressure)
 - b. One "DOWN" push button (dead-man, constant pressure)
 - c. One "EMERGENCY STOP" push button (push-pull)
 - d. One "POWER" green pilot light
 - e. One two-position selector switch to operate the lifts INDIVIDUALLY or as a SYSTEM
2. Units shall have an interface panel which will provide for display for operating status and fault messages. The panel will also allow the operator or maintenance technician to perform diagnostics of the system to determine at a minimum:

- a. Travel limit switch status on all lifts.
 - b. Nut wear status on all lifts.
 - c. Screw rotation counter operation on all lifts.
 - d. Reset counter system for each lift.
 - e. Communication status between the PLC and remote input/output modules.
 - f. Status of Emergency Stop push button on each lift control station.
3. A fusible disconnect switch to control source power that will only allow the box to be opened if the switch is in the off position.
 4. Interconnecting cables with an oil resistant jacket shall be supplied to connect the Primary lift to the Secondary lifts, three (3) of each cable type per eight (8) lift system. The inter-lift power supply cable and the control cable shall be 50 feet in length and shall have a quick disconnect connector.
 5. A Secondary Control Box shall include NEMA type 12 (oil tight and dust tight) enclosure with receptacles for power cables, control cables, and for the pendant station.
 6. One (1) "UP-DOWN" pendent type push button station shall be supplied for every set of lifts. When the pendant station is plugged into a specific lift that lift becomes the master and all other connected lifts become slaves. Also when the pendent is plugged in individual control of each lift is disabled. Pendent enclosure shall be NEMA 12 (oil tight and dust tight) type.
 7. Motor shall be reversible electric.
 8. Each lifting unit shall be powered by a NEMA D electric motor. Each motor reducer shall be equipped with a electromechanical brake that is spring engaged when the motor is not running and is electrically released when either the "UP" and "DOWN" controls are energized.
 9. Safety Interlock with Electrified Overhead Contact Systems (OCS): Lift controls for both lifts shall be locked out whenever the OCS disconnect switched (DS2 and DS3) for those bays shall be locked out whenever either vehicle lift is being used or either vehicle is raised. Mechanical interlock system shall be Kirk Key or equal. Interlock system shall consist of the following:
 - a. Provide one mechanical key interlock on each lift control panel that will require the lift to be off and in a lowered positions before the key can be removed.
 - b. Provide one four-position mechanical transfer key interlock assembly compatible with the above, suitable for separate wall mounting, and containing locks for the following: OCS Disconnect Switch DS2 key, OCS Disconnect Switch DS3 key, Vehicle Lift Keys. Likewise, keys shall be held if either DS2 or DS3 key is removed (or both). Key information for DS2 and DS# locks shall be provided to City Contract Representative.
- E. Utility Requirements:
1. Electrical: 460 VAC, 3 phase, 3 HP motor (24 HP total for 8 lift columns)

- F. Finish: Heavy duty steel structure coated with one coat of rust inhibiting primer followed by two coats of yellow enamel.

2.03 LIFT, TABLE, BOGIE
Equipment Identifier: 5881

A. Manufacturer's Reference:

1. Prime manufacturer: Specifications are based on equipment identified herein by manufacturer's name and model to establish minimal acceptable standards of quality, features, performance, and construction.
 - a. Whiting Corp., Harvey, IL (708) 331-4000
 - b. Model: Bogie Lift Table
2. Alternate manufacturers: *Contingent upon compliance with these specifications* and documentation requirements set forth in SUBMITTALS, equipment produced by other manufacturers, including the following, *may* be considered as equal.

- B. Description: The rail guided Scissor lift shall be designed to travel under a raised vehicle, be positioned under a truck, raised to make contact with the truck and once the truck is disconnected from the rail vehicle, lower truck and transport it back from under the vehicle.

C. Capacities/Dimensions:

1. Overall dimensions: (dimensions to be field verified and coordinated)
 - a. Width: 120 inches
 - b. Depth: 68 inches
 - c. Height (not extended): 30 inches
 - d. Height (fully extended): 78 inches
2. Lifting speed: 30 inches per minute
3. Lifting capacity: 13,500 pounds

D. Features/Performance/Construction:

1. The rail guided scissor shall be designed to support, traverse, lift and lower a truck.
2. Steel plate decking shall come complete with 2 inch by 2 inch steel rails for supporting the truck.
3. Rail gauge spacing shall be 4 feet, 8-1/2 inches.
4. A set of two manually applied rail stops will be provided to allow the Operator to retain the truck in position.
5. A wobble plate shall be provided under the steel decking. When the locking pins are removed the wobble plate shall allow for a 1 foot +/- lateral play (90 degrees to rail). The wobble plate shall allow for fine lateral movement to align the truck back to the rail vehicle body. Final location for locking pins of wobble plate to be determined in the field.

6. The traversing of the lift shall be through battery power. The control of the traversing is through a hand held wireless pendent.
7. A battery charger shall be supplied for overnight re-charging of the system.

E. Utility Requirements:

1. Electrical: 120 VAC, 1 phase, 2 HP, 12.4 amps

F. Finish: Durable enamel in manufacturer's standard color

2.04 TURNTABLE, TRUCK ASSEMBLY

Equipment Identifier: 5950

A. Manufacturer's Reference:

1. Prime manufacturer: Specifications are based on equipment identified herein by manufacturer's name and model to establish minimal acceptable standards of quality, features, performance, and construction.
 - a. Whiting Corp., Harvey, IL (708) 331-4000
 - b. Model: Turntable
2. Alternate manufacturers: Contingent upon compliance with these specifications and documentation requirements set forth in Section 01300 Submittals, equipment produced by other manufacturers, including the following, *may* be considered as equal.
 - a. Macton/Joyce, Oxford, CT (203) 267-1500

B. Capacities/Dimensions:

1. Crossing capacity: 18,000 pounds in truck repair area
2. Rotating capacity: 18,000 pounds
3. Rotation: 360 degrees
4. Rail gauge: 4 feet, 8-1/2 inches
5. Turntable diameter: 10 feet

C. Features/Performance/Construction:

1. The turntable shall be constructed so entire structural assembly may be removed from the pit as a unit.
2. The table shall provide continuous ground capability of shop rails and turntable rails while also providing 360 degree rotation.
3. Negative return bonding to adjacent embedded rail shall be provided by a 750 volt dc, 500 ampere circuit, using a 360 degree collector ring mounted on the turntable with collector shoes mounted to the base frame.
4. Grounding wiring and insulation from the approach rails to the collector shoes and from rail to rail shall be provided.

5. Turntables shall be capable of being manually rotated to any one of four lockup positions by one man when supporting a two axle transit truck load of 18,000 pounds.
 6. The operator shall be able to rotate and lock/unlock the table from a telescoping leverage bar.
 7. The deck shall be designated to support a point load of 6,000 pounds anywhere, or a 300 pounds per square feet (psf) uniform load. Manufacturer shall provide access to bearings and pit drains.
 8. The turntable shall be designed with supports so that a deflection of 1/4 inch is not exceeded at the perimeter when the load is rolled on the table. Maximum deflection of any structural element shall not exceed 1/500 of its unsupported span.
 9. The basic structural design of the turntables shall include the following:
 - a. Center post shall provide a heavy-duty bearing assembly designed to carry the entire thrust and moment loading.
 - b. Structural frame shall be designed to provide a support for the transit vehicle running rails and top deck plate.
 - c. Top deck shall consist of a system of structural steel members spaced to provide adequate support for the diamond plate pattern steel deck plate.
 - d. Steel curb angle trim system: A rolled steel angle or steel tube shall be provided for embedment in the pit wall. Install in related concrete work as indicated. The gap between the fixed steel angle and the turntable shall not be more than 3/8 inch.
 - e. Rails: The shop rails shall be made with the turntable rails and shall be AREA Type 115RE or bar stock. The rail gauge shall be 4 feet, 8-1/2 inches. The table top shall be furnished with two sets of rails. The rails shall be centered on the table and intersect one another at 90 degrees.
- D. Finish: All equipment shall be rust free and all exposed surfaces shall be painted, with the exception of machined surfaces, with one coat of primer and two coats of paint in manufacturers standard colors

PART 3 - EXECUTION

3.01 INSPECTION

- A. Coordinate location of rough-in work and utility stub-outs to assure match with equipment to be installed.
- B. Inspect delivered equipment for damage from shipping and exposure to weather. Compare delivered equipment with packing lists and specifications to assure receipt of all equipment items and specified accessories.
- C. Report in writing to the Architect, any damaged, missing or incomplete scheduled equipment and improper rough-in or utility stub-outs.

3.02 INSTALLATION

- A. Perform work under direct supervision of Foreman of Construction Superintendent with authority to coordinate installation of scheduled equipment with Architect or designated representative.
- B. Install equipment in accordance with plans, shop drawings, and manufacturer's instructions:
 - 1. Positioning: Place equipment in accordance with any noted special positioning requirements generally level (or slight slope as required by instructions), plumb, and at right angles to adjacent work.
 - 2. Fitting: Where field cutting or trimming is necessary, perform in a neat, accurate, professional manner without damaging equipment or adjacent work.
 - 3. Anchorage: Attach equipment as directed by Architect or designated representative. Installation fasteners shall be installed to avoid scratching or damaging adjacent surfaces.
 - 4. Upon completion of work, finish surfaces shall be free of tool marks, scratches, blemishes, and stains.

3.03 TESTING

- A. After final connections are made and prior to authorizing payment, specified equipment shall be tested for compliance with specifications in the presence of the Architect or designated representative using acceptance procedures provided by the manufacturer.
- B. Each lift shall be tested with the vehicle types operated by the Owner.

3.04 CLEANUP

- A. Touch-up damage to painted finishes.
- B. Wipe and clean equipment of any oil, grease, and solvents, and make ready for use.
- C. Clean area around equipment installation and remove packing and installation debris from job site.
- D. Notify Architect or designated representative for acceptance inspection.

3.05 TRAINING

- A. Direct the technical representative to provide specified hours of training to designated Owner's maintenance personnel in operation and maintenance of the following equipment. Coordinate, with Owner, training schedule and list of personnel to be trained.
 - 1. 5432 Lift, parts, 3,000 pounds; 2 hours (minimum)
 - 2. 5876 Lift, portable, electric (set of 8); 4 hours (minimum)
 - 3. 5881 Lift, table, bogie; 2 hours (minimum)
 - 4. 5950 Turntable, truck assembly; 1 hour (minimum)

- B. Demonstrate each lift operation utilizing each of the vehicle types operated by Owner.
- C. Obtain, from technical representative, a list of Owner's personnel trained in equipment operations and maintenance.

END OF SECTION 14 45 00

SECTION 21 05 17**SLEEVES AND SLEEVE SEALS FOR FIRE-SUPPRESSION PIPING**

PART 1 - GENERAL

1.01. SUMMARY

- A. Section Includes:
 - 1. Sleeves.
 - 2. Sleeve-seal systems.
 - 3. Grout.

PART 2 - PRODUCTS

2.01. SLEEVES

- A. Cast-Iron Wall Pipes: Cast or fabricated of cast or ductile iron and equivalent to ductile-iron pressure pipe, with plain ends and integral waterstop unless otherwise indicated.
- B. Galvanized-Steel Wall Pipes: ASTM A 53/A 53M, Schedule 40, with plain ends and welded steel collar; zinc coated.
- C. Galvanized-Steel-Pipe Sleeves: ASTM A 53/A 53M, Type E, Grade B, Schedule 40, zinc coated, with plain ends.
- D. PVC-Pipe Sleeves: ASTM D 1785, Schedule 40.
- E. Galvanized-Steel-Sheet Sleeves: 0.0239-inch (0.6-mm) minimum thickness; round tube closed with welded longitudinal joint.

2.02. SLEEVE-SEAL SYSTEMS

- A. Description: Modular sealing-element unit, designed for field assembly, for filling annular space between piping and sleeve.
 - 1. Sealing Elements: EPDM-rubber or NBR interlocking links shaped to fit surface of pipe. Include type and number required for pipe material and size of pipe.
 - 2. Pressure Plates: Stainless steel.
 - 3. Connecting Bolts and Nuts: Stainless steel of length required to secure pressure plates to sealing elements.

2.03. GROUT

- A. Standard: ASTM C 1107/C 1107M, Grade B, post-hardening and volume-adjusting, dry, hydraulic-cement grout.
- B. Characteristics: Nonshrink; recommended for interior and exterior applications.
- C. Design Mix: 5000-psi (34.5-MPa), 28-day compressive strength.
- D. Packaging: Premixed and factory packaged.

PART 3 - EXECUTION

3.01. SLEEVE INSTALLATION

- A. Install sleeves for piping passing through penetrations in floors, partitions, roofs, and walls.
- B. For sleeves that will have sleeve-seal system installed, select sleeves of size large enough to provide 1-inch (25-mm) annular clear space between piping and concrete slabs and walls.
 - 1. Sleeves are not required for core-drilled holes.
- C. Install sleeves in concrete floors, concrete roof slabs, and concrete walls as new slabs and walls are constructed.
 - 1. Cut sleeves to length for mounting flush with both surfaces.
 - a. Exception: Extend sleeves installed in floors of mechanical equipment areas or other wet areas 2 inches (50 mm) above finished floor level.
 - 2. Using grout, seal the space outside of sleeves in slabs and walls without sleeve-seal system.
- D. Install sleeves for pipes passing through interior partitions.
 - 1. Cut sleeves to length for mounting flush with both surfaces.
 - 2. Install sleeves that are large enough to provide 1/4-inch (6.4-mm) annular clear space between sleeve and pipe or pipe insulation.
 - 3. Seal annular space between sleeve and piping or piping insulation; use joint sealants appropriate for size, depth, and location of joint. Comply with requirements for sealants specified in Section 07 92 00 "Joint Sealants."
- E. Fire-Barrier Penetrations: Maintain indicated fire rating of walls, partitions, ceilings, and floors at pipe penetrations. Seal pipe penetrations with firestop materials. Comply with requirements for firestopping specified in Section 07 84 13 "Penetration Firestopping."

3.02. SLEEVE-SEAL-SYSTEM INSTALLATION

- A. Install sleeve-seal systems in sleeves in exterior concrete walls and slabs-on-grade at service piping entries into building.
- B. Select type, size, and number of sealing elements required for piping material and size and for sleeve ID or hole size. Position piping in center of sleeve. Center piping in penetration, assemble sleeve-seal system components, and install in annular space between piping and sleeve. Tighten bolts against pressure plates that cause sealing elements to expand and make a watertight seal.

3.03. SLEEVE AND SLEEVE-SEAL SCHEDULE

- A. Use sleeves and sleeve seals for the following piping-penetration applications:
 - 1. Exterior Concrete Walls above Grade: Cast-iron wall sleeves, Galvanized-steel wall sleeves or Galvanized-steel-pipe sleeves.
 - 2. Exterior Concrete Walls below Grade: Cast-iron wall sleeves with sleeve-seal system, Galvanized-steel wall sleeves with sleeve-seal system or Galvanized-steel-pipe sleeves with sleeve-seal system.
 - 3. Concrete Slabs above Grade: Galvanized-steel-pipe sleeves or PVC-pipe sleeves.
 - 4. Interior Partitions: Galvanized-steel-pipe sleeves or PVC-pipe sleeves.

END OF SECTION 21 05 17

SECTION 21 05 18**ESCUTCHEONS FOR FIRE-SUPPRESSION PIPING****PART 1 - GENERAL****1.01 SUMMARY**

- A. Section Includes:
 - 1. Escutcheons.
 - 2. Floor plates.

PART 2 - PRODUCTS**2.01 ESCUTCHEONS**

- A. One-Piece, Cast-Brass Type: With polished, chrome-plated finish and setscrew fastener.
- B. One-Piece, Deep-Pattern Type: Deep-drawn, box-shaped brass with chrome-plated finish and spring-clip fasteners.
- C. One-Piece, Stamped-Steel Type: With chrome-plated finish and spring-clip fasteners.

2.02 FLOOR PLATES

- A. One-Piece Floor Plates: Cast-iron flange with holes for fasteners.

PART 3 - EXECUTION**3.01 INSTALLATION**

- A. Install escutcheons for piping penetrations of walls, ceilings, and finished floors.
- B. Install escutcheons with ID to closely fit around pipe, tube, and insulation of piping and with OD that completely covers opening.
 - 1. Escutcheons for New Piping:
 - a. Piping with Fitting or Sleeve Protruding from Wall: One-piece, deep-pattern type.

- b. Chrome-Plated Piping: One-piece, cast-brass type with polished, chrome-plated finish.
 - c. Insulated Piping: One-piece, stamped-steel type.
 - d. Bare Piping at Wall and Floor Penetrations in Finished Spaces: One-piece, cast-brass type with polished, chrome-plated finish.
 - e. Bare Piping at Wall and Floor Penetrations in Finished Spaces: One-piece, stamped-steel type.
 - f. Bare Piping at Ceiling Penetrations in Finished Spaces: One-piece, cast-brass type with polished, chrome-plated finish.
 - g. Bare Piping at Ceiling Penetrations in Finished Spaces: One-piece, stamped-steel type.
 - h. Bare Piping in Unfinished Service Spaces: One-piece, cast-brass type with rough-brass finish.
 - i. Bare Piping in Unfinished Service Spaces: One-piece, stamped-steel type.
 - j. Bare Piping in Equipment Rooms: One-piece, cast-brass type with polished, chrome-plated or rough-brass finish.
 - k. Bare Piping in Equipment Rooms: One-piece, stamped-steel type.
- C. Install floor plates for piping penetrations of equipment-room floors.
- D. Install floor plates with ID to closely fit around pipe, tube, and insulation of piping and with OD that completely covers opening.
- 1. New Piping: One-piece, floor-plate type.

3.02 FIELD QUALITY CONTROL

- A. Replace broken and damaged escutcheons and floor plates using new materials.

END OF SECTION 21 05 18

SECTION 21 13 13

WET-PIPE SPRINKLER SYSTEMS

PART 1 - GENERAL

1.01 SUMMARY

A. Section Includes:

1. Pipes, fittings, and specialties.
2. Fire-protection valves.
3. Sprinklers.
4. Alarm devices.
5. Pressure gages.

1.02 SYSTEM DESCRIPTIONS

- A. Wet-Pipe Sprinkler System: Automatic sprinklers are attached to piping containing water and that is connected to water supply through alarm valve. Water discharges immediately from sprinklers when they are opened. Sprinklers open when heat melts fusible link or destroys frangible device. Hose connections are included if indicated.

1.03 PERFORMANCE REQUIREMENTS

- A. Standard-Pressure Piping System Component: Listed for **175-psig (1200-kPa)** minimum working pressure.
- B. Delegated Design: Design sprinkler system(s), including comprehensive engineering analysis by a qualified professional engineer, using performance requirements and design criteria indicated.
1. Available fire-hydrant flow test records (**1st and Holmes**) indicate the following conditions:
 - a. Date: 08/13.
 - b. Performed by: KCMO Water Service Department.
 - c. Location of Residual Fire Hydrant R: 3rd and Holmes.
 - d. Location of Flow Fire Hydrant F: 1st and Holmes.
 - e. Static Pressure at Residual Fire Hydrant R: 123 PSIG.
 - f. Measured Flow at Flow Fire Hydrant F: 1426 GPM.
 - g. Residual Pressure at Residual Fire Hydrant R: 108 PSIG.
 2. Available fire-hydrant flow test records (**3rd and Holmes**) indicate the following conditions:

- a. Date: 08/13.
 - b. Performed by: KCMO Water Service Department.
 - c. Location of Residual Fire Hydrant R: 1st and Holmes.
 - d. Location of Flow Fire Hydrant F: 3rd and Holmes.
 - e. Static Pressure at Residual Fire Hydrant R: 140 PSIG.
 - f. Measured Flow at Flow Fire Hydrant F: 1665 GPM.
 - g. Residual Pressure at Residual Fire Hydrant R: 118 PSIG.
- C. Sprinkler system design shall be approved by authorities having jurisdiction.
1. Margin of Safety for Available Water Flow and Pressure: 10 percent, including losses through water-service piping, valves, and backflow preventers.
 2. Sprinkler Occupancy Hazard Classifications:
 - a. Building Service Areas: Ordinary Hazard, Group 1.
 - b. Electrical Equipment Rooms: Ordinary Hazard, Group 1.
 - c. General Storage Areas: Ordinary Hazard, Group 1.
 - d. Machine Shops: Ordinary Hazard, Group 2.
 - e. Mechanical Equipment Rooms: Ordinary Hazard, Group 1.
 - f. Office and Public Areas: Light Hazard.
 - g. Repair Garages: Ordinary Hazard, Group 2.
 3. Minimum Density for Automatic-Sprinkler Piping Design:
 - a. Light-Hazard Occupancy: 0.10 gpm over 1500-sq. ft. (4.1 mm/min. over 139-sq. m) area.
 - b. Ordinary-Hazard, Group 1 Occupancy: 0.15 gpm over 1500-sq. ft. (6.1 mm/min. over 139-sq. m) area.
 - c. Ordinary-Hazard, Group 2 Occupancy: 0.20 gpm over 1500-sq. ft. (8.1 mm/min. over 139-sq. m) area.
 - d. Extra-Hazard, Group 1 Occupancy: 0.30 gpm over 2500-sq. ft. (12.2 mm/min. over 232-sq. m) area.
 - e. Extra-Hazard, Group 2 Occupancy: 0.40 gpm over 2500-sq. ft. (16.3 mm/min. over 232-sq. m) area.
 - f. Special Occupancy Hazard: As determined by authorities having jurisdiction.
 4. Maximum Protection Area per Sprinkler: Per UL listing.
 5. Maximum Protection Area per Sprinkler:
 - a. Office Spaces: 225 sq. ft. (20.9 sq. m).
 - b. Storage Areas: 130 sq. ft. (12.1 sq. m).
 - c. Mechanical Equipment Rooms: 130 sq. ft. (12.1 sq. m).
 - d. Electrical Equipment Rooms: 130 sq. ft. (12.1 sq. m).
 - e. Other Areas: According to NFPA 13 recommendations unless otherwise indicated.
 6. Total Combined Hose-Stream Demand Requirement: According to NFPA 13 unless otherwise indicated:

- a. Light-Hazard Occupancies: 100 gpm (6.3 L/s) for 30 minutes.
 - b. Ordinary-Hazard Occupancies: 250 gpm (15.75 L/s) for 60 to 90 minutes.
 - c. Extra-Hazard Occupancies: 500 gpm (31.5 L/s) for 90 to 120 minutes.
- D. Seismic Performance: Sprinkler piping shall withstand the effects of earthquake motions determined according to NFPA 13 and ASCE/SEI 7.

1.04 SUBMITTALS

- A. Product Data: For each type of product indicated.
- B. Shop Drawings: For wet-pipe sprinkler systems. Include plans, elevations, sections, details, and attachments to other work.
 1. Wiring Diagrams: For power, signal, and control wiring.
- C. Delegated-Design Submittal: For sprinkler systems indicated to comply with performance requirements and design criteria, including analysis data signed and sealed by the qualified professional engineer responsible for their preparation.
- D. Qualification Data: For qualified Installer and professional engineer.
- E. Approved Sprinkler Piping Drawings: Working plans, prepared according to NFPA 13, that have been approved by authorities having jurisdiction, including hydraulic calculations if applicable.
- F. Welding certificates.
- G. Field Test Reports and Certificates: Indicate and interpret test results for compliance with performance requirements and as described in NFPA 13. Include "Contractor's Material and Test Certificate for Aboveground Piping."
- H. Field quality-control reports.
- I. Operation and maintenance data.

1.05 QUALITY ASSURANCE

- A. Installer Qualifications:
 1. Installer's responsibilities include designing, fabricating, and installing sprinkler systems and providing professional engineering services needed to assume engineering responsibility. Base calculations on results of fire-hydrant flow test.

- a. Engineering Responsibility: Preparation of working plans, calculations, and field test reports by a qualified professional engineer.
- B. Welding Qualifications: Qualify procedures and operators according to ASME Boiler and Pressure Vessel Code.
- C. Electrical Components, Devices, and Accessories: Listed and labeled as defined in NFPA 70, by a qualified testing agency, and marked for intended location and application.
- D. NFPA Standards: Sprinkler system equipment, specialties, accessories, installation, and testing shall comply with the following:
 - 1. NFPA 13, "Installation of Sprinkler Systems."
 - 2. NFPA 24, "Installation of Private Fire Service Mains and Their Appurtenances."

PART 2 - PRODUCTS

2.01 PIPING MATERIALS

- A. Comply with requirements in "Piping Schedule" Article for applications of pipe, tube, and fitting materials, and for joining methods for specific services, service locations, and pipe sizes.

2.02 STEEL PIPE AND FITTINGS

- A. Standard Weight, Black-Steel Pipe: ASTM A 53/A 53M, Type E, Grade B. Pipe ends may be factory or field formed to match joining method.
- B. Schedule 30, Black-Steel Pipe: ASTM A 135; ASTM A 795/A 795M, Type E; or ASME B36.10M, wrought steel; with wall thickness not less than Schedule 30 and not more than Schedule 40. Pipe ends may be factory or field formed to match joining method.
- C. Thinwall Black-Steel Pipe: ASTM A 135 or ASTM A 795/A 795M, threadable, with wall thickness less than Schedule 30 and equal to or greater than Schedule 10. Pipe ends may be factory or field formed to match joining method.
- D. Black-Steel Pipe Nipples: ASTM A 733, made of ASTM A 53/A 53M, standard-weight, seamless steel pipe with threaded ends.

PRODUCT DATA SHEET 1 - Uncoated, Steel Couplings: ASTM A 865, threaded.

- A. Uncoated, Gray-Iron Threaded Fittings: ASME B16.4, Class 125, standard pattern.

- B. Malleable- or Ductile-Iron Unions: UL 860.
- C. Cast-Iron Flanges: ASME 16.1, Class 125.
- D. Steel Flanges and Flanged Fittings: ASME B16.5, Class 150.
- E. Steel Welding Fittings: ASTM A 234/A 234M and ASME B16.9.
- F. Grooved-Joint, Steel-Pipe Appurtenances:
 - 1. Pressure Rating: **175 psig (1200 kPa)** minimum.
 - 2. Uncoated, Grooved-End Fittings for Steel Piping: ASTM A 47/A 47M, malleable-iron casting or ASTM A 536, ductile-iron casting; with dimensions matching steel pipe.
 - 3. Grooved-End-Pipe Couplings for Steel Piping: AWWA C606 and UL 213, rigid pattern, unless otherwise indicated, for steel-pipe dimensions. Include ferrous housing sections, EPDM-rubber gasket, and bolts and nuts.
- G. Steel Pressure-Seal Fittings: UL 213, FM-approved, **175-psig (1200-kPa)** pressure rating with steel housing, rubber O-rings, and pipe stop; for use with fitting manufacturers' pressure-seal tools.

2.02 PIPING JOINING MATERIALS

- A. Pipe-Flange Gasket Materials: AWWA C110, rubber, flat face, **1/8 inch (3.2 mm)** thick or ASME B16.21, nonmetallic and asbestos free.
 - 1. Class 125, Cast-Iron Flat-Face Flanges: Full-face gaskets.
- B. Metal, Pipe-Flange Bolts and Nuts: ASME B18.2.1, carbon steel unless otherwise indicated.
- C. Welding Filler Metals: Comply with AWS D10.12M/D10.12 for welding materials appropriate for wall thickness and chemical analysis of steel pipe being welded.

2.03 LISTED FIRE-PROTECTION VALVES

- A. General Requirements:
 - 1. Valves shall be UL listed or FM approved.
 - 2. Minimum Pressure Rating: **175 psig (1200 kPa)**.
- B. Check Valves:

1. Standard: UL 312.
2. Pressure Rating: 250 psig (1725 kPa) minimum.
3. Type: Swing check.
4. Body Material: Cast iron.
5. End Connections: Flanged or grooved.

C. Bronze OS&Y Gate Valves:

1. Standard: UL 262.
2. Pressure Rating: 175 psig (1200 kPa).
3. Body Material: Bronze.
4. End Connections: Threaded.

D. Iron OS&Y Gate Valves:

1. Standard: UL 262.
2. Pressure Rating: 250 psig (1725 kPa) minimum.
3. Body Material: Cast or ductile iron.
4. End Connections: Flanged or grooved.

E. Indicating-Type Butterfly Valves:

1. Standard: UL 1091.
2. Pressure Rating: 175 psig (1200 kPa) minimum.
3. Valves NPS 2 (DN 50) and Smaller:
 - a. Valve Type: Ball or butterfly.
 - b. Body Material: Bronze.
 - c. End Connections: Threaded.
4. Valves NPS 2-1/2 (DN 65) and Larger:
 - a. Valve Type: Butterfly.
 - b. Body Material: Cast or ductile iron.
 - c. End Connections: Flanged, grooved, or wafer.
5. Valve Operation: Integral electrical, 115-V ac, prewired, two-circuit, supervisory switch indicating device.

2.04 TRIM AND DRAIN VALVES

A. General Requirements:

1. Standard: UL's "Fire Protection Equipment Directory" listing or "Approval Guide," published by FM Global, listing.
2. Minimum Pressure Rating: 175 psig (1200 kPa).

B. Ball Valves:

2.05 SPECIALTY VALVES

A. General Requirements:

1. Standard: UL's "Fire Protection Equipment Directory" listing or "Approval Guide," published by FM Global, listing.
2. Minimum Pressure Rating: 175 psig (1200 kPa).
3. Body Material: Cast or ductile iron.
4. Size: Same as connected piping.
5. End Connections: Flanged or grooved.

B. Alarm Valves:

1. Standard: UL 193.
2. Design: For horizontal or vertical installation.
3. Include trim sets for bypass, drain, electrical sprinkler alarm switch, pressure gages, retarding chamber, and fill-line attachment with strainer.
4. Drip Cup Assembly: Pipe drain without valves and separate from main drain piping.
5. Drip Cup Assembly: Pipe drain with check valve to main drain piping.

C. Automatic (Ball Drip) Drain Valves:

1. Standard: UL 1726.
2. Pressure Rating: 175 psig (1200 kPa) minimum.
3. Type: Automatic draining, ball check.
4. Size: NPS 3/4 (DN 20).
5. End Connections: Threaded.

2.06 SPRINKLER SPECIALTY PIPE FITTINGS

A. Branch Outlet Fittings:

1. Standard: UL 213.
2. Pressure Rating: 175 psig (1200 kPa) minimum.
3. Body Material: Ductile-iron housing with EPDM seals and bolts and nuts.
4. Type: Mechanical-T and -cross fittings.
5. Configurations: Snap-on and strapless, ductile-iron housing with branch outlets.
6. Size: Of dimension to fit onto sprinkler main and with outlet connections as required to match connected branch piping.
7. Branch Outlets: Grooved, plain-end pipe, or threaded.

B. Flow Detection and Test Assemblies:

1. Standard: UL's "Fire Protection Equipment Directory" listing or "Approval Guide," published by FM Global, listing.
2. Pressure Rating: 175 psig (1200 kPa) minimum.

3. Body Material: Cast- or ductile-iron housing with orifice, sight glass, and integral test valve.
4. Size: Same as connected piping.
5. Inlet and Outlet: Threaded.

C. Branch Line Testers:

1. Standard: UL 199.
2. Pressure Rating: 175 psig (1200 kPa) minimum.
3. Body Material: Brass.
4. Size: Same as connected piping.
5. Inlet: Threaded.
6. Drain Outlet: Threaded and capped.
7. Branch Outlet: Threaded, for sprinkler.

D. Sprinkler Inspector's Test Fittings:

1. Standard: UL's "Fire Protection Equipment Directory" listing or "Approval Guide," published by FM Global, listing.
2. Pressure Rating: 175 psig (1200 kPa) minimum.
3. Body Material: Cast- or ductile-iron housing with sight glass.
4. Size: Same as connected piping.
5. Inlet and Outlet: Threaded.

E. Adjustable Drop Nipples:

1. Standard: UL 1474.
2. Pressure Rating: 250 psig (1725 kPa) minimum.
3. Body Material: Steel pipe with EPDM-rubber O-ring seals.
4. Size: Same as connected piping.
5. Length: Adjustable.
6. Inlet and Outlet: Threaded.

F. Flexible, Sprinkler Hose Fittings:

1. Standard: UL 1474.
2. Type: Flexible hose for connection to sprinkler, and with bracket for connection to ceiling grid.
3. Pressure Rating: 175 psig (1200 kPa) minimum.
4. Size: Same as connected piping, for sprinkler.

2.07 SPRINKLERS

A. General Requirements:

1. Standard: UL's "Fire Protection Equipment Directory" listing or "Approval Guide," published by FM Global, listing.
2. Pressure Rating for Residential Sprinklers: 175 psig (1200 kPa) maximum.

3. Pressure Rating for Automatic Sprinklers: 175 psig (1200 kPa) minimum.
 4. Pressure Rating for High-Pressure Automatic Sprinklers: 250 psig (1725 kPa) minimum.
- B. Automatic Sprinklers with Heat-Responsive Element:
1. Early-Suppression, Fast-Response Applications: UL 1767.
 2. Nonresidential Applications: UL 199.
 3. Characteristics: Nominal 1/2-inch (12.7-mm) orifice with Discharge Coefficient K of 5.6, and for "Ordinary" temperature classification rating unless otherwise indicated or required by application.
- C. Sprinkler Finishes:
1. Chrome plated.
 2. Bronze.
 3. Painted.
- D. Special Coatings:
1. Wax.
 2. Lead.
 3. Corrosion-resistant paint.
- E. Sprinkler Escutcheons: Materials, types, and finishes for the following sprinkler mounting applications. Escutcheons for concealed, flush, and recessed-type sprinklers are specified with sprinklers.
1. Ceiling Mounting: Chrome-plated steel, two piece, with 1-inch (25-mm) vertical adjustment.
 2. Sidewall Mounting: Chrome-plated steel, one piece, flat.
- F. Sprinkler Guards:
1. Standard: UL 199.
 2. Type: Wire cage with fastening device for attaching to sprinkler.
- 2.08 ALARM DEVICES
- A. Alarm-device types shall match piping and equipment connections. Provide horn and strobe where indicated on the drawings.
- B. Electric Operated Alarm: Per NFPA
- C. Water-Flow Indicators:
1. Standard: UL 346.
 2. Water-Flow Detector: Electrically supervised.
 3. Components: Two single-pole, double-throw circuit switches for isolated alarm and auxiliary contacts, 7 A, 125-V ac and 0.25 A, 24-V dc; complete with factory-

set, field-adjustable retard element to prevent false signals and tamperproof cover that sends signal if removed.

4. Type: Paddle operated.
5. Pressure Rating: 250 psig (1725 kPa).
6. Design Installation: Horizontal or vertical.

D. Valve Supervisory Switches:

1. Standard: UL 346.
2. Type: Electrically supervised.
3. Components: Single-pole, double-throw switch with normally closed contacts.
4. Design: Signals that controlled valve is in other than fully open position.

2.09 PRESSURE GAGES

- A. Standard: UL 393.
- B. Dial Size: 3-1/2- to 4-1/2-inch (90- to 115-mm) diameter.
- C. Pressure Gage Range: 0 to 250 psig (0 to 1725 kPa) minimum.
- D. Water System Piping Gage: Include "WATER" or "AIR/WATER" label on dial face.

PART 3 - EXECUTION

3.01 SERVICE-ENTRANCE PIPING

- A. Connect sprinkler piping to water-service piping for service entrance to building. Comply with requirements per KCMO water Department and local Fire Marshall.
- B. Install shutoff gate valve, detector check backflow preventer, pressure gage, drain, and other accessories indicated at connection to water-service piping.

3.02 PIPING INSTALLATION

- A. Locations and Arrangements: Drawing plans, schematics, and diagrams indicate general location and arrangement of piping. Install piping as indicated, as far as practical.
 1. Deviations from approved working plans for piping require written approval from authorities having jurisdiction. File written approval with Architect before deviating from approved working plans.

- B. Piping Standard: Comply with requirements for installation of sprinkler piping in NFPA 13.
- C. Install seismic restraints on piping. Comply with requirements for seismic-restraint device materials and installation in NFPA 13.
- D. Use listed fittings to make changes in direction, branch takeoffs from mains, and reductions in pipe sizes.
- E. Install unions adjacent to each valve in pipes **NPS 2 (DN 50)** and smaller.
- F. Install flanges, flange adapters, or couplings for grooved-end piping on valves, apparatus, and equipment having **NPS 2-1/2 (DN 65)** and larger end connections.
- G. Install "Inspector's Test Connections" in sprinkler system piping, complete with shutoff valve, and sized and located according to NFPA 13.
- H. Install sprinkler piping with drains for complete system drainage.
- I. Install sprinkler control valves, test assemblies, and drain risers adjacent to standpipes when sprinkler piping is connected to standpipes.
- J. Install automatic (ball drip) drain valve at each check valve for fire-department connection, to drain piping between fire-department connection and check valve. Install drain piping to and spill over floor drain or to outside building.
- K. Install alarm devices in piping systems.
- L. Install hangers and supports for sprinkler system piping according to NFPA 13. Comply with requirements for hanger materials in NFPA 13.
- M. Install pressure gages on riser or feed main, at each sprinkler test connection, and at top of each standpipe. Include pressure gages with connection not less than **NPS 1/4 (DN 8)** and with soft metal seated globe valve, arranged for draining pipe between gage and valve. Install gages to permit removal, and install where they will not be subject to freezing.
- N. Fill sprinkler system piping with water.
- O. Install electric heating cables and pipe insulation on sprinkler piping in areas subject to freezing. Comply with requirements for heating cables in Section 21 05 33 "Heat Tracing for Fire-Suppression Piping" and for piping insulation in Section 21 07 00 "Fire-Suppression Systems Insulation."

- P. Install sleeves for piping penetrations of walls, ceilings, and floors. Comply with requirements for sleeves specified in Section 21 05 17 "Sleeves and Sleeve Seals for Fire-Suppression Piping."
- Q. Install sleeve seals for piping penetrations of concrete walls and slabs. Comply with requirements for sleeve seals specified in Section 21 05 17 "Sleeves and Sleeve Seals for Fire-Suppression Piping."
- R. Install escutcheons for piping penetrations of walls, ceilings, and floors. Comply with requirements for escutcheons specified in Section 21 05 18 "Escutcheons for Fire-Suppression Piping."

3.03 JOINT CONSTRUCTION

- A. Install couplings, flanges, flanged fittings, unions, nipples, and transition and special fittings that have finish and pressure ratings same as or higher than system's pressure rating for aboveground applications unless otherwise indicated.
- B. Install unions adjacent to each valve in pipes **NPS 2 (DN 50)** and smaller.
- C. Install flanges, flange adapters, or couplings for grooved-end piping on valves, apparatus, and equipment having **NPS 2-1/2 (DN 65)** and larger end connections.
- D. Ream ends of pipes and tubes and remove burrs. Bevel plain ends of steel pipe.
- E. Remove scale, slag, dirt, and debris from inside and outside of pipes, tubes, and fittings before assembly.
- F. Flanged Joints: Select appropriate gasket material in size, type, and thickness suitable for water service. Join flanges with gasket and bolts according to ASME B31.9.
- G. Threaded Joints: Thread pipe with tapered pipe threads according to ASME B1.20.1. Cut threads full and clean using sharp dies. Ream threaded pipe ends to remove burrs and restore full ID. Join pipe fittings and valves as follows:
 - 1. Apply appropriate tape or thread compound to external pipe threads.
 - 2. Damaged Threads: Do not use pipe or pipe fittings with threads that are corroded or damaged.
- H. Twist-Locked Joints: Insert plain end of steel pipe into plain-end-pipe fitting. Rotate retainer lugs one-quarter turn or tighten retainer pin.
- I. Steel-Piping, Pressure-Sealed Joints: Join lightwall steel pipe and steel pressure-seal fittings with tools recommended by fitting manufacturer.

- J. Welded Joints: Construct joints according to AWS D10.12M/D10.12, using qualified processes and welding operators according to "Quality Assurance" Article.
 - 1. Shop weld pipe joints where welded piping is indicated. Do not use welded joints for galvanized-steel pipe.
- K. Steel-Piping, Cut-Grooved Joints: Cut square-edge groove in end of pipe according to AWWA C606. Assemble coupling with housing, gasket, lubricant, and bolts. Join steel pipe and grooved-end fittings according to AWWA C606 for steel-pipe joints.
- L. Steel-Piping, Roll-Grooved Joints: Roll rounded-edge groove in end of pipe according to AWWA C606. Assemble coupling with housing, gasket, lubricant, and bolts. Join steel pipe and grooved-end fittings according to AWWA C606 for steel-pipe grooved joints.
- M. Steel-Piping, Pressure-Sealed Joints: Join Schedule 5 steel pipe and steel pressure-seal fittings with tools recommended by fitting manufacturer.
- N. Dissimilar-Material Piping Joints: Make joints using adapters compatible with materials of both piping systems.

3.04 VALVE AND SPECIALTIES INSTALLATION

- A. Install listed fire-protection valves, trim and drain valves, specialty valves and trim, controls, and specialties according to NFPA 13 and authorities having jurisdiction.
- B. Install listed fire-protection shutoff valves supervised open, located to control sources of water supply except from fire-department connections. Install permanent identification signs indicating portion of system controlled by each valve.
- C. Install check valve in each water-supply connection. Install backflow preventers instead of check valves in potable-water-supply sources.
- D. Specialty Valves:
 - 1. General Requirements: Install in vertical position for proper direction of flow, in main supply to system.
 - 2. Alarm Valves: Include bypass check valve and retarding chamber drain-line connection.

3.05 SPRINKLER INSTALLATION

- A. Install sprinklers in suspended ceilings in center of narrow dimension of acoustical ceiling panels.
- B. Do not install pendent or sidewall, wet-type sprinklers in areas subject to freezing.

- C. Install sprinklers into flexible, sprinkler hose fittings and install hose into bracket on ceiling grid.

3.06 IDENTIFICATION

- A. Install labeling and pipe markers on equipment and piping according to requirements in NFPA 13.
- B. Identify system components, wiring, cabling, and terminals. Comply with requirements for identification specified in Section 26 05 53 "Identification for Electrical Systems."

3.07 FIELD QUALITY CONTROL

- A. Perform tests and inspections.
- B. Tests and Inspections:
 - 1. Leak Test: After installation, charge systems and test for leaks. Repair leaks and retest until no leaks exist.
 - 2. Test and adjust controls and safeties. Replace damaged and malfunctioning controls and equipment.
 - 3. Flush, test, and inspect sprinkler systems according to NFPA 13, "Systems Acceptance" Chapter.
 - 4. Energize circuits to electrical equipment and devices.
 - 5. Coordinate with fire-alarm tests. Operate as required.
 - 6. Coordinate with fire-pump tests. Operate as required.
 - 7. Verify that equipment hose threads are same as local fire-department equipment.
- C. Sprinkler piping system will be considered defective if it does not pass tests and inspections.
- D. Prepare test and inspection reports.

3.08 CLEANING

- A. Clean dirt and debris from sprinklers.
- B. Remove and replace sprinklers with paint other than factory finish.

3.09 PIPING SCHEDULE

- A. Piping between Fire-Department Connections and Check Valves: Galvanized, standard-weight steel pipe with threaded ends; cast-iron threaded fittings; and

threaded, grooved ends; grooved-end fittings; grooved-end-pipe couplings; and grooved joints.

- B. Sprinkler specialty fittings may be used, downstream of control valves, instead of specified fittings.
- C. Wet-pipe sprinkler system, **NPS 2 (DN 50)** and smaller, shall be one of the following:
 - 1. Standard-weight or Schedule 30, black-steel pipe with threaded ends; uncoated, gray-iron threaded fittings; and threaded joints.
 - 2. Standard-weight or Schedule 30, black-steel pipe with plain ends; uncoated, plain-end-pipe fittings; and twist-locked joints.
 - 3. Standard-weight or Schedule 30, black-steel pipe with cut- or roll-grooved ends; uncoated, grooved-end fittings for steel piping; grooved-end-pipe couplings for steel piping; and grooved joints.
 - 4. Standard-weight Schedule 30, black-steel pipe with plain ends; steel welding fittings; and welded joints.
 - 5. Thinwall black-steel pipe with roll-grooved ends; uncoated, grooved-end fittings for steel piping; grooved-end-pipe couplings for steel piping; and grooved joints.
 - 6. Thinwall black-steel pipe with plain ends; uncoated, plain-end-pipe fittings; and twist-locked joints.
 - 7. Thinwall black-steel pipe with plain ends; welding fittings; and welded joints.
- D. Standard-pressure, wet-pipe sprinkler system, **NPS 2-1/2 to NPS 6 (DN 65 to DN 150)**, shall be one of the following:
 - 1. Standard-weight or Schedule 30, black-steel pipe with threaded ends; uncoated, gray-iron threaded fittings; and threaded joints.
 - 2. Standard-weight or Schedule 30], black-steel pipe with cut- or roll-grooved ends; uncoated, grooved-end fittings for steel piping; grooved-end-pipe couplings for steel piping; and grooved joints.
 - 3. Standard-weight or Schedule 30, black-steel pipe with plain ends; steel welding fittings; and welded joints.
 - 4. Thinwall black-steel pipe with roll-grooved ends; uncoated, grooved-end fittings for steel piping; grooved-end-pipe couplings for steel piping; and grooved joints.
 - 5. Thinwall black-steel pipe with plain ends; welding fittings; and welded joints.

3.10 SPRINKLER SCHEDULE

- A. Use sprinkler types in subparagraphs below for the following applications:
 - 1. Rooms without Ceilings: Upright sprinklers.
 - 2. Rooms with Suspended Ceilings: Pendent, recessed, flush, and concealed sprinklers as required.
 - 3. Wall Mounting: Sidewall sprinklers.
 - 4. Special Applications: Extended-coverage, flow-control, and quick-response sprinklers.

B. Provide sprinkler types in subparagraphs below with finishes indicated.

1. Concealed Sprinklers: Rough brass, with factory-painted white cover plate.
2. Flush Sprinklers: Bright chrome, with painted white escutcheon.
3. Recessed Sprinklers: Bright chrome, with bright chrome escutcheon.
4. Residential Sprinklers: Dull chrome.
5. Upright, Pendent and Sidewall Sprinklers: Chrome plated in finished spaces exposed to view; rough bronze in unfinished spaces not exposed to view; wax coated where exposed to acids, chemicals, or other corrosive fumes.

END OF SECTION 21 13 13

SECTION 21 21 13.16**CLEAN AGENT FIRE-EXTINGUISHING SYSTEMS****PART 1 - GENERAL****1.01 SUMMARY****A. Section Includes:**

1. Clean agent.
2. Piping.
3. Flexible-hose connectors.
4. Insulated carbon-dioxide containers.
5. Distribution valves.
6. Discharge nozzles.
7. Hangers and supports.
8. Control panels.
9. Detection devices.
10. Manual stations.
11. Switches.
12. Alarm devices.

1.02 ACTION SUBMITTALS**A. Product Data:** For each type of product.**B. Shop Drawings:** For low-pressure clean agent fire-extinguishing system signed and sealed by a qualified professional engineer.

1. Include plans, elevations, sections, and attachment details.
2. Include details of equipment assemblies. Indicate dimensions, weights, loads, required clearances, method of field assembly, components, and location and size of each field connection.
3. Include diagrams for power, signal, and control wiring.

1.03 INFORMATIONAL SUBMITTALS**A. Permit-Approved Drawings:** Working plans including design calculations, prepared according to NFPA 12, that have been approved by authorities having jurisdiction.**B. Seismic Qualification Certificates:** For container foundations, container racks, supports, hangers, braces, accessories, and components, from manufacturer.

1. **Basis for Certification:** Indicate whether withstand certification is based on actual test of assembled components or on calculation.

2. Dimensioned Outline Drawings of Equipment Unit: Identify center of gravity and locate and describe mounting and anchorage provisions.
3. Detailed description of equipment anchorage devices on which the certification is based and their installation requirements.

C. Field quality-control reports.

1.04 CLOSEOUT SUBMITTALS

- A. Operation and Maintenance Data: For clean agent fire-extinguishing system to include in emergency, operation, and maintenance manuals.

PART 2 - PRODUCTS

2.01 SYSTEM DESCRIPTION

- A. Manufacturers: Subject to compliance with requirements, available manufacturers offering products that may be incorporated into the Work include, but are not limited to, the following:

1. Fike Corporation.

- B. Total-Flooding System: Pre-engineered clean agent fire-extinguishing system designed for total flooding of the hazard area including the room cavity above the ceiling and below the ceiling.

- C. Electrical Components, Devices, and Accessories: Listed and labeled as defined in NFPA 70, by a qualified testing agency, and marked for intended location and application.

- D. NFPA Compliance: Fire-extinguishing system, equipment, and components shall comply with NFPA 12.

2.02 PERFORMANCE REQUIREMENTS

- A. Total-Flooding System Design Criteria:

1. Hazards: Electrical equipment room.
2. Discharge clean agent for 60 seconds and maintain 34 percent concentration by volume at 70 deg F (21 deg C) for 10 minute holding time in hazard areas.
3. Operations and Controls: If smoke is detected below the ceiling, extinguishing agent shall be discharged. If smoke is detected above the ceiling, extinguishing agent shall be discharged in the zone above the ceiling only.

- B. Seismic Performance: Container foundations, supports, hangers, and braces shall withstand the effects of earthquake motions determined according to ASCE/SEI 7.

1. The term "withstand" means "the system will remain in place without separation of any parts when subjected to the seismic forces specified and the system will be fully operational after the seismic event."
 2. Component Importance Factor is 1.5.
- C. Design clean agent fire-extinguishing system and obtain approval from authorities having jurisdiction. Design system for TPSS SI Equipment Room as appropriate for areas being protected and include safety factor.
- 2.03 CLEAN AGENT
- A. HFC-227ea or FM200..
- 2.04 PIPING MATERIALS
- A. Piping, Valves, and Discharge Nozzles: Comply with types and standards listed in NFPA 12, Section "Distribution," for charging pressure of system.
- 2.05 PIPES AND FITTINGS
- A. Steel Pipe: ASTM A 53/A 53M, Schedule 40, Grade B, Type E or ASTM A 106/A 106M, Grade A, black finish, seamless-steel pipe.
1. Threaded Fittings:
 - a. Malleable-Iron Fittings: ASME B16.3, Class 300.
 - b. Flanges and Flanged Fittings: ASME B16.5, Class 300.
- 2.06 FLEXIBLE-HOSE CONNECTORS
- A. Description: Teflon-lined, braided hose with stainless-steel wire-braid covering.
1. Design Standard: ASME B31.1.
 2. Internal Pressure: 450 psi (3101 kPa).
 3. Burst Pressure: 1800 psi (12 411 kPa) minimum.
 4. End Connections: Threaded male couplings.
- 2.07 INSULATED CLEAN AGENT CONTAINERS
- A. Containers:
1. Minimum Manufacturing Standard: ASME Boiler & Pressure Vessel Code, Section VIII, Division 1.
 2. Housing: Steel.
 3. Working Pressure: 363 psi (2503 kPa).
 4. Maintenance Pressure Requirements: 300 psi (2068 kPa) and 0 deg F (minus 18 deg C) with a design pressure of 325 psi (2241 kPa).

5. Bulk System Storage Container Nominal Size: 3/4 ton (680 kg).
6. Mini-Bulk System Storage Container Nominal Size: 800 lb (363 kg).

B. Valves:

1. Manual shutoff valve.
2. Bleeder Valve: 341 psi (2352 kPa).
3. Relief Valve: 357 psi (2462 kPa).

C. Gages:

1. Liquid level.
2. Pressure.

D. High- and Low-Pressure Supervisory Alarm:

1. Maximum Pressure Set Point: 90 percent of allowable working pressure.
2. Minimum Pressure Set Point: 250 psi (1724 kPa).

E. Refrigeration System:

1. Maintenance Pressure: 300 psi (2068 kPa) at maximum expected temperature.
2. Pressure Switch:
 - a. Start Pressure: 295 psi (2034 kPa).
 - b. Stop Pressure: 305 psi (2103 kPa).
3. Compressor: Commercial grade.
4. Refrigeration Coil Location: Lengthwise near top.
5. Motor:
 - a. Comply with NEMA designation, temperature rating, service factor, and efficiency requirements
 - b. Efficiency: Premium efficient.
 - c. Electrical Characteristics:
 - 1) Horsepower: As required.
 - 2) Volts: 120.
 - 3) Phase: Single.
 - 4) Hertz: 60.

F. Heating System:

1. Maintenance Temperature: 32 deg F (0 deg C) at minimum expected temperature.

2.08 DISTRIBUTION VALVES

A. Selector Valve:

1. Actuation: Pneumatic, electro pneumatic, or manual.

2. Design: Ball or Butterfly with spring-return actuator.
 - a. Minimum Burst Pressure: 5000 psi (34 474 kPa).
 - b. Minimum Pressure without Permanent Distortion: 1800 psi (12 411 kPa).

B. Master Valve:

1. Actuation: Pneumatic, electro pneumatic, or manual.
2. Design: Ball or butterfly, with spring-return actuator.
 - a. Minimum burst pressure: 5000 psi (34 474 kPa).
 - b. Minimum pressure without permanent distortion: 1800 psi (12 411 kPa).

2.09 DISCHARGE NOZZLES

- A. Equipment manufacturer's standard material of working pressure, size, discharge pattern, and capacity required for application.
- B. Corrosion-resistant metal.
- C. Stamped with orifice size and type.

2.10 HANGERS AND SUPPORTS

- A. Carbon-Steel Pipe Hangers and Supports:
 1. Description: MSS SP-58, Types 1 through 58, factory-fabricated components.
 2. Galvanized Metallic Coatings: Pregalvanized or hot dipped.
 3. Nonmetallic Coatings: Plastic coating, jacket, or liner.
 4. Padded Hangers: Hanger with fiberglass or other pipe insulation pad or cushion to support bearing surface of piping.
 5. Hanger Rods: Continuous-thread rod with compatible nuts and washers.

2.11 CONTROL PANELS

- A. Description: FM Approved or listed and labeled by a nationally recognized testing agency acceptable to authorities having jurisdiction, including equipment and features required for testing, supervising, and operating fire-extinguishing system.
- B. Power Requirements: 120/240-V ac; with electrical contacts for connection to system components and fire-alarm system, and transformer or rectifier as needed to produce power at voltage required for accessories and alarm devices.

2.12 DETECTION DEVICES

- A. General Requirements for Detection Devices:
 1. Comply with NFPA 12, NFPA 72, and UL 268.

2. 24-V dc, nominal.

- B. Ionization Detectors: Dual-chamber type, having sampling and referencing chambers, with smoke-sensing element.
- C. Photoelectric Detectors: LED light source and silicon photodiode receiving element.

2.13 MANUAL STATIONS

- A. Description: Surface, FM Approved or listed and labeled by a nationally recognized testing agency acceptable to authorities having jurisdiction, with clear plastic hinged cover, 120-V ac or low voltage compatible with controls. Include contacts for connection to control panel.
- B. Manual Release: "MANUAL RELEASE" caption, with red finish. Unit can manually discharge extinguishing agent with operating device that remains engaged until unlocked.
- C. Abort Switch: "ABORT" caption, momentary contact, with green finish.
- D. EPO Switch: "EPO" caption, with yellow finish.

2.14 SWITCHES

- A. Description: FM Approved or listed and labeled by a nationally recognized testing agency acceptable to authorities having jurisdiction.
 - 1. Control Voltage: 120-V ac compatible with controls.
 - 2. Include contacts for connection to control panel.
 - 3. Discharge Pressure Switches: Pneumatic operation for shutdown of equipment.
 - 4. Power Transfer Switches: Key-operation selector for transfer of release circuit signal from main supply to reserve supply.
 - 5. Door Closers: Magnetic retaining and release device or electrical interlock to cause the door operator to drive the door closed.

2.15 ALARM DEVICES

- A. Description: FM Approved or listed and labeled by a nationally recognized testing agency acceptable to authorities having jurisdiction; low voltage and surface mounting.
- B. Comply with requirements in Section 28 31 11 "Digital, Addressable Fire-Alarm System" for alarm and monitoring devices.
- C. Bells: Minimum 6-inch (150-mm) diameter.
- D. Horns: 90 to 94 dBA.
- E. Strobe Lights: Translucent lens, with "FIRE" or similar caption.

PART 3 - EXECUTION**3.01 INSTALLATION**

- A. Comply with requirements in NFPA 12.

3.02 HANGERS AND SUPPORTS

- A. Field fabricate hangers and supports from ASTM A 36/A 36M, carbon-steel shapes selected for loads being supported. Weld steel according to AWS D1.1/D1.1M.
- B. Install hangers and supports complete with necessary attachments, inserts, bolts, rods, nuts, washers, and other accessories.
- C. Equipment Support Installation: Fabricate from welded-structural-steel shapes.
- D. Install hangers and supports to allow controlled thermal and seismic movement of piping systems, to permit freedom of movement between pipe anchors, and to facilitate action of expansion joints, expansion loops, expansion bends, and similar units.
- E. Install building attachments within concrete slabs or attach to structural steel. Install additional attachments at concentrated loads, including valves, flanges, and strainers, **NPS 2-1/2 (DN 65)** and larger, and at changes in direction of piping. Install concrete inserts before concrete is placed; fasten inserts to forms and install reinforcing bars through openings at top of inserts.
- F. Load Distribution: Install hangers and supports so that piping live and dead loads and stresses from movement will not be transmitted to connected equipment.
- G. Pipe Slopes: Install hangers and supports to provide indicated pipe slopes to facilitate draining moisture and to not exceed maximum pipe deflections allowed by ASME B31.9 for building-services piping.
- H. Install carbon-steel hangers and supports for steel piping.
- I. Vertical Piping: MSS Type 8 or 42, clamps.
- J. Individual, Straight, Horizontal Piping Runs:
 - 1. **100 Feet (30 m)** and Less: MSS Type 1, adjustable, steel, clevis hangers.
 - 2. Longer Than **100 Feet (30 m)**: MSS Type 43, adjustable, roller hangers.
- K. Base of Vertical Piping: MSS Type 52, spring hangers.
- L. Support horizontal piping within **12 inches (300 mm)** of each fitting and coupling.
- M. Rod diameter may be reduced one size for double-rod hangers, with **3/8-inch- (10-mm-)** minimum rods.
- N. Maximum Span between Hangers and Piping with Threaded or Welded Joints:

1. NPS 1/4 to NPS 1/2 (DN 8 to DN 15): 60 inches (1500 mm) with 3/8-inch (10-mm) rod.
2. NPS 3/4 (DN 20): 72 inches (1800 mm) with 3/8-inch (10-mm) rod.
3. NPS 1 (DN 25): 84 inches (2100 mm) with 3/8-inch (10-mm) rod.
4. NPS 1-1/4 (DN 32): 96 inches (2400 mm) with 3/8-inch (10-mm) rod.
5. NPS 1-1/2 (DN 40): 108 inches (2700 mm) with 3/8-inch (10-mm) rod.
6. NPS 2 (DN 50): 10 feet (3 m) with 3/8-inch (10-mm) rod.
7. NPS 2-1/2 (DN 65): 11 feet (3.4 m) with 3/8-inch (10-mm) rod.
8. NPS 3 (DN 80): 12 feet (3.6 m) with 1/2-inch (13-mm) rod.
9. NPS 4 (DN 100): 14 feet (4.3 m) with 1/2-inch (13-mm) rod.

O. Maximum Span between Hangers and Piping with Mechanical Joints:

1. NPS 3/4 to NPS 2 (DN 20 to DN 50): 84 inches (2100 mm) with 3/8-inch (10-mm) rod.
2. NPS 3 to NPS 4 (DN 80 to DN 100): 10 feet (3 m) with 3/8-inch (10-mm) rod.

P. Install seismic restraints on piping.

3.03 IDENTIFICATION

- A. Identify piping, extinguishing-agent containers, other equipment, and panels according to NFPA 12.
- B. Install signs at entry doors for protected areas to warn occupants that they are entering a room protected by a carbon-dioxide fire-extinguishing system.
- C. Install signs at entry doors to advise persons outside the room of the meaning of the horn(s), bell(s), and strobe light(s) outside the protected space.

3.04 FIELD QUALITY CONTROL

- A. Perform tests and inspections according to NFPA 12.
- B. Carbon-dioxide fire-extinguishing system will be considered defective if it does not pass tests and inspections.
- C. Prepare test and inspection reports.

3.05 DEMONSTRATION

- A. Train Owner's maintenance personnel to adjust, operate, and maintain clean agent fire-extinguishing system.

END OF SECTION 21 21 13.16

SECTION 22 05 17**SLEEVES AND SLEEVE SEALS FOR PLUMBING PIPING****PART 1 - GENERAL****1.01 SUMMARY**

- A. Section Includes:
1. Sleeves.
 2. Sleeve-seal systems.
 3. Grout.

PART 2 - PRODUCTS**2.01 SLEEVES**

- A. Cast-Iron Wall Pipes: Cast or fabricated of cast or ductile iron and equivalent to ductile-iron pressure pipe, with plain ends and integral waterstop unless otherwise indicated.
- B. Galvanized-Steel Wall Pipes: ASTM A 53/A 53M, Schedule 40, with plain ends and welded steel collar; zinc coated.
- C. Galvanized-Steel-Pipe Sleeves: ASTM A 53/A 53M, Type E, Grade B, Schedule 40, zinc coated, with plain ends.
- D. PVC-Pipe Sleeves: ASTM D 1785, Schedule 40.
- E. Galvanized-Steel-Sheet Sleeves: 0.0239-inch (0.6-mm) minimum thickness; round tube closed with welded longitudinal joint.

2.02 SLEEVE-SEAL SYSTEMS

- A. Description: Modular sealing-element unit, designed for field assembly, for filling annular space between piping and sleeve.
1. Sealing Elements: EPDM-rubber or NBR interlocking links shaped to fit surface of pipe. Include type and number required for pipe material and size of pipe.
 2. Pressure Plates: Stainless steel.
 3. Connecting Bolts and Nuts: Stainless steel of length required to secure pressure plates to sealing elements.

2.03 GROUT

- A. Standard: ASTM C 1107/C 1107M, Grade B, post-hardening and volume-adjusting, dry, hydraulic-cement grout.
- B. Characteristics: Nonshrink; recommended for interior and exterior applications.
- C. Design Mix: 5000-psi (34.5-MPa), 28-day compressive strength.
- D. Packaging: Premixed and factory packaged.

PART 3 - EXECUTION

3.01 SLEEVE INSTALLATION

- A. Install sleeves for piping passing through penetrations in floors, partitions, roofs, and walls.
- B. For sleeves that will have sleeve-seal system installed, select sleeves of size large enough to provide 1-inch (25-mm) annular clear space between piping and concrete slabs and walls.
 - 1. Sleeves are not required for core-drilled holes.
- C. Install sleeves in concrete floors, concrete roof slabs, and concrete walls as new slabs and walls are constructed.
 - 1. Cut sleeves to length for mounting flush with both surfaces.
 - a. Exception: Extend sleeves installed in floors of mechanical equipment areas or other wet areas 2 inches (50 mm) above finished floor level.
 - 2. Using grout, seal the space outside of sleeves in slabs and walls without sleeve-seal system.
- D. Install sleeves for pipes passing through interior partitions.
 - 1. Cut sleeves to length for mounting flush with both surfaces.
 - 2. Install sleeves that are large enough to provide 1/4-inch (6.4-mm) annular clear space between sleeve and pipe or pipe insulation.
 - 3. Seal annular space between sleeve and piping or piping insulation; use joint sealants appropriate for size, depth, and location of joint. Comply with requirements for sealants specified in Section 07 92 00 "Joint Sealants."
- E. Fire-Barrier Penetrations: Maintain indicated fire rating of walls, partitions, ceilings, and floors at pipe penetrations. Seal pipe penetrations with firestop materials. Comply with requirements for firestopping specified in Section 07 84 13 "Penetration Firestopping."

3.02 SLEEVE-SEAL-SYSTEM INSTALLATION

- A. Install sleeve-seal systems in sleeves in exterior concrete walls and slabs-on-grade at service piping entries into building.
- B. Select type, size, and number of sealing elements required for piping material and size and for sleeve ID or hole size. Position piping in center of sleeve. Center piping in penetration, assemble sleeve-seal system components, and install in annular space between piping and sleeve. Tighten bolts against pressure plates that cause sealing elements to expand and make a watertight seal.

3.03 SLEEVE AND SLEEVE-SEAL SCHEDULE

- A. Use sleeves and sleeve seals for the following piping-penetration applications:
 - 1. Exterior Concrete Walls above Grade:
 - a. Cast-iron wall sleeves, Galvanized-steel wall sleeves or Galvanized-steel-pipe sleeves.
 - 2. Exterior Concrete Walls below Grade:
 - a. Cast-iron wall sleeves with sleeve-seal system, Galvanized-steel wall sleeves with sleeve-seal system or Galvanized-steel-pipe sleeves with sleeve-seal system.
 - 1) Select sleeve size to allow for 1-inch (25-mm) annular clear space between piping and sleeve for installing sleeve-seal system.
 - 3. Concrete Slabs-on-Grade:
 - a. Cast-iron wall sleeves with sleeve-seal system, Galvanized-steel wall sleeves with sleeve-seal system, or Galvanized-steel-pipe sleeves with sleeve-seal system.
 - 1) Select sleeve size to allow for 1-inch (25-mm) annular clear space between piping and sleeve for installing sleeve-seal system.
 - 4. Concrete Slabs above Grade:
 - a. Galvanized-steel-pipe sleeves.
 - 5. Interior Partitions:
 - a. Galvanized-steel-pipe sleeves.

END OF SECTION 22 05 17

SECTION 22 05 18
ESCUTCHEONS FOR PLUMBING PIPING

PART 1 - GENERAL

1.01 SUMMARY

- A. Section Includes:
1. Escutcheons.
 2. Floor plates.

1.02 ACTION SUBMITTALS

- A. Product Data: For each type of product indicated.

PART 2 - PRODUCTS

2.01 ESCUTCHEONS

- A. One-Piece, Cast-Brass Type: With polished, chrome-plated rough-brass finish and setscrew fastener.
- B. One-Piece, Deep-Pattern Type: Deep-drawn, box-shaped brass with chrome-plated finish and spring-clip fasteners.
- C. One-Piece, Stamped-Steel Type: With chrome-plated finish and spring-clip fasteners.

2.02 FLOOR PLATES

- A. One-Piece Floor Plates: Cast-iron flange with holes for fasteners.

PART 3 - EXECUTION

3.01 INSTALLATION

- A. Install escutcheons for piping penetrations of walls, ceilings, and finished floors.
- B. Install escutcheons with ID to closely fit around pipe, tube, and insulation of piping and with OD that completely covers opening.
1. Escutcheons for New Piping:

- a. Piping with Fitting or Sleeve Protruding from Wall: One-piece, deep-pattern type.
 - b. Chrome-Plated Piping: One-piece, cast-brass type with polished, chrome-plated finish.
 - c. Insulated Piping: One-piece, stamped-steel type.
 - d. Bare Piping at Wall and Floor Penetrations in Finished Spaces: One-piece, cast-brass type with polished, chrome-plated finish.
 - e. Bare Piping at Wall and Floor Penetrations in Finished Spaces: One-piece, stamped-steel type.
 - f. Bare Piping at Ceiling Penetrations in Finished Spaces: One-piece, cast-brass type with polished, chrome-plated finish.
 - g. Bare Piping at Ceiling Penetrations in Finished Spaces: One-piece, stamped-steel type.
 - h. Bare Piping in Unfinished Service Spaces: One-piece, cast-brass type with polished, chrome-plated or rough-brass finish.
 - i. Bare Piping in Unfinished Service Spaces: One-piece, stamped-steel type.
 - j. Bare Piping in Equipment Rooms: One-piece, cast-brass type with polished, chrome-plated or rough-brass finish.
 - k. Bare Piping in Equipment Rooms: One-piece, stamped-steel type.
- C. Install floor plates for piping penetrations of equipment-room floors.
- D. Install floor plates with ID to closely fit around pipe, tube, and insulation of piping and with OD that completely covers opening.
1. New Piping: One-piece, floor-plate type.

3.02 FIELD QUALITY CONTROL

- A. Replace broken and damaged escutcheons and floor plates using new materials.

END OF SECTION 22 05 18

SECTION 22 05 19**METERS AND GAGES FOR PLUMBING PIPING**

PART 1 - GENERAL

1.01 SUMMARY

- A. Section Includes:
 - 1. Bimetallic-actuated thermometers.
 - 2. Liquid-in-glass thermometers.
 - 3. Thermowells.
 - 4. Dial-type pressure gages.
 - 5. Gage attachments.

1.02 SUBMITTALS

- A. Product Data: thermometers and pressure gages
- B. Product certificates.
- C. Operation and maintenance data.

PART 2 - PRODUCTS

2.01 BIMETALLIC-ACTUATED THERMOMETERS

- A. Standard: ASME B40.200.
- B. Case: Liquid-filled and sealed type(s); stainless steel with 3-inch nominal diameter.
- C. Dial: Nonreflective aluminum with permanently etched scale markings and scales in deg F and deg C.
- D. Connector Type(s): Union joint, adjustable angle, with unified-inch screw threads.
- E. Connector Size: 1/2 inch, with ASME B1.1 screw threads.
- F. Stem: 0.25 or 0.375 inch in diameter; stainless steel.
- G. Window: Plain glass.
- H. Ring: Stainless steel.
- I. Element: Bimetal coil.

- J. Pointer: Dark-colored metal.
- K. Accuracy: Plus or minus 1 percent of scale range.

2.02 LIQUID-IN-GLASS THERMOMETERS

A. Metal-Case, Industrial-Style, Liquid-in-Glass Thermometers:

1. Standard: ASME B40.200.
2. Case: Cast aluminum; **7-inch** nominal size unless otherwise indicated.
3. Case Form: Adjustable angle unless otherwise indicated.
4. Tube: Glass with magnifying lens and blue or red organic liquid.
5. Tube Background: Nonreflective aluminum with permanently etched scale markings graduated in deg F and deg C.
6. Window: Glass.
7. Stem: Aluminum and of length to suit installation.
 - a. Design for Thermowell Installation: Bare stem.
8. Connector: **1-1/4 inches (32 mm)**, with ASME B1.1 screw threads.
9. Accuracy: Plus or minus 1 percent of scale range or one scale division, to a maximum of 1.5 percent of scale range.

B. Plastic-Case, Industrial-Style, Liquid-in-Glass Thermometers:

1. Standard: ASME B40.200.
2. Case: Plastic; **7-inch** nominal size unless otherwise indicated.
3. Case Form: Adjustable angle unless otherwise indicated.
4. Tube: Glass with magnifying lens and blue or red organic liquid.
5. Tube Background: Nonreflective aluminum with permanently etched scale markings graduated in deg F and deg C.
6. Window: Glass.
7. Stem: Aluminum, brass, or stainless steel and of length to suit installation.
 - a. Design for Thermowell Installation: Bare stem.
8. Connector: **1-1/4 inches**, with ASME B1.1 screw threads.
9. Accuracy: Plus or minus 1 percent of scale range or one scale division, to a maximum of 1.5 percent of scale range.

2.03 THERMOWELLS

A. Thermowells:

1. Standard: ASME B40.200.
2. Description: Pressure-tight, socket-type fitting made for insertion into piping tee fitting.
3. Material for Use with Copper Tubing: CNR or CUNI.
4. Material for Use with Steel Piping: CRES or CSA.
5. Type: Stepped shank unless straight or tapered shank is indicated.
6. External Threads: **NPS 1/2, NPS 3/4, or NPS 1**, ASME B1.20.1 pipe threads.
7. Internal Threads: **1/2, 3/4, and 1 inch** with ASME B1.1 screw threads.
8. Bore: Diameter required to match thermometer bulb or stem.

9. Insertion Length: Length required to match thermometer bulb or stem.
10. Lagging Extension: Include on thermowells for insulated piping and tubing.
11. Bushings: For converting size of thermowell's internal screw thread to size of thermometer connection.

B. Heat-Transfer Medium: Mixture of graphite and glycerin.

2.04 PRESSURE GAGES

A. Direct-Mounted, Metal-Case, Dial-Type Pressure Gages:

1. Standard: ASME B40.100.
2. Case: Liquid-filled or Sealed; cast aluminum or drawn steel; 4-1/2-inch nominal diameter.
3. Pressure-Element Assembly: Bourdon tube unless otherwise indicated.
4. Pressure Connection: Brass, with NPS 1/4 or NPS 1/2, ASME B1.20.1 pipe threads and bottom-outlet type unless back-outlet type is indicated.
5. Movement: Mechanical, with link to pressure element and connection to pointer.
6. Dial: Nonreflective aluminum with permanently etched scale markings graduated in psi and kPa.
7. Pointer: Dark-colored metal.
8. Window: Glass.
9. Ring: Stainless steel.
10. Accuracy: Grade B, plus or minus 2 percent of middle half of scale range.

2.05 GAGE ATTACHMENTS

- A. Snubbers: ASME B40.100, brass; with NPS 1/4 or NPS 1/2, ASME B1.20.1 pipe threads and piston-type surge-dampening device. Include extension for use on insulated piping.
- B. Valves: brass ball or stainless-steel needle, with NPS 1/4 or NPS 1/2, ASME B1.20.1 pipe threads.

PART 3 - EXECUTION

3.01 INSTALLATION

- A. Install thermowells with socket extending a minimum of 2 inches into fluid or to center of pipe as applicable and in vertical position in piping tees.
- B. Install thermowells of sizes required to match thermometer connectors. Include bushings if required to match sizes.
- C. Install thermowells with extension on insulated piping.
- D. Fill thermowells with heat-transfer medium.

- E. Install direct-mounted thermometers in thermowells and adjust vertical and tilted positions.
- F. Install direct-mounted pressure gages in piping tees with pressure gage located on pipe at the most readable position.
- G. Install valve and snubber in piping for each pressure gage for fluids.
- H. Install thermometers in the following locations:
 - 1. Inlet and outlet of each water heater.
- I. Install pressure gages in the following locations:
 - 1. Building water service entrance into building.
- J. Install meters and gages adjacent to machines and equipment to allow service and maintenance of meters, gages, machines, and equipment.
- K. Adjust faces of meters and gages to proper angle for best visibility.

3.02 THERMOMETER SCHEDULE

- A. Thermometers at inlet and outlet of each domestic water heater shall be one of the following:
 - 1. Liquid-filled or Sealed, bimetallic-actuated type.
 - 2. Industrial-style, liquid-in-glass type.
- B. Thermometer stems shall be of length to match thermowell insertion length.

3.03 THERMOMETER SCALE-RANGE SCHEDULE

- A. Scale Range for Domestic Cold-Water Piping: 0 to 150 deg F and minus 20 to plus 70 deg C.
- B. Scale Range for Domestic Hot-Water Piping: 0 to 250 deg F and 0 to 150 deg C.

3.04 PRESSURE-GAGE SCHEDULE

- A. Pressure gages at discharge of each water service into building shall be the following:
 - 1. Liquid-filled or Sealed direct-mounted, metal case.

3.05 PRESSURE-GAGE SCALE-RANGE SCHEDULE

- A. Scale Range for Water Service Piping: 0 to 100 psi and 0 to 600 kPa.

END OF SECTION 22 05 19

SECTION 22 05 23**GENERAL-DUTY VALVES FOR PLUMBING PIPING****PART 1 - GENERAL****1.01 SUMMARY****A. Section Includes:**

1. Brass ball valves.
2. Bronze ball valves.
3. Iron, single-flange butterfly valves.
4. Bronze swing check valves.
5. Iron swing check valves.
6. Iron swing check valves with closure control.
7. Bronze globe valves.
8. Iron globe valves.
9. Chainwheels.

1.02 SUBMITTALS

- A. Product Data: For each type of valve indicated.

1.03 QUALITY ASSURANCE

- A. ASME Compliance: ASME B16.10 and ASME B16.34 for ferrous valve dimensions and design criteria.
- B. NSF Compliance: NSF 61 for valve materials for potable-water service.

PART 2 - PRODUCTS**2.01 GENERAL REQUIREMENTS FOR VALVES**

- A. Refer to valve schedule articles for applications of valves.
- B. Valve Pressure and Temperature Ratings: Not less than indicated and as required for system pressures and temperatures.
- C. Valve Sizes: Same as upstream piping unless otherwise indicated.
- D. Valve Actuator Types:

1. Gear Actuator: For quarter-turn valves **NPS 8 (DN 200)** and larger.
 2. Handwheel: For valves other than quarter-turn types.
 3. Handlever: For quarter-turn valves **NPS 6 (DN 150)** and smaller.
 4. Chainwheel: Device for attachment to valve handwheel, stem, or other actuator; of size and with chain for mounting height, as indicated in the "Valve Installation" Article.
- E. Valves in Insulated Piping: With **2-inch (50-mm)** stem extensions and the following features:
1. Gate Valves: With rising stem.
 2. Ball Valves: With extended operating handle of non-thermal-conductive material, and protective sleeve that allows operation of valve without breaking the vapor seal or disturbing insulation.
 3. Butterfly Valves: With extended neck.
- F. Valve-End Connections:
1. Flanged: With flanges according to ASME B16.1 for iron valves.
 2. Solder Joint: With sockets according to ASME B16.18.
 3. Threaded: With threads according to ASME B1.20.1.
- 2.02 BRASS BALL VALVES
- A. Two-Piece, Full-Port, Brass Ball Valves with Brass Trim:
1. Description:
 - a. Standard: MSS SP-110.
 - b. SWP Rating: **150 psig (1035 kPa)**.
 - c. CWP Rating: **600 psig (4140 kPa)**.
 - d. Body Design: Two piece.
 - e. Body Material: Forged brass.
 - f. Ends: Threaded.
 - g. Seats: PTFE or TFE.
 - h. Stem: Brass.
 - i. Ball: Chrome-plated brass.
 - j. Port: Full.
- B. Two-Piece, Regular-Port, Brass Ball Valves with Brass Trim:
1. Description:
 - a. Standard: MSS SP-110.
 - b. SWP Rating: **150 psig (1035 kPa)**.
 - c. CWP Rating: **600 psig (4140 kPa)**.
 - d. Body Design: Two piece.
 - e. Body Material: Forged brass.
 - f. Ends: Threaded.

- g. Seats: PTFE or TFE.
- h. Stem: Brass.
- i. Ball: Chrome-plated brass.
- j. Port: Regular.

2.03 BRONZE BALL VALVES

A. Two-Piece, Full-Port, Bronze Ball Valves with Bronze Trim:

1. Description:

- a. Standard: MSS SP-110.
- b. SWP Rating: 150 psig (1035 kPa).
- c. CWP Rating: 600 psig (4140 kPa).
- d. Body Design: Two piece.
- e. Body Material: Bronze.
- f. Ends: Threaded.
- g. Seats: PTFE or TFE.
- h. Stem: Bronze.
- i. Ball: Chrome-plated brass.
- j. Port: Full.

B. Two-Piece, Regular-Port, Bronze Ball Valves with Bronze Trim:

1. Description:

- a. Standard: MSS SP-110.
- b. SWP Rating: 150 psig (1035 kPa).
- c. CWP Rating: 600 psig (4140 kPa).
- d. Body Design: Two piece.
- e. Body Material: Bronze.
- f. Ends: Threaded.
- g. Seats: PTFE or TFE.
- h. Stem: Bronze.
- i. Ball: Chrome-plated brass.
- j. Port: Regular.

2.04 IRON, SINGLE-FLANGE BUTTERFLY VALVES

A. 200 CWP, Iron, Single-Flange Butterfly Valves with EPDM Seat and Aluminum-Bronze Disc:

1. Description:

- a. Standard: MSS SP-67, Type I.
- b. CWP Rating: 200 psig (1380 kPa).
- c. Body Design: Lug type; suitable for bidirectional dead-end service at rated pressure without use of downstream flange.
- d. Body Material: ASTM A 126, cast iron or ASTM A 536, ductile iron.
- e. Seat: EPDM.

- f. Stem: One- or two-piece stainless steel.
 - g. Disc: Aluminum bronze.
 - B. 200 CWP, Iron, Single-Flange Butterfly Valves with NBR Seat and Aluminum-Bronze Disc:
 - 1. Description:
 - a. Standard: MSS SP-67, Type I.
 - b. CWP Rating: 200 psig (1380 kPa).
 - c. Body Design: Lug type; suitable for bidirectional dead-end service at rated pressure without use of downstream flange.
 - d. Body Material: ASTM A 126, cast iron or ASTM A 536, ductile iron.
 - e. Seat: NBR.
 - f. Stem: One- or two-piece stainless steel.
 - g. Disc: Aluminum bronze.
 - C. 200 CWP, Iron, Single-Flange Butterfly Valves with EPDM Seat and Ductile-Iron Disc:
 - 1. Description:
 - a. Standard: MSS SP-67, Type I.
 - b. CWP Rating: 200 psig (1380 kPa).
 - c. Body Design: Lug type; suitable for bidirectional dead-end service at rated pressure without use of downstream flange.
 - d. Body Material: ASTM A 126, cast iron or ASTM A 536, ductile iron.
 - e. Seat: EPDM.
 - f. Stem: One- or two-piece stainless steel.
 - g. Disc: Nickel-plated ductile iron.
 - D. 200 CWP, Iron, Single-Flange Butterfly Valves with NBR Seat and Ductile-Iron Disc:
 - 1. Description:
 - a. Standard: MSS SP-67, Type I.
 - b. CWP Rating: 200 psig (1380 kPa).
 - c. Body Design: Lug type; suitable for bidirectional dead-end service at rated pressure without use of downstream flange.
 - d. Body Material: ASTM A 126, cast iron or ASTM A 536, ductile iron.
 - e. Seat: NBR.
 - f. Stem: One- or two-piece stainless steel.
 - g. Disc: Nickel-plated ductile iron.
- 2.05 BRONZE SWING CHECK VALVES
- A. Class 125, Bronze Swing Check Valves with Bronze Disc:
 - 1. Description:
 - a. Standard: MSS SP-80, Type 3.
 - b. CWP Rating: 200 psig (1380 kPa).
 - c. Body Design: Horizontal flow.
 - d. Body Material: ASTM B 62, bronze.
 - e. Ends: Threaded.

f. Disc: Bronze.

B. Class 125, Bronze Swing Check Valves with Nonmetallic Disc:

1. Description:

- a. Standard: MSS SP-80, Type 4.
- b. CWP Rating: 200 psig (1380 kPa).
- c. Body Design: Horizontal flow.
- d. Body Material: ASTM B 62, bronze.
- e. Ends: Threaded.
- f. Disc: PTFE or TFE.

2.06 IRON SWING CHECK VALVES

A. Class 125, Iron Swing Check Valves with Metal Seats:

1. Description:

- a. Standard: MSS SP-71, Type I.
- b. CWP Rating: 200 psig (1380 kPa).
- c. Body Design: Clear or full waterway.
- d. Body Material: ASTM A 126, gray iron with bolted bonnet.
- e. Ends: Flanged.
- f. Trim: Bronze.
- g. Gasket: Asbestos free.

B. Class 125, Iron Swing Check Valves with Nonmetallic-to-Metal Seats:

1. Description:

- a. Standard: MSS SP-71, Type I.
- b. CWP Rating: 200 psig (1380 kPa).
- c. Body Design: Clear or full waterway.
- d. Body Material: ASTM A 126, gray iron with bolted bonnet.
- e. Ends: Flanged.
- f. Trim: Composition.
- g. Seat Ring: Bronze.
- h. Disc Holder: Bronze.
- i. Disc: PTFE or TFE.
- j. Gasket: Asbestos free.

2.07 IRON SWING CHECK VALVES WITH CLOSURE CONTROL

A. Class 125, Iron Swing Check Valves with Lever- and Spring-Closure Control:

1. Description:

- a. Standard: MSS SP-71, Type I.
- b. CWP Rating: 200 psig (1380 kPa).
- c. Body Design: Clear or full waterway.
- d. Body Material: ASTM A 126, gray iron with bolted bonnet.
- e. Ends: Flanged.

- f. Trim: Bronze.
 - g. Gasket: Asbestos free.
 - h. Closure Control: Factory-installed, exterior lever and spring.
- B. Class 125, Iron Swing Check Valves with Lever- and Weight-Closure Control:
- a. Standard: MSS SP-71, Type I.
 - b. CWP Rating: 200 psig (1380 kPa).
 - c. Body Design: Clear or full waterway.
 - d. Body Material: ASTM A 126, gray iron with bolted bonnet.
 - e. Ends: Flanged.
 - f. Trim: Bronze.
 - g. Gasket: Asbestos free.
 - h. Closure Control: Factory-installed, exterior lever and weight.

2.08 BRONZE GLOBE VALVES

- A. Class 125, Bronze Globe Valves with Bronze Disc:
- 1. Description:
 - a. Standard: MSS SP-80, Type 1.
 - b. CWP Rating: 200 psig (1380 kPa).
 - c. Body Material: ASTM B 62, bronze with integral seat and screw-in bonnet.
 - d. Ends: Threaded or solder joint.
 - e. Stem and Disc: Bronze.
 - f. Packing: Asbestos free.
 - g. Handwheel: Malleable iron, bronze, or aluminum.
- B. Class 125, Bronze Globe Valves with Nonmetallic Disc:
- 1. Description:
 - a. Standard: MSS SP-80, Type 2.
 - b. CWP Rating: 200 psig (1380 kPa).
 - c. Body Material: ASTM B 62, bronze with integral seat and screw-in bonnet.
 - d. Ends: Threaded or solder joint.
 - e. Stem: Bronze.
 - f. Disc: PTFE or TFE.
 - g. Packing: Asbestos free.
 - h. Handwheel: Malleable iron, bronze, or aluminum.

2.09 IRON GLOBE VALVES

- A. Class 125, Iron Globe Valves:
- 1. Description:
 - a. Standard: MSS SP-85, Type I.
 - b. CWP Rating: 200 psig (1380 kPa).
 - c. Body Material: ASTM A 126, gray iron with bolted bonnet.
 - d. Ends: Flanged.
 - e. Trim: Bronze.

- f. Packing and Gasket: Asbestos free.

2.10 CHAINWHEELS

- A. Description: Valve actuation assembly with sprocket rim, brackets, and chain.
 - 1. Brackets: Type, number, size, and fasteners required to mount actuator on valve.
 - 2. Attachment: For connection to butterfly valve stems.
 - 3. Sprocket Rim with Chain Guides: Ductile iron, of type and size required for valve. Include zinc coating.
 - 4. Chain: Hot-dip, galvanized steel, of size required to fit sprocket rim.

PART 3 - EXECUTION

3.01 VALVE INSTALLATION

- A. Install valves with unions or flanges at each piece of equipment arranged to allow service, maintenance, and equipment removal without system shutdown.
- B. Locate valves for easy access and provide separate support where necessary.
- C. Install valves in horizontal piping with stem at or above center of pipe.
- D. Install valves in position to allow full stem movement.
- E. Install chainwheels on operators for butterfly and globe valves **NPS 4 (DN 100)** and larger and more than **96 inches (2400 mm)** above floor. Extend chains to **60 inches (1520 mm)** above finished floor.
 - 1. Install swing check valves for proper direction of flow and in horizontal position with hinge pin level.

3.02 ADJUSTING

- A. Adjust or replace valve packing after piping systems have been tested and put into service but before final adjusting and balancing. Replace valves if persistent leaking occurs.

3.03 GENERAL REQUIREMENTS FOR VALVE APPLICATIONS

- A. If valve applications are not indicated, use the following:
 - 1. Shutoff Service: Ball and butterfly valves. Gate valves are only allowed at water and fire service entrance per local water company standards as shown on details on drawings.
 - 2. Throttling Service: Globe, ball, or butterfly valves.

3. Pump-Discharge Check Valves:
 - a. **NPS 2 (DN 50)** and Smaller: Bronze swing check valves with bronze disc.
 - b. **NPS 2-1/2 (DN 65)** and Larger for Domestic Water: Iron swing check valves with lever and weight or with spring.
 - c. **NPS 2-1/2 (DN 65)** and Larger for Sanitary Waste and Storm Drainage: Iron swing check valves with lever and weight or spring.
 - B. If valves with specified SWP classes or CWP ratings are not available, the same types of valves with higher SWP class or CWP ratings may be substituted.
 - C. Select valves, except wafer types, with the following end connections:
 1. For Copper Tubing, **NPS 2 (DN 50)** and Smaller: Threaded ends except where solder-joint valve-end option is indicated in valve schedules below.
 2. For Copper Tubing, **NPS 2-1/2 to NPS 4 (DN 65 to DN 100)**: Flanged ends except where threaded valve-end option is indicated in valve schedules below.
 3. For Copper Tubing, **NPS 5 (DN 125)** and Larger: Flanged ends.
 4. For Steel Piping, **NPS 2 (DN 50)** and Smaller: Threaded ends.
 5. For Steel Piping, **NPS 2-1/2 to NPS 4 (DN 65 to DN 100)**: Flanged ends except where threaded valve-end option is indicated in valve schedules below.
 6. For Steel Piping, **NPS 5 (DN 125)** and Larger: Flanged ends.
- 3.04 LOW-PRESSURE, COMPRESSED-AIR VALVE SCHEDULE (**150 PSIG (1035 kPa)** OR LESS)
- A. Pipe **NPS 2 (DN 50)** and Smaller:
 1. Bronze and Brass Valves: May be provided with solder-joint ends instead of threaded ends.
 2. Ball Valves: Two piece, full or regular port, brass or bronze.
 3. Bronze Swing Check Valves: Class 125, bronze disc.
 - B. Pipe **NPS 2-1/2 (DN 65)** and Larger:
 1. Iron Valves, **NPS 2-1/2 to NPS 4 (DN 65 to NPS 100)**: May be provided with threaded ends instead of flanged ends.
 2. Iron, Single-Flange Butterfly Valves: 200 CWP, NBR seat, aluminum-bronze or ductile-iron disc.
 3. Iron Swing Check Valves: Class 125, metal seats.
- 3.05 DOMESTIC, HOT- AND COLD-WATER VALVE SCHEDULE
- A. Pipe **NPS 2 (DN 50)** and Smaller:
 1. Bronze and Brass Valves: May be provided with solder-joint ends instead of threaded ends.
 2. Bronze Angle Valves: Class 125, bronze disc.
 3. Ball Valves: Two piece, full or regular port, brass or bronze with brass or bronze trim.

4. Bronze Swing Check Valves: Class 125, bronze disc.
5. Bronze Globe Valves: Class 125, bronze disc.

B. Pipe **NPS 2-1/2 (DN 65)** and Larger:

1. Iron Valves, **NPS 2-1/2 to NPS 4 (DN 65 to NPS 100)**: May be provided with threaded ends instead of flanged ends.
2. Iron, Single-Flange Butterfly Valves: 200 CWP, EPDM or NBR seat, aluminum-bronze or ductile-iron disc.
3. Iron Swing Check Valves: Class 125, metal seats.
4. Iron Swing Check Valves with Closure Control: Class 125, lever and weight.
5. Iron Globe Valves: Class 125.

3.06 SANITARY-WASTE VALVE SCHEDULE

A. Pipe **NPS 2 (DN 50)** and Smaller:

1. Bronze Valves: May be provided with solder-joint ends instead of threaded ends.
2. Ball Valves: Two piece, full port, bronze with bronze trim.
3. Bronze Swing Check Valves: Class 125, bronze disc.
4. Bronze Globe Valves: Class 125, bronze disc.

B. Pipe **NPS 2-1/2 (DN 65)** and Larger:

1. Iron Valves, **NPS 2-1/2 to NPS 4 (DN 65 to NPS 100)**: May be provided with threaded ends instead of flanged ends.
2. Iron Swing Check Valves: Class 125, metal seats.
3. Iron Swing Check Valves with Closure Control: Class 125, lever and spring or weight\.
4. Iron Globe Valves: Class 125.

END OF SECTION 22 05 23

SECTION 22 05 29**HANGERS AND SUPPORTS FOR PLUMBING PIPING AND EQUIPMENT**

PART 1 - GENERAL

1.01 SUMMARY

- A. Section Includes:
 - 1. Metal pipe hangers and supports.

1.02 SUBMITTALS

- A. Product Data: For each type of product indicated.
- B. Welding certificates.

1.03 QUALITY ASSURANCE

- A. Structural Steel Welding Qualifications: Qualify procedures and personnel according to AWS D1.1/D1.1M, "Structural Welding Code - Steel."
- B. Pipe Welding Qualifications: Qualify procedures and operators according to ASME Boiler and Pressure Vessel Code.

PART 2 - PRODUCTS

2.01 METAL PIPE HANGERS AND SUPPORTS

- A. Carbon-Steel Pipe Hangers and Supports:
 - 1. Description: MSS SP-58, Types 1 through 58, factory-fabricated components.
 - 2. Galvanized Metallic Coatings: Pregalvanized or hot dipped.
 - 3. Nonmetallic Coatings: Plastic coating, jacket, or liner.
 - 4. Padded Hangers: Hanger with fiberglass or other pipe insulation pad or cushion to support bearing surface of piping.
 - 5. Hanger Rods: Continuous-thread rod, nuts, and washer made of carbon steel.
- B. Copper Pipe Hangers:
 - 1. Description: MSS SP-58, Types 1 through 58, copper-coated-steel, factory-fabricated components.
 - 2. Hanger Rods: Continuous-thread rod, nuts, and washer made of copper-coated steel.

2.02 FASTENER SYSTEMS

- A. Powder-Actuated Fasteners: Threaded-steel stud, for use in hardened portland cement concrete with pull-out, tension, and shear capacities appropriate for supported loads and building materials where used.
- B. Mechanical-Expansion Anchors: Insert-wedge-type, stainless steel anchors, for use in hardened portland cement concrete; with pull-out, tension, and shear capacities appropriate for supported loads and building materials where used.

2.03 MISCELLANEOUS MATERIALS

- A. Structural Steel: ASTM A 36/A 36M, carbon-steel plates, shapes, and bars; black and galvanized.
- B. Grout: ASTM C 1107, factory-mixed and -packaged, dry, hydraulic-cement, nonshrink and nonmetallic grout; suitable for interior and exterior applications.
 - 1. Properties: Nonstaining, noncorrosive, and nongaseous.
 - 2. Design Mix: **5000-psi**, 28-day compressive strength.

PART 3 - EXECUTION

3.01 HANGER AND SUPPORT INSTALLATION

- A. Metal Pipe-Hanger Installation: Comply with MSS SP-69 and MSS SP-89. Install hangers, supports, clamps, and attachments as required to properly support piping from the building structure.
- B. Fastener System Installation:
 - 1. Install powder-actuated fasteners for use in lightweight concrete or concrete slabs less than **4 inches** thick in concrete after concrete is placed and completely cured. Use operators that are licensed by powder-actuated tool manufacturer. Install fasteners according to powder-actuated tool manufacturer's operating manual.
 - 2. Install mechanical-expansion anchors in concrete after concrete is placed and completely cured. Install fasteners according to manufacturer's written instructions.
- C. Install hangers and supports complete with necessary attachments, inserts, bolts, rods, nuts, washers, and other accessories.
- D. Equipment Support Installation: Fabricate from welded-structural-steel shapes.
- E. Install hangers and supports to allow controlled thermal and seismic movement of piping systems, to permit freedom of movement between pipe anchors, and to facilitate action of expansion joints, expansion loops, expansion bends, and similar units.

- F. Install lateral bracing with pipe hangers and supports to prevent swaying.
- G. Pipe Slopes: Install hangers and supports to provide indicated pipe slopes and to not exceed maximum pipe deflections allowed by ASME B31.9 for building services piping.
- H. Insulated Piping:
 - 1. Attach clamps and spacers to piping.
 - a. Piping Operating above Ambient Air Temperature: Clamp may project through insulation.
 - b. Piping Operating below Ambient Air Temperature: Use thermal-hanger shield insert with clamp sized to match OD of insert.
 - c. Do not exceed pipe stress limits allowed by ASME B31.9 for building services piping.
 - 2. Install MSS SP-58, Type 39, protection saddles if insulation without vapor barrier is indicated. Fill interior voids with insulation that matches adjoining insulation.
 - a. Option: Thermal-hanger shield inserts may be used. Include steel weight-distribution plate for pipe **NPS 4** and larger if pipe is installed on rollers.
 - 3. Install MSS SP-58, Type 40, protective shields on cold piping with vapor barrier. Shields shall span an arc of 180 degrees.
 - a. Option: Thermal-hanger shield inserts may be used. Include steel weight-distribution plate for pipe **NPS 4** and larger if pipe is installed on rollers.
 - 4. Shield Dimensions for Pipe: Not less than the following:
 - a. **NPS 1/4 to NPS 3-1/2: 12 inches** long and **0.048 inch** thick.
 - b. **NPS 4: 12 inches** long and **0.06 inch** thick.
 - c. **NPS 5 and NPS 6: 18 inches** long and **0.06 inch** thick.

3.02 EQUIPMENT SUPPORTS

- A. Fabricate structural-steel stands to suspend equipment from structure overhead or to support equipment above floor.
- B. Grouting: Place grout under supports for equipment and make bearing surface smooth.
- C. Provide lateral bracing, to prevent swaying, for equipment supports.

3.03 METAL FABRICATIONS

- A. Cut, drill, and fit miscellaneous metal fabrications for equipment supports.
- B. Fit exposed connections together to form hairline joints. Field weld connections that cannot be shop welded because of shipping size limitations.
- C. Field Welding: Comply with AWS D1.1/D1.1M procedures for shielded, metal arc welding; appearance and quality of welds; and methods used in correcting welding work; and with the following:

1. Use materials and methods that minimize distortion and develop strength and corrosion resistance of base metals.
2. Obtain fusion without undercut or overlap.
3. Remove welding flux immediately.
4. Finish welds at exposed connections so no roughness shows after finishing and so contours of welded surfaces match adjacent contours.

3.04 ADJUSTING

- A. Hanger Adjustments: Adjust hangers to distribute loads equally on attachments and to achieve indicated slope of pipe.
- B. Trim excess length of continuous-thread hanger and support rods to **1-1/2 inches**.

3.05 PAINTING

- A. Touchup: Clean field welds and abraded areas of shop paint. Paint exposed areas immediately after erecting hangers and supports. Use same materials as used for shop painting. Comply with SSPC-PA 1 requirements for touching up field-painted surfaces.
 1. Apply paint by brush or spray to provide a minimum dry film thickness of **2.0 mils**.
- B. Touchup: Cleaning and touchup painting of field welds, bolted connections, and abraded areas of shop paint on miscellaneous metal are specified in Painting Section
- C. Galvanized Surfaces: Clean welds, bolted connections, and abraded areas and apply galvanizing-repair paint to comply with ASTM A 780.

3.06 HANGER AND SUPPORT SCHEDULE

- A. Specific hanger and support requirements are in Sections specifying piping systems and equipment.
- B. Comply with MSS SP-69 for pipe-hanger selections and applications that are not specified in piping system Sections.
- C. Use hangers and supports with galvanized metallic coatings for piping and equipment that will not have field-applied finish.
- D. Use nonmetallic coatings on attachments for electrolytic protection where attachments are in direct contact with copper tubing.
- E. Use carbon-steel pipe hangers and supports and attachments for general service applications.
- F. Use stainless-steel pipe hangers and stainless-steel or corrosion-resistant attachments for hostile environment applications.

- G. Use copper-plated pipe hangers and copper or stainless-steel attachments for copper piping and tubing.
- H. Use padded hangers for piping that is subject to scratching.
- I. Use thermal-hanger shield inserts for insulated piping and tubing.
- J. Horizontal-Piping Hangers and Supports: Unless otherwise indicated and except as specified in piping system Sections, install the following types:
1. Adjustable, Steel Clevis Hangers (MSS Type 1): For suspension of noninsulated or insulated, stationary pipes **NPS 1/2 to NPS 30**.
 2. Yoke-Type Pipe Clamps (MSS Type 2): For suspension of up to **1050 deg F**, pipes **NPS 4 to NPS 24**, requiring up to **4 inches** of insulation.
 3. Carbon- or Alloy-Steel, Double-Bolt Pipe Clamps (MSS Type 3): For suspension of pipes **NPS 3/4 to NPS 36**, requiring clamp flexibility and up to **4 inches** of insulation.
 4. Adjustable, Steel Band Hangers (MSS Type 7): For suspension of noninsulated, stationary pipes **NPS 1/2 to NPS 8**.
 5. U-Bolts (MSS Type 24): For support of heavy pipes **NPS 1/2 to NPS 30**.
 6. Pipe Saddle Supports (MSS Type 36): For support of pipes **NPS 4 to NPS 36**, with steel-pipe base stanchion support and cast-iron floor flange or carbon-steel plate.
 7. Pipe Stanchion Saddles (MSS Type 37): For support of pipes **NPS 4 to NPS 36**, with steel-pipe base stanchion support and cast-iron floor flange or carbon-steel plate, and with U-bolt to retain pipe.
 8. Single-Pipe Rolls (MSS Type 41): For suspension of pipes **NPS 1 to NPS 30**, from two rods if longitudinal movement caused by expansion and contraction might occur.
 9. Complete Pipe Rolls (MSS Type 44): For support of pipes **NPS 2 to NPS 42** if longitudinal movement caused by expansion and contraction might occur but vertical adjustment is not necessary.
- K. Vertical-Piping Clamps: Unless otherwise indicated and except as specified in piping system Sections, install the following types:
1. Extension Pipe or Riser Clamps (MSS Type 8): For support of pipe risers **NPS 3/4 to NPS 24**.
 2. Carbon- or Alloy-Steel Riser Clamps (MSS Type 42): For support of pipe risers **NPS 3/4 to NPS 24** if longer ends are required for riser clamps.
- L. Hanger-Rod Attachments: Unless otherwise indicated and except as specified in piping system Sections, install the following types:
1. Steel Turnbuckles (MSS Type 13): For adjustment up to **6 inches** for heavy loads.
 2. Steel Clevises (MSS Type 14): For **120 to 450 deg F** piping installations.
- M. Building Attachments: Unless otherwise indicated and except as specified in piping system Sections, install the following types:

1. Steel or Malleable Concrete Inserts (MSS Type 18): For upper attachment to suspend pipe hangers from concrete ceiling.
 2. Top-Beam C-Clamps (MSS Type 19): For use under roof installations with bar-joint construction, to attach to top flange of structural shape.
 3. Side-Beam or Channel Clamps (MSS Type 20): For attaching to bottom flange of beams, channels, or angles.
 4. Center-Beam Clamps (MSS Type 21): For attaching to center of bottom flange of beams.
 5. Welded Beam Attachments (MSS Type 22): For attaching to bottom of beams if loads are considerable and rod sizes are large.
 6. C-Clamps (MSS Type 23): For structural shapes.
 7. Welded-Steel Brackets: For support of pipes from below, or for suspending from above by using clip and rod. Use one of the following for indicated loads:
 - a. Light (MSS Type 31): 750 lb.
 - b. Medium (MSS Type 32): 1500 lb.
 - c. Heavy (MSS Type 33): 3000 lb.
 8. Side-Beam Brackets (MSS Type 34): For sides of steel or wooden beams.
 9. Plate Lugs (MSS Type 57): For attaching to steel beams if flexibility at beam is required.
- N. Saddles and Shields: Unless otherwise indicated and except as specified in piping system Sections, install the following types:
1. Steel-Pipe-Covering Protection Saddles (MSS Type 39): To fill interior voids with insulation that matches adjoining insulation.
 2. Protection Shields (MSS Type 40): Of length recommended in writing by manufacturer to prevent crushing insulation.
 3. Thermal-Hanger Shield Inserts: For supporting insulated pipe.
- O. Comply with MSS SP-69 for trapeze pipe-hanger selections and applications that are not specified in piping system Sections.
- P. Use powder-actuated fasteners or mechanical-expansion anchors instead of building attachments where required in concrete construction.
- Q. Use pipe positioning systems in pipe spaces behind plumbing fixtures to support supply and waste piping for plumbing fixtures.

END OF SECTION 22 05 29

SECTION 22 05 53**IDENTIFICATION FOR PLUMBING PIPING AND EQUIPMENT****PART 1 - GENERAL****1.01 SUMMARY**

- A. Section Includes:
1. Equipment labels.
 2. Warning signs and labels.
 3. Pipe labels.

1.02 ACTION SUBMITTAL

- A. Product Data: For each type of product indicated.

PART 2 - PRODUCTS**2.01 EQUIPMENT LABELS**

- A. Metal Labels for Equipment:
1. Material and Thickness: Brass, 0.032-inch (0.8-mm), Stainless steel, 0.025-inch (0.64-mm), Aluminum, 0.032-inch (0.8-mm) or anodized aluminum, 0.032-inch (0.8-mm) minimum thickness, and having predrilled or stamped holes for attachment hardware.
 2. Minimum Label Size: Length and width vary for required label content, but not less than 2-1/2 by 3/4 inch (64 by 19 mm).
 3. Minimum Letter Size: 1/4 inch (6.4 mm) for name of units if viewing distance is less than 24 inches (600 mm), 1/2 inch (13 mm) for viewing distances up to 72 inches (1830 mm), and proportionately larger lettering for greater viewing distances. Include secondary lettering two-thirds to three-fourths the size of principal lettering.
 4. Fasteners: Stainless-steel rivets or self-tapping screws.
 5. Adhesive: Contact-type permanent adhesive, compatible with label and with substrate.
- B. Label Content: Include equipment's Drawing designation or unique equipment number, Drawing numbers where equipment is indicated (plans, details, and schedules), plus the Specification Section number and title where equipment is specified.
- C. Equipment Label Schedule: For each item of equipment to be labeled, on 8-1/2-by-11-inch (A4) bond paper. Tabulate equipment identification number and identify Drawing numbers where equipment is indicated (plans, details, and schedules), plus the

Specification Section number and title where equipment is specified. Equipment schedule shall be included in operation and maintenance data.

2.02 WARNING SIGNS AND LABELS

- A. Material and Thickness: Multilayer, multicolor, plastic labels for mechanical engraving, **1/16 inch (1.6 mm)** thick, and having predrilled holes for attachment hardware.
- B. Letter Color: Black.
- C. Background Color: Yellow.
- D. Maximum Temperature: Able to withstand temperatures up to **160 deg F (71 deg C)**.
- E. Minimum Label Size: Length and width vary for required label content, but not less than **2-1/2 by 3/4 inch (64 by 19 mm)**.
- F. Minimum Letter Size: **1/4 inch (6.4 mm)** for name of units if viewing distance is less than **24 inches (600 mm)**, **1/2 inch (13 mm)** for viewing distances up to **72 inches (1830 mm)**, and proportionately larger lettering for greater viewing distances. Include secondary lettering two-thirds to three-fourths the size of principal lettering.
- G. Fasteners: Stainless-steel rivets or self-tapping screws.
- H. Adhesive: Contact-type permanent adhesive, compatible with label and with substrate.
- I. Label Content: Include caution and warning information, plus emergency notification instructions.

2.03 PIPE LABELS

- A. General Requirements for Manufactured Pipe Labels: Preprinted, color-coded, with lettering indicating service, and showing flow direction.
- B. Pretensioned Pipe Labels: Precoiled, semirigid plastic formed to cover full circumference of pipe and to attach to pipe without fasteners or adhesive.
- C. Self-Adhesive Pipe Labels: Printed plastic with contact-type, permanent-adhesive backing.
- D. Pipe Label Contents: Include identification of piping service using same designations or abbreviations as used on Drawings, pipe size, and an arrow indicating flow direction.
 - 1. Flow-Direction Arrows: Integral with piping system service lettering to accommodate both directions, or as separate unit on each pipe label to indicate flow direction.
 - 2. Lettering Size: At least **1-1/2 inches (38 mm)** high.

PART 3 - EXECUTION**3.01 PREPARATION**

- A. Clean piping and equipment surfaces of substances that could impair bond of identification devices, including dirt, oil, grease, release agents, and incompatible primers, paints, and encapsulants.

3.02 EQUIPMENT LABEL INSTALLATION

- A. Install or permanently fasten labels on each major item of mechanical equipment.
- B. Locate equipment labels where accessible and visible.

3.03 PIPE LABEL INSTALLATION

- A. Piping Color-Coding: Painting of piping is specified in Division 9.
- B. Locate pipe labels where piping is exposed or above accessible ceilings in finished spaces; machine rooms; accessible maintenance spaces such as shafts, tunnels, and plenums; and exterior exposed locations as follows:
 - 1. Near each valve and control device.
 - 2. Near each branch connection, excluding short takeoffs for fixtures and terminal units. Where flow pattern is not obvious, mark each pipe at branch.
 - 3. Near penetrations through walls, floors, ceilings, and inaccessible enclosures.
 - 4. At access doors, manholes, and similar access points that permit view of concealed piping.
 - 5. Near major equipment items and other points of origination and termination.
 - 6. Spaced at maximum intervals of **50 feet (15 m)** along each run. Reduce intervals to **25 feet (7.6 m)** in areas of congested piping and equipment.
- C. Pipe Label Color Schedule:
 - 1. Compressed-Air Piping: Painting and labeling Compressed Air Pipe is shown on the Equipment Drawings.
 - 2. Domestic Water Piping:
 - a. Background Color: White.
 - b. Letter Color: Green.
 - 3. Sanitary Waste and Storm Drainage Piping:
 - a. Background Color: White.
 - b. Letter Color: Black.

END OF SECTION 22 05 53

SECTION 22 07 19**PLUMBING PIPING INSULATION****PART 1 - GENERAL****1.01 SUMMARY**

- A. Section includes insulating the following plumbing piping services:
1. Domestic hot-water piping.
 2. Domestic recirculating hot-water piping.
 3. Sanitary waste piping exposed to freezing conditions.
 4. Storm-water piping exposed to freezing conditions.
 5. Roof drains and rainwater leaders.
 6. Supplies and drains for handicap-accessible lavatories and sinks.

1.02 SUBMITTALS

- A. Product Data: For each type of product indicated.
- B. LEED Submittals:
1. Product Data for Credit IEQ 4.1: For adhesives and sealants, documentation including printed statement of VOC content and chemical components.
 2. Laboratory Test Reports for Credit IEQ 4: For adhesives and sealants, documentation indicating that product complies with the testing and product requirements of the California Department of Health Services' "Standard Practice for the Testing of Volatile Organic Emissions from Various Sources Using Small-Scale Environmental Chambers."
- C. Shop Drawings: Include plans, elevations, sections, details, and attachments to other work.
1. Detail application of protective shields, saddles, and inserts at hangers for each type of insulation and hanger.
 2. Detail attachment and covering of heat tracing inside insulation.
 3. Detail insulation application at pipe expansion joints for each type of insulation.
 4. Detail insulation application at elbows, fittings, flanges, valves, and specialties for each type of insulation.
 5. Detail removable insulation at piping specialties, equipment connections, and access panels.
 6. Detail application of field-applied jackets.
 7. Detail application at linkages of control devices.
- D. Field quality-control reports.

1.03 QUALITY ASSURANCE

- A. Surface-Burning Characteristics: For insulation and related materials, as determined by testing identical products according to ASTM E 84 by a testing agency acceptable to authorities having jurisdiction. Factory label insulation and jacket materials and adhesive, mastic, tapes, and cement material containers, with appropriate markings of applicable testing agency.
 - 1. Insulation Installed Indoors: Flame-spread index of 25 or less, and smoke-developed index of 50 or less.
 - 2. Insulation Installed Outdoors: Flame-spread index of 75 or less, and smoke-developed index of 150 or less.
- B. Comply with the following applicable standards and other requirements specified for miscellaneous components:
 - 1. Supply and Drain Protective Shielding Guards: ICC A117.1.

PART 2 - PRODUCTS

2.01 INSULATION MATERIALS

- A. Comply with requirements in "Piping Insulation Schedule, General," "Indoor Piping Insulation Schedule," "Outdoor, Aboveground Piping Insulation Schedule," and "Outdoor, Underground Piping Insulation Schedule" articles for where insulating materials shall be applied.
- B. Products shall not contain asbestos, lead, mercury, or mercury compounds.
- C. Products that come in contact with stainless steel shall have a leachable chloride content of less than 50 ppm when tested according to ASTM C 871.
- D. Insulation materials for use on austenitic stainless steel shall be qualified as acceptable according to ASTM C 795.
- E. Foam insulation materials shall not use CFC or HCFC blowing agents in the manufacturing process.
- F. Cellular Glass: Inorganic, incombustible, foamed or cellulated glass with annealed, rigid, hermetically sealed cells. Factory-applied jacket requirements are specified in "Factory-Applied Jackets" Article.
 - 1. Special-Shaped Insulation: ASTM C 552, Type III.
 - 2. Preformed Pipe Insulation without Jacket: Comply with ASTM C 552, Type II, Class 1.
 - 3. Preformed Pipe Insulation with Factory-Applied ASJ: Comply with ASTM C 552, Type II, Class 2.
 - 4. Factory fabricate shapes according to ASTM C 450 and ASTM C 585.

- G. Flexible Elastomeric Insulation: Closed-cell, sponge- or expanded-rubber materials. Comply with ASTM C 534, Type I for tubular materials.
- H. Mineral-Fiber, Preformed Pipe Insulation:
 - 1. Type I, 850 Deg F (454 Deg C) Materials: Mineral or glass fibers bonded with a thermosetting resin. Comply with ASTM C 547, Type I, Grade A, with factory-applied ASJ. Factory-applied jacket requirements are specified in "Factory-Applied Jackets" Article.

2.02 INSULATING CEMENTS

- A. Mineral-Fiber, Hydraulic-Setting Insulating and Finishing Cement: Comply with ASTM C 449.

2.03 ADHESIVES

- A. Materials shall be compatible with insulation materials, jackets, and substrates and for bonding insulation to itself and to surfaces to be insulated, unless otherwise indicated.
- B. Cellular-Glass Adhesive: Two-component, thermosetting urethane adhesive containing no flammable solvents, with a service temperature range of minus 100 to plus 200 deg F (minus 73 to plus 93 deg C).
 - 1. For indoor applications, adhesive shall have a VOC content of 50 g/L or less when calculated according to 40 CFR 59, Subpart D (EPA Method 24).
 - 2. Adhesive shall comply with the testing and product requirements of the California Department of Health Services' "Standard Practice for the Testing of Volatile Organic Emissions from Various Sources Using Small-Scale Environmental Chambers."
- C. Flexible Elastomeric and Polyolefin Adhesive: Comply with MIL-A-24179A, Type II, Class I.
 - 1. For indoor applications, adhesive shall have a VOC content of 50 g/L or less when calculated according to 40 CFR 59, Subpart D (EPA Method 24).
 - 2. Adhesive shall comply with the testing and product requirements of the California Department of Health Services' "Standard Practice for the Testing of Volatile Organic Emissions from Various Sources Using Small-Scale Environmental Chambers."
- D. Mineral-Fiber Adhesive: Comply with MIL-A-3316C, Class 2, Grade A.
 - 1. For indoor applications, adhesive shall have a VOC content of 80 g/L or less when calculated according to 40 CFR 59, Subpart D (EPA Method 24).
 - 2. Adhesive shall comply with the testing and product requirements of the California Department of Health Services' "Standard Practice for the Testing of Volatile Organic Emissions from Various Sources Using Small-Scale Environmental Chambers."

- E. ASJ Adhesive: Comply with MIL-A-3316C, Class 2, Grade A for bonding insulation jacket lap seams and joints.
 - 1. For indoor applications, adhesive shall have a VOC content of 50 g/L or less when calculated according to 40 CFR 59, Subpart D (EPA Method 24).
 - 2. Adhesive shall comply with the testing and product requirements of the California Department of Health Services' "Standard Practice for the Testing of Volatile Organic Emissions from Various Sources Using Small-Scale Environmental Chambers."

- F. PVC Jacket Adhesive: Compatible with PVC jacket.
 - 1. For indoor applications, adhesive shall have a VOC content of 50 g/L or less when calculated according to 40 CFR 59, Subpart D (EPA Method 24).
 - 2. Adhesive shall comply with the testing and product requirements of the California Department of Health Services' "Standard Practice for the Testing of Volatile Organic Emissions from Various Sources Using Small-Scale Environmental Chambers."

2.04 MASTICS

- A. Materials shall be compatible with insulation materials, jackets, and substrates; comply with MIL-PRF-19565C, Type II.
 - 1. For indoor applications, use mastics that have a VOC content of 50 g/L or less when calculated according to 40 CFR 59, Subpart D (EPA Method 24).

- B. Vapor-Barrier Mastic: Water based; suitable for indoor use on below-ambient services.
 - 1. Water-Vapor Permeance: ASTM E 96/E 96M, Procedure B, **0.013 perm (0.009 metric perm)** at **43-mil (1.09-mm)** dry film thickness.
 - 2. Service Temperature Range: **Minus 20 to plus 180 deg F (Minus 29 to plus 82 deg C)**.
 - 3. Solids Content: ASTM D 1644, 58 percent by volume and 70 percent by weight.
 - 4. Color: White.

- C. Breather Mastic: Water based; suitable for indoor and outdoor use on above-ambient services.
 - 1. Water-Vapor Permeance: ASTM F 1249, **1.8 perms (1.2 metric perms)** at **0.0625-inch (1.6-mm)** dry film thickness.
 - 2. Service Temperature Range: **Minus 20 to plus 180 deg F (Minus 29 to plus 82 deg C)**.
 - 3. Solids Content: 60 percent by volume and 66 percent by weight.
 - 4. Color: White.

2.05 SEALANTS

- A. Joint Sealants:

1. Materials shall be compatible with insulation materials, jackets, and substrates.
2. Permanently flexible, elastomeric sealant.
3. Service Temperature Range: Minus 100 to plus 300 deg F (Minus 73 to plus 149 deg C).
4. Color: White or gray.
5. For indoor applications, sealants shall have a VOC content of 420 g/L or less when calculated according to 40 CFR 59, Subpart D (EPA Method 24).
6. Sealants shall comply with the testing and product requirements of the California Department of Health Services' "Standard Practice for the Testing of Volatile Organic Emissions from Various Sources Using Small-Scale Environmental Chambers."

B. FSK and Metal Jacket Flashing Sealants:

1. Materials shall be compatible with insulation materials, jackets, and substrates.
2. Fire- and water-resistant, flexible, elastomeric sealant.
3. Service Temperature Range: Minus 40 to plus 250 deg F (Minus 40 to plus 121 deg C).
4. Color: Aluminum.
5. For indoor applications, sealants shall have a VOC content of 420 g/L or less when calculated according to 40 CFR 59, Subpart D (EPA Method 24).
6. Sealants shall comply with the testing and product requirements of the California Department of Health Services' "Standard Practice for the Testing of Volatile Organic Emissions from Various Sources Using Small-Scale Environmental Chambers."

C. ASJ Flashing Sealants, and Vinyl, PVDC, and PVC Jacket Flashing Sealants:

- a.
2. Materials shall be compatible with insulation materials, jackets, and substrates.
3. Fire- and water-resistant, flexible, elastomeric sealant.
4. Service Temperature Range: Minus 40 to plus 250 deg F (Minus 40 to plus 121 deg C).
5. Color: White.
6. For indoor applications, sealants shall have a VOC content of 420 g/L or less when calculated according to 40 CFR 59, Subpart D (EPA Method 24).
7. Sealants shall comply with the testing and product requirements of the California Department of Health Services' "Standard Practice for the Testing of Volatile Organic Emissions from Various Sources Using Small-Scale Environmental Chambers."

2.06 FACTORY-APPLIED JACKETS

A. Insulation system schedules indicate factory-applied jackets on various applications. When factory-applied jackets are indicated, comply with the following:

1. ASJ: White, kraft-paper, fiberglass-reinforced scrim with aluminum-foil backing; complying with ASTM C 1136, Type I.
2. FSK Jacket: Aluminum-foil, fiberglass-reinforced scrim with kraft-paper backing; complying with ASTM C 1136, Type II.

2.07 FIELD-APPLIED FABRIC-REINFORCING MESH

- A. Woven Polyester Fabric: Approximately **1 oz./sq. yd. (34 g/sq. m)** with a thread count of **10 strands by 10 strands/sq. in. (4 strands by 4 strands/sq. mm)**, in a Leno weave, for pipe.

2.08 FIELD-APPLIED JACKETS

- A. Field-applied jackets shall comply with ASTM C 921, Type I, unless otherwise indicated.
- B. PVC Jacket: High-impact-resistant, UV-resistant PVC complying with ASTM D 1784, Class 16354-C; thickness as scheduled; roll stock ready for shop or field cutting and forming. Thickness is indicated in field-applied jacket schedules.
 - 1. Adhesive: As recommended by jacket material manufacturer.
 - 2. Color: White.
 - 3. Factory-fabricated fitting covers to match jacket if available; otherwise, field fabricate.
 - a. Shapes: 45- and 90-degree, short- and long-radius elbows, tees, valves, flanges, unions, reducers, end caps, soil-pipe hubs, traps, mechanical joints, and P-trap and supply covers for lavatories.
- C. Underground Direct-Buried Jacket: **125-mil- (3.2-mm-)** thick vapor barrier and waterproofing membrane consisting of a rubberized bituminous resin reinforced with a woven-glass fiber or polyester scrim and laminated aluminum foil.

2.09 TAPES

- A. ASJ Tape: White vapor-retarder tape matching factory-applied jacket with acrylic adhesive, complying with ASTM C 1136.
 - 1. Width: **3 inches (75 mm)**.
 - 2. Thickness: **11.5 mils (0.29 mm)**.
 - 3. Adhesion: **90 ounces force/inch (1.0 N/mm)** in width.
 - 4. Elongation: 2 percent.
 - 5. Tensile Strength: **40 lbf/inch (7.2 N/mm)** in width.
 - 6. ASJ Tape Disks and Squares: Precut disks or squares of ASJ tape.
- B. PVC Tape: White vapor-retarder tape matching field-applied PVC jacket with acrylic adhesive; suitable for indoor and outdoor applications.
 - 1. Width: **2 inches (50 mm)**.
 - 2. Thickness: **6 mils (0.15 mm)**.
 - 3. Adhesion: **64 ounces force/inch (0.7 N/mm)** in width.
 - 4. Elongation: 500 percent.
 - 5. Tensile Strength: **18 lbf/inch (3.3 N/mm)** in width.

2.10 SECUREMENTS

- A. Aluminum Bands: **ASTM B 209 (ASTM B 209M)**, Alloy 3003, 3005, 3105, or 5005; Temper H-14, **0.020 inch (0.51 mm)** thick, **3/4 inch (19 mm)** wide with wing seal or closed seal.
- B. Staples: Outward-clinching insulation staples, nominal **3/4-inch- (19-mm-)** wide, stainless steel or Monel.
- C. Wire: **0.080-inch (2.0-mm)** nickel-copper alloy, **0.062-inch (1.6-mm)** soft-annealed, stainless steel or **0.062-inch (1.6-mm)** soft-annealed, galvanized steel.

2.11 PROTECTIVE SHIELDING GUARDS

- A. Protective Shielding Pipe Covers:
 - 1. Description: Manufactured plastic wraps for covering plumbing fixture hot- and cold-water supplies and trap and drain piping. Comply with Americans with Disabilities Act (ADA) requirements.
- B. Protective Shielding Piping Enclosures:
 - 1. Description: Manufactured plastic enclosure for covering plumbing fixture hot- and cold-water supplies and trap and drain piping. Comply with ADA requirements.

PART 3 - EXECUTION

3.01 PREPARATION

- A. Surface Preparation: Clean and dry surfaces to receive insulation. Remove materials that will adversely affect insulation application.
- B. Coordinate insulation installation with the trade installing heat tracing. Comply with requirements for heat tracing that apply to insulation.
- C. Mix insulating cements with clean potable water; if insulating cements are to be in contact with stainless-steel surfaces, use demineralized water.

3.02 GENERAL INSTALLATION REQUIREMENTS

- A. Install insulation materials, accessories, and finishes with smooth, straight, and even surfaces; free of voids throughout the length of piping including fittings, valves, and specialties.
- B. Install insulation materials, forms, vapor barriers or retarders, jackets, and thicknesses required for each item of pipe system as specified in insulation system schedules.

- C. Install accessories compatible with insulation materials and suitable for the service. Install accessories that do not corrode, soften, or otherwise attack insulation or jacket in either wet or dry state.
- D. Install insulation with longitudinal seams at top and bottom of horizontal runs.
- E. Install multiple layers of insulation with longitudinal and end seams staggered.
- F. Do not weld brackets, clips, or other attachment devices to piping, fittings, and specialties.
- G. Keep insulation materials dry during application and finishing.
- H. Install insulation with tight longitudinal seams and end joints. Bond seams and joints with adhesive recommended by insulation material manufacturer.
- I. Install insulation with least number of joints practical.
- J. Where vapor barrier is indicated, seal joints, seams, and penetrations in insulation at hangers, supports, anchors, and other projections with vapor-barrier mastic.
 - 1. Install insulation continuously through hangers and around anchor attachments.
 - 2. For insulation application where vapor barriers are indicated, extend insulation on anchor legs from point of attachment to supported item to point of attachment to structure. Taper and seal ends at attachment to structure with vapor-barrier mastic.
 - 3. Install insert materials and install insulation to tightly join the insert. Seal insulation to insulation inserts with adhesive or sealing compound recommended by insulation material manufacturer.
 - 4. Cover inserts with jacket material matching adjacent pipe insulation. Install shields over jacket, arranged to protect jacket from tear or puncture by hanger, support, and shield.
- K. Apply adhesives, mastics, and sealants at manufacturer's recommended coverage rate and wet and dry film thicknesses.
- L. Install insulation with factory-applied jackets as follows:
 - 1. Draw jacket tight and smooth.
 - 2. Cover circumferential joints with **3-inch- (75-mm-)** wide strips, of same material as insulation jacket. Secure strips with adhesive and outward clinching staples along both edges of strip, spaced **4 inches (100 mm)** o.c.
 - 3. Overlap jacket longitudinal seams at least **1-1/2 inches (38 mm)**. Install insulation with longitudinal seams at bottom of pipe. Clean and dry surface to receive self-sealing lap. Staple laps with outward clinching staples along edge at [**2 inches (50 mm)**] [**4 inches (100 mm)**] o.c.
 - a. For below-ambient services, apply vapor-barrier mastic over staples.
 - 4. Cover joints and seams with tape, according to insulation material manufacturer's written instructions, to maintain vapor seal.
 - 5. Where vapor barriers are indicated, apply vapor-barrier mastic on seams and joints and at ends adjacent to pipe flanges and fittings.

- M. Cut insulation in a manner to avoid compressing insulation more than 75 percent of its nominal thickness.
- N. Finish installation with systems at operating conditions. Repair joint separations and cracking due to thermal movement.
- O. Repair damaged insulation facings by applying same facing material over damaged areas. Extend patches at least **4 inches (100 mm)** beyond damaged areas. Adhere, staple, and seal patches similar to butt joints.
- P. For above-ambient services, do not install insulation to the following:
 - 1. Vibration-control devices.
 - 2. Testing agency labels and stamps.
 - 3. Nameplates and data plates.
 - 4. Cleanouts.

3.03 PENETRATIONS

- A. Insulation Installation at Roof Penetrations: Install insulation continuously through roof penetrations.
 - 1. Seal penetrations with flashing sealant.
 - 2. For applications requiring only indoor insulation, terminate insulation above roof surface and seal with joint sealant. For applications requiring indoor and outdoor insulation, install insulation for outdoor applications tightly joined to indoor insulation ends. Seal joint with joint sealant.
 - 3. Extend jacket of outdoor insulation outside roof flashing at least **2 inches (50 mm)** below top of roof flashing.
 - 4. Seal jacket to roof flashing with flashing sealant.
- B. Insulation Installation at Underground Exterior Wall Penetrations: Terminate insulation flush with sleeve seal. Seal terminations with flashing sealant.
- C. Insulation Installation at Aboveground Exterior Wall Penetrations: Install insulation continuously through wall penetrations.
 - 1. Seal penetrations with flashing sealant.
 - 2. For applications requiring only indoor insulation, terminate insulation inside wall surface and seal with joint sealant. For applications requiring indoor and outdoor insulation, install insulation for outdoor applications tightly joined to indoor insulation ends. Seal joint with joint sealant.
 - 3. Extend jacket of outdoor insulation outside wall flashing and overlap wall flashing at least **2 inches (50 mm)**.
 - 4. Seal jacket to wall flashing with flashing sealant.
- D. Insulation Installation at Interior Wall and Partition Penetrations (That Are Not Fire Rated): Install insulation continuously through walls and partitions.

- E. Insulation Installation at Fire-Rated Wall and Partition Penetrations: Install insulation continuously through penetrations of fire-rated walls and partitions.
 - 1. Comply with requirements in Section 07 84 13 "Penetration Firestopping" for firestopping and fire-resistive joint sealers.

- F. Insulation Installation at Floor Penetrations:
 - 1. Pipe: Install insulation continuously through floor penetrations.
 - 2. Seal penetrations through fire-rated assemblies. Comply with requirements in Section 07 84 13 "Penetration Firestopping."

3.04 GENERAL PIPE INSULATION INSTALLATION

- A. Requirements in this article generally apply to all insulation materials except where more specific requirements are specified in various pipe insulation material installation articles.

- B. Insulation Installation on Fittings, Valves, Strainers, Flanges, and Unions:
 - 1. Install insulation over fittings, valves, strainers, flanges, unions, and other specialties with continuous thermal and vapor-retarder integrity unless otherwise indicated.
 - 2. Insulate pipe elbows using preformed fitting insulation or mitered fittings made from same material and density as adjacent pipe insulation. Each piece shall be butted tightly against adjoining piece and bonded with adhesive. Fill joints, seams, voids, and irregular surfaces with insulating cement finished to a smooth, hard, and uniform contour that is uniform with adjoining pipe insulation.
 - 3. Insulate tee fittings with preformed fitting insulation or sectional pipe insulation of same material and thickness as used for adjacent pipe. Cut sectional pipe insulation to fit. Butt each section closely to the next and hold in place with tie wire. Bond pieces with adhesive.
 - 4. Insulate valves using preformed fitting insulation or sectional pipe insulation of same material, density, and thickness as used for adjacent pipe. Overlap adjoining pipe insulation by not less than two times the thickness of pipe insulation, or one pipe diameter, whichever is thicker. For valves, insulate up to and including the bonnets, valve stuffing-box studs, bolts, and nuts. Fill joints, seams, and irregular surfaces with insulating cement.
 - 5. Insulate strainers using preformed fitting insulation or sectional pipe insulation of same material, density, and thickness as used for adjacent pipe. Overlap adjoining pipe insulation by not less than two times the thickness of pipe insulation, or one pipe diameter, whichever is thicker. Fill joints, seams, and irregular surfaces with insulating cement. Insulate strainers so strainer basket flange or plug can be easily removed and replaced without damaging the insulation and jacket. Provide a removable reusable insulation cover. For below-ambient services, provide a design that maintains vapor barrier.
 - 6. Insulate flanges and unions using a section of oversized preformed pipe insulation. Overlap adjoining pipe insulation by not less than two times the thickness of pipe insulation, or one pipe diameter, whichever is thicker.
 - 7. Cover segmented insulated surfaces with a layer of finishing cement and coat with a mastic. Install vapor-barrier mastic for below-ambient services and a

- breather mastic for above-ambient services. Reinforce the mastic with fabric-reinforcing mesh. Trowel the mastic to a smooth and well-shaped contour.
8. For services not specified to receive a field-applied jacket except for flexible elastomeric and polyolefin, install fitted PVC cover over elbows, tees, strainers, valves, flanges, and unions. Terminate ends with PVC end caps. Tape PVC covers to adjoining insulation facing using PVC tape.
 9. Stencil or label the outside insulation jacket of each union with the word "union." Match size and color of pipe labels.
- C. Insulate instrument connections for thermometers, pressure gages, pressure temperature taps, test connections, flow meters, sensors, switches, and transmitters on insulated pipes. Shape insulation at these connections by tapering it to and around the connection with insulating cement and finish with finishing cement, mastic, and flashing sealant.
- D. Install removable insulation covers at locations indicated. Installation shall conform to the following:
1. Make removable flange and union insulation from sectional pipe insulation of same thickness as that on adjoining pipe. Install same insulation jacket as adjoining pipe insulation.
 2. When flange and union covers are made from sectional pipe insulation, extend insulation from flanges or union long at least two times the insulation thickness over adjacent pipe insulation on each side of flange or union. Secure flange cover in place with stainless-steel or aluminum bands. Select band material compatible with insulation and jacket.
 3. Construct removable valve insulation covers in same manner as for flanges, except divide the two-part section on the vertical center line of valve body.
 4. When covers are made from block insulation, make two halves, each consisting of mitered blocks wired to stainless-steel fabric. Secure this wire frame, with its attached insulation, to flanges with tie wire. Extend insulation at least **2 inches (50 mm)** over adjacent pipe insulation on each side of valve. Fill space between flange or union cover and pipe insulation with insulating cement. Finish cover assembly with insulating cement applied in two coats. After first coat is dry, apply and trowel second coat to a smooth finish.
 5. Unless a PVC jacket is indicated in field-applied jacket schedules, finish exposed surfaces with a metal jacket.

3.05 INSTALLATION OF CELLULAR-GLASS INSULATION

- A. Insulation Installation on Straight Pipes and Tubes:
1. Secure each layer of insulation to pipe with wire or bands and tighten bands without deforming insulation materials.
 2. Where vapor barriers are indicated, seal longitudinal seams, end joints, and protrusions with vapor-barrier mastic and joint sealant.
 3. For insulation with factory-applied jackets on above-ambient services, secure laps with outward clinched staples at **6 inches (150 mm)** o.c.
 4. For insulation with factory-applied jackets on below-ambient services, do not staple longitudinal tabs. Instead, secure tabs with additional adhesive as

recommended by insulation material manufacturer and seal with vapor-barrier mastic and flashing sealant.

B. Insulation Installation on Pipe Flanges:

1. Install preformed pipe insulation to outer diameter of pipe flange.
2. Make width of insulation section same as overall width of flange and bolts, plus twice the thickness of pipe insulation.
3. Fill voids between inner circumference of flange insulation and outer circumference of adjacent straight pipe segments with cut sections of cellular-glass block insulation of same thickness as pipe insulation.
4. Install jacket material with manufacturer's recommended adhesive, overlap seams at least **1 inch (25 mm)**, and seal joints with flashing sealant.

C. Insulation Installation on Pipe Fittings and Elbows:

1. Install preformed sections of same material as straight segments of pipe insulation when available. Secure according to manufacturer's written instructions.
2. When preformed sections of insulation are not available, install mitered sections of cellular-glass insulation. Secure insulation materials with wire or bands.

D. Insulation Installation on Valves and Pipe Specialties:

1. Install preformed sections of cellular-glass insulation to valve body.
2. Arrange insulation to permit access to packing and to allow valve operation without disturbing insulation.
3. Install insulation to flanges as specified for flange insulation application.

3.06 INSTALLATION OF FLEXIBLE ELASTOMERIC INSULATION

A. Seal longitudinal seams and end joints with manufacturer's recommended adhesive to eliminate openings in insulation that allow passage of air to surface being insulated.

B. Insulation Installation on Pipe Flanges:

1. Install pipe insulation to outer diameter of pipe flange.
2. Make width of insulation section same as overall width of flange and bolts, plus twice the thickness of pipe insulation.
3. Fill voids between inner circumference of flange insulation and outer circumference of adjacent straight pipe segments with cut sections of sheet insulation of same thickness as pipe insulation.
4. Secure insulation to flanges and seal seams with manufacturer's recommended adhesive to eliminate openings in insulation that allow passage of air to surface being insulated.

C. Insulation Installation on Pipe Fittings and Elbows:

1. Install mitered sections of pipe insulation.

2. Secure insulation materials and seal seams with manufacturer's recommended adhesive to eliminate openings in insulation that allow passage of air to surface being insulated.

D. Insulation Installation on Valves and Pipe Specialties:

1. Install preformed valve covers manufactured of same material as pipe insulation when available.
2. When preformed valve covers are not available, install cut sections of pipe and sheet insulation to valve body. Arrange insulation to permit access to packing and to allow valve operation without disturbing insulation.
3. Install insulation to flanges as specified for flange insulation application.
4. Secure insulation to valves and specialties and seal seams with manufacturer's recommended adhesive to eliminate openings in insulation that allow passage of air to surface being insulated.

3.07 INSTALLATION OF MINERAL-FIBER PREFORMED PIPE INSULATION

A. Insulation Installation on Straight Pipes and Tubes:

1. Secure each layer of preformed pipe insulation to pipe with wire or bands and tighten bands without deforming insulation materials.
2. Where vapor barriers are indicated, seal longitudinal seams, end joints, and protrusions with vapor-barrier mastic and joint sealant.
3. For insulation with factory-applied jackets on above-ambient surfaces, secure laps with outward clinched staples at **6 inches (150 mm)** o.c.
4. For insulation with factory-applied jackets on below-ambient surfaces, do not staple longitudinal tabs. Instead, secure tabs with additional adhesive as recommended by insulation material manufacturer and seal with vapor-barrier mastic and flashing sealant.

B. Insulation Installation on Pipe Flanges:

1. Install preformed pipe insulation to outer diameter of pipe flange.
2. Make width of insulation section same as overall width of flange and bolts, plus twice the thickness of pipe insulation.
3. Fill voids between inner circumference of flange insulation and outer circumference of adjacent straight pipe segments with mineral-fiber blanket insulation.
4. Install jacket material with manufacturer's recommended adhesive, overlap seams at least **1 inch (25 mm)**, and seal joints with flashing sealant.

C. Insulation Installation on Pipe Fittings and Elbows:

1. Install preformed sections of same material as straight segments of pipe insulation when available.
2. When preformed insulation elbows and fittings are not available, install mitered sections of pipe insulation, to a thickness equal to adjoining pipe insulation. Secure insulation materials with wire or bands.

- D. Insulation Installation on Valves and Pipe Specialties:
1. Install preformed sections of same material as straight segments of pipe insulation when available.
 2. When preformed sections are not available, install mitered sections of pipe insulation to valve body.
 3. Arrange insulation to permit access to packing and to allow valve operation without disturbing insulation.
 4. Install insulation to flanges as specified for flange insulation application.

3.08 FIELD-APPLIED JACKET INSTALLATION

- A. Where PVC jackets are indicated, install with **1-inch (25-mm)** overlap at longitudinal seams and end joints. Seal with manufacturer's recommended adhesive.
1. Apply two continuous beads of adhesive to seams and joints, one bead under lap and the finish bead along seam and joint edge.

3.09 FINISHES

- A. Insulation with ASJ, Glass-Cloth, or Other Paintable Jacket Material: Paint jacket with paint system identified below and as specified in Section 09 91 13 "Exterior Painting" and Section 09 91 23 "Interior Painting."
1. Flat Acrylic Finish: Two finish coats over a primer that is compatible with jacket material and finish coat paint. Add fungicidal agent to render fabric mildew proof.
 - a. Finish Coat Material: Interior, flat, latex-emulsion size.
- B. Flexible Elastomeric Thermal Insulation: After adhesive has fully cured, apply two coats of insulation manufacturer's recommended protective coating.
- C. Color: Final color as selected by Architect. Vary first and second coats to allow visual inspection of the completed Work.
- D. Do not field paint aluminum or stainless-steel jackets.

3.10 FIELD QUALITY CONTROL

- A. Perform tests and inspections.
- B. Tests and Inspections:
1. Inspect pipe, fittings, strainers, and valves, randomly selected by Architect, by removing field-applied jacket and insulation in layers in reverse order of their installation. Extent of inspection shall be limited to 3 locations of straight pipe, 3 locations of threaded fittings, 3 locations of welded fittings, 2 locations of threaded strainers, 2 locations of welded strainers, 3 locations of threaded valves, and 3 locations of flanged valves for each pipe service defined in the "Piping Insulation Schedule, General" Article.

- C. All insulation applications will be considered defective Work if sample inspection reveals noncompliance with requirements.

3.11 PIPING INSULATION SCHEDULE, GENERAL

- A. Acceptable preformed pipe and tubular insulation materials and thicknesses are identified for each piping system and pipe size range. If more than one material is listed for a piping system, selection from materials listed is Contractor's option.
- B. Items Not Insulated: Unless otherwise indicated, do not install insulation on the following:
 - 1. Drainage piping located in crawl spaces.
 - 2. Underground piping.
 - 3. Chrome-plated pipes and fittings unless there is a potential for personnel injury.

3.12 INDOOR PIPING INSULATION SCHEDULE

- A. Domestic Hot and Recirculated Hot Water: Insulation shall be one of the following:
 - 1. Flexible Elastomeric: 1 inch (25 mm) thick.
 - 2. Mineral-Fiber, Preformed Pipe Insulation, Type I: 1 inch (25 mm) thick.
- B. Stormwater and Overflow: Insulation shall be one of the following:
 - 1. Flexible Elastomeric: 1 inch (25 mm) thick.
 - 2. Mineral-Fiber, Preformed Pipe Insulation, Type I: 1 inch (25 mm) thick.
- C. Roof Drain and Overflow Drain Bodies: Insulation shall be one of the following:
 - 1. Flexible Elastomeric: 1 inch (25 mm) thick.
 - 2. Mineral-Fiber, Preformed Pipe Insulation, Type I: 1 inch (25 mm) thick.
- D. Exposed Sanitary Drains, Domestic Water, Domestic Hot Water, and Stops for Plumbing Fixtures for People with Disabilities: Insulation shall be one of the following:
 - 1. Flexible Elastomeric: 3/4 inch (19 mm) thick.
 - 2. Mineral-Fiber, Preformed Pipe Insulation, Type I: 1 inch (25 mm) thick.

3.13 INDOOR, FIELD-APPLIED JACKET SCHEDULE

- A. Install jacket over insulation material. For insulation with factory-applied jacket, install the field-applied jacket over the factory-applied jacket.
- B. If more than one material is listed, selection from materials listed is Contractor's option.
- C. Domestic Water Piping, Exposed in Wash Bay and Wash equipment room:
 - 1. PVC: 20 mils (0.5 mm) thick.

3.14 UNDERGROUND, FIELD-INSTALLED INSULATION JACKET

- A. For underground direct-buried piping applications, install underground direct-buried jacket over insulation material.

END OF SECTION 22 07 19

SECTION 22 11 16
DOMESTIC WATER PIPING

PART 1 - GENERAL

1.01 SUMMARY

- A. Section includes under-building-slab and aboveground domestic water pipes, tubes, and fittings inside buildings.

1.02 SUBMITTALS

- A. Product Data: For transition fittings and dielectric fittings.
- B. System purging and disinfecting activities report.
- C. Field quality-control reports.

PART 2 - PRODUCTS

2.01 PIPING MATERIALS

- A. Comply with requirements in "Piping Schedule" Article for applications of pipe, tube, fitting materials, and joining methods for specific services, service locations, and pipe sizes.
- B. Potable-water piping and components shall comply with NSF 14 and NSF 61. Plastic piping components shall be marked with "NSF-pw."

2.02 COPPER TUBE AND FITTINGS

- A. Hard Copper Tube: **ASTM B 88, Type L** or **ASTM B 88, Type M** water tube, drawn temper.
- B. Soft Copper Tube: **ASTM B 88, Type K** and **ASTM B 88, Type L** water tube, annealed temper.
- C. Cast-Copper, Solder-Joint Fittings: ASME B16.18, pressure fittings.
- D. Wrought-Copper, Solder-Joint Fittings: ASME B16.22, wrought-copper pressure fittings.
- E. Bronze Flanges: ASME B16.24, Class 150, with solder-joint ends.

F. Copper Unions:

1. MSS SP-123.
2. Cast-copper-alloy, hexagonal-stock body.
3. Ball-and-socket, metal-to-metal seating surfaces.
4. Solder-joint or threaded ends.

G. Copper Pressure-Seal-Joint Fittings:

1. Fittings for **NPS 2** and Smaller: Wrought-copper fitting with EPDM-rubber, O-ring seal in each end.
2. Fittings for **NPS 2-1/2 to NPS 4**: Cast-bronze or wrought-copper fitting with EPDM-rubber, O-ring seal in each end.

H. Copper Push-on-Joint Fittings:

1. Cast-copper fitting complying with ASME B16.18 or wrought-copper fitting complying with ASME B 16.22.
2. Stainless-steel teeth and EPDM-rubber, O-ring seal in each end instead of solder-joint ends.

2.03 DUCTILE-IRON PIPE AND FITTINGS

A. Mechanical-Joint, Ductile-Iron Pipe:

1. AWWA C151/A21.51, with mechanical-joint bell and plain spigot end unless grooved or flanged ends are indicated.
2. Glands, Gaskets, and Bolts: AWWA C111/A21.11, ductile- or gray-iron glands, rubber gaskets, and steel bolts.

B. Standard-Pattern, Mechanical-Joint Fittings:

1. AWWA C110/A21.10, ductile or gray iron.
2. Glands, Gaskets, and Bolts: AWWA C111/A21.11, ductile- or gray-iron glands, rubber gaskets, and steel bolts.

C. Compact-Pattern, Mechanical-Joint Fittings:

1. AWWA C153/A21.53, ductile iron.
2. Glands, Gaskets, and Bolts: AWWA C111/A21.11, ductile- or gray-iron glands, rubber gaskets, and steel bolts.

2.04 GALVANIZED-STEEL PIPE AND FITTINGS

A. Galvanized-Steel Pipe:

1. ASTM A 53/A 53M, Type E, Grade B Standard Weight.
2. Include ends matching joining method.

- B. Galvanized-Steel Pipe Nipples: ASTM A 733, made of ASTM A 53/A 53M or ASTM A 106/A 106M, Standard Weight, seamless steel pipe with threaded ends.
- C. Galvanized, Gray-Iron Threaded Fittings: ASME B16.4, Class 125, standard pattern.
- D. Malleable-Iron Unions:
 - 1. ASME B16.39, Class 150.
 - 2. Hexagonal-stock body.
 - 3. Ball-and-socket, metal-to-metal, bronze seating surface.
 - 4. Threaded ends.
- E. Flanges: ASME B16.1, Class 125, cast iron.

2.05 CPVC PIPING

- A. CPVC Pipe: ASTM F 441/F 441M, Schedule 40 and Schedule 80.
 - 1. CPVC Socket Fittings: ASTM F 438 for Schedule 40 and ASTM F 439 for Schedule 80.
 - 2. CPVC Threaded Fittings: ASTM F 437, Schedule 80.
- B. CPVC Piping System: ASTM D 2846/D 2846M, SDR 11, pipe and socket fittings.

2.06 PVC PIPE AND FITTINGS

- A. PVC Pipe: ASTM D 1785, Schedule 40 and Schedule 80.
- B. PVC Socket Fittings: ASTM D 2466 for Schedule 40 and ASTM D 2467 for Schedule 80.
- C. PVC Schedule 80 Threaded Fittings: ASTM D 2464.

2.07 PIPING JOINING MATERIALS

- A. Pipe-Flange Gasket Materials:
 - 1. AWWA C110/A21.10, rubber, flat face, 1/8 inch thick or ASME B16.21, nonmetallic and asbestos free unless otherwise indicated.
 - 2. Full-face or ring type unless otherwise indicated.
- B. Metal, Pipe-Flange Bolts and Nuts: ASME B18.2.1, carbon steel unless otherwise indicated.
- C. Solder Filler Metals: ASTM B 32, lead-free alloys.
- D. Flux: ASTM B 813, water flushable.

- E. Brazing Filler Metals: AWS A5.8/A5.8M, BCuP Series, copper-phosphorus alloys for general-duty brazing unless otherwise indicated.
- F. Solvent Cements for Joining CPVC Piping and Tubing: ASTM F 493.
 - 1. CPVC solvent cement shall have a VOC content of 490 g/L or less when calculated according to 40 CFR 59, Subpart D (EPA Method 24).
 - 2. Adhesive primer shall have a VOC content of 550 g/L or less when calculated according to 40 CFR 59, Subpart D (EPA Method 24).
 - 3. Solvent cement and adhesive primer shall comply with the testing and product requirements of the California Department of Health Services' "Standard Practice for the Testing of Volatile Organic Emissions from Various Sources Using Small-Scale Environmental Chambers."
- G. Solvent Cements for Joining PVC Piping: ASTM D 2564. Include primer according to ASTM F 656.
 - 1. PVC solvent cement shall have a VOC content of 510 g/L or less when calculated according to 40 CFR 59, Subpart D (EPA Method 24).
 - 2. Adhesive primer shall have a VOC content of 550 g/L or less when calculated according to 40 CFR 59, Subpart D (EPA Method 24).
 - 3. Solvent cement and adhesive primer shall comply with the testing and product requirements of the California Department of Health Services' "Standard Practice for the Testing of Volatile Organic Emissions from Various Sources Using Small-Scale Environmental Chambers."
- H. Plastic, Pipe-Flange Gaskets, Bolts, and Nuts: Type and material recommended by piping system manufacturer unless otherwise indicated.

2.08 TRANSITION FITTINGS

- A. General Requirements:
 - 1. Same size as pipes to be joined.
 - 2. Pressure rating at least equal to pipes to be joined.
 - 3. End connections compatible with pipes to be joined.
- B. Fitting-Type Transition Couplings: Manufactured piping coupling or specified piping system fitting.
- C. Plastic-to-Metal Transition Fittings:
 - 1. Description:
 - a. CPVC or PVC one-piece fitting with manufacturer's Schedule 80 equivalent dimensions.
 - b. One end with threaded brass insert and one solvent-cement-socket or threaded end.
- D. Plastic-to-Metal Transition Unions:
 - 1. Description:

- a. CPVC or PVC four-part union.
- b. Brass or stainless-steel threaded end.
- c. Solvent-cement-joint or threaded plastic end.
- d. Rubber O-ring.
- e. Union nut.

2.09 DIELECTRIC FITTINGS

- A. General Requirements: Assembly of copper alloy and ferrous materials with separating nonconductive insulating material. Include end connections compatible with pipes to be joined.
- B. Dielectric Unions:
 1. Standard: ASSE 1079.
 2. Pressure Rating: 125 psig minimum at 180 deg F.
 3. End Connections: Solder-joint copper alloy and threaded ferrous.
- C. Dielectric Flanges:
 1. Standard: ASSE 1079.
 2. Factory-fabricated, bolted, companion-flange assembly.
 3. Pressure Rating: 125 psig minimum at 180 deg F.
 4. End Connections: Solder-joint copper alloy and threaded ferrous; threaded solder-joint copper alloy and threaded ferrous.
- D. Dielectric-Flange Insulating Kits:
 1. Nonconducting materials for field assembly of companion flanges.
 2. Pressure Rating: 150 psig.
 3. Gasket: Neoprene or phenolic.
 4. Bolt Sleeves: Phenolic or polyethylene.
 5. Washers: Phenolic with steel backing washers.
- E. Dielectric Nipples:
 1. Standard: IAPMO PS 66.
 2. Electroplated steel nipple complying with ASTM F 1545.
 3. Pressure Rating and Temperature: 300 psig at 225 deg F.
 4. End Connections: Male threaded or grooved.
 5. Lining: Inert and noncorrosive, propylene.

PART 3 - EXECUTION

3.01 EARTHWORK

- A. Comply with requirements in Section 31 20 00 "Earth Moving" for excavating, trenching, and backfilling.

3.02 PIPING INSTALLATION

- A. Drawing plans, schematics, and diagrams indicate general location and arrangement of domestic water piping. Indicated locations and arrangements are used to size pipe and calculate friction loss, expansion, and other design considerations. Install piping as indicated unless deviations to layout are approved on coordination drawings.
- B. Install copper tubing under building slab according to CDA's "Copper Tube Handbook."
- C. Install ductile-iron piping under building slab with restrained joints according to AWWA C600 and AWWA M41.
- D. Install shutoff valve, hose-end drain valve, strainer, pressure gage, and test tee with valve inside the building at each domestic water-service entrance. Comply with requirements for pressure gages in Section 22 05 19 "Meters and Gages for Plumbing Piping" and with requirements for drain valves and strainers in Section 22 11 19 "Domestic Water Piping Specialties."
- E. Install shutoff valve immediately upstream of each dielectric fitting.
- F. Install water-pressure-reducing valves downstream from shutoff valves. Comply with requirements for pressure-reducing valves in Section 22 11 19 "Domestic Water Piping Specialties."
- G. Install domestic water piping level without pitch and plumb.
- H. Rough-in domestic water piping for water-meter installation according to utility company's requirements.
- I. Install piping concealed from view and protected from physical contact by building occupants unless otherwise indicated and except in equipment rooms and service areas.
- J. Install piping indicated to be exposed and piping in equipment rooms and service areas at right angles or parallel to building walls. Diagonal runs are prohibited unless specifically indicated otherwise.
- K. Install piping above accessible ceilings to allow sufficient space for ceiling panel removal, and coordinate with other services occupying that space.
- L. Install piping to permit valve servicing.
- M. Install nipples, unions, special fittings, and valves with pressure ratings the same as or higher than the system pressure rating used in applications below unless otherwise indicated.
- N. Install piping free of sags and bends.
- O. Install fittings for changes in direction and branch connections.
- P. Install unions in copper tubing at final connection to each piece of equipment, machine, and specialty.

- Q. Install pressure gages per requirements for pressure gages in Section 22 05 19 "Meters and Gages for Plumbing Piping."
- R. Install sleeves for piping penetrations of walls, ceilings, and floor per requirements for sleeves specified in Section 22 05 17 "Sleeves and Sleeve Seals for Plumbing Piping."
- S. Install sleeve seals for piping penetrations of concrete walls and slabs per requirements for sleeve seals specified in Section 22 05 17 "Sleeves and Sleeve Seals for Plumbing Piping."
- T. Install escutcheons for piping penetrations of walls, ceilings, and floors per requirements for escutcheons specified in Section 22 05 18 "Escutcheons for Plumbing Piping."

3.03 JOINT CONSTRUCTION

- A. Ream ends of pipes and tubes and remove burrs. Bevel plain ends of steel pipe.
- B. Remove scale, slag, dirt, and debris from inside and outside of pipes, tubes, and fittings before assembly.
- C. Threaded Joints: Thread pipe with tapered pipe threads according to ASME B1.20.1. Cut threads full and clean using sharp dies. Ream threaded pipe ends to remove burrs and restore full ID. Join pipe fittings and valves as follows:
 - 1. Apply appropriate tape or thread compound to external pipe threads.
 - 2. Damaged Threads: Do not use pipe or pipe fittings with threads that are corroded or damaged.
- D. Brazed Joints for Copper Tubing: Comply with CDA's "Copper Tube Handbook," "Braze Joints" chapter.
- E. Soldered Joints for Copper Tubing: Apply ASTM B 813, water-flushable flux to end of tube. Join copper tube and fittings according to ASTM B 828 or CDA's "Copper Tube Handbook."
- F. Pressure-Sealed Joints for Copper Tubing: Join copper tube and pressure-seal fittings with tools recommended by fitting manufacturer.
- G. Flanged Joints: Select appropriate asbestos-free, nonmetallic gasket material in size, type, and thickness suitable for domestic water service. Join flanges with gasket and bolts according to ASME B31.9.
- H. Joint Construction for Solvent-Cemented Plastic Piping: Clean and dry joining surfaces. Join pipe and fittings according to the following:
 - 1. Comply with ASTM F 402 for safe-handling practice of cleaners, primers, and solvent cements. Apply primer.
 - 2. CPVC Piping: Join according to ASTM D 2846/D 2846M Appendix.
 - 3. PVC Piping: Join according to ASTM D 2855.

- I. Joints for Dissimilar-Material Piping: Make joints using adapters compatible with materials of both piping systems.

3.04 TRANSITION FITTING INSTALLATION

- A. Install transition couplings at joints of dissimilar piping.
- B. Transition Fittings in Underground Domestic Water Piping:
 1. Fittings for **NPS 1-1/2** and Smaller: Fitting-type coupling.
 2. Fittings for **NPS 2** and Larger: Sleeve-type coupling.
- C. Transition Fittings in Aboveground Domestic Water Piping **NPS 2** and Smaller: Plastic-to-metal transition fittings or unions.

3.05 DIELECTRIC FITTING INSTALLATION

- A. Install dielectric fittings in piping at connections of dissimilar metal piping and tubing.
- B. Dielectric Fittings for **NPS 2** and Smaller: Use dielectric couplings, nipples or unions.
- C. Dielectric Fittings for **NPS 2-1/2 and larger**: Use dielectric flange or flange kits.

3.06 HANGER AND SUPPORT INSTALLATION

- A. Comply with requirements for seismic-restraint devices in Section 22 05 48 "Vibration and Seismic Controls for Plumbing Piping and Equipment."
- B. Comply with requirements for pipe hanger, support products, and installation in Section 22 05 29 "Hangers and Supports for Plumbing Piping and Equipment."
 1. Vertical Piping: MSS Type 8 or 42, clamps.
 2. Individual, Straight, Horizontal Piping Runs:
 - a. **100 Feet** and Less: MSS Type 1, adjustable, steel clevis hangers.
 - b. Longer Than **100 Feet** MSS Type 43, adjustable roller hangers.
 - c. Longer Than **100 Feet**) if Indicated: MSS Type 49, spring cushion rolls.
 3. Multiple, Straight, Horizontal Piping Runs **100 Feet** or Longer: MSS Type 44, pipe rolls. Support pipe rolls on trapeze.
 4. Base of Vertical Piping: MSS Type 52, spring hangers.
- C. Support vertical piping and tubing at base and at each floor.
- D. Rod diameter may be reduced one size for double-rod hangers, to a minimum of **3/8 inch**.
- E. Install hangers for copper tubing with the following maximum horizontal spacing and minimum rod diameters:

1. NPS 3/4 and Smaller: 60 inches with 3/8-inch rod.
 2. NPS 1 and NPS 1-1/4: 72 inches with 3/8-inch rod.
 3. NPS 1-1/2 and NPS 2: 96 inches with 3/8-inch rod.
- F. Install supports for vertical copper tubing every 10 feet.
- G. Install hangers for steel piping with the following maximum horizontal spacing and minimum rod diameters:
1. NPS 2-1/2: 11 feet with 1/2-inch rod.
 2. NPS 3 and NPS 3-1/2: 2 feet with 1/2-inch rod.
 3. NPS 4 and NPS 5: 12 feet with 5/8-inch rod.
 4. NPS 6: 12 feet with 3/4-inch rod.
 5. NPS 8 to NPS 12: 12 feet with 7/8-inch rod.
- H. Install supports for vertical steel piping every 15 feet.
- I. Install vinyl-coated hangers for CPVC piping with the following maximum horizontal spacing and minimum rod diameters:
1. NPS 1 and Smaller: 36 inches with 3/8-inch rod.
 2. NPS 1-1/4 to NPS 2: 48 inches with 3/8-inch rod.
 3. NPS 2-1/2 to NPS 3-1/2: 48 inches with 1/2-inch rod.
 4. NPS 4 and NPS 5: 48 inches with 5/8-inch rod.
 5. NPS 6: 48 inches with 3/4-inch rod.
 6. NPS 8: 48 inches with 7/8-inch rod.
- J. Install supports for vertical CPVC piping every 60 inches for NPS 1) and smaller, and every 72 inches for NPS 1-1/4 and larger.
- K. Install vinyl-coated hangers for PVC piping with the following maximum horizontal spacing and minimum rod diameters:
1. NPS 2 and Smaller: 48 inches with 3/8-inch rod.
 2. NPS 2-1/2 to NPS 3-1/2: 48 inches with 1/2-inch rod.
 3. NPS 4 and NPS 5: 48 inches with 5/8-inch rod.
 4. NPS 6: 48 inches with 3/4-inch rod.
 5. NPS 8: 48 inches with 7/8-inch rod.
- L. Install supports for vertical PVC piping every 48 inches.
- M. Support piping and tubing not listed in this article according to MSS SP-69 and manufacturer's written instructions.
- 3.07 CONNECTIONS
- A. Drawings indicate general arrangement of piping, fittings, and specialties.

- B. When installing piping adjacent to equipment and machines, allow space for service and maintenance.
- C. Connect domestic water piping to exterior water-service piping. Use transition fitting to join dissimilar piping materials.
- D. Connect domestic water piping to water-service piping with shutoff valve; extend and connect to the following:
 - 1. Water Heaters: Cold-water inlet and hot-water outlet piping in sizes indicated, but not smaller than sizes of water heater connections.
 - 2. Plumbing Fixtures: Cold- and hot-water-supply piping in sizes indicated, but not smaller than that required by plumbing code.
 - 3. Equipment: Cold- and hot-water-supply piping as indicated, but not smaller than equipment connections. Provide shutoff valve and union for each connection. Use flanges instead of unions for **NPS 2-1/2** and larger.

3.08 FIELD QUALITY CONTROL

- A. Perform the following tests and inspections:
 - 1. Piping Inspections:
 - a. Do not enclose, cover, or put piping into operation until it has been inspected and approved by authorities having jurisdiction.
 - b. During installation, notify authorities having jurisdiction at least one day before inspection must be made. Perform tests specified below in presence of authorities having jurisdiction:
 - 1) Roughing-in Inspection: Arrange for inspection of piping before concealing or closing in after roughing in and before setting fixtures.
 - 2) Final Inspection: Arrange for authorities having jurisdiction to observe tests specified in "Piping Tests" Subparagraph below and to ensure compliance with requirements.
 - c. Reinspection: If authorities having jurisdiction find that piping will not pass tests or inspections, make required corrections and arrange for reinspection.
 - d. Reports: Prepare inspection reports and have them signed by authorities having jurisdiction.
 - 2. Piping Tests:
 - a. Fill domestic water piping. Check components to determine that they are not air bound and that piping is full of water.
 - b. Test for leaks and defects in new piping and parts of existing piping that have been altered, extended, or repaired. If testing is performed in segments, submit a separate report for each test, complete with diagram of portion of piping tested.
 - c. Leave new, altered, extended, or replaced domestic water piping uncovered and unconcealed until it has been tested and approved. Expose work that was covered or concealed before it was tested.

- d. Cap and subject piping to static water pressure of 50 psig) above operating pressure, without exceeding pressure rating of piping system materials. Isolate test source and allow it to stand for four hours. Leaks and loss in test pressure constitute defects that must be repaired.
 - e. Repair leaks and defects with new materials, and retest piping or portion thereof until satisfactory results are obtained.
 - f. Prepare reports for tests and for corrective action required.
- B. Domestic water piping will be considered defective if it does not pass tests and inspections.
- C. Prepare test and inspection reports.

3.09 ADJUSTING

- A. Perform the following adjustments before operation:
1. Close drain valves, hydrants, and hose bibbs.
 2. Open shutoff valves to fully open position.
 3. Open throttling valves to proper setting.
 4. Adjust balancing valves in hot-water-circulation return piping to provide adequate flow.
 - a. Manually adjust ball-type balancing valves in hot-water-circulation return piping to provide hot-water flow in each branch.
 - b. Adjust calibrated balancing valves to flows indicated.
 5. Remove plugs used during testing of piping and for temporary sealing of piping during installation.
 6. Remove and clean strainer screens. Close drain valves and replace drain plugs.
 7. Remove filter cartridges from housings and verify that cartridges are as specified for application where used and are clean and ready for use.
 8. Check plumbing specialties and verify proper settings, adjustments, and operation.

3.10 CLEANING

- A. Clean and disinfect potable domestic water piping as follows:
1. Purge new piping and parts of existing piping that have been altered, extended, or repaired before using.
 2. Use purging and disinfecting procedures prescribed by authorities having jurisdiction; if methods are not prescribed, use procedures described in either AWWA C651 or AWWA C652 or follow procedures described below:
 - a. Flush piping system with clean, potable water until dirty water does not appear at outlets.
 - b. Fill and isolate system according to either of the following:
 - 1) Fill system or part thereof with water/chlorine solution with at least 50 ppm (50 mg/L) of chlorine. Isolate with valves and allow to stand for 24 hours.

- 2) Fill system or part thereof with water/chlorine solution with at least 200 ppm (200 mg/L) of chlorine. Isolate and allow to stand for three hours.
 - c. Flush system with clean, potable water until no chlorine is in water coming from system after the standing time.
 - d. Repeat procedures if biological examination shows contamination.
 - e. Submit water samples in sterile bottles to authorities having jurisdiction.
- B. Prepare and submit reports of purging and disinfecting activities. Include copies of water-sample approvals from authorities having jurisdiction.
- C. Clean interior of domestic water piping system. Remove dirt and debris as work progresses.

3.11 PIPING SCHEDULE

- A. Transition and special fittings with pressure ratings at least equal to piping rating may be used in applications below unless otherwise indicated.
- B. Flanges and unions may be used for aboveground piping joints unless otherwise indicated.
- C. Fitting Option: Extruded-tee connections and brazed joints may be used on aboveground copper tubing.
- D. Under-building-slab, domestic water or building-service piping, NPS 3 and smaller, shall be one of the following:
1. Soft copper tube, ASTM B 88, Type K; wrought-copper, solder-joint fittings; and brazed or copper pressure-seal fittings; and pressure-sealed joints.
 2. PVC, Schedule 80; socket fittings; and solvent-cemented joints.
- E. Under-building-slab, domestic water or building-service piping, NPS 4 and larger, shall be one of the following:
1. Soft copper tube, ASTM B 88, Type K; wrought-copper, solder-joint fittings; and brazed joints.
 2. Plain-end, ductile-iron pipe; grooved-joint, ductile-iron-pipe appurtenances; and grooved joints.
 3. PVC, Schedule 40; socket fittings; and solvent-cemented joints.
- F. Aboveground domestic water piping, NPS 2 and smaller, shall be one of the following:
1. Hard copper tube, ASTM B 88, Type L; cast or wrought-copper, solder-joint fittings; and brazed or soldered joints.
 2. Hard copper tube, ASTM B 88, Type L or ASTM B 88, Type M; copper pressure-seal-joint fittings; and pressure-sealed joints.
 3. Hard copper tube, ASTM B 88, Type L or ASTM B 88, Type M; copper push-on-joint fittings; and push-on joints.

4. CPVC, Schedule 40; socket fittings; and solvent-cemented joints.
 5. PVC, Schedule 40; socket fittings; and solvent-cemented joints.
- G. Aboveground domestic water piping, **NPS 2-1/2 and larger**, shall be one of the following:
1. Galvanized-steel pipe and nipples; galvanized, gray-iron threaded fittings; and threaded joints.
 2. CPVC, Schedule 40; socket fittings; and solvent-cemented joints.
 3. PVC, Schedule 40; socket fittings; and solvent-cemented joints.

END OF SECTION 22 11 16

SECTION 22 11 19
DOMESTIC WATER PIPING SPECIALTIES

PART 1 - GENERAL

1.01 SUMMARY

- A. Section Includes:
1. Vacuum breakers.
 2. Backflow preventers.
 3. Water pressure-reducing valves.
 4. Balancing valves.
 5. Temperature-actuated, water mixing valves.
 6. Strainers.
 7. Hose bibbs.
 8. Wall hydrants.
 9. Drain valves.
 10. Water-hammer arresters.

1.02 SUBMITTALS

- A. Product Data: For each type of product.
- B. Field quality-control reports.
- C. Operation and maintenance data.

PART 2 - PRODUCTS

2.01 GENERAL REQUIREMENTS FOR PIPING SPECIALTIES

- A. Potable-water piping and components shall comply with NSF 61 and NSF 14. Mark "NSF-pw" on plastic piping components.

2.02 PERFORMANCE REQUIREMENTS

- A. Minimum Working Pressure for Domestic Water Piping Specialties: **125 psig** unless otherwise indicated.

2.03 VACUUM BREAKERS

- A. Pipe-Applied, Atmospheric-Type Vacuum Breakers:

1. Standard: ASSE 1001.
2. Size: **NPS 1/4 to NPS 3**, as required to match connected piping.
3. Body: Bronze.
4. Inlet and Outlet Connections: Threaded.
5. Finish: Rough bronze.

B. Hose-Connection Vacuum Breakers:

1. Standard: ASSE 1011.
2. Body: Bronze, nonremovable, with manual drain.
3. Outlet Connection: Garden-hose threaded complying with ASME B1.20.7.
4. Finish: Rough bronze.

2.04 BACKFLOW PREVENTERS

A. Reduced-Pressure-Principle Backflow Preventers:

1. Standard: ASSE 1013.
2. Operation: Continuous-pressure applications.
3. Pressure Loss: 12 PSIG maximum, through middle third of flow range.
4. Size: as shown on drawings.
5. Design Flow Rate: as shown on drawings.
6. Body: Bronze for **NPS 2** and smaller; steel with interior lining that complies with AWWA C550 or that is FDA approved. For **NPS 2-1/2** and larger stainless steel.
7. End Connections: Threaded for **NPS 2** and smaller; flanged for **NPS 2-1/2** and larger.
8. Configuration: Designed for horizontal, straight-through or vertical-inlet and outlet (if space is limited) flow.
9. Accessories:
 - a. Valves **NPS 2** and Smaller: Ball type with threaded ends on inlet and outlet.
 - b. Valves **NPS 2-1/2** and Larger: Outside-screw and yoke-gate type with flanged ends on inlet and outlet.
 - c. Air-Gap Fitting: ASME A112.1.2, matching backflow-preventer connection.

B. Double-Check, Backflow-Prevention Assemblies:

1. Standard: ASSE 1015.
2. Operation: Continuous-pressure applications unless otherwise indicated.
3. Pressure Loss: **5 psig** maximum, through middle third of flow range.
4. Size: as shown on drawings.
5. Bronze for **NPS 2** and smaller; steel with interior lining that complies with AWWA C550 or that is FDA approved. For **NPS 2-1/2** and larger stainless steel. End Connections: Threaded for **NPS 2** and smaller; flanged for **NPS 2-1/2** and larger.
6. Configuration: Designed for horizontal, straight-through flow.
7. Accessories:
 - a. Valves **NPS 2** and Smaller: Ball type with threaded ends on inlet and outlet.

- b. Valves **NPS 2-1/2** and Larger: Outside-screw and yoke-gate type with flanged ends on inlet and outlet.

2.05 WATER PRESSURE-REDUCING VALVES

A. Water Regulators:

1. Standard: ASSE 1003.
2. Pressure Rating: Initial working pressure of **150 psig**.
3. Body: Bronze with chrome-plated finish for **NPS 2** and smaller; cast iron with interior lining that complies with AWWA C550 or that is FDA approved for **NPS 2-1/2 and NPS 3**.
4. Valves for Booster Heater Water Supply: Include integral bypass.
5. End Connections: Threaded for **NPS 2** and smaller; flanged for **NPS 2-1/2 and NPS 3**.

2.06 BALANCING VALVES

A. Memory-Stop Balancing Valves:

1. Standard: MSS SP-110 for two-piece, copper-alloy ball valves.
2. Pressure Rating: **400-psig** minimum CWP.
3. Size: **NPS 2** or smaller.
4. Body: Copper alloy.
5. Port: Standard or full port.
6. Ball: Chrome-plated brass.
7. Seats and Seals: Replaceable.
8. End Connections: Solder joint or threaded.
9. Handle: Vinyl-covered steel with memory-setting device.

2.07 TEMPERATURE-ACTUATED, WATER MIXING VALVES

A. Water-Temperature Limiting Devices:

1. Standard: ASSE 1017.
2. Pressure Rating: **125 psig**.
3. Type: Thermostatically controlled, water mixing valve.
4. Material: Bronze body with corrosion-resistant interior components.
5. Connections: Threaded union inlets and outlet.
6. Accessories: Check stops on hot- and cold-water supplies, and adjustable, temperature-control handle.
7. Tempered-Water Setting: scheduled
8. Tempered-Water Design Flow Rate: scheduled
9. Valve Finish: Chrome plated.

2.08 STRAINERS FOR DOMESTIC WATER PIPING

A. Y-Pattern Strainers:

1. Pressure Rating: 125 psig minimum unless otherwise indicated.
2. Body: Bronze for NPS 2 and smaller; cast iron with interior lining that complies with AWWA C550 or that is FDA approved, epoxy coated and for NPS 2-1/2 and larger.
3. End Connections: Threaded for NPS 2 and smaller; flanged for NPS 2-1/2 and larger.
4. Screen: Stainless steel with round perforations unless otherwise indicated.
5. Perforation Size:
 - a. Strainers NPS 2 and Smaller: 0.020 inch.
 - b. Strainers NPS 2-1/2 to NPS 4: 0.045 inch.
6. Drain: Factory-installed, hose-end drain valve.

2.09 HOSE BIBBS

A. Hose Bibbs (HB):

1. Standard: ASME A112.18.1 for sediment faucets.
2. Body Material: Bronze.
3. Seat: Bronze, replaceable.
4. Supply Connections: NPS 1/2 or NPS 3/4 threaded or solder-joint inlet.
5. Outlet Connection: Garden-hose thread complying with ASME B1.20.7.
6. Pressure Rating: 125 psig.
7. Vacuum Breaker: Integral nonremovable, drainable, hose-connection vacuum breaker complying with ASSE 1011.
8. Finish for Equipment Rooms: Rough bronze, or chrome or nickel plated.
9. Finish for Service Areas: Rough bronze
10. Finish for Finished Rooms: Chrome or nickel plated.
11. Operation for Equipment Rooms: Wheel handle or operating key.
12. Operation for Finished Rooms: Operating key.
13. Include operating key with each operating-key hose bibb.
14. Include wall flange with each chrome- or nickel-plated hose bibb.

2.10 WALL HYDRANTS

A. Nonfreeze Wall Hydrants (WH):

1. Standard: ASME A112.21.3M for concealed-outlet, self-draining wall hydrants.
2. Pressure Rating: 125 psig.
3. Operation: Loose key.
4. Casing and Operating Rod: Of length required to match wall thickness. Include wall clamp.
5. Inlet: NPS 3/4 or NPS 1.
6. Outlet: Concealed, with integral vacuum breaker and garden-hose thread complying with ASME B1.20.7.
7. Box: Deep, flush mounted with cover.

8. Box and Cover Finish: Chrome plated.
9. Outlet: Exposed, with integral vacuum breaker and garden-hose thread complying with ASME B1.20.7.
10. Nozzle and Wall-Plate Finish: Polished nickel bronze.
11. Operating Keys(s): Two with each wall hydrant.

2.11 DRAIN VALVES

A. Ball-Valve-Type, Hose-End Drain Valves;

1. Standard: MSS SP-110 for standard-port, two-piece ball valves.
2. Pressure Rating: 400-psig minimum CWP.
3. Size: NPS 3/4.
4. Body: Copper alloy.
5. Ball: Chrome-plated brass.
6. Seats and Seals: Replaceable.
7. Handle: Vinyl-covered steel.
8. Inlet: Threaded or solder joint.
9. Outlet: Threaded, short nipple with garden-hose thread complying with ASME B1.20.7 and cap with brass chain.

2.12 WATER-HAMMER ARRESTERS

A. Water-Hammer Arresters:

1. Standard: ASSE 1010 or PDI-WH 201.
2. Type: Metal bellows or Copper tube with piston.
3. Size: ASSE 1010, Sizes AA and A through F, or PDI-WH 201, Sizes A through F.

PART 3 - EXECUTION

3.01 INSTALLATION

- #### A. Install backflow preventers in each water supply to mechanical equipment and systems and to other equipment and water systems that may be sources of contamination. Comply with authorities having jurisdiction.
1. Locate backflow preventers in same room as connected equipment or system.
 2. Install drain for backflow preventers with atmospheric-vent drain connection with air-gap fitting, fixed air-gap fitting, or equivalent positive pipe separation of at least two pipe diameters in drain piping and pipe-to-floor drain. Locate air-gap device attached to or under backflow preventer. Simple air breaks are unacceptable for this application.
 3. Do not install bypass piping around backflow preventers.

- B. Install water regulators with inlet and outlet shutoff valves and bypass with memory-stop balancing valve. Install pressure gages on inlet and outlet.
- C. Install balancing valves in locations where they can easily be adjusted.
- D. Install temperature-actuated, water mixing valves with check stops or shutoff valves on inlets and with shutoff valve on outlet.
- E. Install Y-pattern strainers for water on supply side of each water pressure-reducing valve.
- F. Set nonfreeze, nondraining-type post hydrants in concrete or pavement.
- G. Set freeze-resistant yard hydrants with riser pipe in concrete or pavement. Do not encase canister in concrete.
- H. Install water-hammer arresters in water piping according to PDI-WH 201.
- I. Install supply-type, trap-seal primer valves with outlet piping pitched down toward drain trap a minimum of 1 percent, and connect to floor-drain body, trap, or inlet fitting. Adjust valve for proper flow.
- J. Install drainage-type, trap-seal primer valves as lavatory trap with outlet piping pitched down toward drain trap a minimum of 1 percent, and connect to floor-drain body, trap, or inlet fitting.

3.02 CONNECTIONS

- A. Comply with requirements for ground equipment in Section 26 05 26 "Grounding and Bonding for Electrical Systems."
- B. Fire-retardant-treated-wood blocking is specified in Section 26 05 19 "Low-Voltage Electrical Power Conductors and Cables" for electrical connections.

3.03 FIELD QUALITY CONTROL

- A. Perform the following tests and inspections:
 - 1. Test each backflow device according to authorities having jurisdiction and the device's reference standard.
- B. Domestic water piping specialties will be considered defective if they do not pass tests and inspections.
- C. Prepare test and inspection reports.

3.04 ADJUSTING

- A. Set field-adjustable pressure set points of water pressure-reducing valves.

- B. Set field-adjustable flow set points of balancing valves.
- C. Set field-adjustable temperature set points of temperature-actuated, water mixing valves.

END OF SECTION 22 11 19

SECTION 22 11 23
DOMESTIC WATER PUMPS

PART 1 - GENERAL

1.01 SUMMARY

- A. Section Includes: Horizontally mounted, in-line, close-coupled centrifugal pumps.

1.02 ACTION SUBMITTALS

- A. Product Data: For each type of product indicated.
- B. LEED Submittals:
1. Product Data for Prerequisite EA 2: Documentation indicating that units comply with applicable requirements in ASHRAE/IESNA 90.1, without amendments, Section 7 - "Service Water Heating."

1.03 CLOSEOUT SUBMITTALS

- A. Operation and maintenance data.

1.04 QUALITY ASSURANCE

- A. Electrical Components, Devices, and Accessories: Listed and labeled as defined in NFPA 70, by a qualified testing agency, and marked for intended location and application.
- B. UL Compliance: Comply with UL 778 for motor-operated water pumps.

PART 2 - PRODUCTS

2.01 HORIZONTALLY MOUNTED, IN-LINE, CLOSE-COUPLED CENTRIFUGAL PUMPS

- A. Description: Factory-assembled and -tested, in-line, single-stage, close-coupled, overhung-impeller centrifugal pumps designed for installation with pump and motor shaft mounted horizontal.
- B. Pump Construction:

1. Casing: Radially split with threaded companion-flange connections for pumps with NPS 2 (DN 50) pipe connections and flanged connections for pumps with NPS 2-1/2 (DN 65) pipe connections.
 2. Impeller: Statically and dynamically balanced, closed, and keyed to shaft.
 3. Shaft and Shaft Sleeve: Steel shaft with deflector, with copper-alloy shaft sleeve. Include water slinger on shaft between motor and seal.
 4. Seal: Mechanical, with carbon-steel rotating ring, stainless-steel spring, ceramic seat, and rubber bellows and gasket.
 5. Bearings: Oil-lubricated; bronze-journal or ball type.
 6. Shaft Coupling: Flexible, capable of absorbing torsional vibration and shaft misalignment.
- C. Motor: Single speed, with grease-lubricated ball bearings; and resiliently or rigidly mounted to pump casing.
- D. Capacities and Characteristics: as shown on drawing schedules.

2.02 MOTORS

- A. Comply with NEMA designation, temperature rating, service factor, enclosure type, and efficiency requirements for motors specified in Section 22 05 13 "Common Motor Requirements for Plumbing Equipment."
1. Motor Sizes: Minimum size as indicated. If not indicated, large enough so driven load will not require motor to operate in service factor range above 1.0.

2.03 CONTROLS

- A. Thermostats: Electric; adjustable for control of hot-water circulation pump.
1. Type: Water-immersion temperature sensor, for installation in piping.
 2. Range: 50 to 125 deg F (10 to 52 deg C).
 3. Enclosure: NEMA 250, Type 4X.
 4. Operation of Pump: On or off.
 5. Transformer: Provide if required.
 6. Power Requirement: 24 V, ac.
 7. Settings: Start pump at 105 deg F (41 deg C)]
- B. Timers: Electric, for control of hot-water circulation pump.
1. Type: Programmable, seven-dayclock with manual override on-off switch.
 2. Enclosure: NEMA 250, Type 1, suitable for wall mounting.
 3. Operation of Pump: On or off.
 4. Transformer: Provide if required.
 5. Power Requirement: 24-V ac.
 6. Programmable Sequence of Operation: Up to two on-off cycles each day for seven days.

PART 3 - EXECUTION**3.01 PUMP INSTALLATION**

- A. Comply with HI 1.4.
- B. Install horizontally mounted, in-line, close-coupled centrifugal pumps with shaft horizontal.
- C. Install continuous-thread hanger rods and spring hangers of size required to support pump weight.
- D. Install thermostats in hot-water return piping.
- E. Install timers on wall adjacent to unit.

3.02 CONNECTIONS

- A. Comply with requirements for piping specified in Section 22 11 16 "Domestic Water Piping." Drawings indicate general arrangement of piping, fittings, and specialties.
- B. Install piping adjacent to pumps to allow service and maintenance.
- C. Connect domestic water piping to pumps. Install suction and discharge piping equal to or greater than size of pump nozzles.
 - 1. Install flexible connectors adjacent to pumps in suction and discharge piping of the following pumps:
 - a. Horizontally mounted, in-line, close-coupled centrifugal pumps.
 - b. Comply with requirements for flexible connectors specified in Section 22 11 16 "Domestic Water Piping."
 - 2. Install shutoff valve and strainer on suction side of each pump, and check, shutoff, and throttling valves on discharge side of each pump. Install valves same size as connected piping. Comply with requirements for valves specified in Section 22 05 23
 - 3. Install pressure gage at suction and at discharge of each pump. Install at integral pressure-gage tappings where provided or install pressure-gage connectors in suction and discharge piping around pumps. Comply with requirements for pressure gages and snubbers specified in Section 22 05 19 "Meters and Gages for Plumbing Piping."
- D. Connect thermostats and timers to pumps that they control.

3.03 ADJUSTING

- A. Adjust domestic water pumps to function smoothly, and lubricate as recommended by manufacturer.

- B. Adjust initial temperature set points.
- C. Set field-adjustable switches and circuit-breaker trip ranges as indicated.

END OF SECTION 22 11 23

SECTION 22 13 16
SANITARY WASTE AND VENT PIPING

PART 1 - GENERAL

1.01 SUMMARY

- A. Section Includes:
 - 1. Pipe, tube, and fittings.
 - 2. Specialty pipe fittings.

1.02 SUBMITTALS

- A. Product Data: For each type of product indicated.
- B. Field quality-control reports.

1.03 QUALITY ASSURANCE

- A. Piping materials shall bear label, stamp, or other markings of specified testing agency.
- B. Comply with NSF/ANSI 14, "Plastics Piping Systems Components and Related Materials," for plastic piping components. Include marking with "NSF-dwv" for plastic drain, waste, and vent piping and "NSF-sewer" for plastic sewer piping.

PART 2 - PRODUCTS

2.01 PIPING MATERIALS

- A. Comply with requirements in "Piping Schedule" Article for applications of pipe, tube, fitting materials, and joining methods for specific services, service locations, and pipe sizes.

2.02 HUB-AND-SPIGOT, CAST-IRON SOIL PIPE AND FITTINGS

- A. Pipe and Fittings: ASTM A 74, Service class.
- B. Gaskets: ASTM C 564, rubber.

2.03 HUBLESS, CAST-IRON SOIL PIPE AND FITTINGS

- A. Pipe and Fittings: ASTM A 888 or CISPI 301.
- B. CISPI, Hubless-Piping Couplings:
 - 1. Standards: ASTM C 1277 and CISPI 310.
 - 2. Description: Stainless-steel corrugated shield with stainless-steel bands and tightening devices; and ASTM C 564, rubber sleeve with integral, center pipe stop.

2.04 COPPER TUBE AND FITTINGS

- A. Copper DWV Tube: ASTM B 306, drainage tube, drawn temper.
- B. Copper Drainage Fittings: ASME B16.23, cast copper or ASME B16.29, wrought copper, solder-joint fittings.
- C. Copper Flanges: ASME B16.24, Class 150, cast copper with solder-joint end.
 - 1. Flange Gasket Materials: ASME B16.21, full-face, flat, nonmetallic, asbestos-free, 1/8-inch maximum thickness unless thickness or specific material is indicated.
 - 2. Flange Bolts and Nuts: ASME B18.2.1, carbon steel unless otherwise indicated.
- D. Solder: ASTM B 32, lead free with ASTM B 813, water-flushable flux.

2.05 ABS PIPE AND FITTINGS

- A. Solid-Wall ABS Pipe: ASTM D 2661, Schedule 40.
- B. ABS Socket Fittings: ASTM D 2661, made to ASTM D 3311, drain, waste, and vent patterns.
- C. Solvent Cement: ASTM D 2235.
 - 1. ABS solvent cement shall have a VOC content of 325 g/L or less when calculated according to 40 CFR 59, Subpart D (EPA Method 24).

2.06 PVC PIPE AND FITTINGS

- A. Solid-Wall PVC Pipe: ASTM D 2665, drain, waste, and vent.
- B. PVC Socket Fittings: ASTM D 2665, made to ASTM D 3311, drain, waste, and vent patterns and to fit Schedule 40 pipe.
- C. Adhesive Primer: ASTM F 656.

1. Adhesive primer shall have a VOC content of 550 g/L or less when calculated according to 40 CFR 59, Subpart D (EPA Method 24).

D. Solvent Cement: ASTM D 2564.

1. PVC solvent cement shall have a VOC content of 510 g/L or less when calculated according to 40 CFR 59, Subpart D (EPA Method 24).

2.07 SPECIALTY PIPE FITTINGS

A. Transition Couplings:

1. General Requirements: Fitting or device for joining piping with small differences in OD's or of different materials. Include end connections same size as and compatible with pipes to be joined.
2. Fitting-Type Transition Couplings: Manufactured piping coupling or specified piping system fitting.
3. Unshielded, Nonpressure Transition Couplings:
 - a. Standard: ASTM C 1173.
 - b. Description: Elastomeric, sleeve-type, reducing or transition pattern. Include shear ring and corrosion-resistant-metal tension band and tightening mechanism on each end.
 - c. Sleeve Materials:
 - 1) For Cast-Iron Soil Pipes: ASTM C 564, rubber.
 - 2) For Plastic Pipes: ASTM F 477, elastomeric seal or ASTM D 5926, PVC.
 - 3) For Dissimilar Pipes: ASTM D 5926, PVC or other material compatible with pipe materials being joined.

PART 3 - EXECUTION

3.01 EARTH MOVING

- A. Comply with requirements for excavating, trenching, and backfilling specified in Section 31 20 00 "Earth Moving."

3.02 PIPING INSTALLATION

- A. Drawing plans, schematics, and diagrams indicate general location and arrangement of piping systems. Indicated locations and arrangements were used to size pipe and calculate friction loss, expansion, pump sizing, and other design considerations. Install piping as indicated unless deviations to layout are approved on coordination drawings.
- B. Install piping in concealed locations unless otherwise indicated and except in equipment rooms and service areas.

- C. Install piping indicated to be exposed and piping in equipment rooms and service areas at right angles or parallel to building walls. Diagonal runs are prohibited unless specifically indicated otherwise.
- D. Install piping above accessible ceilings to allow sufficient space for ceiling panel removal.
- E. Install piping at indicated slopes.
- F. Install piping free of sags and bends.
- G. Install fittings for changes in direction and branch connections.
- H. Make changes in direction for soil and waste drainage and vent piping using appropriate branches, bends, and long-sweep bends. Sanitary tees and short-sweep 1/4 bends may be used on vertical stacks if change in direction of flow is from horizontal to vertical. Use long-turn, double Y-branch and 1/8-bend fittings if two fixtures are installed back to back or side by side with common drain pipe. Straight tees, elbows, and crosses may be used on vent lines. Do not change direction of flow more than 90 degrees. Use proper size of standard increasers and reducers if pipes of different sizes are connected. Reducing size of drainage piping in direction of flow is prohibited.
- I. Lay buried building drainage piping beginning at low point of each system. Install true to grades and alignment indicated, with unbroken continuity of invert. Place hub ends of piping upstream. Install required gaskets according to manufacturer's written instructions for use of lubricants, cements, and other installation requirements. Maintain swab in piping and pull past each joint as completed.
- J. Install soil and waste drainage and vent piping at the following minimum slopes unless otherwise indicated:
 - 1. Building Sanitary Drain: 2 percent downward in direction of flow for piping **NPS 3** and smaller; 1 percent downward in direction of flow for piping **NPS 4** and larger.
 - 2. Horizontal Sanitary Drainage Piping: 2 percent downward in direction of flow.
 - 3. Vent Piping: 1 percent down toward vertical fixture vent or toward vent stack.
- K. Install cast-iron soil piping according to CISPI's "Cast Iron Soil Pipe and Fittings Handbook," Chapter IV, "Installation of Cast Iron Soil Pipe and Fittings."
- L. Install aboveground copper tubing according to CDA's "Copper Tube Handbook."
- M. Install aboveground ABS piping according to ASTM D 2661.
- N. Install aboveground PVC piping according to ASTM D 2665.
- O. Install underground ABS AND PVC piping according to ASTM D 2321.
- P. Plumbing Specialties:

1. Install backwater valves in sanitary waste gravity-flow piping. Comply with requirements for backwater valves specified in Section 22 13 19 "Sanitary Waste Piping Specialties."
2. Install cleanouts at grade and extend to where building sanitary drains connect to building sanitary sewers in sanitary drainage gravity-flow piping. Comply with requirements for cleanouts specified in Section 22 13 19 "Sanitary Waste Piping Specialties."
3. Install drains in sanitary drainage gravity-flow piping. Comply with requirements for drains specified in Section 22 13 19 "Sanitary Waste Piping Specialties."

- Q. Do not enclose, cover, or put piping into operation until it is inspected and approved by authorities having jurisdiction.
- R. Install sleeves for piping penetrations of walls, ceilings, and floors. Comply with requirements for sleeves specified in Section 22 05 17 "Sleeves and Sleeve Seals for Plumbing Piping."
- S. Install sleeve seals for piping penetrations of concrete walls and slabs. Comply with requirements for sleeve seals specified in Section 22 05 17 "Sleeves and Sleeve Seals for Plumbing Piping."
- T. Install escutcheons for piping penetrations of walls, ceilings, and floors. Comply with requirements for escutcheons specified in Section 22 05 18 "Escutcheons for Plumbing Piping."

3.03 JOINT CONSTRUCTION

- A. Join hub-and-spigot, cast-iron soil piping with gasket joints according to CISPI's "Cast Iron Soil Pipe and Fittings Handbook" for compression joints.
- B. Join hubless, cast-iron soil piping according to CISPI 310 and CISPI's "Cast Iron Soil Pipe and Fittings Handbook" for hubless-piping coupling joints.
- C. Join copper tube and fittings with soldered joints according to ASTM B 828. Use ASTM B 813, water-flushable, lead-free flux and ASTM B 32, lead-free-alloy solder.
- D. Flanged Joints: Align bolt holes. Select appropriate gasket material, size, type, and thickness. Install gasket concentrically positioned. Use suitable lubricants on bolt threads. Torque bolts in cross pattern.
- E. Plastic, Nonpressure-Piping, Solvent-Cement Joints: Clean and dry joining surfaces. Join pipe and fittings according to the following:
1. Comply with ASTM F 402 for safe-handling practice of cleaners, primers, and solvent cements.
 2. ABS Piping: Join according to ASTM D 2235 and ASTM D 2661 Appendixes.
 3. PVC Piping: Join according to ASTM D 2855 and ASTM D 2665 Appendixes.

3.04 SPECIALTY PIPE FITTING INSTALLATION

A. Transition Couplings:

1. Install transition couplings at joints of piping with small differences in OD's.
2. In Drainage Piping: Unshielded, nonpressure transition couplings.

3.05 VALVE INSTALLATION

A. Backwater Valves: Install backwater valves in piping subject to backflow.

1. Horizontal Piping: Horizontal backwater valves. Use normally closed type unless otherwise indicated.
2. Floor Drains: Drain outlet backwater valves unless drain has integral backwater valve.
3. Install backwater valves in accessible locations.
4. Comply with requirements for backwater valve specified in Section 22 13 19 "Sanitary Waste Piping Specialties."

3.06 HANGER AND SUPPORT INSTALLATION

A. Comply with requirements for seismic-restraint devices specified in Section 22 05 48 "Vibration and Seismic Controls for Plumbing Piping and Equipment."

B. Comply with requirements for pipe hanger and support devices and installation specified in Section 22 05 29 "Hangers and Supports for Plumbing Piping and Equipment."

1. Install carbon-steel pipe hangers for horizontal piping in noncorrosive environments.
2. Install stainless-steel pipe hangers for horizontal piping in corrosive environments.
3. Install carbon-steel pipe support clamps for vertical piping in noncorrosive environments.
4. Install stainless-steel pipe support clamps for vertical piping in corrosive environments.
5. Vertical Piping: MSS Type 8 or Type 42, clamps.
6. Install individual, straight, horizontal piping runs:
 - a. **100 Feet** and Less: MSS Type 1, adjustable, steel clevis hangers.
 - b. Longer Than **100 Feet**: MSS Type 43, adjustable roller hangers.
 - c. Longer Than **100 Feet** if Indicated: MSS Type 49, spring cushion rolls.
7. Multiple, Straight, Horizontal Piping Runs **100 Feet** or Longer: MSS Type 44, pipe rolls. Support pipe rolls on trapeze.
8. Base of Vertical Piping: MSS Type 52, spring hangers.

C. Support horizontal piping and tubing within **12 inches** of each fitting[, valve,] and coupling.

- D. Support vertical piping and tubing at base and at each floor.
 - E. Rod diameter may be reduced one size for double-rod hangers, with **3/8-inch** minimum rods.
 - F. Install hangers for cast-iron soil piping with the following maximum horizontal spacing and minimum rod diameters:
 - 1. **NPS 1-1/2 and NPS 2: 60 inches** with **3/8-inch** rod.
 - 2. **NPS 3: 60 inches** with **1/2-inch** rod.
 - 3. **NPS 4 and NPS 5: 60 inches** with **5/8-inch** rod.
 - 4. **NPS 6 and NPS 8: 60 inches** with **3/4-inch** rod.
 - 5. Spacing for **10-foot** lengths may be increased to **10 feet**. Spacing for fittings is limited to **60 inches**.
 - G. Install supports for vertical cast-iron soil piping every **15 feet**.
 - H. Install hangers for copper tubing with the following maximum horizontal spacing and minimum rod diameters:
 - 1. **NPS 1-1/4: 72 inches** with **3/8-inch** rod.
 - 2. **NPS 1-1/2 and NPS 2: 96 inches** with **3/8-inch** rod.
 - 3. **NPS 2-1/2: 108 inches** with **1/2-inch** rod.
 - 4. **NPS 3 and NPS 5: 10 feet** with **1/2-inch** rod.
 - 5. **NPS 6: 10 feet** with **5/8-inch** rod.
 - 6. **NPS 8: 10 feet** with **3/4-inch** rod.
 - I. Install supports for vertical copper tubing every **10 feet**.
 - J. Install hangers for ABS and PVC piping with the following maximum horizontal spacing and minimum rod diameters:
 - 1. **NPS 1-1/2 and NPS 2: 48 inches** with **3/8-inch** rod.
 - 2. **NPS 3: 48 inches** with **1/2-inch** rod.
 - 3. **NPS 4 and NPS 5: 48 inches** with **5/8-inch** rod.
 - 4. **NPS 6 and NPS 8: 48 inches** with **3/4-inch** rod.
 - K. Install supports for vertical ABS and PVC piping every **48 inches**.
 - L. Support piping and tubing not listed above according to MSS SP-69 and manufacturer's written instructions.
- 3.07 CONNECTIONS
- A. Drawings indicate general arrangement of piping, fittings, and specialties.
 - B. Connect soil and waste piping to exterior sanitary sewerage piping. Use transition fitting to join dissimilar piping materials.
 - C. Connect drainage and vent piping to the following:

1. Plumbing Fixtures: Connect drainage piping in sizes indicated, but not smaller than required by plumbing code.
 2. Plumbing Fixtures and Equipment: Connect atmospheric vent piping in sizes indicated, but not smaller than required by authorities having jurisdiction.
 3. Plumbing Specialties: Connect drainage and vent piping in sizes indicated, but not smaller than required by plumbing code.
 4. Install test tees (wall cleanouts) in conductors near floor and floor cleanouts with cover flush with floor.
 5. Install horizontal backwater valves with cleanout cover flush with floor.
 6. Comply with requirements for backwater valves, cleanouts and drains specified in Section 22 13 19 "Sanitary Waste Piping Specialties."
 7. Equipment: Connect drainage piping as indicated. Provide shutoff valve if indicated and union for each connection. Use flanges instead of unions for connections **NPS 2-1/2** and larger.
- D. Where installing piping adjacent to equipment, allow space for service and maintenance of equipment.
- E. Make connections according to the following unless otherwise indicated:
1. Install unions, in piping **NPS 2** and smaller, adjacent to each valve and at final connection to each piece of equipment.
 2. Install flanges, in piping **NPS 2-1/2** and larger, adjacent to flanged valves and at final connection to each piece of equipment.

3.08 IDENTIFICATION

- A. Identify exposed sanitary waste and vent piping. Comply with requirements for identification specified in Section 22 05 53 "Identification for Plumbing Piping and Equipment."

3.09 FIELD QUALITY CONTROL

- A. During installation, notify authorities having jurisdiction at least 24 hours before inspection must be made. Perform tests specified below in presence of authorities having jurisdiction.
1. Roughing-in Inspection: Arrange for inspection of piping before concealing or closing-in after roughing-in and before setting fixtures.
 2. Final Inspection: Arrange for final inspection by authorities having jurisdiction to observe tests specified below and to ensure compliance with requirements.
- B. Reinspection: If authorities having jurisdiction find that piping will not pass test or inspection, make required corrections and arrange for reinspection.
- C. Reports: Prepare inspection reports and have them signed by authorities having jurisdiction.

- D. Test sanitary drainage and vent piping according to procedures of authorities having jurisdiction or, in absence of published procedures, as follows:
1. Test for leaks and defects in new piping and parts of existing piping that have been altered, extended, or repaired. If testing is performed in segments, submit separate report for each test, complete with diagram of portion of piping tested.
 2. Leave uncovered and unconcealed new, altered, extended, or replaced drainage and vent piping until it has been tested and approved. Expose work that was covered or concealed before it was tested.
 3. Roughing-in Plumbing Test Procedure: Test drainage and vent piping except outside leaders on completion of roughing-in. Close openings in piping system and fill with water to point of overflow, but not less than **10-foot head of water**. From 15 minutes before inspection starts to completion of inspection, water level must not drop. Inspect joints for leaks.
 4. Finished Plumbing Test Procedure: After plumbing fixtures have been set and traps filled with water, test connections and prove they are gastight and watertight. Plug vent-stack openings on roof and building drains where they leave building. Introduce air into piping system equal to pressure of **1-inch wg**. Use U-tube or manometer inserted in trap of water closet to measure this pressure. Air pressure must remain constant without introducing additional air throughout period of inspection. Inspect plumbing fixture connections for gas and water leaks.
 5. Repair leaks and defects with new materials and retest piping, or portion thereof, until satisfactory results are obtained.
 6. Prepare reports for tests and required corrective action.

3.10 CLEANING AND PROTECTION

- A. Clean interior of piping. Remove dirt and debris as work progresses.
- B. Protect drains during remainder of construction period to avoid clogging with dirt and debris and to prevent damage from traffic and construction work.
- C. Place plugs in ends of uncompleted piping at end of day and when work stops.
- D. Exposed ABS and PVC Piping: Protect plumbing vents exposed to sunlight with two coats of water-based latex paint.

3.11 PIPING SCHEDULE

- A. Flanges and unions may be used on aboveground pressure piping unless otherwise indicated.
- B. Aboveground, soil, waste and vent piping shall be any of the following:
 1. Service class, cast-iron soil pipe and fittings; gaskets; and gasketed joints.
 2. Hubless, cast-iron soil pipe and fittings; CISPI hubless-piping couplings; and coupled joints.
 3. Copper DWV tube, copper drainage fittings, and soldered joints.
 4. Solid-wall ABS pipe; ABS socket fittings, and solvent-cemented joints.

5. Solid-wall PVC pipe; PVC socket fittings, and solvent-cemented joints.
 6. Dissimilar Pipe-Material Couplings: Unshielded, nonpressure transition couplings.
- C. Underground, soil, waste, and vent piping shall be any of the following:
1. Service class, cast-iron soil piping; gaskets; and gasketed joints.
 2. Hubless, cast-iron soil pipe and fittings; CISPI hubless-piping couplings; and coupled joints.
 3. Solid wall ABS pipe, ABS socket fittings, and solvent-cemented joints.
 4. Solid wall PVC pipe, PVC socket fittings, and solvent-cemented joints.
 5. Dissimilar Pipe-Material Couplings: Unshielded, nonpressure transition couplings.

END OF SECTION 22 13 16

SECTION 22 13 19**SANITARY WASTE PIPING SPECIALTIES****PART 1 - GENERAL****1.01 SUMMARY**

- A. Section Includes:
1. Backwater valves.
 2. Cleanouts.
 3. Floor drains.
 4. Roof flashing assemblies.
 5. Miscellaneous sanitary drainage piping specialties.
 6. Flashing materials.

1.02 ACTION SUBMITTALS

- A. Product Data: For each type of product indicated.

1.03 QUALITY ASSURANCE

- A. Drainage piping specialties shall bear label, stamp, or other markings of specified testing agency.

PART 2 - PRODUCTS**2.01 BACKWATER VALVES**

- A. Horizontal, Cast-Iron Backwater Valves:
1. Standard: ASME A112.14.1.
 2. Size: Same as connected piping.
 3. Body: Cast iron.
 4. Cover: Cast iron with bolted or threaded access check valve.
 5. End Connections: Hub and spigot or hubless.
 6. Type Check Valve: Removable, bronze, swing check, factory assembled or field modified to hang open for airflow unless subject to backflow condition.
 7. Extension: ASTM A 74, Service class; full-size, cast-iron, soil-pipe extension to field-installed cleanout at floor; replaces backwater valve cover.
- B. Drain-Outlet Backwater Valves:
1. Size: Same as floor drain outlet.

2. Body: Cast iron or bronze made for vertical installation in bottom outlet of floor drain.
3. Check Valve: Removable ball float.
4. Inlet: Threaded.
5. Outlet: Threaded or spigot.

2.02 CLEANOUTS

A. Exposed Cast-Iron Cleanouts (CO):

1. Standard: ASME A112.36.2M for cast iron for cleanout test tee.
2. Size: Same as connected drainage piping
3. Body Material: Hub-and-spigot, cast-iron soil pipe T-branch or Hubless, cast-iron soil pipe test tee as required to match connected piping.
4. Closure: Countersunk or raised-head, brass plug.
5. Closure Plug Size: Same as or not more than one size smaller than cleanout size.

B. Cast-Iron Floor Cleanouts (FCO):

1. Standard: ASME A112.36.2M for threaded, adjustable housing cleanout.
2. Size: Same as connected branch.
3. Body or Ferrule: Cast iron.
4. Outlet Connection: Threaded.
5. Closure: Brass plug with tapered threads.
6. Adjustable Housing Material: Cast iron with threads, set-screws or other device.
7. Frame and Cover Material and Finish: Nickel-bronze, copper alloy.
8. Frame and Cover Shape: Round.
9. Top Loading Classification: Heavy Duty.
10. Riser: ASTM A 74, Service class, cast-iron drainage pipe fitting and riser to cleanout.

C. Cast-Iron Wall Cleanouts (WCO):

1. Standard: ASME A112.36.2M. Include wall access.
2. Size: Same as connected drainage piping.
3. Body: Hub-and-spigot, cast-iron soil pipe T-branch or Hubless, cast-iron soil pipe test tee as required to match connected piping.
4. Closure: Countersunk or raised-head, brass plug.
5. Closure Plug Size: Same as or not more than one size smaller than cleanout size.
6. Wall Access: Round, flat, chrome-plated brass or stainless-steel cover plate with screw.
7. Wall Access: Round, nickel-bronze, copper-alloy, or stainless-steel wall-installation frame and cover.

2.03 FLOOR DRAINS

- A. Cast-Iron Floor Drains : As Scheduled on the Drawings and herein.

1. Standard: ASME A112.6.3 with backwater valve.
2. Pattern: Floor drain.
3. Body Material: Gray iron.
4. Seepage Flange: as required
5. Anchor Flange: as required.
6. Clamping Device: as required.
7. Outlet: Bottom.
8. Backwater Valve: Drain-outlet type.
9. Coating on Interior and Exposed Exterior Surfaces: Not required.
10. Sediment Bucket: Not required.
11. Top or Strainer Material: Bronze.
12. Top of Body and Strainer Finish: Nickel bronze.
13. Top Shape: Square.
14. Top Loading Classification: Heavy Duty.
15. Inlet Fitting: Gray iron, with threaded inlet and threaded or spigot outlet, and trap-seal primer valve connection.

2.04 TRENCH DRAINS

- A. Trench Drains TD-1: Modular with plastic catch basins as defined on drawings. Coordinate installation with structural foundation.

2.05 ROOF FLASHING ASSEMBLIES

- A. Roof Flashing Assemblies:
 1. Description: Manufactured assembly made of 4.0-lb/sq. ft., 0.0625-inch thick, lead flashing collar and skirt extending at least 6 inches from pipe, with galvanized-steel boot reinforcement and counterflashing fitting.
 - a. Open-Top Vent Cap: Without cap.
 - b. Low-Silhouette Vent Cap: With vandal-proof vent cap.
 - c. Extended Vent Cap: With field-installed, vandal-proof vent cap.

2.06 MISCELLANEOUS SANITARY DRAINAGE PIPING SPECIALTIES

- A. Open Drains:
 1. Description: Shop or field fabricate from ASTM A 74, Service class, hub-and-spigot, cast-iron, soil-pipe fittings. Include P-trap, hub-and-spigot riser section; and where required, increaser fitting joined with ASTM C 564, rubber gaskets.
 2. Size: Same as connected waste piping.
- B. Deep-Seal Traps:
 1. Description: Cast-iron or bronze casting, with inlet and outlet matching connected piping and cleanout trap-seal primer valve connection.
 2. Size: Same as connected waste piping.

-
- a. NPS 2: 4-inch- minimum water seal.
 - b. NPS 2-1/2 and Larger: 5-inch- minimum water seal.
- C. Floor-Drain, Trap-Seal Primer Fittings:
- 1. Description: Cast iron, with threaded inlet and threaded or spigot outlet, and trap-seal primer valve connection.
 - 2. Size: Same as floor drain outlet with NPS 1/2 side inlet.
- D. Air-Gap Fittings:
- 1. Standard: ASME A112.1.2, for fitting designed to ensure fixed, positive air gap between installed inlet and outlet piping.
 - 2. Body: Bronze or cast iron.
 - 3. Inlet: Opening in top of body.
 - 4. Outlet: Larger than inlet.
 - 5. Size: Same as connected waste piping and with inlet large enough for associated indirect waste piping.
- E. Sleeve Flashing Device:
- 1. Description: Manufactured, cast-iron fitting, with clamping device, that forms sleeve for pipe floor penetrations of floor membrane. Include galvanized-steel pipe extension in top of fitting that will extend 1 inch above finished floor and galvanized-steel pipe extension in bottom of fitting that will extend through floor slab.
 - 2. Size: As required for close fit to riser or stack piping.
- F. Stack Flashing Fittings:
- 1. Description: Counterflashing-type, cast-iron fitting, with bottom recess for terminating roof membrane, and with threaded or hub top for extending vent pipe.
 - 2. Size: Same as connected stack vent or vent stack.
- G. Vent Caps:
- 1. Description: Cast-iron body with threaded or hub inlet and vandal-proof design. Include vented hood and setscrews to secure to vent pipe.
 - 2. Size: Same as connected stack vent or vent stack.
- 2.07 FLASHING MATERIALS
- A. Lead Sheet: ASTM B 749, Type L51121, copper bearing, with the following minimum weights and thicknesses, unless otherwise indicated:
- 1. General Use: 4.0-lb/sq. ft., 0.0625-inch thickness.
 - 2. Vent Pipe Flashing: 3.0-lb/sq. ft., 0.0469-inch thickness.
 - 3. Burning: 6-lb/sq. ft., 0.0938-inch thickness.
- B. Fasteners: Metal compatible with material and substrate being fastened.

- C. Metal Accessories: Sheet metal strips, clamps, anchoring devices, and similar accessory units required for installation; matching or compatible with material being installed.
- D. Solder: ASTM B 32, lead-free alloy.
- E. Bituminous Coating: SSPC-Paint 12, solvent-type, bituminous mastic.

PART 3 - EXECUTION

3.01 INSTALLATION

- A. Install backwater valves in building drain piping. For interior installation, provide cleanout deck plate flush with floor and centered over backwater valve cover, and of adequate size to remove valve cover for servicing.
- B. Install cleanouts in aboveground piping and building drain piping according to the following, unless otherwise indicated:
 - 1. Size same as drainage piping up to **NPS 4**. Use **NPS 4** for larger drainage piping unless larger cleanout is indicated.
 - 2. Locate at each change in direction of piping greater than 45 degrees.
 - 3. Locate at minimum intervals of **50 feet** for piping **NPS 4** and smaller and **100 feet** for larger piping.
 - 4. Locate at base of each vertical soil and waste stack.
- C. For floor cleanouts for piping below floors, install cleanout deck plates with top flush with finished floor.
- D. For cleanouts located in concealed piping, install cleanout wall access covers, of types indicated, with frame and cover flush with finished wall.
- E. Install floor drains at low points of surface areas to be drained. Set grates of drains flush with finished floor, unless otherwise indicated.
 - 1. Position floor drains for easy access and maintenance.
 - 2. Set floor drains below elevation of surrounding finished floor to allow floor drainage. Set with grates depressed according to the following drainage area radii:
 - a. Radius, **30 Inches** or Less: Equivalent to 1 percent slope, but not less than **1/4-inch** total depression.
 - b. Radius, **30 to 60 Inches**: Equivalent to 1 percent slope.
 - c. Radius, **60 Inches** or Larger: Equivalent to 1 percent slope, but not greater than **1-inch** total depression.
 - 3. Install floor-drain flashing collar or flange so no leakage occurs between drain and adjoining flooring. Maintain integrity of waterproof membranes where penetrated.
 - 4. Install individual traps for floor drains connected to sanitary building drain, unless otherwise indicated.

- F. Install roof flashing assemblies on sanitary stack vents and vent stacks that extend through roof.
- G. Install flashing fittings on sanitary stack vents and vent stacks that extend through roof.
- H. Assemble open drain fittings and install with top of hub 2 inches above floor.
- I. Install deep-seal traps on floor drains and other waste outlets in the non restroom areas.
- J. Install air-gap fittings on draining-type backflow preventers and on indirect-waste piping discharge into sanitary drainage system.
- K. Install sleeve flashing device with each riser and stack passing through floors with waterproof membrane.
- L. Install vent caps on each vent pipe passing through roof.
- M. Install traps on plumbing specialty drain outlets. Omit traps on indirect wastes unless trap is indicated.
- N. Coordinate installation of trench drains and catch basins with structural foundation.

3.02 CONNECTIONS

- A. Comply with requirements in Section 22 13 16 "Sanitary Waste and Vent Piping" for piping installation requirements. Drawings indicate general arrangement of piping, fittings, and specialties.
- B. Install piping adjacent to equipment to allow service and maintenance.
- C. Connect to catch basin on trench drains per manufacturer recommendation.

3.03 FLASHING INSTALLATION

- A. Fabricate flashing from single piece unless large pans, sumps, or other drainage shapes are required. Join flashing according to the following if required:
 - 1. Lead Sheets: Burn joints of lead sheets **6.0-lb/sq. ft., 0.0938-inch** thickness or thicker. Solder joints of lead sheets **4.0-lb/sq. ft., 0.0625-inch** thickness or thinner.
- B. Install sheet flashing on pipes, sleeves, and specialties passing through or embedded in floors and roofs with waterproof membrane.
 - 1. Pipe Flashing: Sleeve type, matching pipe size, with minimum length of **10 inches**, and skirt or flange extending at least **8 inches** around pipe.
 - 2. Sleeve Flashing: Flat sheet, with skirt or flange extending at least **8 inches** around sleeve.

-
3. Embedded Specialty Flashing: Flat sheet, with skirt or flange extending at least **8 inches** around specialty.
 - C. Set flashing on floors and roofs in solid coating of bituminous cement.
 - D. Secure flashing into sleeve and specialty clamping ring or device.
 - E. Install flashing for piping passing through roofs with counterflashing or commercially made flashing fittings, according to Section 07 62 00 "Sheet Metal Flashing and Trim."
 - F. Extend flashing up vent pipe passing through roofs and turn down into pipe, or secure flashing into cast-iron sleeve having calking recess.

3.04 PROTECTION

- A. Protect drains during remainder of construction period to avoid clogging with dirt or debris and to prevent damage from traffic or construction work.
- B. Place plugs in ends of uncompleted piping at end of each day or when work stops.

END OF SECTION 22 13 19

SECTION 22 13 23**SANITARY WASTE INTERCEPTORS****PART 1 - GENERAL****1.01 SUMMARY**

- A. Section Includes:
1. Oil interceptors.

1.02 ACTION SUBMITTALS

- A. Product Data: For each type of metal interceptor indicated.
- B. Shop Drawings: For each type and size of precast-concrete interceptor indicated.

PART 2 - PRODUCTS**2.01 OIL INTERCEPTORS**

- A. Oil Interceptors: Factory-fabricated, cast-iron or steel body; with removable sediment bucket or strainer, baffles, vents, and flow-control fitting on inlet.
1. Inlet, Outlet, Vent, and Waste-Oil Outlet Piping Connections: Hub, hubless, or threaded, unless otherwise indicated.
 2. Extension: Cast-iron or steel shroud, full size of interceptor, extending from top of interceptor to grade.
 3. Cover: Cast iron or steel, with steel reinforcement to provide ASTM C 890, heavy truck traffic load.
 4. Comply with requirements in Section 23 11 13 "Facility Fuel-Oil Piping" for waste-oil storage tank and piping
- B. Capacities and Characteristics: per drawings

2.02 PRECAST-CONCRETE MANHOLE RISERS

- A. Precast-Concrete Manhole Risers: **ASTM C 478 (ASTM C 478M)**, with rubber-gasket joints.
1. Structural Design Loads:
 - a. Light-Traffic Load: Comply with ASTM C 890, A-8 (ASSHTO HS10-44).
 - b. Medium-Traffic Load: Comply with ASTM C 890, A-12 (ASSHTO HS15-44).

- c. Heavy-Traffic Load: Comply with ASTM C 890, A-16 (ASSHTO HS20-44).
 - d. Walkway Load: Comply with ASTM C 890, A-03.
2. Length: From top of underground concrete structure to grade.
 3. Riser Sections: 3-inch (75-mm) minimum thickness and 24-inch (600-mm) diameter.
 4. Top Section: Eccentric cone, unless otherwise indicated. Include top of cone to match grade ring size.
 5. Gaskets: ASTM C 443 (ASTM C 443M), rubber.
 6. Steps: [Individual FRP steps or FRP ladder] [Individual FRP steps, FRP ladder, or ASTM A 615/A 615M, deformed, 1/2-inch (13-mm) steel reinforcing rods encased in ASTM D 4101, PP] [ASTM A 615/A 615M, deformed, 1/2-inch (13-mm) steel reinforcing rods encased in ASTM D 4101, PP] <Insert material>, wide enough to allow worker to place both feet on one step and designed to prevent lateral slippage off step. Cast or anchor steps into sidewalls at 12- to 16-inch (300- to 400-mm) intervals.
- B. Grade Rings: Reinforced-concrete rings, 6- to 9-inch (150- to 225-mm) total thickness, diameter matching manhole frame and cover, and height as required to adjust the manhole frame and cover to indicated elevation and slope.
- C. Manhole Frames and Covers: Ferrous; 24-inch (610-mm) ID by 7- to 9-inch (175- to 225-mm) riser with 4-inch- (100-mm-) minimum width flange and 26-inch- (660-mm-) diameter cover.
1. Ductile Iron: ASTM A 536, Grade 60-40-18, unless otherwise indicated.
 2. Gray Iron: ASTM A 48, Class 35, unless otherwise indicated.
 3. Include indented top design with lettering cast into cover, using wording equivalent to the following:

PART 3 - EXECUTION

3.01 EARTHWORK

- A. Excavating, trenching, and backfilling are specified in Section 31 20 00 "Earth Moving."

3.02 INSTALLATION

- A. Install precast-concrete interceptors according to ASTM C 891. Set level and plumb.
- B. Install manhole risers from top of underground concrete interceptors to manholes and gratings at finished grade.
- C. Set tops of manhole frames and covers flush with finished surface in pavements. Set metal interceptors level and plumb.

3.03 CONNECTIONS

- A. Piping installation requirements are specified in Section 22 13 16 "Sanitary Waste and Vent Piping." Drawings indicate general arrangement of piping, fittings, and specialties.
- B. Make piping connections between interceptors and piping systems.

3.04 IDENTIFICATION

- A. Identification materials and installation are specified in Section 31 20 00 "Earth Moving." Arrange for installation of green warning tapes directly over piping and at outside edges of underground interceptors.
 - 1. Use warning tapes or detectable warning tape over ferrous piping.
 - 2. Use detectable warning tape over nonferrous piping and over edges of underground structures.

END OF SECTION 22 13 23

SECTION 22 14 13
FACILITY STORM DRAINAGE PIPING

PART 1 - GENERAL

1.01 SUMMARY

- A. Section Includes:
1. Pipe, tube, and fittings.
 2. Specialty pipe fittings.

1.02 SUBMITTALS

- A. Product Data: For each type of product indicated.
- B. Field quality-control reports.

1.03 QUALITY ASSURANCE

- A. Piping materials shall bear label, stamp, or other markings of specified testing agency.
- B. Comply with NSF/ANSI 14, "Plastics Piping System Components and Related Materials," for plastic piping components. Include marking with "NSF-drain" for plastic drain piping and "NSF-sewer" for plastic sewer piping.

PART 2 - PRODUCTS

2.01 PIPING MATERIALS

- A. Comply with requirements in "Piping Schedule" Article for applications of pipe, tube, fitting materials, and joining methods for specific services, service locations, and pipe sizes.

2.02 HUB-AND-SPIGOT, CAST-IRON SOIL PIPE AND FITTINGS

- A. Pipe and Fittings: ASTM A 74, Service class.
- B. Gaskets: ASTM C 564, rubber.

2.03 HUBLESS, CAST-IRON SOIL PIPE AND FITTINGS

- A. Pipe and Fittings: ASTM A 888 or CISPI 301.
- B. CISPI, Hubless-Piping Couplings:
 - 1. Standards: ASTM C 1277 and CISPI 310.
 - 2. Description: Stainless-steel corrugated shield with stainless-steel bands and tightening devices; and ASTM C 564, rubber sleeve with integral, center pipe stop.
- C. Heavy-Duty, Hubless-Piping Couplings:
 - 1. Standards: ASTM C 1277 and ASTM C 1540.
 - 2. Description: Stainless-steel shield with stainless-steel bands and tightening devices; and ASTM C 564, rubber sleeve with integral, center pipe stop.

2.04 PVC PIPE AND FITTINGS

- A. Solid-Wall PVC Pipe: ASTM D 2665, drain, waste, and vent.
- B. PVC Socket Fittings: ASTM D 2665, made to ASTM D 3311, drain, waste, and vent patterns and to fit Schedule 40 pipe.
- C. Adhesive Primer: ASTM F 656.
- D. Solvent Cement: ASTM D 2564.

2.05 SPECIALTY PIPE FITTINGS

- A. Transition Couplings:
 - 1. General Requirements: Fitting or device for joining piping with small differences in OD's or of different materials. Include end connections same size as and compatible with pipes to be joined.
 - 2. Fitting-Type Transition Couplings: Manufactured piping coupling or specified-piping-system fitting.
 - 3. Unshielded, Nonpressure Transition Couplings:
 - a. Standard: ASTM C 1173.
 - b. Description: Elastomeric, sleeve-type, reducing or transition pattern. Include shear ring and corrosion-resistant-metal tension band and tightening mechanism on each end.
 - c. Sleeve Materials:
 - 1) For Cast-Iron Soil Pipes: ASTM C 564, rubber.
 - 2) For Plastic Pipes: ASTM F 477, elastomeric seal or ASTM D 5926, PVC.
 - 3) For Dissimilar Pipes: ASTM D 5926, PVC or other material compatible with pipe materials being joined.
 - 4. Shielded, Nonpressure Transition Couplings:

- a. Standard: ASTM C 1460.
- b. Description: Elastomeric or rubber sleeve with full-length, corrosion-resistant outer shield and corrosion-resistant-metal tension band and tightening mechanism on each end.

PART 3 - EXECUTION

3.01 PIPING INSTALLATION

- A. Drawing plans, schematics, and diagrams indicate general location and arrangement of piping systems. Indicated locations and arrangements were used to size pipe and calculate friction loss, expansion, pump sizing, and other design considerations. Install piping as indicated unless deviations from layout are approved on coordination drawings.
- B. Install piping in concealed locations unless otherwise indicated and except in equipment rooms and service areas.
- C. Install piping indicated to be exposed and piping in equipment rooms and service areas at right angles or parallel to building walls. Diagonal runs are prohibited unless specifically indicated otherwise.
- D. Install piping above accessible ceilings to allow sufficient space for ceiling panel removal.
- E. Install piping at indicated slopes.
- F. Install piping free of sags and bends.
- G. Install fittings for changes in direction and branch connections.
- H. Make changes in direction for storm drainage piping using appropriate branches, bends, and long-sweep bends. Do not change direction of flow more than 90 degrees. Use proper size of standard increasers and reducers if pipes of different sizes are connected. Reducing size of drainage piping in direction of flow is prohibited.
- I. Lay buried building storm drainage piping beginning at low point of each system. Install true to grades and alignment indicated, with unbroken continuity of invert. Place hub ends of piping upstream. Install required gaskets according to manufacturer's written instructions for use of lubricants, cements, and other installation requirements. Maintain swab in piping and pull past each joint as completed.
- J. Install storm drainage piping at the following minimum slopes unless otherwise indicated:
 1. Horizontal Storm-Drainage Piping: 1 percent downward in direction of flow.
- K. Install cast-iron soil piping according to CISPI's "Cast Iron Soil Pipe and Fittings Handbook," Chapter IV, "Installation of Cast Iron Soil Pipe and Fittings."

1. Install encasement on underground piping according to ASTM A 674 or AWWA C105.
 - L. Install aboveground copper tubing according to CDA's "Copper Tube Handbook."
 - M. Install aboveground PVC piping according to ASTM D 2665.
 - N. Install underground PVC piping according to ASTM D 2321.
 - O. Plumbing Specialties:
 1. Install backwater valves in storm drainage gravity-flow piping. Comply with requirements for backwater valves specified in Section 22 14 23 "Storm Drainage Piping Specialties."
 2. Install cleanouts at grade and extend to where building storm drains connect to building storm sewers in storm drainage gravity-flow piping. Install cleanout fitting with closure plug inside the building in storm drainage force-main piping. Comply with requirements for cleanouts specified in Section 22 14 23 "Storm Drainage Piping Specialties."
 3. Install drains in storm drainage gravity-flow piping. Comply with requirements for drains specified in Section 22 14 23 "Storm Drainage Piping Specialties."
 - P. Do not enclose, cover, or put piping into operation until it is inspected and approved by authorities having jurisdiction.
 - Q. Install sleeves for piping penetrations of walls, ceilings, and floors per requirements for sleeves specified in Section 22 05 17 "Sleeves and Sleeve Seals for Plumbing Piping."
 - R. Install sleeve seals for piping penetrations of concrete walls and slabs per requirements for sleeve seals specified in Section 22 05 17 "Sleeves and Sleeve Seals for Plumbing Piping."
 - S. Install escutcheons for piping penetrations of walls, ceilings, and floors per requirements for escutcheons specified in Section 22 05 18 "Escutcheons for Plumbing Piping."
- 3.02 JOINT CONSTRUCTION
- A. Join hub-and-spigot, cast-iron soil piping with gasketed joints according to CISPI's "Cast Iron Soil Pipe and Fittings Handbook" for compression joints.
 - B. Join hubless, cast-iron soil piping according to CISPI 310 and CISPI's "Cast Iron Soil Pipe and Fittings Handbook" for hubless-piping coupling joints.
 - C. Join copper tube and fittings with soldered joints according to ASTM B 828 procedure. Use ASTM B 813, water-flushable, lead-free flux and ASTM B 32, lead-free-alloy solder.

- D. Flanged Joints: Align bolt holes. Select appropriate gasket material, size, type, and thickness. Install gasket concentrically positioned. Use suitable lubricants on bolt threads. Torque bolts in cross pattern.
- E. Plastic, Nonpressure-Piping, Solvent-Cemented Joints: Clean and dry joining surfaces. Join pipe and fittings according to the following:
 - 1. Comply with ASTM F 402 for safe-handling practice of cleaners, primers, and solvent cements.
 - 2. ABS Piping: Join according to ASTM D 2235 and ASTM D 2661 Appendixes.
 - 3. PVC Piping: Join according to ASTM D 2855 and ASTM D 2665 Appendixes.

3.03 SPECIALTY PIPE FITTING INSTALLATION

- A. Transition Couplings:
 - 1. Install transition couplings at joints of piping with small differences in OD's.
 - 2. In Drainage Piping: Unshielded or Shielded, nonpressure transition couplings.

3.04 HANGER AND SUPPORT INSTALLATION

- A. Comply with requirements for seismic-restraint devices specified in Section 22 05 48 "Vibration and Seismic Controls for Plumbing Piping and Equipment."
- B. Comply with requirements for pipe hanger and support devices and installation specified in Section 22 05 29 "Hangers and Supports for Plumbing Piping and Equipment."
 - 1. Install carbon-steel pipe hangers for horizontal piping in noncorrosive environments.
 - 2. Install carbon-steel pipe support clamps for vertical piping in noncorrosive environments.
 - 3. Install stainless-steel pipe support clamps for vertical piping in corrosive environments.
 - 4. Vertical Piping: MSS Type 8 or Type 42, clamps.
 - 5. Individual, Straight, Horizontal Piping Runs:
 - a. **100 Feet** and Less: MSS Type 1, adjustable, steel clevis hangers.
 - b. Longer Than **100 Feet**: MSS Type 43, adjustable roller hangers.
 - c. Longer Than **100 Feet** if Indicated: MSS Type 49, spring cushion rolls.
 - 6. Multiple, Straight, Horizontal Piping Runs **100 Feet** or Longer: MSS Type 44, pipe rolls. Support pipe rolls on trapeze.
 - 7. Base of Vertical Piping: MSS Type 52, spring hangers.
- C. Support horizontal piping and tubing within **12 inches** of each fitting and coupling.
- D. Support vertical piping and tubing at base and at each floor.

- E. Rod diameter may be reduced one size for double-rod hangers, with **3/8-inch** minimum rods.
- F. Install hangers for cast-iron soil piping with the following maximum horizontal spacing and minimum rod diameters:
 - 1. **NPS 1-1/2 and NPS 2: 60 inches** with **3/8-inch** rod.
 - 2. **NPS 3: 60 inches** with **1/2-inch** rod.
 - 3. **NPS 4 and NPS 5: 60 inches** with **5/8-inch** rod.
 - 4. **NPS 6 and NPS 8: 60 inches** with **3/4-inch** rod.
- G. Install supports for vertical cast-iron soil piping every **15 feet**.
- H. Install hangers for PVC piping with the following maximum horizontal spacing and minimum rod diameters:
 - 1. **NPS 1-1/2 and NPS 2: 48 inches** with **3/8-inch** rod.
 - 2. **NPS 3: 48 inches** with **1/2-inch** rod.
 - 3. **NPS 4 and NPS 5: 48 inches** with **5/8-inch** rod.
- I. Install supports for vertical PVC piping every **48 inches**.
- J. Support piping and tubing not listed above according to MSS SP-69 and manufacturer's written instructions.

3.05 CONNECTIONS

- A. Drawings indicate general arrangement of piping, fittings, and specialties.
- B. Connect interior storm drainage piping to exterior storm drainage piping. Use transition fitting to join dissimilar piping materials.
- C. Connect storm drainage piping to roof drains and storm drainage specialties.
 - 1. Install test tees (wall cleanouts) in conductors near floor, and floor cleanouts with cover flush with floor.
- D. Where installing piping adjacent to equipment, allow space for service and maintenance of equipment.

3.06 IDENTIFICATION

- A. Identify exposed storm drainage piping. Comply with requirements for identification specified in Section 22 05 53 "Identification for Plumbing Piping and Equipment."

3.07 FIELD QUALITY CONTROL

- A. During installation, notify authorities having jurisdiction at least 24 hours before inspection must be made. Perform tests specified below in presence of authorities having jurisdiction.
 - 1. Roughing-in Inspection: Arrange for inspection of piping before concealing or closing-in after roughing-in.
 - 2. Final Inspection: Arrange for final inspection by authorities having jurisdiction to observe tests specified below and to ensure compliance with requirements.
- B. Reinspection: If authorities having jurisdiction find that piping will not pass test or inspection, make required corrections and arrange for reinspection.
- C. Reports: Prepare inspection reports and have them signed by authorities having jurisdiction.
- D. Test storm drainage piping according to procedures of authorities having jurisdiction or, in absence of published procedures, as follows:
 - 1. Test for leaks and defects in new piping and parts of existing piping that have been altered, extended, or repaired. If testing is performed in segments, submit separate report for each test, complete with diagram of portion of piping tested.
 - 2. Leave uncovered and unconcealed new, altered, extended, or replaced storm drainage piping until it has been tested and approved. Expose work that was covered or concealed before it was tested.
 - 3. Test Procedure: Test storm drainage piping on completion of roughing-in. Close openings in piping system and fill with water to point of overflow, but not less than **10-foot head of water**. From 15 minutes before inspection starts until completion of inspection, water level must not drop. Inspect joints for leaks.
 - 4. Repair leaks and defects with new materials and retest piping, or portion thereof, until satisfactory results are obtained.
 - 5. Prepare reports for tests and required corrective action.

3.08 CLEANING

- A. Clean interior of piping. Remove dirt and debris as work progresses.
- B. Protect drains during remainder of construction period to avoid clogging with dirt and debris and to prevent damage from traffic and construction work.
- C. Place plugs in ends of uncompleted piping at end of day and when work stops.

3.09 PIPING SCHEDULE

- A. Flanges and unions may be used on aboveground pressure piping unless otherwise indicated.
- B. Aboveground storm drainage piping shall be any of the following:

1. Service class, cast-iron soil pipe and fittings; gaskets; and gasketed joints.
2. Hubless, cast-iron soil pipe and fittings; CISPI hubless-piping couplings; and coupled joints.
3. Solid-wall PVC pipe, PVC socket fittings, and solvent-cemented joints.
4. Dissimilar Pipe-Material Couplings: Unshielded or Shielded, nonpressure transition couplings.

C. Underground storm drainage piping shall be any of the following:

1. Service class, cast-iron soil pipe and fittings; gaskets; and gasketed joints.
2. Hubless, cast-iron soil pipe and fittings; CISPI hubless-piping couplings; and coupled joints.
3. Solid-wall PVC pipe, PVC socket fittings, and solvent-cemented joints.
4. Dissimilar Pipe-Material Couplings: Unshielded or Shielded, nonpressure transition couplings.

END OF SECTION 22 14 13

SECTION 22 14 23
STORM DRAINAGE PIPING SPECIALTIES

PART 1 - GENERAL

1.01 SUMMARY

- A. Section Includes:
1. Roof drains.
 2. Miscellaneous storm drainage piping specialties.
 3. Cleanouts.
 4. Flashing materials.

1.02 SUBMITTALS

- A. Product Data: For each type of product indicated.

1.03 QUALITY ASSURANCE

- A. Drainage piping specialties shall bear label, stamp, or other markings of specified testing agency.

PART 2 - PRODUCTS

2.01 ROOF DRAINS

- A. General-Purpose Roof Drains RD and RD (O):
1. Standard: ASME A112.6.4, for general-purpose roof drains.
 2. Body Material: Cast iron.
 3. Dimension of Body: Nominal **14-inch** diameter.
 4. Combination Flashing Ring and Gravel Stop: Required.
 5. Flow-Control Weirs: Not required.
 6. Outlet: Bottom.
 7. Extension Collars: as required
 8. Underdeck Clamp: as required].
 9. Dome Material: Cast iron.
 10. Perforated Gravel Guard: Stainless steel
 11. Vandal-Proof Dome: Required.
 12. Water Dam: **2 inches** high on RD(O).

2.02 MISCELLANEOUS STORM DRAINAGE PIPING SPECIALTIES

A. Downspout Adaptors:

1. Description: Manufactured, gray-iron casting, for attaching to horizontal-outlet, parapet roof drain and to exterior, sheet metal downspout.
2. Size: Inlet size to match parapet drain outlet.

B. Downspout Boots:

1. Description: Manufactured, ASTM A 48/A 48M, gray-iron casting, with strap or ears for attaching to building; NPS 4 outlet; and shop-applied bituminous coating.
2. Size: Inlet size to match downspout and NPS 4 outlet.

C. Conductor Nozzles:

1. Description: Bronze body with threaded inlet and bronze wall flange with mounting holes.
2. Size: Same as connected conductor.

2.03 CLEANOUTS

A. Test Tees:

1. Standard: ASME A112.36.2M and ASTM A 74, ASTM A 888, or CISPI 301, for cleanout test tees.
2. Size: Same as connected drainage piping.
3. Body Material: Hub-and-spigot, cast-iron soil-pipe T-branch or hubless, cast-iron soil-pipe test tee as required to match connected piping.
4. Closure Plug: raised head, brass.
5. Closure Plug Size: Same as or not more than one size smaller than cleanout size.

B. Wall Cleanouts:

1. Standard: ASME A112.36.2M, for cleanouts. Include wall access.
2. Size: Same as connected drainage piping.
3. Body Material: Hub-and-spigot, cast-iron soil-pipe T-branch or Hubless, cast-iron soil-pipe test tee as required to match connected piping.
4. Closure: Countersunk or raised-head, cast-iron plug.
5. Closure Plug Size: Same as or not more than one size smaller than cleanout size.
6. Wall Access: Round, flat, chrome-plated brass or stainless-steel cover plate with screw.

2.04 FLASHING MATERIALS

A. Copper Sheet: ASTM B 152/B 152M, 12 oz./sq. ft.

B. Zinc-Coated Steel Sheet: ASTM A 653/A 653M, with 0.20 percent copper content and 0.04-inch minimum thickness unless otherwise indicated. Include G90 hot-dip galvanized, mill-phosphatized finish for painting if indicated.

- C. Elastic Membrane Sheet: ASTM D 4068, flexible, chlorinated polyethylene, 40-mil minimum thickness.
- D. Fasteners: Metal compatible with material and substrate being fastened.
- E. Metal Accessories: Sheet metal strips, clamps, anchoring devices, and similar accessory units required for installation; matching or compatible with material being installed.
- F. Solder: ASTM B 32, lead-free alloy.

PART 3 - EXECUTION

3.01 INSTALLATION

- A. Install roof drains at low points of roof areas according to roof membrane manufacturer's written installation instructions.
 - 1. Install flashing collar or flange of roof drain to prevent leakage between drain and adjoining roofing. Maintain integrity of waterproof membranes where penetrated.
 - 2. Install expansion joints, if indicated, in roof drain outlets.
 - 3. Position roof drains for easy access and maintenance.
- B. Install downspout adapters on outlet of back-outlet parapet roof drains and connect to sheet metal downspouts.
- C. Install downspout boots at grade with top 12 inches above grade. Secure to building wall.
- D. Install conductor nozzles at exposed bottom of conductors where they spill onto grade.
- E. Install cleanouts in aboveground piping and building drain piping according to the following instructions unless otherwise indicated:
 - 1. Use cleanouts the same size as drainage piping up to NPS 4. Use NPS 4 for larger drainage piping unless larger cleanout is indicated.
 - 2. Locate cleanouts at each change in direction of piping greater than 45 degrees.
 - 3. Locate cleanouts at base of each vertical soil and waste stack.
- F. For cleanouts located in concealed piping, install cleanout wall access covers, of types indicated, with frame and cover flush with finished wall.
- G. Install test tees in vertical conductors and near floor.
- H. Install wall cleanouts in vertical conductors. Install access door in wall if indicated.
- I. Install sleeve flashing device with each conductor passing through floors with waterproof membrane.

3.02 CONNECTIONS

- A. Comply with requirements for piping specified in Section 22 14 13 "Facility Storm Drainage Piping." Drawings indicate general arrangement of piping, fittings, and specialties.

3.03 FLASHING INSTALLATION

- A. Fabricate flashing from single piece of metal unless large pans, sumps, or other drainage shapes are required. Join flashing according to the following if required:
 - 1. Lead Sheets: Burn joints of 6.0-lb/sq. ft. lead sheets, 0.0938-inch thickness or thicker. Solder joints of 4.0-lb/sq. ft. lead sheets, 0.0625-inch thickness or thinner.
 - 2. Copper Sheets: Solder joints of copper sheets.
- B. Install sheet flashing on pipes, sleeves, and specialties passing through or embedded in floors and roofs with waterproof membrane.
 - 1. Pipe Flashing: Sleeve type, matching the pipe size, with a minimum length of 10 inches and with skirt or flange extending at least 8 inches around pipe.
 - 2. Sleeve Flashing: Flat sheet, with skirt or flange extending at least 8 inches around sleeve.
 - 3. Embedded Specialty Flashing: Flat sheet, with skirt or flange extending at least 8 inches around specialty.
- C. Set flashing on floors and roofs in solid coating of bituminous cement.
- D. Secure flashing into sleeve and specialty clamping ring or device.
- E. Fabricate and install flashing and pans, sumps, and other drainage shapes.

3.04 PROTECTION

- A. Protect drains during remainder of construction period to avoid clogging with dirt or debris and to prevent damage from traffic or construction work.
- B. Place plugs in ends of uncompleted piping at end of each day or when work stops.

END OF SECTION 22 14 23

SECTION 22 14 29**SUMP PUMPS**

PART 1 - GENERAL

1.01 SUMMARY

- A. Section Includes:
 - 1. Submersible sump pumps.

1.02 ACTION SUBMITTALS

- A. Product Data: For each type of product indicated.
- B. Wiring Diagrams: For power, signal, and control wiring.

1.03 CLOSEOUT SUBMITTALS

- A. Operation and maintenance data.

1.04 QUALITY ASSURANCE

- A. Electrical Components, Devices, and Accessories: Listed and labeled as defined in NFPA 70, by a qualified testing agency, and marked for intended location and application.
- B. UL Compliance: Comply with UL 778 for motor-operated water pumps.

PART 2 - PRODUCTS

2.01 SUBMERSIBLE SUMP PUMPS

- A. Submersible, Fixed-Position, Single-Seal Sump Pumps:
 - 1. Description: Factory-assembled and -tested sump-pump unit.
 - 2. Pump Type: Submersible, end-suction, single-stage, close-coupled, overhung-impeller, centrifugal sump pump as defined in HI 1.1-1.2 and HI 1.3.
 - 3. Pump Casing: Cast iron, with strainer inlet, legs that elevate pump to permit flow into impeller, and vertical discharge for piping connection.
 - 4. Impeller: Statically and dynamically balanced, ASTM A 532/A 532M, abrasion-resistant cast iron design for clear wastewater handling, and keyed and secured to shaft.

5. Pump and Motor Shaft: Stainless steel, with factory-sealed, grease-lubricated ball bearings.
6. Seal: Mechanical.
7. Motor: Hermetically sealed, capacitor-start type; with built-in overload protection; lifting eye or lug; and three-conductor, waterproof power cable of length required and with grounding plug and cable-sealing assembly for connection at pump.
 - a. Motor Housing Fluid: Oil.
8. Capacity: As scheduled on drawings.
9. Controls:
 - a. Enclosure: NEMA 250, Type 4X.
 - b. Switch Type: Pedestal-mounted float switch with float rods and rod buttons.
 - c. Automatic Alternator: Start pumps on successive cycles and start multiple pumps if one cannot handle load.
 - d. Float Guides: Pipe or other restraint for floats and rods in basins of depth greater than 60 inches (1500 mm).
 - e. High-Water Alarm: Cover-mounted, compression-probe alarm, with electric bell; 120-V ac, with transformer and contacts for remote alarm bell.
10. Control-Interface Features:
 - a. Remote Alarm Contacts: For remote alarm interface.
 - b. Building Automation System Interface: Auxiliary contacts in pump controls for interface to building automation system and capable of providing the following:
 - 1) On-off status of pump.
 - 2) Alarm status.

2.02 MOTORS

- A. Comply with NEMA designation, temperature rating, service factor, enclosure type, and efficiency requirements for motors specified in Section 22 05 13 "Common Motor Requirements for Plumbing Equipment."
 1. Motor Sizes: Minimum size as indicated. If not indicated, large enough so driven load will not require motor to operate in service factor range above 1.0.
- B. Motors for submersible pumps shall be hermetically sealed.

PART 3 - EXECUTION

3.01 INSTALLATION

- A. Pump Installation Standard: Comply with HI 1.4 for installation of sump pumps.

END OF SECTION 22 14 29

SECTION 22 34 00**FUEL-FIRED, DOMESTIC-WATER HEATERS**

PART 1 - GENERAL

1.01 SUMMARY

- A. Section Includes:
 - 1. Commercial, condensing, gas-fired, storage, domestic-water heaters.
 - 2. Domestic-water heater accessories.

1.02 PERFORMANCE REQUIREMENTS

- A. Seismic Performance: Commercial domestic-water heaters shall withstand the effects of earthquake motions determined according to ASCE/SEI 7.
 - 1. The term "withstand" means "the unit will remain in place without separation of any parts from the device when subjected to the seismic forces specified and the unit will be fully operational after the seismic event."

1.03 SUBMITTALS

- A. Product Data: For each type and size of domestic-water heater indicated.
- B. LEED Submittals:
 - 1. Product Data for Prerequisite EA 2: Documentation indicating that units comply with applicable requirements in ASHRAE/IESNA 90.1, Section 7, "Service Water Heating."
- C. Shop Drawings:
 - 1. Wiring Diagrams: For power, signal, and control wiring.
- D. Seismic Qualification Certificates: For fuel-fired, domestic-water heaters, accessories, and components, from manufacturer.
- E. Product certificates.
- F. Domestic-Water Heater Labeling: Certified and labeled by testing agency acceptable to authorities having jurisdiction.
- G. Source quality-control reports.
- H. Field quality-control reports.
- I. Warranty: Sample of special warranty.

- J. Operation and maintenance data.

1.04 QUALITY ASSURANCE

- A. Electrical Components, Devices, and Accessories: Listed and labeled as defined in NFPA 70, by a qualified testing agency, and marked for intended location and application.
- B. ASHRAE/IESNA Compliance: Fabricate and label fuel-fired, domestic-water heaters to comply with ASHRAE/IESNA 90.1.
- C. ASME Compliance:
1. Where ASME-code construction is indicated, fabricate and label commercial, domestic-water heater storage tanks to comply with ASME Boiler and Pressure Vessel Code: Section VIII, Division 1.
 2. Where ASME-code construction is indicated, fabricate and label commercial, finned-tube, domestic-water heaters to comply with ASME Boiler and Pressure Vessel Code: Section IV.
- D. NSF Compliance: Fabricate and label equipment components that will be in contact with potable water to comply with NSF 61, "Drinking Water System Components - Health Effects."

1.05 WARRANTY

- A. Special Warranty: Manufacturer's standard form in which manufacturer agrees to repair or replace components of fuel-fired, domestic-water heaters that fail in materials or workmanship within specified warranty period.
1. Warranty Periods: From date of Substantial Completion.
 - a. Commercial, Gas-Fired, Storage, Domestic-Water Heaters:
 - 1) Storage Tank: Five years.
 - 2) Controls and Other Components: One year(s).
 - b. Commercial, Finned-Tube, Gas-Fired, Domestic-Water Heaters:
 - 1) Heat Exchanger: Five years.
 - 2) Controls and Other Components: One year(s).
 - 3) Separate Hot-Water Storage Tanks: Three years.
 - c. Compression Tanks: Five years.

PART 2 - PRODUCTS

- A. Commercial, Power-Burner, Gas-Fired, Storage, Domestic-Water Heaters:
1. Standard: ANSI Z21.10.3/CSA 4.3.
 2. Storage-Tank Construction: ASME-code steel with 150-psig (1035-kPa) working-pressure rating.

- a. Tappings: Factory fabricated of materials compatible with tank. Attach tappings to tank before testing.
 - 1) **NPS 2 (DN 50)** and Smaller: Threaded ends according to ASME B1.20.1.
 - 2) **NPS 2-1/2 (DN 65)** and Larger: Flanged ends according to ASME B16.5 for steel and stainless-steel flanges and according to ASME B16.24 for copper and copper-alloy flanges.
 - b. Interior Finish: Comply with NSF 61 barrier materials for potable-water tank linings, including extending finish into and through tank fittings and outlets.
 - c. Lining: Nickel plate, Phenolic coating or Sheet copper complying with NSF 61 barrier materials for potable-water tank linings, including extending lining into and through tank fittings and outlets.
3. Factory-Installed Storage-Tank Appurtenances:
- a. Anode Rod: Replaceable magnesium.
 - b. Dip Tube: Required unless cold-water inlet is near bottom of tank.
 - c. Drain Valve: Corrosion-resistant metal complying with ASSE 1005.
 - d. Insulation: Comply with ASHRAE/IESNA 90.1. Surround entire storage tank except connections and controls.
 - e. Jacket: Steel with enameled finish.
 - f. Burner: UL 795 for power-burner, gas-fired, domestic-water heaters and natural-gas fuel.
 - g. Automatic Ignition: ANSI Z21.20/CSA C22.2 No. 199, electric, automatic, gas-ignition system.
 - h. Temperature Control: Adjustable thermostat.
 - i. Safety Controls: Automatic, high-temperature-limit and low-water cutoff devices or systems.
 - j. Combination Temperature-and-Pressure Relief Valves: ANSI Z21.22/CSA 4.4-M. Include one or more relief valves with total relieving capacity at least as great as heat input, and include pressure setting less than domestic-water heater working-pressure rating. Select one relief valve with sensing element that extends into storage tank.
4. Special Requirements: NSF 5 construction.
5. High Efficiency (90% Plus) condensing type.

2.02 WATER HEATER ACCESSORIES

A. Domestic-Water Compression Tanks:

1. Description: Steel, pressure-rated tank constructed with welded joints and factory-installed butyl-rubber diaphragm. Include air precharge to minimum system-operating pressure at tank.
2. Construction:
 - a. Tappings: Factory-fabricated steel, welded to tank before testing and labeling. Include ASME B1.20.1 pipe thread.
 - b. Interior Finish: Comply with NSF 61 barrier materials for potable-water tank linings, including extending finish into and through tank fittings and outlets.
 - c. Air-Charging Valve: Factory installed.

-
3. Capacity and Characteristics:
 - a. Working-Pressure Rating: 100 psig (690 kPa).
 - b. Capacity Acceptable: 10 gal. (37.9 L minimum).
 - c. Air Precharge Pressure: as recommended by MFR.
 - B. Drain Pans: Corrosion-resistant metal with raised edge. Comply with ANSI/CSA LC 3. Include dimensions not less than base of domestic-water heater, and include drain outlet not less than NPS 3/4 (DN 20) with ASME B1.20.1 pipe threads or with ASME B1.20.7 garden-hose threads.
 - C. Piping-Type Heat Traps: Field-fabricated piping arrangement according to ASHRAE/IESNA 90.1.
 - D. Heat-Trap Fittings: ASHRAE 90.2.
 - E. Gas Shutoff Valves: ANSI Z21.15/CSA 9.1-M, manually operated. Furnish for installation in piping.
 - F. Gas Pressure Regulators: ANSI Z21.18/CSA 6.3, appliance type. Include 1/2-psig (3.5-kPa) pressure rating as required to match gas supply.
 - G. Automatic Gas Valves: ANSI Z21.21/CSA 6.5, appliance, electrically operated, on-off automatic valve.
 - H. Combination Temperature-and-Pressure Relief Valves: Include relieving capacity at least as great as heat input, and include pressure setting less than domestic-water heater working-pressure rating. Select relief valves with sensing element that extends into storage tank.
 1. Gas-Fired, Domestic-Water Heaters: ANSI Z21.22/CSA 4.4-M.
 2. Oil-Fired, Domestic-Water Heaters: ASME rated and stamped.
 - I. Pressure Relief Valves: Include pressure setting less than domestic-water heater working-pressure rating.
 1. Gas-Fired, Domestic-Water Heaters: ANSI Z21.22/CSA 4.4-M.
 2. Oil-Fired, Domestic-Water Heaters: ASME rated and stamped.
 - J. Vacuum Relief Valves: ANSI Z21.22/CSA 4.4-M.
 - K. Domestic-Water Heater Stands: Manufacturer's factory-fabricated steel stand for floor mounting, capable of supporting domestic-water heater and water. Provide dimension that will support bottom of domestic-water heater a minimum of 18 inches (457 mm) above the floor.
- 2.03 SOURCE QUALITY CONTROL
- A. Factory Tests: Test and inspect assembled domestic-water heaters specified to be ASME-code construction, according to ASME Boiler and Pressure Vessel Code.

- B. Hydrostatically test commercial domestic-water heaters to minimum of one and one-half times pressure rating before shipment.
- C. Domestic-water heaters will be considered defective if they do not pass tests and inspections. Comply with requirements in Section 01 40 00 "Quality Requirements" for retesting and reinspecting requirements and Section 01 73 00 "Execution" for requirements for correcting the Work.
- D. Prepare test and inspection reports.

PART 3 - EXECUTION

3.01 WATER HEATER INSTALLATION

- A. Commercial, Domestic-Water Heater Mounting: Install commercial domestic-water heaters on concrete base. Comply with requirements for concrete base specified in Section 03 30 00 "Cast-in-Place Concrete."
 - 1. Maintain manufacturer's recommended clearances.
 - 2. Arrange units so controls and devices that require servicing are accessible.
 - 3. Install dowel rods to connect concrete base to concrete floor. Unless otherwise indicated, install dowel rods on **18-inch (450-mm)** centers around the full perimeter of concrete base.
 - 4. For supported equipment, install epoxy-coated anchor bolts that extend through concrete base and anchor into structural concrete floor.
 - 5. Place and secure anchorage devices. Use setting drawings, templates, diagrams, instructions, and directions furnished with items to be embedded.
 - 6. Install anchor bolts to elevations required for proper attachment to supported equipment.
 - 7. Anchor domestic-water heaters to substrate.
- B. Install domestic-water heaters level and plumb, according to layout drawings, original design, and referenced standards. Maintain manufacturer's recommended clearances. Arrange units so controls and devices needing service are accessible.
 - 1. Install shutoff valves on domestic-water-supply piping to domestic-water heaters and on domestic-hot-water outlet piping. Comply with requirements for shutoff valves specified in Section 22 05 23.12 "Ball Valves for Plumbing Piping," Section 22 05 23.13 "Butterfly Valves for Plumbing Piping," and Section 22 05 23.15 "Gate Valves for Plumbing Piping."
- C. Install gas-fired, domestic-water heaters according to NFPA 54.
 - 1. Install gas shutoff valves on gas supply piping to gas-fired, domestic-water heaters without shutoff valves.
 - 2. Install gas pressure regulators on gas supplies to gas-fired, domestic-water heaters without gas pressure regulators if gas pressure regulators are required to reduce gas pressure at burner.

3. Install automatic gas valves on gas supplies to gas-fired, domestic-water heaters if required for operation of safety control.
 4. Comply with requirements for gas shutoff valves, gas pressure regulators, and automatic gas valves specified in Section 23 11 23 "Facility Natural-Gas Piping."
- D. Install oil-fired, domestic-water heaters according to NFPA 31.
1. Install shutoff valves on fuel-oil supply piping to oil-fired water-heater burners without shutoff valves. Comply with requirements for shutoff valves specified in Section 23 05 23 "General-Duty Valves for HVAC Piping."
- E. Install commercial domestic-water heaters with seismic-restraint devices. Comply with requirements for seismic-restraint devices specified in Section 22 05 48 "Vibration and Seismic Controls for Plumbing Piping and Equipment."
- F. Install combination temperature-and-pressure relief valves in top portion of storage tanks. Use relief valves with sensing elements that extend into tanks. Extend commercial-water-heater relief-valve outlet, with drain piping same as domestic-water piping in continuous downward pitch, and discharge by positive air gap onto closest floor drain.
- G. Install combination temperature-and-pressure relief valves in water piping for domestic-water heaters without storage. Extend commercial-water-heater relief-valve outlet, with drain piping same as domestic-water piping in continuous downward pitch, and discharge by positive air gap onto closest floor drain.
- H. Install water-heater drain piping as indirect waste to spill by positive air gap into open drains or over floor drains. Install hose-end drain valves at low points in water piping for domestic-water heaters that do not have tank drains. Comply with requirements for hose-end drain valves specified in Section 22 11 19 "Domestic Water Piping Specialties."
- I. Install thermometer on outlet piping of domestic-water heaters. Comply with requirements for thermometers specified in Section 22 05 19 "Meters and Gages for Plumbing Piping."
- J. Install piping-type heat traps on inlet and outlet piping of domestic-water heater storage tanks without integral or fitting-type heat traps.
- K. Fill domestic-water heaters with water.
- L. Charge domestic-water compression tanks with air.
- 3.02 CONNECTIONS
- A. Comply with requirements for domestic-water piping specified in Section 22 11 16 "Domestic Water Piping."
 - B. Comply with requirements for gas piping specified in Section 23 11 23 "Facility Natural-Gas Piping."

- C. Drawings indicate general arrangement of piping, fittings, and specialties.
- D. Where installing piping adjacent to fuel-fired, domestic-water heaters, allow space for service and maintenance of water heaters. Arrange piping for easy removal of domestic-water heaters.

3.03 IDENTIFICATION

- A. Identify system components. Comply with requirements for identification specified in Section 22 05 53 "Identification for Plumbing Piping and Equipment."

3.04 FIELD QUALITY CONTROL

- A. Perform tests and inspections.
 - 1. Manufacturer's Field Service: Engage a factory-authorized service representative to inspect components, assemblies, and equipment installations, including connections, and to assist in testing.
 - 2. Leak Test: After installation, charge system and test for leaks. Repair leaks and retest until no leaks exist.
 - 3. Operational Test: After electrical circuitry has been energized, start units to confirm proper operation.
 - 4. Test and adjust controls and safeties. Replace damaged and malfunctioning controls and equipment.
- B. Domestic-water heaters will be considered defective if they do not pass tests and inspections. Comply with requirements in Section 01 40 00 "Quality Requirements" for retesting and reinspecting requirements and Section 01 73 00 "Execution" for requirements for correcting the Work.
- C. Prepare test and inspection reports.

3.05 DEMONSTRATION

- A. Engage a factory-authorized service representative to train Owner's maintenance personnel to adjust, operate, and maintain domestic-water heaters.

END OF SECTION 22 34 00

SECTION 22 42 13.13
COMMERCIAL WATER CLOSETS

PART 1 - GENERAL

1.01 SUMMARY

- A. Section Includes:
1. Water closets.
 2. Flushometer valves.
 3. Toilet seats.

1.02 SUBMITTALS

- A. Product Data: For each type of product.
- B. LEED Submittals:
1. Product Data for Prerequisite WE 1, Credit WE 2, and Credit WE 3: Documentation indicating flow and water consumption requirements.
- C. Shop Drawings: Include diagrams for power, signal, and control wiring.
- D. Operation and Maintenance Data: For flushometer valves and electronic sensors to include in operation and maintenance manuals.

PART 2 - PRODUCTS

2.01 FLOOR-MOUNTED, BOTTOM-OUTLET WATER CLOSETS

2.02 WALL-MOUNTED WATER CLOSETS

- A. Water Closets (WC-1): Wall mounted, top spud.
1. Bowl:
 - a. Standards: ASME A112.19.2/CSA B45.1 and ASME A112.19.5.
 - b. Material: Vitreous china.
 - c. Type: Siphon jet.
 - d. Style: Flushometer valve.
 - e. Height: Standard.
 - f. Rim Contour: Elongated.
 - g. Water Consumption: 1.28 gal. (4.8 L) per flush.
 - h. Spud Size and Location: NPS 1-1/2 (DN 40); top.

2. Flushometer Valve: as specified herein
3. Toilet Seat: as specified herein.
4. Support:
 - a. Standard: ASME A112.6.1M.
 - b. Description: Waste-fitting assembly, as required to match drainage piping material and arrangement with faceplates, couplings gaskets, and feet; bolts and hardware matching fixture.

B. Water Closets (WCH-1): Wall mounted, top spud, accessible.

1. Bowl:
 - a. Standards: ASME A112.19.2/CSA B45.1 and ASME A112.19.5.
 - b. Material: Vitreous china.
 - c. Type: Siphon jet.
 - d. Style: Flushometer valve.
 - e. Rim Contour: Elongated.
 - f. Water Consumption: 1.28 gal. (4.8 L) per flush.
 - g. Spud Size and Location: NPS 1-1/2 (DN 40); top.
2. Flushometer Valve: as specified herein
3. Toilet Seat: as specified herein.
4. Support:
 - a. Standard: ASME A112.6.1M.
 - b. Description: Waste-fitting assembly, as required to match drainage piping material and arrangement with faceplates, couplings gaskets, and feet; bolts and hardware matching fixture.
 - c. Water-Closet Mounting Height: Handicapped/elderly according to ICC/ANSI A117.1.

2.03 FLUSHOMETER VALVES

A. Battery-Powered, Solenoid-Actuator, Piston Flushometer Valves:

1. Standard: ASSE 1037.
2. Minimum Pressure Rating: 125 psig.
3. Features: Include integral check stop and backflow-prevention device.
4. Material: Brass body with corrosion-resistant components.
5. Exposed Flushometer-Valve Finish: Chrome plated.
6. Style: Exposed.
7. Actuator: Solenoid complying with UL 1951; listed and labeled as defined in NFPA 70, by a qualified testing agency; and marked for intended location and application.
8. Trip Mechanism: Battery-powered electronic sensor complying with UL 1951; listed and labeled as defined in NFPA 70, by a qualified testing agency; and marked for intended location and application.
9. Consumption: 1.28. gallon per flush.
10. Minimum Inlet: NPS 1.
11. Minimum Outlet: NPS 1-1/4.

2.04 TOILET SEATS

A. Toilet Seats:

1. Standard: IAPMO/ANSI Z124.5.
2. Material: Plastic.
3. Type: Commercial (Standard).
4. Shape: Elongated rim, open front.
5. Hinge: Check.
6. Hinge Material: Noncorroding metal.
7. Seat Cover: Not required.
8. Color: White.

PART 3 - EXECUTION

3.01 INSTALLATION

A. Water-Closet Installation:

1. Install level and plumb according to roughing-in drawings.
2. Install accessible, wall-mounted water closets at mounting height for handicapped/elderly, according to ICC/ANSI A117.1.

B. Support Installation:

1. Use carrier supports with waste-fitting assembly and seal.
2. Install wall-mounted, back-outlet water-closet supports with waste-fitting assembly and waste-fitting seals; and affix to building substrate.

C. Flushometer-Valve Installation:

1. Install flushometer-valve, water-supply fitting on each supply to each water closet.
2. Attach supply piping to supports or substrate within pipe spaces behind fixtures.
3. Install actuators in locations that are easy for people with disabilities to reach.

D. Install toilet seats on water closets.

E. Wall Flange and Escutcheon Installation:

1. Install wall flanges or escutcheons at piping wall penetrations in exposed, finished locations and within cabinets and millwork.
2. Install deep-pattern escutcheons if required to conceal protruding fittings.
3. Comply with escutcheon requirements specified in Section 22 05 18 "Escutcheons for Plumbing Piping."

F. Joint Sealing:

1. Seal joints between water closets and walls and floors using sanitary-type, one-part, mildew-resistant silicone sealant.
2. Match sealant color to water-closet color.
3. Comply with sealant requirements specified in Section 07 92 00 "Joint Sealants."

3.02 CONNECTIONS

- A. Connect water closets with water supplies and soil, waste, and vent piping. Use size fittings required to match water closets.
- B. Comply with water piping requirements specified in Section 22 11 16 "Domestic Water Piping."
- C. Comply with soil and waste piping requirements specified in Section 22 13 16 "Sanitary Waste and Vent Piping."
- D. Where installing piping adjacent to water closets, allow space for service and maintenance.

3.03 ADJUSTING

- A. Operate and adjust water closets and controls. Replace damaged and malfunctioning water closets, fittings, and controls.
- B. Adjust water pressure at flushometer valves to produce proper flow.

3.04 CLEANING AND PROTECTION

- A. Clean water closets and fittings with manufacturers' recommended cleaning methods and materials.
- B. Install protective covering for installed water closets and fittings.
- C. Do not allow use of water closets for temporary facilities unless approved in writing by Owner.

END OF SECTION 22 42 13.13

SECTION 22 42 13.16
COMMERCIAL URINALS

PART 1 - GENERAL

1.01 SUMMARY

- A. Section Includes:
1. Urinals.
 2. Flushometer valves.

1.02 SUBMITTALS

- A. Product Data: For each type of product.
- B. LEED Submittals:
1. Product Data for Prerequisite WE 1, Credit WE 2, and Credit WE 3: Documentation indicating flow and water consumption requirements.
- C. Shop Drawings: Include diagrams for power, signal, and control wiring.
- D. Operation and Maintenance Data: For flushometer valves and electronic sensors to include in operation and maintenance manuals.

PART 2 - PRODUCTS

2.01 WALL-HUNG URINALS

- A. Urinals (U-1): Wall hung, back outlet, siphon jet, accessible.
1. Fixture:
 - a. Standards: ASME A112.19.2/CSA B45.1 and ASME A112.19.5.
 - b. Material: Vitreous china.
 - c. Type: Siphon jet with extended shields].
 - d. Strainer or Trapway: Manufacturer's standard strainer with integral trap.
 - e. Water Consumption: Low.
 - f. Spud Size and Location: **NPS 3/4**; top.
 - g. Outlet Size and Location: **NPS 2**; back.
 - h. Color: White.
 2. Flushometer Valve: As specified herein
 3. Waste Fitting:
 - a. Standard: ASME A112.18.2/CSA B125.2 for coupling.
 - b. Size: **NPS 2**.

4. Support: ASME A112.6.1M, Type I, urinal carrier with fixture support plates and coupling with seal and fixture bolts and hardware matching fixture. Include rectangular, steel uprights.

2.02 URINAL FLUSHOMETER VALVES

A. Solenoid-Actuator, Diaphragm Flushometer Valves:

1. Standard: ASSE 1037.
2. Minimum Pressure Rating: 125 psig (860 kPa).
3. Features: Include integral check stop and backflow-prevention device.
4. Material: Brass body with corrosion-resistant components.
5. Exposed Flushometer-Valve Finish: Chrome plated.
6. Style: Exposed.
7. Actuator: Solenoid complying with UL 1951; listed and labeled as defined in NFPA 70, by a qualified testing agency; and marked for intended location and application.
8. Trip Mechanism: Battery-powered, electronic sensor complying with UL 1951; listed and labeled as defined in NFPA 70, by a qualified testing agency; and marked for intended location and application.
9. Consumption: 0.5 gal. (1.9 L) per flush.
10. Minimum Inlet: NPS 3/4 (DN 20).
11. Minimum Outlet: NPS 3/4 (DN 20).

B. Battery-Powered, Solenoid-Actuator, Piston Flushometer Valve:

1. Standard: ASSE 1037.
2. Minimum Pressure Rating: 125 psig.
3. Features: Include integral check stop and backflow-prevention device.
4. Material: Brass body with corrosion-resistant components.
5. Exposed Flushometer-Valve Finish: Chrome plated.
6. Style: Exposed.
7. Actuator: Solenoid complying with UL 1951; listed and labeled as defined in NFPA 70, by a qualified testing agency; and marked for intended location and application.
8. Trip Mechanism: Battery-powered electronic sensor complying with UL 1951; listed and labeled as defined in NFPA 70, by a qualified testing agency; and marked for intended location and application.
9. Consumption: 0.5 gal. per flush.
10. Minimum Inlet: NPS 3/4.
11. Minimum Outlet: NPS 3/4.

PART 3 - EXECUTION

3.01 EXAMINATION

- A. Examine roughing-in of water supply and sanitary drainage and vent piping systems to verify actual locations of piping connections before urinal installation.
- B. Examine walls and floors for suitable conditions where urinals will be installed.

- C. Proceed with installation only after unsatisfactory conditions have been corrected.

3.02 INSTALLATION

A. Urinal Installation:

1. Install urinals level and plumb according to roughing-in drawings.
2. Install wall-hung, back-outlet urinals onto waste fitting seals and attached to supports.
3. Install accessible, wall-mounted urinals at mounting height for the handicapped/elderly, according to ICC/ANSI A117.1.

B. Support Installation:

1. Install supports, affixed to building substrate, for wall-hung urinals.
2. Use chair-type carrier supports with rectangular steel uprights for accessible urinals.

C. Flushometer-Valve Installation:

1. Install flushometer-valve water-supply fitting on each supply to each urinal.
2. Attach supply piping to supports or substrate within pipe spaces behind fixtures.
3. Install fresh batteries in battery-powered, electronic-sensor mechanisms.

D. Wall Flange and Escutcheon Installation:

1. Install wall flanges or escutcheons at piping wall penetrations in exposed, finished locations.
2. Install deep-pattern escutcheons if required to conceal protruding fittings.
3. Comply with escutcheon requirements specified in Section 22 05 18 "Escutcheons for Plumbing Piping."

E. Joint Sealing:

1. Seal joints between urinals and walls and floors using sanitary-type, one-part, mildew-resistant silicone sealant.
2. Match sealant color to urinal color.
3. Comply with sealant requirements specified in Section 07 92 00 "Joint Sealants."

3.03 CONNECTIONS

- A. Connect urinals with water supplies and soil, waste, and vent piping. Use size fittings required to match urinals.
- B. Comply with water piping requirements specified in Section 22 11 16 "Domestic Water Piping."
- C. Comply with soil and waste piping requirements specified in Section 22 13 16 "Sanitary Waste and Vent Piping."
- D. Where installing piping adjacent to urinals, allow space for service and maintenance.

3.04 ADJUSTING

- A. Operate and adjust urinals and controls. Replace damaged and malfunctioning urinals, fittings, and controls.
- B. Adjust water pressure at flushometer valves to produce proper flow.

3.05 CLEANING AND PROTECTION

- A. Clean urinals and fittings with manufacturers' recommended cleaning methods and materials.
- B. Install protective covering for installed urinals and fittings.
- C. Do not allow use of urinals for temporary facilities unless approved in writing by Owner.

END OF SECTION 22 42 13.16

SECTION 22 42 16.13
COMMERCIAL LAVATORIES

PART 1 - GENERAL

1.01 SUMMARY

A. Section Includes:

1. Lavatories.
2. Faucets.

1.02 SUBMITTALS

A. Product Data: For each type of product.

B. LEED Submittals:

1. Product Data for Prerequisite WE 1, Credit WE 2, and Credit WE 3: Documentation indicating flow and water consumption requirements.

C. Shop Drawings: Include diagrams for power, signal, and control wiring of automatic faucets.

D. Operation and Maintenance Data: For lavatories and faucets to include in operation and maintenance manuals.

PART 2 - PRODUCTS

2.01 VITREOUS-CHINA, COUNTER-MOUNTED LAVATORIES

A. Lavatory (L-1): Oval, self rimming, vitreous china, counter mounted.

1. Fixture:

- a. Standard: ASME A112.19.2/CSA B45.1.
- b. Type: Self-rimming for above-counter mounting.
- c. Nominal Size: Oval, 20 by 17 inches (508 by 432 mm).
- d. Faucet-Hole Punching: One hole.
- e. Faucet-Hole Location: Top.
- f. Color: White.
- g. Mounting Material: Sealant.

2. Faucet: Combination mixing sensor operated as scheduled on drawings.

2.02 SUPPLY FITTINGS

- A. NSF Standard: Comply with NSF/ANSI 61, "Drinking Water System Components - Health Effects," for supply-fitting materials that will be in contact with potable water.
- B. Standard: ASME A112.18.1/CSA B125.1.
- C. Supply Piping: Chrome-plated-brass pipe or chrome-plated copper tube matching water-supply piping size. Include chrome-plated-brass or stainless-steel wall flange.
- D. Supply Stops: Chrome-plated-brass, one-quarter-turn, ball-type or compression valve with inlet connection matching supply piping.
- E. Operation: Loose key.
- F. Risers:
 - 1. NPS 3/8 (DN 10).
 - 2. Chrome-plated, soft-copper flexible tube or ASME A112.18.6, braided- or corrugated-stainless-steel, flexible hose riser.

2.03 WASTE FITTINGS

- A. Standard: ASME A112.18.2/CSA B125.2.
- B. Drain: Grid type with NPS 1-1/4 (DN 32) offset and straight tailpiece.
- C. Trap:
 - 1. Size: NPS 1-1/4 (DN 32).
 - 2. Material: Chrome-plated, two-piece, cast-brass trap and swivel elbow with 0.032-inch- (0.83-mm-) thick brass tube to wall or two-piece, cast-brass trap and ground-joint swivel elbow with 0.032-inch- (0.83-mm-) thick brass tube to wall; and chrome-plated, brass or steel wall flange.
 - 3. Material: Stainless-steel, two-piece trap and swivel elbow with 0.012-inch- (0.30-mm-) thick stainless-steel tube to wall; and stainless-steel wall flange.

PART 3 - EXECUTION

3.01 EXAMINATION

- A. Examine roughing-in of water supply and sanitary drainage and vent piping systems to verify actual locations of piping connections before lavatory installation.
- B. Examine counters and walls for suitable conditions where lavatories will be installed.
- C. Proceed with installation only after unsatisfactory conditions have been corrected.

3.02 INSTALLATION

- A. Install lavatories level and plumb according to roughing-in drawings.
- B. Install supports, affixed to building substrate, for wall-mounted lavatories.
- C. Install accessible wall-mounted lavatories at handicapped/elderly mounting height for people with disabilities or the elderly, according to ICC/ANSI A117.1.
- D. Install wall flanges or escutcheons at piping wall penetrations in exposed, finished locations. Use deep-pattern escutcheons if required to conceal protruding fittings. Comply with escutcheon requirements specified in Section 22 05 18 "Escutcheons for Plumbing Piping."
- E. Seal joints between lavatories and counters and walls using sanitary-type, one-part, mildew-resistant silicone sealant. Match sealant color to fixture color. Comply with sealant requirements specified in Section 07 92 00 "Joint Sealants."
- F. Install protective shielding pipe covers and enclosures on exposed supplies and waste piping of accessible lavatories. Comply with requirements in Section 22 07 19 "Plumbing Piping Insulation."

3.03 CONNECTIONS

- A. Connect fixtures with water supplies, stops, and risers, and with traps, soil, waste, and vent piping. Use size fittings required to match fixtures.
- B. Comply with water piping requirements specified in Section 22 11 16 "Domestic Water Piping."
- C. Comply with soil and waste piping requirements specified in Section 22 13 16 "Sanitary Waste and Vent Piping."

3.04 ADJUSTING

- A. Operate and adjust lavatories and controls. Replace damaged and malfunctioning lavatories, fittings, and controls.
- B. Adjust water pressure at faucets to produce proper flow.
- C. Install fresh batteries in battery-powered, electronic-sensor mechanisms.

3.05 CLEANING AND PROTECTION

- A. After completing installation of lavatories, inspect and repair damaged finishes.
- B. Clean lavatories, faucets, and other fittings with manufacturers' recommended cleaning methods and materials.
- C. Provide protective covering for installed lavatories and fittings.

D. Do not allow use of lavatories for temporary facilities unless approved in writing by Owner.

END OF SECTION 22 42 16.13

SECTION 22 42 16.16**COMMERCIAL SINKS**

PART 1 - GENERAL

1.01 RELATED DOCUMENTS

- A. Drawings and general provisions of the Contract, including General and Supplementary Conditions and Division 01 Specification Sections, apply to this Section.

1.02 SUMMARY

- A. Section Includes:
 - 1. Service basins.
 - 2. Service sinks.
 - 3. Utility sinks.
 - 4. Sink faucets.
 - 5. Laminar-flow, faucet-spout outlets.
 - 6. Supply fittings.
 - 7. Waste fittings.

1.03 SUBMITTALS

- A. Product Data: For each type of product.
 - 1. Include construction details, material descriptions, dimensions of individual components and profiles, and finishes for sinks.
 - 2. Include rated capacities, operating characteristics, electrical characteristics, and furnished specialties and accessories.
- B. LEED Submittals:
 - 1. Product Data for Prerequisite WE 1, Credit WE 2, and Credit WE 3: Documentation indicating flow and water consumption requirements.
- C. Maintenance Data: For sinks to include in maintenance manuals.

PART 2 - PRODUCTS

2.01 MOP SINKS

- A. Mop Sink (MS-1): Molded stone or cast polymer, floor mounted.
 - 1. Fixture:

- a. Standard: IAPMO PS 99.
 - b. Shape: Rectangular.
 - c. Nominal Size: 24 by 36 inches (610 by 915 mm)]
 - d. Height: 12 inches (305 mm).
 - e. Tiling Flange: Not required.
 - f. Rim Guard: On all top surfaces.
 - g. Drain: Grid with NPS 3 (DN 80) outlet.
2. Mounting: On floor and flush to wall.
 3. Faucet: Wall mounted service sink type faucet with support bracket, pail hook, spout hose. Provide individual wall mounted mop support.

2.02 BREAK ROOM SINK

A. Sink (S-1): Stainless steel, counter mounted with sealant.

1. Fixture: As scheduled on drawings
 - a. Standard: ASME A112.19.3/CSA B45.4.
 - b. Type: counter mounted.
 - c. Number of Compartments: One.
 - d. Metal Thickness: 0.050 inch (1.3 mm).
 - e. Compartment:
 - 1) Drain: Grid with NPS 1-1/2 (DN 40) tailpiece and twist drain.
 - 2) Drain Location: Centered in compartment.
2. Faucet: As scheduled on drawings.
3. Supply Fittings:
 - a. Standard: ASME A112.18.1/CSA B125.1.
 - b. Supplies: Chrome-plated brass compression stop with inlet connection matching water-supply piping type and size.
 - 1) Operation: Wheel handle.
 - 2) Risers: NPS 1/2 (DN 15), chrome-plated, soft-copper flexible tube or ASME A112.18.6, braided or corrugated stainless-steel flexible hose.
4. Waste Fittings:
 - a. Standard: ASME A112.18.2/CSA B125.2.
 - b. Trap(s):
 - 1) Size: NPS 1-1/2 (DN 40).
 - 2) Material: Chrome-plated, two-piece, cast-brass trap and swivel elbow with 0.032-inch- (0.83-mm-) thick brass tube to wall or two-piece, cast-brass trap and ground-joint swivel elbow with 0.032-inch- (0.83-mm-); and chrome-plated brass or steel wall flange.
 - 3) Material: Stainless-steel, two-piece trap and swivel elbow with 0.012-inch- (0.30-mm-) thick stainless-steel tube to wall; and stainless-steel wall flange.
 - c. Continuous Waste:
 - 1) Size: NPS 1-1/2 (DN 40).
 - 2) Material: Chrome-plated, 0.032-inch- (0.83-mm-) thick brass tube.

2.03 GROUT

- A. Standard: ASTM C 1107/C 1107M, Grade B, post-hardening and volume-adjusting, dry, hydraulic-cement grout.
- B. Characteristics: Nonshrink; recommended for interior and exterior applications.
- C. Design Mix: 5000-psi (34.5-MPa), 28-day compressive strength.
- D. Packaging: Premixed and factory packaged.

PART 3 - EXECUTION

3.01 EXAMINATION

- A. Examine roughing-in of water supply and sanitary drainage and vent piping systems to verify actual locations of piping connections before sink installation.
- B. Examine walls, floors, and counters for suitable conditions where sinks will be installed.
- C. Proceed with installation only after unsatisfactory conditions have been corrected.

3.02 INSTALLATION

- A. Install sinks level and plumb according to roughing-in drawings.
- B. Set floor-mounted sinks in leveling bed of cement grout.
- C. Install water-supply piping with stop on each supply to each sink faucet.
 - 1. Exception: Use ball or globe valves if supply stops are not specified with sink. Comply with valve requirements specified in Section 22 05 23 "General-Duty Valves for Plumbing Piping."
 - 2. Install stops in locations where they can be easily reached for operation.
- D. Install wall flanges or escutcheons at piping wall penetrations in exposed, finished locations. Use deep-pattern escutcheons if required to conceal protruding fittings. Comply with escutcheon requirements specified in Section 22 05 18 "Escutcheons for Plumbing Piping."
- E. Seal joints between sinks and counters, floors, and walls using sanitary-type, one-part, mildew-resistant silicone sealant. Match sealant color to fixture color. Comply with sealant requirements specified in Section 07 92 00 "Joint Sealants."
- F. Install protective shielding pipe covers and enclosures on exposed supplies and waste piping of accessible sinks. Comply with requirements in Section 22 07 19 "Plumbing Piping Insulation."

3.03 CONNECTIONS

- A. Connect sinks with water supplies, stops, and risers, and with traps, soil, waste, and vent piping. Use size fittings required to match fixtures.
- B. Comply with water piping requirements specified in Section 22 11 16 "Domestic Water Piping."
- C. Comply with soil and waste piping requirements specified in Section 22 13 16 "Sanitary Waste and Vent Piping."

3.04 ADJUSTING

- A. Operate and adjust sinks and controls. Replace damaged and malfunctioning sinks, fittings, and controls.
- B. Adjust water pressure at faucets to produce proper flow.

3.05 CLEANING AND PROTECTION

- A. After completing installation of sinks, inspect and repair damaged finishes.
- B. Clean sinks, faucets, and other fittings with manufacturers' recommended cleaning methods and materials.
- C. Provide protective covering for installed sinks and fittings.
- D. Do not allow use of sinks for temporary facilities unless approved in writing by Owner.

END OF SECTION 22 42 16.16

SECTION 22 42 23
COMMERCIAL SHOWERS

PART 1 - GENERAL

1.01 SUMMARY

- A. Section Includes:
 - 1. Individual showers.
 - 2. Shower faucets.

1.02 ACTION SUBMITTALS

- A. Product Data: For each type of product.
- B. LEED Submittals:
 - 1. Product Data for Prerequisite WE 1, Credit WE 2, and Credit WE 3: Documentation indicating flow and water consumption requirements.

1.03 CLOSEOUT SUBMITTALS

- A. Maintenance data.

PART 2 - PRODUCTS

2.01 INDIVIDUAL SHOWERS

- A. Individual Showers SH-1:
 - 1. General: Basin per Division 10.

2.02 SHOWER FAUCETS

- A. NSF Standard: Comply with NSF 61, "Drinking Water System Components - Health Effects," for shower materials that will be in contact with potable water.
- B. Shower Faucets (SH-1) as scheduled on drawings.

PART 3 - EXECUTION**3.01 INSTALLATION**

- A. Assemble shower components according to manufacturers' written instructions.
- B. Install showers level and plumb according to roughing-in drawings.
- C. Install water-supply piping with stop on each supply to each shower faucet.
 - 1. Exception: Use ball valves if supply stops are not specified with shower. Comply with valve requirements specified in Section 22 05 23."
 - 2. Install stops in locations where they can be easily reached for operation.
- D. Install shower flow-control fittings with specified maximum flow rates in shower arms.
- E. Install wall flanges or escutcheons at piping wall penetrations in exposed, finished locations. Use deep-pattern escutcheons if required to conceal protruding fittings. Comply with escutcheons requirements specified in Section 22 05 18 "Escutcheons for Plumbing Piping."
- F. Seal joints between showers and floors and walls using sanitary-type, one-part, mildew-resistant silicone sealant. Match sealant color to fixture color. Comply with sealant requirements specified in Section 07 92 00 "Joint Sealants."

3.02 CONNECTIONS

- A. Connect fixtures with water supplies, stops, and risers, and with traps, soil, waste, and vent piping. Use size fittings required to match fixtures.
- B. Comply with water piping requirements specified in Section 22 11 16 "Domestic Water Piping."
- C. Comply with traps and soil and waste piping requirements specified in Section 22 13 16 "Sanitary Waste and Vent Piping."

3.03 ADJUSTING

- A. Operate and adjust showers and controls. Replace damaged and malfunctioning showers, fittings, and controls.
- B. Adjust water pressure at faucets to produce proper flow.

3.04 CLEANING AND PROTECTION

- A. After completing installation of showers, inspect and repair damaged finishes.

- B. Clean showers, faucets, and other fittings with manufacturers' recommended cleaning methods and materials.
- C. Provide protective covering for installed fixtures and fittings.
- D. Do not allow use of showers for temporary facilities unless approved in writing by Owner.

END OF SECTION 22 42 23

SECTION 22 45 00
EMERGENCY PLUMBING FIXTURES

PART 1 - GENERAL

1.01 SUMMARY

A. Section Includes:

1. Eyewash/Emergency shower combination units.
2. Water-tempering equipment.

1.02 ACTION SUBMITTALS

- A. Product Data:** For each type of product indicated.

1.03 INFORMATIONAL SUBMITTALS

- A. Field quality-control test reports.**

1.04 CLOSEOUT SUBMITTALS

- A. Operation and maintenance data.**

1.05 QUALITY ASSURANCE

- A. Electrical Components, Devices, and Accessories:** Listed and labeled as defined in NFPA 70, by a qualified testing agency, and marked for intended location and application.
- B. ANSI Standard:** Comply with ANSI Z358.1, "Emergency Eyewash and Shower Equipment."
- C. NSF Standard:** Comply with NSF 61, "Drinking Water System Components - Health Effects," for fixture materials that will be in contact with potable water.

PART 2 - PRODUCTS

2.01 COMBINATION UNITS

- A. Standard, Plumbed Emergency Shower with Eyewash Combination Units, (EWSS):**

1. Piping:
 - a. Material: Galvanized steel or plastic.
 - b. Unit Supply: **NPS 1-1/4 (DN 32)** minimum.
 - c. Unit Drain: Outlet at back or side near bottom.

2. Shower:
 - a. Capacity: Not less than **20 gpm (76 L/min.)** for at least 15 minutes.
 - b. Supply Piping: **NPS 1 (DN 25)** with flow regulator and stay-open control valve.
 - c. Control-Valve Actuator: Pull rod.
 - d. Shower Head: **8-inch- (200-mm-)** minimum diameter, plastic.
 - e. Mounting: Pedestal.

3. Eyewash Unit:
 - a. Capacity: Not less than **0.4 gpm (1.5 L/min.)** for at least 15 minutes.
 - b. Supply Piping: **NPS 1/2 (DN 15)** with flow regulator and stay-open control valve.
 - c. Control-Valve Actuator: Paddle.
 - d. Spray-Head Assembly: Two receptor-mounted spray heads.
 - e. Receptor: Plastic bowl.
 - f. Mounting: Attached shower pedestal.

2.02 WATER-TEMPERING EQUIPMENT

A. Hot- and Cold-Water, Water-Tempering Equipment, MV-1:

1. Description: Factory-fabricated equipment with thermostatic mixing valve.
 - a. Thermostatic Mixing Valve: Designed to provide **85 deg F (29 deg C)** tepid, potable water at emergency plumbing fixtures, to maintain temperature at plus or minus **5 deg F (3 deg C)** throughout required 15-minute test period, and in case of unit failure to continue cold-water flow, with union connections, controls, metal piping, and corrosion-resistant enclosure.
 - b. Supply Connections: For hot and cold water.

PART 3 - EXECUTION

3.01 EMERGENCY PLUMBING FIXTURE INSTALLATION

- A. Assemble emergency plumbing fixture piping, fittings, control valves, and other components.
- B. Install fixtures level and plumb.
- C. Fasten fixtures to substrate.

- D. Install shutoff ball valves in water-supply piping to fixtures. Install valves chained or locked in open position if permitted. Install valves in locations where they can easily be reached for operation. Comply with requirements for valves specified in Section 22 05 23.
- E.
 - 1. Exception: Omit shutoff valve on supply to emergency equipment if prohibited by authorities having jurisdiction.
- F. Install dielectric fitting in supply piping to emergency equipment if piping and equipment connections are made of different metals. Comply with requirements for dielectric fittings specified in Section 22 11 16 "Domestic Water Piping."
- G. Install thermometers in supply and outlet piping connections to water-tempering equipment. Comply with requirements for thermometers specified in Section 22 05 19 "Meters and Gages for Plumbing Piping."
- H. Install escutcheons on piping wall and ceiling penetrations in exposed, finished locations. Comply with requirements for escutcheons specified in Section 22 05 18 "Escutcheons for Plumbing Piping."
- I. Fill self-contained fixtures with flushing fluid.

3.02 CONNECTIONS

- A. Connect hot- and cold-water-supply piping to hot- and cold-water, water-tempering equipment. Connect output from water-tempering equipment to emergency plumbing fixtures. Comply with requirements for hot- and cold-water piping specified in Section 22 11 16 "Domestic Water Piping."
- B. Indirectly connect emergency plumbing fixture receptors without trapped drain outlet to sanitary waste or storm drainage piping.
- C. Where installing piping adjacent to emergency plumbing fixtures, allow space for service and maintenance of fixtures.

3.03 IDENTIFICATION

- A. Install equipment nameplates or equipment markers on emergency plumbing fixtures and equipment and equipment signs on water-tempering equipment. Comply with requirements for identification materials specified in Section 22 05 53 "Identification for Plumbing Piping and Equipment."

3.04 FIELD QUALITY CONTROL

- A. Mechanical-Component Testing: After plumbing connections have been made, test for compliance with requirements. Verify ability to achieve indicated capacities.
- B. Tests and Inspections:

1. Perform each visual and mechanical inspection.
 2. Leak Test: After installation, charge system and test for leaks. Repair leaks and retest until no leaks exist.
 3. Operational Test: After electrical circuitry has been energized, start units to confirm proper unit operation.
 4. Test and adjust controls and safeties. Replace damaged and malfunctioning controls and equipment.
- C. Emergency plumbing fixtures and water-tempering equipment will be considered defective if they do not pass tests and inspections.
- D. Prepare test and inspection reports.

3.05 ADJUSTING

- A. Adjust or replace fixture flow regulators for proper flow.
- B. Adjust equipment temperature settings.

END OF SECTION 22 45 00

SECTION 22 47 16

PRESSURE WATER COOLERS

PART 1 - GENERAL

1.01 SUMMARY

- A. Section includes pressure water coolers and related components.

1.02 SUBMITTALS

- A. Product Data: For each type of pressure water cooler.
- B. Shop Drawings: Include diagrams for power, signal, and control wiring.
- C. Maintenance Data: For pressure water coolers to include in maintenance manuals.

PART 2 - PRODUCTS

2.01 PRESSURE WATER COOLERS

- A. Pressure Water Coolers (EWC-1): Wall mounted recessed as scheduled on the drawings.
 - 1. Cabinet: Bi-level with two attached contoured bowls, all stainless steel.
 - 2. Bubbler: One, with adjustable stream regulator, located on each cabinet deck.
 - 3. Control: Push button on front end.
 - 4. Drain: Grid with NPS 1-1/4 (DN 32) tailpiece.
 - 5. Supply: NPS 3/8 (DN 10) with shutoff valve.
 - 6. Waste Fitting: ASME A112.18.2/CSA B125.2, NPS 1-1/4 (DN 32) brass P-trap.
 - 7. Filter: One or more water filters complying with NSF 42 and NSF 53 for cyst and lead reduction to below EPA standards; with capacity sized for unit peak flow rate.
 - 8. Cooling System: Electric, with hermetically sealed compressor, cooling coil, air-cooled condensing unit, corrosion-resistant tubing, refrigerant, corrosion-resistant-metal storage tank, and adjustable thermostat.
 - a. Electrical Components, Devices, and Accessories: Listed and labeled as defined in NFPA 70, by a qualified testing agency, and marked for intended location and application.
 - 9. Capacities and Characteristics:
 - a. Cooled Water: 8 gph (0.0084 L/s)
 - b. Ambient-Air Temperature: 90 deg F (32 deg C).
 - c. Inlet-Water Temperature: 80 deg F (27 deg C).
 - d. Cooled-Water Temperature: 50 deg F (10 deg C).

e. Electrical Characteristics:

- 1) Motor Horsepower: 370 watts.
- 2) Volts: 120-V ac.
- 3) Phase: Single.
- 4) Hertz: 60.
- 5) Full-Load Amperes: 4.0.

10. Support: ASME A112.6.1M, Type I water-cooler carrier.

PART 3 - EXECUTION

3.01 EXAMINATION

- A. Examine roughing-in for water-supply and sanitary drainage and vent piping systems to verify actual locations of piping connections before fixture installation.
- B. Examine walls and floors for suitable conditions where fixtures will be installed.
- C. Proceed with installation only after unsatisfactory conditions have been corrected.

3.02 INSTALLATION

- A. Install fixtures level and plumb according to roughing-in drawings. For fixtures indicated for children, install at height required by authorities having jurisdiction.
- B. Install off-the-floor carrier supports, affixed to building substrate, for wall-mounted fixtures.
- C. Install water-supply piping with shutoff valve on supply to each fixture to be connected to domestic-water distribution piping. Use ball or globe valve. Install valves in locations where they can be easily reached for operation. Valves are specified in Section 22 05 23 "General-Duty Valves for Plumbing Piping."
- D. Install trap and waste piping on drain outlet of each fixture to be connected to sanitary drainage system.
- E. Install wall flanges or escutcheons at piping wall penetrations in exposed, finished locations. Use deep-pattern escutcheons where required to conceal protruding fittings. Comply with escutcheon requirements specified in Section 22 05 18 "Escutcheons for Plumbing Piping."
- F. Seal joints between fixtures and walls using sanitary-type, one-part, mildew-resistant, silicone sealant. Match sealant color to fixture color. Comply with sealant requirements specified in Section 07 92 00 "Joint Sealants."

3.03 CONNECTIONS

- A. Connect fixtures with water supplies, stops, and risers, and with traps, soil, waste, and vent piping. Use size fittings required to match fixtures.
- B. Comply with water piping requirements specified in Section 22 11 16 "Domestic Water Piping."
- C. Install ball or globe shutoff valve on water supply to each fixture. Comply with valve requirements specified in Section 22 05 23 "General-Duty Valves for Plumbing Piping."
- D. Comply with soil and waste piping requirements specified in Section 22 13 16 "Sanitary Waste and Vent Piping."

3.04 ADJUSTING

- A. Adjust fixture flow regulators for proper flow and stream height.
- B. Adjust pressure water-cooler temperature settings.

3.05 CLEANING

- A. After installing fixture, inspect unit. Remove paint splatters and other spots, dirt, and debris. Repair damaged finish to match original finish.
- B. Clean fixtures, on completion of installation, according to manufacturer's written instructions.
- C. Provide protective covering for installed fixtures.
- D. Do not allow use of fixtures for temporary facilities unless approved in writing by Owner.

END OF SECTION 22 47 16

SECTION 23 05 13**COMMON MOTOR REQUIREMENTS FOR HVAC EQUIPMENT**

PART 1 - GENERAL

1.01 SUMMARY

- A. Section includes general requirements for single-phase and polyphase, general-purpose, horizontal, small and medium, squirrel-cage induction motors for use on ac power systems up to 600 V and installed at equipment manufacturer's factory or shipped separately by equipment manufacturer for field installation.

1.02 COORDINATION

- A. Coordinate features of motors, installed units, and accessory devices to be compatible with the following:
 - 1. Motor controllers.
 - 2. Torque, speed, and horsepower requirements of the load.
 - 3. Ratings and characteristics of supply circuit and required control sequence.
 - 4. Ambient and environmental conditions of installation location.

PART 2 - PRODUCTS

2.01 GENERAL MOTOR REQUIREMENTS

- A. Comply with NEMA MG 1 unless otherwise indicated.

2.02 MOTOR CHARACTERISTICS

- A. Duty: Continuous duty at ambient temperature of 40 deg C and at altitude of 3300 feet (1000 m) above sea level.
- B. Capacity and Torque Characteristics: Sufficient to start, accelerate, and operate connected loads at designated speeds, at installed altitude and environment, with indicated operating sequence, and without exceeding nameplate ratings or considering service factor.

2.03 POLYPHASE MOTORS

- A. Description: NEMA MG 1, Design B, medium induction motor.
- B. Efficiency: Energy efficient, as defined in NEMA MG 1.

- C. Service Factor: 1.15.
- D. Multispeed Motors: Variable torque.
 - 1. For motors with 2:1 speed ratio, consequent pole, single winding.
 - 2. For motors with other than 2:1 speed ratio, separate winding for each speed.
- E. Rotor: Random-wound, squirrel cage.
- F. Bearings: Regreasable, shielded, antifriction ball bearings suitable for radial and thrust loading.
- G. Temperature Rise: Match insulation rating.
- H. Insulation: Class F.
- I. Code Letter Designation:
 - 1. Motors 15 HP and Larger: NEMA starting Code F or Code G.
 - 2. Motors Smaller than 15 HP: Manufacturer's standard starting characteristic.
- J. Enclosure Material: Cast iron for motor frame sizes 324T and larger; rolled steel for motor frame sizes smaller than 324T.

2.04 POLYPHASE MOTORS WITH ADDITIONAL REQUIREMENTS

- A. Motors Used with Reduced-Voltage and Multispeed Controllers: Match wiring connection requirements for controller with required motor leads. Provide terminals in motor terminal box, suited to control method.
- B. Motors Used with Variable Frequency Controllers: Ratings, characteristics, and features coordinated with and approved by controller manufacturer.
 - 1. Windings: Copper magnet wire with moisture-resistant insulation varnish, designed and tested to resist transient spikes, high frequencies, and short time rise pulses produced by pulse-width modulated inverters.
 - 2. Energy- and Premium-Efficient Motors: Class B temperature rise; Class F insulation.
 - 3. Inverter-Duty Motors: Class F temperature rise; Class H insulation.
 - 4. Thermal Protection: Comply with NEMA MG 1 requirements for thermally protected motors.

2.05 SINGLE-PHASE MOTORS

- A. Motors larger than 1/20 hp shall be one of the following, to suit starting torque and requirements of specific motor application:
 - 1. Permanent-split capacitor.
 - 2. Split phase.
 - 3. Capacitor start, inductor run.
 - 4. Capacitor start, capacitor run.

- B. Multispeed Motors: Variable-torque, permanent-split-capacitor type.
- C. Bearings: Prelubricated, antifriction ball bearings or sleeve bearings suitable for radial and thrust loading.
- D. Motors 1/20 HP and Smaller: Shaded-pole type.
- E. Thermal Protection: Internal protection to automatically open power supply circuit to motor when winding temperature exceeds a safe value calibrated to temperature rating of motor insulation. Thermal-protection device shall automatically reset when motor temperature returns to normal range.

PART 3 - EXECUTION (Not Applicable)

END OF SECTION 23 05 13

SECTION 23 05 29**HANGERS AND SUPPORTS FOR HVAC PIPING AND EQUIPMENT****PART 1 - GENERAL****1.01 SUMMARY**

- A. Section Includes:
1. Metal pipe hangers and supports.
 2. Fastener systems.
 3. Equipment supports.

1.02 SUBMITTALS

- A. Product Data: For each type of product indicated or to be used.
- B. Welding certificates.

1.03 QUALITY ASSURANCE

- A. Structural Steel Welding Qualifications: Qualify procedures and personnel according to AWS D1.1/D1.1M, "Structural Welding Code - Steel."
- B. Pipe Welding Qualifications: Qualify procedures and operators according to ASME Boiler and Pressure Vessel Code.

PART 2 - PRODUCTS**2.01 METAL PIPE HANGERS AND SUPPORTS**

- A. Carbon-Steel Pipe Hangers and Supports:
1. Description: MSS SP-58, Types 1 through 58, factory-fabricated components.
 2. Galvanized Metallic Coatings: Pregalvanized or hot dipped.
 3. Nonmetallic Coatings: Plastic coating, jacket, or liner.
 4. Padded Hangers: Hanger with fiberglass or other pipe insulation pad or cushion to support bearing surface of piping.
 5. Hanger Rods: Continuous-thread rod, nuts, and washer made of carbon steel.
- B. Stainless-Steel Pipe Hangers and Supports:
1. Description: MSS SP-58, Types 1 through 58, factory-fabricated components.
 2. Padded Hangers: Hanger with fiberglass or other pipe insulation pad or cushion to support bearing surface of piping.

3. Hanger Rods: Continuous-thread rod, nuts, and washer made of stainless steel.

C. Copper Pipe Hangers:

1. Description: MSS SP-58, Types 1 through 58, copper-coated-steel, factory-fabricated components.
2. Hanger Rods: Continuous-thread rod, nuts, and washer made of copper-coated steel or stainless steel.

2.02 FASTENER SYSTEMS

- A. Powder-Actuated Fasteners: Threaded-steel stud, for use in hardened portland cement concrete with pull-out, tension, and shear capacities appropriate for supported loads and building materials where used.
- B. Mechanical-Expansion Anchors: Insert-wedge-type, zinc-coated or stainless steel anchors, for use in hardened portland cement concrete; with pull-out, tension, and shear capacities appropriate for supported loads and building materials where used.

2.03 EQUIPMENT SUPPORTS

- A. Description: Welded, shop- or field-fabricated equipment support made from structural carbon-steel shapes.

2.04 MISCELLANEOUS MATERIALS

- A. Structural Steel: ASTM A 36/A 36M, carbon-steel plates, shapes, and bars; black and galvanized.
- B. Grout: ASTM C 1107, factory-mixed and -packaged, dry, hydraulic-cement, nonshrink and nonmetallic grout; suitable for interior and exterior applications.
 1. Properties: Nonstaining, noncorrosive, and nongaseous.
 2. Design Mix: 5000-psi (34.5-MPa), 28-day compressive strength.

PART 3 - EXECUTION

3.01 HANGER AND SUPPORT INSTALLATION

- A. Metal Pipe-Hanger Installation: Comply with MSS SP-69 and MSS SP-89. Install hangers, supports, clamps, and attachments as required to properly support piping from the building structure.
- B. Metal Trapeze Pipe-Hanger Installation: Comply with MSS SP-69 and MSS SP-89. Arrange for grouping of parallel runs of horizontal piping, and support together on field-fabricated trapeze pipe hangers.

1. Pipes of Various Sizes: Support together and space trapezes for smallest pipe size or install intermediate supports for smaller diameter pipes as specified for individual pipe hangers.
 2. Field fabricate from ASTM A 36/A 36M, carbon-steel shapes selected for loads being supported. Weld steel according to AWS D1.1/D1.1M.
- C. Fastener System Installation:
1. Install powder-actuated fasteners for use in lightweight concrete or concrete slabs less than 4 inches (100 mm) thick in concrete after concrete is placed and completely cured. Use operators that are licensed by powder-actuated tool manufacturer. Install fasteners according to powder-actuated tool manufacturer's operating manual.
 2. Install mechanical-expansion anchors in concrete after concrete is placed and completely cured. Install fasteners according to manufacturer's written instructions.
- D. Install hangers and supports complete with necessary attachments, inserts, bolts, rods, nuts, washers, and other accessories.
- E. Equipment Support Installation: Fabricate from welded-structural-steel shapes.
- F. Install hangers and supports to allow controlled thermal and seismic movement of piping systems, to permit freedom of movement between pipe anchors, and to facilitate action of expansion joints, expansion loops, expansion bends, and similar units.
- G. Install lateral bracing with pipe hangers and supports to prevent swaying.
- H. Install building attachments within concrete slabs or attach to structural steel. Install additional attachments at concentrated loads, including valves, flanges, and strainers, NPS 2-1/2 (DN 65) and larger and at changes in direction of piping. Install concrete inserts before concrete is placed; fasten inserts to forms and install reinforcing bars through openings at top of inserts.
- I. Load Distribution: Install hangers and supports so that piping live and dead loads and stresses from movement will not be transmitted to connected equipment.
- J. Pipe Slopes: Install hangers and supports to provide indicated pipe slopes and to not exceed maximum pipe deflections allowed by ASME B31.9 for building services piping.
- K. Insulated Piping:
1. Attach clamps and spacers to piping.
 - a. Piping Operating above Ambient Air Temperature: Clamp may project through insulation.
 - b. Piping Operating below Ambient Air Temperature: Use thermal-hanger shield insert with clamp sized to match OD of insert.
 - c. Do not exceed pipe stress limits allowed by ASME B31.9 for building services piping.
 2. Install MSS SP-58, Type 39, protection saddles if insulation without vapor barrier is indicated. Fill interior voids with insulation that matches adjoining insulation.

- a. Option: Thermal-hanger shield inserts may be used. Include steel weight-distribution plate for pipe NPS 4 (DN 100) and larger if pipe is installed on rollers.
3. Install MSS SP-58, Type 40, protective shields on cold piping with vapor barrier. Shields shall span an arc of 180 degrees.
 - a. Option: Thermal-hanger shield inserts may be used. Include steel weight-distribution plate for pipe NPS 4 (DN 100) and larger if pipe is installed on rollers.
4. Shield Dimensions for Pipe: Not less than the following:
 - a. NPS 1/4 to NPS 3-1/2 (DN 8 to DN 90): 12 inches (305 mm) long and 0.048 inch (1.22 mm) thick.
 - b. NPS 4 (DN 100): 12 inches (305 mm) long and 0.06 inch (1.52 mm) thick.
 - c. NPS 5 and NPS 6 (DN 125 and DN 150): 18 inches (457 mm) long and 0.06 inch (1.52 mm) thick.
 - d. NPS 8 to NPS 14 (DN 200 to DN 350): 24 inches (610 mm) long and 0.075 inch (1.91 mm) thick.
5. Pipes NPS 8 (DN 200) and Larger: Include wood or reinforced calcium-silicate-insulation inserts of length at least as long as protective shield.
6. Thermal-Hanger Shields: Install with insulation same thickness as piping insulation.

3.02 EQUIPMENT SUPPORTS

- A. Fabricate structural-steel stands to suspend equipment from structure overhead or to support equipment above floor.
- B. Grouting: Place grout under supports for equipment and make bearing surface smooth.
- C. Provide lateral bracing, to prevent swaying, for equipment supports.

3.03 METAL FABRICATIONS

- A. Cut, drill, and fit miscellaneous metal fabrications for trapeze pipe hangers and equipment supports.
- B. Fit exposed connections together to form hairline joints. Field weld connections that cannot be shop welded because of shipping size limitations.
- C. Field Welding: Comply with AWS D1.1/D1.1M procedures for shielded, metal arc welding; appearance and quality of welds; and methods used in correcting welding work; and with the following:
 1. Use materials and methods that minimize distortion and develop strength and corrosion resistance of base metals.
 2. Obtain fusion without undercut or overlap.
 3. Remove welding flux immediately.

4. Finish welds at exposed connections so no roughness shows after finishing and so contours of welded surfaces match adjacent contours.

3.04 ADJUSTING

- A. Hanger Adjustments: Adjust hangers to distribute loads equally on attachments and to achieve indicated slope of pipe.
- B. Trim excess length of continuous-thread hanger and support rods to **1-1/2 inches (40 mm)**.

3.05 PAINTING

- A. Touchup: Clean field welds and abraded areas of shop paint. Paint exposed areas immediately after erecting hangers and supports. Use same materials as used for shop painting. Comply with SSPC-PA 1 requirements for touching up field-painted surfaces.
 1. Apply paint by brush or spray to provide a minimum dry film thickness of **2.0 mils (0.05 mm)**.
- B. Touchup: Cleaning and touchup painting of field welds, bolted connections, and abraded areas of shop paint on miscellaneous metal are specified in Division 9.
- C. Galvanized Surfaces: Clean welds, bolted connections, and abraded areas and apply galvanizing-repair paint to comply with ASTM A 780.

3.06 HANGER AND SUPPORT SCHEDULE

- A. Specific hanger and support requirements are in Sections specifying piping systems and equipment.
- B. Comply with MSS SP-69 for pipe-hanger selections and applications that are not specified in piping system Sections.
- C. Use hangers and supports with galvanized metallic coatings for piping and equipment that will not have field-applied finish.
- D. Use nonmetallic coatings on attachments for electrolytic protection where attachments are in direct contact with copper tubing.
- E. Use carbon-steel pipe hangers and supports and metal trapeze pipe hangers and attachments for general service applications.
- F. Use copper-plated pipe hangers and copper or stainless-steel attachments for copper piping and tubing.
- G. Use padded hangers for piping that is subject to scratching.

- H. Use thermal-hanger shield inserts for insulated piping and tubing.
- I. Horizontal-Piping Hangers and Supports: Unless otherwise indicated and except as specified in piping system Sections, install the following types:
1. Adjustable, Steel Clevis Hangers (MSS Type 1): For suspension of noninsulated or insulated, stationary pipes **NPS 1/2 to NPS 30 (DN 15 to DN 750)**.
 2. Yoke-Type Pipe Clamps (MSS Type 2): For suspension of up to **1050 deg F (566 deg C)**, pipes **NPS 4 to NPS 24 (DN 100 to DN 600)**, requiring up to **4 inches (100 mm)** of insulation.
 3. Carbon- or Alloy-Steel, Double-Bolt Pipe Clamps (MSS Type 3): For suspension of pipes **NPS 3/4 to NPS 36 (DN 20 to DN 900)**, requiring clamp flexibility and up to **4 inches (100 mm)** of insulation.
 4. Adjustable, Steel Band Hangers (MSS Type 7): For suspension of noninsulated, stationary pipes **NPS 1/2 to NPS 8 (DN 15 to DN 200)**.
 5. U-Bolts (MSS Type 24): For support of heavy pipes **NPS 1/2 to NPS 30 (DN 15 to DN 750)**.
 6. Pipe Saddle Supports (MSS Type 36): For support of pipes **NPS 4 to NPS 36 (DN 100 to DN 900)**, with steel-pipe base stanchion support and cast-iron floor flange or carbon-steel plate.
 7. Pipe Stanchion Saddles (MSS Type 37): For support of pipes **NPS 4 to NPS 36 (DN 100 to DN 900)**, with steel-pipe base stanchion support and cast-iron floor flange or carbon-steel plate, and with U-bolt to retain pipe.
 8. Single-Pipe Rolls (MSS Type 41): For suspension of pipes **NPS 1 to NPS 30 (DN 25 to DN 750)**, from two rods if longitudinal movement caused by expansion and contraction might occur.
 9. Complete Pipe Rolls (MSS Type 44): For support of pipes **NPS 2 to NPS 42 (DN 50 to DN 1050)** if longitudinal movement caused by expansion and contraction might occur but vertical adjustment is not necessary.
- J. Vertical-Piping Clamps: Unless otherwise indicated and except as specified in piping system Sections, install the following types:
1. Extension Pipe or Riser Clamps (MSS Type 8): For support of pipe risers **NPS 3/4 to NPS 24 (DN 24 to DN 600)**.
 2. Carbon- or Alloy-Steel Riser Clamps (MSS Type 42): For support of pipe risers **NPS 3/4 to NPS 24 (DN 20 to DN 600)** if longer ends are required for riser clamps.
- K. Hanger-Rod Attachments: Unless otherwise indicated and except as specified in piping system Sections, install the following types:
1. Steel Turnbuckles (MSS Type 13): For adjustment up to **6 inches (150 mm)** for heavy loads.
 2. Steel Clevises (MSS Type 14): For **120 to 450 deg F (49 to 232 deg C)** piping installations.
- L. Building Attachments: Unless otherwise indicated and except as specified in piping system Sections, install the following types:
1. Steel or Malleable Concrete Inserts (MSS Type 18): For upper attachment to suspend pipe hangers from concrete ceiling.

2. Top-Beam C-Clamps (MSS Type 19): For use under roof installations with bar-joint construction, to attach to top flange of structural shape.
 3. Side-Beam or Channel Clamps (MSS Type 20): For attaching to bottom flange of beams, channels, or angles.
 4. Center-Beam Clamps (MSS Type 21): For attaching to center of bottom flange of beams.
 5. Welded Beam Attachments (MSS Type 22): For attaching to bottom of beams if loads are considerable and rod sizes are large.
 6. C-Clamps (MSS Type 23): For structural shapes.
 7. Welded-Steel Brackets: For support of pipes from below, or for suspending from above by using clip and rod. Use one of the following for indicated loads:
 - a. Light (MSS Type 31): 750 lb (340 kg).
 - b. Medium (MSS Type 32): 1500 lb (680 kg).
 - c. Heavy (MSS Type 33): 3000 lb (1360 kg).
 8. Side-Beam Brackets (MSS Type 34): For sides of steel or wooden beams.
 9. Plate Lugs (MSS Type 57): For attaching to steel beams if flexibility at beam is required.
- M. Saddles and Shields: Unless otherwise indicated and except as specified in piping system Sections, install the following types:
1. Steel-Pipe-Covering Protection Saddles (MSS Type 39): To fill interior voids with insulation that matches adjoining insulation.
 2. Protection Shields (MSS Type 40): Of length recommended in writing by manufacturer to prevent crushing insulation.
 3. Thermal-Hanger Shield Inserts: For supporting insulated pipe.
- N. Comply with MSS SP-69 for trapeze pipe-hanger selections and applications that are not specified in piping system Sections.
- O. Use powder-actuated fasteners or mechanical-expansion anchors instead of building attachments where required in concrete construction.

END OF SECTION 23 05 29

SECTION 23 05 93**TESTING, ADJUSTING, AND BALANCING FOR HVAC**

PART 1 - GENERAL

1.01 SUMMARY

- A. Section Includes:
 - 1. Balancing Air Systems:
 - a. Constant-volume air systems.

1.02 DEFINITIONS

- A. AABC: Associated Air Balance Council.
- B. NEBB: National Environmental Balancing Bureau.
- C. TAB: Testing, adjusting, and balancing.
- D. TABB: Testing, Adjusting, and Balancing Bureau.
- E. TAB Specialist: An entity engaged to perform TAB Work.

1.03 SUBMITTALS

- A. Certified TAB reports.

1.04 QUALITY ASSURANCE

- A. TAB Contractor Qualifications: Engage a TAB entity certified by AABC, NEBB or TABB.
 - 1. TAB Field Supervisor: Employee of the TAB contractor and certified by AABC, NEBB or TABB
 - 2. TAB Technician: Employee of the TAB contractor and who is certified by AABC, NEBB or TABB as a TAB technician.
- B. Certify TAB field data reports and perform the following:
 - 1. Review field data reports to validate accuracy of data and to prepare certified TAB reports.
 - 2. Certify that the TAB team complied with the approved TAB plan and the procedures specified and referenced in this Specification.
- C. TAB Report Forms: Use standard TAB contractor's forms

- D. Instrumentation Type, Quantity, Accuracy, and Calibration: As described in ASHRAE 111, Section 5, "Instrumentation."
- E. ASHRAE Compliance: Applicable requirements in ASHRAE 62.1, Section 7.2.2 - "Air Balancing."
- F. ASHRAE/IESNA Compliance: Applicable requirements in ASHRAE/IESNA 90.1, Section 6.7.2.3 - "System Balancing."

PART 2 - PRODUCTS (Not Applicable)

PART 3 - EXECUTION

3.01 EXAMINATION

- A. Examine the Contract Documents to become familiar with Project requirements and to discover conditions in systems' designs that may preclude proper TAB of systems and equipment.
- B. Examine systems for installed balancing devices, such as test ports, gage cocks, thermometer wells, flow-control devices, balancing valves and fittings, and manual volume dampers. Verify that locations of these balancing devices are accessible.
- C. Examine the approved submittals for HVAC systems and equipment.
- D. Examine design data including HVAC system descriptions, statements of design assumptions for environmental conditions and systems' output, and statements of philosophies and assumptions about HVAC system and equipment controls.
- E. Examine equipment performance data including fan curves.
 - 1. Relate performance data to Project conditions and requirements, including system effects that can create undesired or unpredicted conditions that cause reduced capacities in all or part of a system.
 - 2. Calculate system-effect factors to reduce performance ratings of HVAC equipment when installed under conditions different from the conditions used to rate equipment performance. To calculate system effects for air systems, use tables and charts found in AMCA 201, "Fans and Systems," or in SMACNA's "HVAC Systems - Duct Design." Compare results with the design data and installed conditions.
- F. Examine system and equipment installations and verify that field quality-control testing, cleaning, and adjusting specified in individual Sections have been performed.
- G. Examine test reports specified in individual system and equipment Sections.
- H. Examine HVAC equipment and filters and verify that bearings are greased, belts are aligned and tight, and equipment with functioning controls is ready for operation.

- I. Examine heat-transfer coils for correct piping connections and for clean and straight fins.
- J. Examine operating safety interlocks and controls on HVAC equipment.
- K. Report deficiencies discovered before and during performance of TAB procedures. Observe and record system reactions to changes in conditions. Record default set points if different from indicated values.

3.02 GENERAL PROCEDURES FOR TESTING AND BALANCING

- A. Perform testing and balancing procedures on each system according to the procedures contained in AABC's "National Standards for Total System Balance", NEBB's "Procedural Standards for Testing, Adjusting, and Balancing of Environmental Systems" or SMACNA's "HVAC Systems - Testing, Adjusting, and Balancing" and in this Section.
- B. Cut insulation, ducts, pipes, and equipment cabinets for installation of test probes to the minimum extent necessary for TAB procedures.
 - 1. After testing and balancing, patch probe holes in ducts with same material and thickness as used to construct ducts.
 - 2. Install and join new insulation that matches removed materials. Restore insulation, coverings, vapor barrier, and finish according to Section 23 07 13 "Duct Insulation," Section 23 07 16 "HVAC Equipment Insulation," Section 23 07 19 "HVAC Piping Insulation."
- C. Mark equipment and balancing devices, including damper-control positions, valve position indicators, fan-speed-control levers, and similar controls and devices, with paint or other suitable, permanent identification material to show final settings.
- D. Take and report testing and balancing measurements in inch-pound (IP) units.

3.03 GENERAL PROCEDURES FOR BALANCING AIR SYSTEMS

- A. Prepare test reports for both fans and outlets. Obtain manufacturer's outlet factors and recommended testing procedures. Crosscheck the summation of required outlet volumes with required fan volumes.
- B. Prepare schematic diagrams of systems' "as-built" duct layouts.
- C. Determine the best locations in main and branch ducts for accurate duct-airflow measurements.
- D. Check airflow patterns from the outdoor-air louvers and dampers and the return- and exhaust-air dampers through the supply-fan discharge and mixing dampers.
- E. Locate start-stop and disconnect switches, electrical interlocks, and motor starters.
- F. Verify that motor starters are equipped with properly sized thermal protection.

- G. Check dampers for proper position to achieve desired airflow path.
- H. Check for airflow blockages.
- I. Check condensate drains for proper connections and functioning.
- J. Check for proper sealing of air-handling-unit components.
- K. Verify that air duct system is sealed as specified in Section 23 31 13 "Metal Ducts."

3.04 PROCEDURES FOR CONSTANT-VOLUME AIR SYSTEMS

- A. Adjust fans to deliver total indicated airflows within the maximum allowable fan speed listed by fan manufacturer.
 - 1. Measure total airflow.
 - a. Where sufficient space in ducts is unavailable for Pitot-tube traverse measurements, measure airflow at terminal outlets and inlets and calculate the total airflow.
 - 2. Measure fan static pressures as follows to determine actual static pressure:
 - a. Measure outlet static pressure as far downstream from the fan as practical and upstream from restrictions in ducts such as elbows and transitions.
 - b. Measure static pressure directly at the fan outlet or through the flexible connection.
 - c. Measure inlet static pressure of single-inlet fans in the inlet duct as near the fan as possible, upstream from the flexible connection, and downstream from duct restrictions.
 - d. Measure inlet static pressure of double-inlet fans through the wall of the plenum that houses the fan.
 - 3. Measure static pressure across each component that makes up an air-handling unit, rooftop unit, and other air-handling and -treating equipment.
 - a. Report the cleanliness status of filters and the time static pressures are measured.
 - 4. Measure static pressures entering and leaving other devices, such as sound traps, heat-recovery equipment, and air washers, under final balanced conditions.
 - 5. Review Record Documents to determine variations in design static pressures versus actual static pressures. Calculate actual system-effect factors. Recommend adjustments to accommodate actual conditions.
 - 6. Obtain approval from Engineer for adjustment of fan speed higher or lower than indicated speed. Comply with requirements in Sections for air-handling units for adjustment of fans, belts, and pulley sizes to achieve indicated air-handling-unit performance.
 - 7. Do not make fan-speed adjustments that result in motor overload. Consult equipment manufacturers about fan-speed safety factors. Modulate dampers and measure fan-motor amperage to ensure that no overload will occur. Measure amperage in full-cooling, full-heating, economizer, and any other operating mode to determine the maximum required brake horsepower.

- B. Adjust volume dampers for main duct, submain ducts, and major branch ducts to indicated airflows within specified tolerances.
 - 1. Measure airflow of submain and branch ducts.
 - a. Where sufficient space in submain and branch ducts is unavailable for Pitot-tube traverse measurements, measure airflow at terminal outlets and inlets and calculate the total airflow for that zone.
 - 2. Measure static pressure at a point downstream from the balancing damper, and adjust volume dampers until the proper static pressure is achieved.
 - 3. Remeasure each submain and branch duct after all have been adjusted. Continue to adjust submain and branch ducts to indicated airflows within specified tolerances.

3.05 PROCEDURES FOR MOTORS

- A. Motors, 1/2 HP and Larger: Test at final balanced conditions and record the following data:
 - 1. Manufacturer's name, model number, and serial number.
 - 2. Motor horsepower rating.
 - 3. Motor rpm.
 - 4. Efficiency rating.
 - 5. Nameplate and measured voltage, each phase.
 - 6. Nameplate and measured amperage, each phase.
 - 7. Starter thermal-protection-element rating.

3.06 PROCEDURES FOR CONDENSING UNITS

- A. Verify proper rotation of fans.
- B. Measure entering- and leaving-air temperatures.
- C. Record compressor data.

3.07 PROCEDURES FOR HEAT-TRANSFER COILS

- A. Measure, adjust, and record the following data for each electric heating coil:
 - 1. Nameplate data.
 - 2. Airflow.
 - 3. Entering- and leaving-air temperature at full load.
 - 4. Voltage and amperage input of each phase at full load and at each incremental stage.
 - 5. Calculated kilowatt at full load.
 - 6. Fuse or circuit-breaker rating for overload protection.
- B. Measure, adjust, and record the following data for each refrigerant coil:
 - 1. Dry-bulb temperature of entering and leaving air.

2. Wet-bulb temperature of entering and leaving air.
3. Airflow.
4. Air pressure drop.
5. Refrigerant suction pressure and temperature.

3.08 TOLERANCES

- A. Set HVAC system's air flow rates and water flow rates within the following tolerances:
 1. Supply and Exhaust Fans: Plus or minus 10 percent.

3.09 REPORTING

- A. Initial Construction-Phase Report: Based on examination of the Contract Documents as specified in "Examination" Article, prepare a report on the adequacy of design for systems' balancing devices. Recommend changes and additions to systems' balancing devices to facilitate proper performance measuring and balancing. Recommend changes and additions to HVAC systems and general construction to allow access for performance measuring and balancing devices.

3.10 FINAL REPORT

- A. General: Prepare a certified written report; tabulate and divide the report into separate sections for tested systems and balanced systems.
 1. Include a certification sheet at the front of the report's binder, signed and sealed by the certified testing and balancing engineer.
 2. Include a list of instruments used for procedures, along with proof of calibration.
- B. Final Report Contents: In addition to certified field-report data, include the following
 1. Fan curves.
 2. Manufacturers' test data.
 3. Field test reports prepared by system and equipment installers.
 4. Other information relative to equipment performance; do not include Shop Drawings and product data.
- C. General Report Data: In addition to form titles and entries, include the following data:
 1. Title page.
 2. Name and address of the TAB contractor.
 3. Project name.
 4. Project location.
 5. Architect's name and address.
 6. Engineer's name and address.
 7. Contractor's name and address.
 8. Report date.
 9. Signature of TAB supervisor who certifies the report.
 10. Table of Contents with the total number of pages defined for each section of the report. Number each page in the report.

11. Summary of contents including the following:
 - a. Indicated versus final performance.
 - b. Notable characteristics of systems.
 - c. Description of system operation sequence if it varies from the Contract Documents.
 12. Nomenclature sheets for each item of equipment.
 13. Data for terminal units, including manufacturer's name, type, size, and fittings.
 14. Notes to explain why certain final data in the body of reports vary from indicated values.
 15. Test conditions for fans and pump performance forms including the following:
 - a. Settings for outdoor-, return-, and exhaust-air dampers.
 - b. Conditions of filters.
 - c. Cooling coil, wet- and dry-bulb conditions.
 - d. Fan drive settings including settings and percentage of maximum pitch diameter.
 - e. Other system operating conditions that affect performance.
- D. System Diagrams: Include schematic layouts of air and hydronic distribution systems. Present each system with single-line diagram and include the following:
1. Quantities of outdoor, supply, return, and exhaust airflows.
 2. Duct, outlet, and inlet sizes.
 3. Position of balancing devices.

3.11 ADDITIONAL TESTS

- A. Within 90 days of completing TAB, perform additional TAB to verify that balanced conditions are being maintained throughout and to correct unusual conditions.
- B. Seasonal Periods: If initial TAB procedures were not performed during near-peak summer and winter conditions, perform additional TAB during near-peak summer and winter conditions.

END OF SECTION 23 05 93

SECTION 23 07 13
DUCT INSULATION**PART 1 - GENERAL****1.01 SUMMARY**

- A. Section includes insulating the following duct services:
 - 1. Indoor, supply, return and outdoor air.

1.02 SUBMITTALS

- A. Product Data: For each type of product indicated.
- B. Field quality-control reports.

1.03 QUALITY ASSURANCE

- A. Surface-Burning Characteristics: For insulation and related materials, as determined by testing identical products according to ASTM E 84, by a testing agency acceptable to authorities having jurisdiction. Factory label insulation and jacket materials and adhesive, mastic, tapes, and cement material containers, with appropriate markings of applicable testing agency.
 - 1. Insulation Installed Indoors: Flame-spread index of 25 or less, and smoke-developed index of 50 or less.

PART 2 - PRODUCTS**2.01 INSULATION MATERIALS**

- A. Comply with requirements in "Duct Insulation Schedules.
- B. Products shall not contain asbestos, lead, mercury, or mercury compounds.
- C. Products that come in contact with stainless steel shall have a leachable chloride content of less than 50 ppm when tested according to ASTM C 871.
- D. Insulation materials for use on austenitic stainless steel shall be qualified as acceptable according to ASTM C 795.
- E. Foam insulation materials shall not use CFC or HCFC blowing agents in the manufacturing process.

- F. Mineral-Fiber Blanket Insulation: Mineral or glass fibers bonded with a thermosetting resin. Comply with ASTM C 553, Type II and ASTM C 1290, Type II with factory-applied vinyl jacket or Type III with factory-applied FSK jacket . Factory-applied jacket requirements are specified in "Factory-Applied Jackets" Article.
- G. Mineral-Fiber Board Insulation: Mineral or glass fibers bonded with a thermosetting resin. Comply with ASTM C 612, Type IA or Type IB. For duct and plenum applications, provide insulation with factory-applied ASJ or with factory-applied FSK jacket. Factory-applied jacket requirements are specified in "Factory-Applied Jackets" Article.

2.02 ADHESIVES

- A. Materials shall be compatible with insulation materials, jackets, and substrates and for bonding insulation to itself and to surfaces to be insulated unless otherwise indicated.
- B. Mineral-Fiber Adhesive: Comply with MIL-A-3316C, Class 2, Grade A.
 - 1. For indoor applications, adhesive shall have a VOC content of 80 g/L or less when calculated according to 40 CFR 59, Subpart D (EPA Method 24).
 - 2. Adhesive shall comply with the testing and product requirements of the California Department of Health Services' "Standard Practice for the Testing of Volatile Organic Emissions from Various Sources Using Small-Scale Environmental Chambers."
- C. ASJ Adhesive, and FSK Jacket Adhesive: Comply with MIL-A-3316C, Class 2, Grade A for bonding insulation jacket lap seams and joints.
 - 1. For indoor applications, adhesive shall have a VOC content of 50 g/L or less when calculated according to 40 CFR 59, Subpart D (EPA Method 24).
 - 2. Adhesive shall comply with the testing and product requirements of the California Department of Health Services' "Standard Practice for the Testing of Volatile Organic Emissions from Various Sources Using Small-Scale Environmental Chambers."

2.03 MASTICS

- A. Materials shall be compatible with insulation materials, jackets, and substrates; comply with MIL-PRF-19565C, Type II.
 - 1. For indoor applications, use mastics that have a VOC content of 50 g/L or less when calculated according to 40 CFR 59, Subpart D (EPA Method 24).
- B. Vapor-Barrier Mastic: Water based; suitable for indoor use on below ambient services.
 - 1. Water-Vapor Permeance: ASTM E 96/E 96M, Procedure B, **0.013 perm** at **43-mil** dry film thickness.
 - 2. Service Temperature Range: **Minus 20 to plus 180 deg F**.
 - 3. Solids Content: ASTM D 1644, 58 percent by volume and 70 percent by weight.
 - 4. Color: White.

- C. Breather Mastic: Water based; suitable for indoor and outdoor use on above ambient services.
1. Water-Vapor Permeance: ASTM F 1249, **1.8 perms** at **0.0625-inch** dry film thickness.
 2. Service Temperature Range: **Minus 20 to plus 180 deg F.**
 3. Solids Content: 60 percent by volume and 66 percent by weight.
 4. Color: White.

2.04 SEALANTS

A. FSK Jacket Flashing Sealants:

1. Materials shall be compatible with insulation materials, jackets, and substrates.
2. Fire- and water-resistant, flexible, elastomeric sealant.
3. Service Temperature Range: **Minus 40 to plus 250 deg F.**
4. Color: Aluminum.
5. For indoor applications, use sealants that have a VOC content of 420 g/L or less when calculated according to 40 CFR 59, Subpart D (EPA Method 24).
6. Sealants shall comply with the testing and product requirements of the California Department of Health Services' "Standard Practice for the Testing of Volatile Organic Emissions from Various Sources Using Small-Scale Environmental Chambers."

B. ASJ Flashing Sealants, and Vinyl Jacket Flashing Sealants:

1. Materials shall be compatible with insulation materials, jackets, and substrates.
2. Fire- and water-resistant, flexible, elastomeric sealant.
3. Service Temperature Range: **Minus 40 to plus 250 deg F.**
4. Color: White.
5. For indoor applications, sealants shall have a VOC content of 420 g/L or less when calculated according to 40 CFR 59, Subpart D (EPA Method 24).
6. Sealants shall comply with the testing and product requirements of the California Department of Health Services' "Standard Practice for the Testing of Volatile Organic Emissions from Various Sources Using Small-Scale Environmental Chambers."

2.05 FACTORY-APPLIED JACKETS

- A. Insulation system schedules indicate factory-applied jackets on various applications. When factory-applied jackets are indicated, comply with the following:
1. ASJ: White, kraft-paper, fiberglass-reinforced scrim with aluminum-foil backing; complying with ASTM C 1136, Type I.
 2. FSK Jacket: Aluminum-foil, fiberglass-reinforced scrim with kraft-paper backing; complying with ASTM C 1136, Type II.
 3. Vinyl Jacket: White vinyl with a permeance of **1.3 perms** when tested according to ASTM E 96/E 96M, Procedure A, and complying with NFPA 90A and NFPA 90B.

2.06 TAPES

- A. ASJ Tape: White vapor-retarder tape matching factory-applied jacket with acrylic adhesive, complying with ASTM C 1136.
1. Width: **3 inches**.
 2. Thickness: **11.5 mils**.
 3. Adhesion: **90 ounces force/inch** in width.
 4. Elongation: 2 percent.
 5. Tensile Strength: **40 lbf/inch** in width.
 6. ASJ Tape Disks and Squares: Precut disks or squares of ASJ tape.
- B. FSK Tape: Foil-face, vapor-retarder tape matching factory-applied jacket with acrylic adhesive; complying with ASTM C 1136.
1. Width: **3 inches**.
 2. Thickness: **6.5 mils**.
 3. Adhesion: **90 ounces force/inch** in width.
 4. Elongation: 2 percent.
 5. Tensile Strength: **40 lbf/inch** in width.
 6. FSK Tape Disks and Squares: Precut disks or squares of FSK tape.

2.07 SECUREMENTS

- A. Insulation Pins and Hangers:
1. Metal, Adhesively Attached, Perforated-Base Insulation Hangers: Baseplate welded to projecting spindle that is capable of holding insulation, of thickness indicated, securely in position indicated when self-locking washer is in place. Comply with the following requirements:
 - a. Baseplate: Perforated, galvanized carbon-steel sheet, **0.030 inch** thick by **2 inches** square.
 - b. Spindle: Aluminum or Stainless steel, fully annealed, **0.106-inch**-diameter shank, length to suit depth of insulation indicated.
 - c. Adhesive: Recommended by hanger manufacturer. Product with demonstrated capability to bond insulation hanger securely to substrates indicated without damaging insulation, hangers, and substrates.
 2. Nonmetal, Adhesively Attached, Perforated-Base Insulation Hangers: Baseplate fastened to projecting spindle that is capable of holding insulation, of thickness indicated, securely in position indicated when self-locking washer is in place. Comply with the following requirements:
 - a. Baseplate: Perforated, nylon sheet, **0.030 inch** thick by **1-1/2 inches** in diameter.
 - b. Spindle: Nylon, **0.106-inch**-diameter shank, length to suit depth of insulation indicated, up to **2-1/2 inches**.
 - c. Adhesive: Recommended by hanger manufacturer. Product with demonstrated capability to bond insulation hanger securely to substrates indicated without damaging insulation, hangers, and substrates.
 3. Self-Sticking-Base Insulation Hangers: Baseplate welded to projecting spindle that is capable of holding insulation, of thickness indicated, securely in position

indicated when self-locking washer is in place. Comply with the following requirements:

- a. Baseplate: Galvanized carbon-steel sheet, 0.030 inch thick by 2 inches square.
 - b. Spindle: Aluminum or Stainless steel, fully annealed, 0.106-inch-diameter shank, length to suit depth of insulation indicated.
 - c. Adhesive-backed base with a peel-off protective cover.
4. Insulation-Retaining Washers: Self-locking washers formed from 0.016-inch-thick, galvanized-steel sheet, with beveled edge sized as required to hold insulation securely in place but not less than 1-1/2 inches in diameter.
- a. Protect ends with capped self-locking washers incorporating a spring steel insert to ensure permanent retention of cap in exposed locations.
5. Nonmetal Insulation-Retaining Washers: Self-locking washers formed from 0.016-inch- (0.41-mm-) thick nylon sheet, with beveled edge sized as required to hold insulation securely in place but not less than 1-1/2 inches in diameter.
- B. Staples: Outward-clinching insulation staples, nominal 3/4-inch-wide, stainless steel or Monel.
- C. Wire: 0.062-inch soft-annealed, galvanized steel.

PART 3 - EXECUTION

3.01 PREPARATION

- A. Surface Preparation: Clean and dry surfaces to receive insulation. Remove materials that will adversely affect insulation application.

3.02 GENERAL INSTALLATION REQUIREMENTS

- A. Install insulation materials, accessories, and finishes with smooth, straight, and even surfaces; free of voids throughout the length of ducts and fittings.
- B. Install insulation materials, vapor barriers or retarders, jackets, and thicknesses required for each item of duct system as specified in insulation system schedules.
- C. Install accessories compatible with insulation materials and suitable for the service. Install accessories that do not corrode, soften, or otherwise attack insulation or jacket in either wet or dry state.
- D. Install insulation with longitudinal seams at top and bottom of horizontal runs.
- E. Install multiple layers of insulation with longitudinal and end seams staggered.
- F. Keep insulation materials dry during application and finishing.

- G. Install insulation with tight longitudinal seams and end joints. Bond seams and joints with adhesive recommended by insulation material manufacturer.
- H. Install insulation with least number of joints practical.
- I. Where vapor barrier is indicated, seal joints, seams, and penetrations in insulation at hangers, supports, anchors, and other projections with vapor-barrier mastic.
 - 1. Install insulation continuously through hangers and around anchor attachments.
 - 2. For insulation application where vapor barriers are indicated, extend insulation on anchor legs from point of attachment to supported item to point of attachment to structure. Taper and seal ends at attachment to structure with vapor-barrier mastic.
 - 3. Install insert materials and install insulation to tightly join the insert. Seal insulation to insulation inserts with adhesive or sealing compound recommended by insulation material manufacturer.
- J. Apply adhesives, mastics, and sealants at manufacturer's recommended coverage rate and wet and dry film thicknesses.
- K. Install insulation with factory-applied jackets as follows:
 - 1. Draw jacket tight and smooth.
 - 2. Cover circumferential joints with **3-inch**-wide strips, of same material as insulation jacket. Secure strips with adhesive and outward clinching staples along both edges of strip, spaced **4 inches** o.c.
 - 3. Overlap jacket longitudinal seams at least **1-1/2 inches**. Clean and dry surface to receive self-sealing lap. Staple laps with outward clinching staples along edge at 2 inches o.c.
 - a. For below ambient services, apply vapor-barrier mastic over staples.
 - 4. Cover joints and seams with tape, according to insulation material manufacturer's written instructions, to maintain vapor seal.
 - 5. Where vapor barriers are indicated, apply vapor-barrier mastic on seams and joints and at ends adjacent to duct flanges and fittings.
- L. Cut insulation in a manner to avoid compressing insulation more than 75 percent of its nominal thickness.
- M. Finish installation with systems at operating conditions. Repair joint separations and cracking due to thermal movement.
- N. Repair damaged insulation facings by applying same facing material over damaged areas. Extend patches at least **4 inches** beyond damaged areas. Adhere, staple, and seal patches similar to butt joints.

3.03 PENETRATIONS

- A. Insulation Installation at Interior Wall and Partition Penetrations (That Are Not Fire Rated): Install insulation continuously through walls and partitions.

- B. Insulation Installation at Fire-Rated Wall and Partition Penetrations: Terminate insulation at fire damper sleeves for fire-rated wall and partition penetrations. Externally insulate damper sleeves to match adjacent insulation and overlap duct insulation at least **2 inches**.
1. Comply with requirements in Section 07 84 13 "Penetration Firestopping" for firestopping and fire-resistive joint sealers.

3.04 INSTALLATION OF MINERAL-FIBER INSULATION

- A. Blanket Insulation Installation on Ducts and Plenums: Secure with adhesive and insulation pins.
1. Apply adhesives according to manufacturer's recommended coverage rates per unit area, for 100 percent coverage of duct and plenum surfaces.
 2. Apply adhesive to entire circumference of ducts and to all surfaces of fittings and transitions.
 3. Install either capacitor-discharge-weld pins and speed washers or cupped-head, capacitor-discharge-weld pins on sides and bottom of horizontal ducts and sides of vertical ducts as follows:
 - a. On duct sides with dimensions **18 inches** and smaller, place pins along longitudinal centerline of duct. Space **3 inches** maximum from insulation end joints, and **16 inches** o.c.
 - b. On duct sides with dimensions larger than **18 inches**, place pins **16 inches** o.c. each way, and **3 inches** maximum from insulation joints. Install additional pins to hold insulation tightly against surface at cross bracing.
 - c. Pins may be omitted from top surface of horizontal, rectangular ducts and plenums.
 - d. Do not overcompress insulation during installation.
 - e. Impale insulation over pins and attach speed washers.
 - f. Cut excess portion of pins extending beyond speed washers or bend parallel with insulation surface. Cover exposed pins and washers with tape matching insulation facing.
 4. For ducts and plenums with surface temperatures below ambient, install a continuous unbroken vapor barrier. Create a facing lap for longitudinal seams and end joints with insulation by removing **2 inches** from one edge and one end of insulation segment. Secure laps to adjacent insulation section with **1/2-inch** outward-clinching staples, **1 inch** o.c. Install vapor barrier consisting of factory- or field-applied jacket, adhesive, vapor-barrier mastic, and sealant at joints, seams, and protrusions.
 - a. Repair punctures, tears, and penetrations with tape or mastic to maintain vapor-barrier seal.
 - b. Install vapor stops for ductwork and plenums operating below **50 deg F** at **18-foot (5.5-m)** intervals. Vapor stops shall consist of vapor-barrier mastic applied in a Z-shaped pattern over insulation face, along butt end of insulation, and over the surface. Cover insulation face and surface to be insulated a width equal to two times the insulation thickness, but not less than **3 inches**.

5. Overlap unfaced blankets a minimum of **2 inches** on longitudinal seams and end joints. At end joints, secure with steel bands spaced a maximum of **18 inches** o.c.
 6. Install insulation on rectangular duct elbows and transitions with a full insulation section for each surface. Install insulation on round and flat-oval duct elbows with individually mitered gores cut to fit the elbow.
 7. Insulate duct stiffeners, hangers, and flanges that protrude beyond insulation surface with **6-inch-wide** strips of same material used to insulate duct. Secure on alternating sides of stiffener, hanger, and flange with pins spaced **6 inches** o.c.
- B. Board Insulation Installation on Ducts and Plenums: Secure with adhesive and insulation pins.
1. Apply adhesives according to manufacturer's recommended coverage rates per unit area, for 100 percent coverage of duct and plenum surfaces.
 2. Apply adhesive to entire circumference of ducts and to all surfaces of fittings and transitions.
 3. Install either capacitor-discharge-weld pins and speed washers or cupped-head, capacitor-discharge-weld pins on sides and bottom of horizontal ducts and sides of vertical ducts as follows:
 - a. On duct sides with dimensions **18 inches** and smaller, place pins along longitudinal centerline of duct. Space **3 inches** maximum from insulation end joints, and **16 inches** o.c.
 - b. On duct sides with dimensions larger than **18 inches**, space pins **16 inches** o.c. each way, and **3 inches** maximum from insulation joints. Install additional pins to hold insulation tightly against surface at cross bracing.
 - c. Pins may be omitted from top surface of horizontal, rectangular ducts and plenums.
 - d. Do not overcompress insulation during installation.
 - e. Cut excess portion of pins extending beyond speed washers or bend parallel with insulation surface. Cover exposed pins and washers with tape matching insulation facing.
 4. For ducts and plenums with surface temperatures below ambient, install a continuous unbroken vapor barrier. Create a facing lap for longitudinal seams and end joints with insulation by removing **2 inches** from one edge and one end of insulation segment. Secure laps to adjacent insulation section with **1/2-inch** outward-clinching staples, **1 inch** o.c. Install vapor barrier consisting of factory- or field-applied jacket, adhesive, vapor-barrier mastic, and sealant at joints, seams, and protrusions.
 - a. Repair punctures, tears, and penetrations with tape or mastic to maintain vapor-barrier seal.
 - b. Install vapor stops for ductwork and plenums operating below **50 deg F** at **18-foot** intervals. Vapor stops shall consist of vapor-barrier mastic applied in a Z-shaped pattern over insulation face, along butt end of insulation, and over the surface. Cover insulation face and surface to be insulated a width equal to two times the insulation thickness, but not less than **3 inches**.
 5. Install insulation on rectangular duct elbows and transitions with a full insulation section for each surface. Groove and score insulation to fit as closely as

possible to outside and inside radius of elbows. Install insulation on round and flat-oval duct elbows with individually mitered gores cut to fit the elbow.

6. Insulate duct stiffeners, hangers, and flanges that protrude beyond insulation surface with **6-inch- (150-mm-)** wide strips of same material used to insulate duct. Secure on alternating sides of stiffener, hanger, and flange with pins spaced **6 inches** o.c.

3.05 FINISHES

- A. Insulation with ASJ or Other Paintable Jacket Material: Paint jacket with paint system identified below and as specified in Section 09 91 23 "Interior Painting."
 1. Flat Acrylic Finish: Two finish coats over a primer that is compatible with jacket material and finish coat paint. Add fungicidal agent to render fabric mildew proof.
 - a. Finish Coat Material: Interior, flat, latex-emulsion size.
- B. Color: Final color as selected by Architect. Vary first and second coats to allow visual inspection of the completed Work.
- C. Do not field paint aluminum or stainless-steel jackets.

3.06 FIELD QUALITY CONTROL

- A. Perform tests and inspections.
- B. Tests and Inspections:
 1. Inspect ductwork, randomly selected by Architect, by removing field-applied jacket and insulation in layers in reverse order of their installation. Extent of inspection shall be limited to one location.
- C. All insulation applications will be considered defective Work if sample inspection reveals noncompliance with requirements.

3.07 DUCT INSULATION SCHEDULE, GENERAL

- A. Plenums and Ducts Requiring Insulation:
 1. Indoor, supply, return and outdoor air.
- B. Items Not Insulated:
 1. Flexible connectors.
 2. Vibration-control devices.
 3. Factory-insulated access panels and doors.

3.08 INSULATION SCHEDULE

- A. Supply, Return and Outdoor Air Duct Insulation: Mineral-fiber blanket or board 1-1/2 inches thick and 1.5-lb/cu. ft. nominal density.

END OF SECTION 23 07 13

SECTION 23 07 19
HVAC PIPING INSULATION

PART 1 - GENERAL

1.01 SUMMARY

- A. Section includes insulating the following HVAC piping systems:
 - 1. Refrigerant suction and hot-gas piping for Refrigerant Systems.

1.02 SUBMITTALS

- A. Product Data: For each type of product indicated.
- B. Field quality-control reports.

1.03 QUALITY ASSURANCE

- A. Surface-Burning Characteristics: For insulation and related materials, as determined by testing identical products according to ASTM E 84, by a testing and inspecting agency acceptable to authorities having jurisdiction. Factory label insulation and jacket materials and adhesive, mastic, tapes, and cement material containers, with appropriate markings of applicable testing agency.
 - 1. Insulation Installed Indoors: Flame-spread index of 25 or less, and smoke-developed index of 50 or less.
 - 2. Insulation Installed Outdoors: Flame-spread index of 75 or less, and smoke-developed index of 150 or less.

PART 2 - PRODUCTS

2.01 INSULATION MATERIALS

- A. Products shall not contain asbestos, lead, mercury, or mercury compounds.
- B. Products that come in contact with stainless steel shall have a leachable chloride content of less than 50 ppm when tested according to ASTM C 871.
- C. Insulation materials for use on austenitic stainless steel shall be qualified as acceptable according to ASTM C 795.
- D. Foam insulation materials shall not use CFC or HCFC blowing agents in the manufacturing process.

- E. Flexible Elastomeric Insulation: Closed-cell, sponge- or expanded-rubber materials. Comply with ASTM C 534, Type I for tubular materials.

2.02 ADHESIVES

- A. Materials shall be compatible with insulation materials, jackets, and substrates and for bonding insulation to itself and to surfaces to be insulated unless otherwise indicated.
- B. Flexible Elastomeric Adhesive: Comply with MIL-A-24179A, Type II, Class I.

PART 3 - EXECUTION

3.01 PREPARATION

- A. Surface Preparation: Clean and dry surfaces to receive insulation. Remove materials that will adversely affect insulation application.
- B. Coordinate insulation installation with the trade installing heat tracing. Comply with requirements for heat tracing that apply to insulation.
- C. Mix insulating cements with clean potable water; if insulating cements are to be in contact with stainless-steel surfaces, use demineralized water.

3.02 PENETRATIONS

- A. Insulation Installation at Aboveground Exterior Wall Penetrations: Install insulation continuously through wall penetrations.
 - 1. Seal penetrations with flashing sealant.
 - 2. For applications requiring only indoor insulation, terminate insulation inside wall surface and seal with joint sealant. For applications requiring indoor and outdoor insulation, install insulation for outdoor applications tightly joined to indoor insulation ends. Seal joint with joint sealant.
 - 3. Extend jacket of outdoor insulation outside wall flashing and overlap wall flashing at least **2 inches**.
 - 4. Seal jacket to wall flashing with flashing sealant.

3.03 INSTALLATION OF FLEXIBLE ELASTOMERIC INSULATION

- A. Seal longitudinal seams and end joints with manufacturer's recommended adhesive to eliminate openings in insulation that allow passage of air to surface being insulated.
- B. Insulation Installation on Pipe Fittings and Elbows:
 - 1. Install mitered sections of pipe insulation.
 - 2. Secure insulation materials and seal seams with manufacturer's recommended adhesive to eliminate openings in insulation that allow passage of air to surface being insulated.

- C. Insulation Installation on Valves and Pipe Specialties:
1. Install preformed valve covers manufactured of same material as pipe insulation when available.
 2. When preformed valve covers are not available, install cut sections of pipe and sheet insulation to valve body. Arrange insulation to permit access to packing and to allow valve operation without disturbing insulation.
 3. Install insulation to flanges as specified for flange insulation application.
 4. Secure insulation to valves and specialties and seal seams with manufacturer's recommended adhesive to eliminate openings in insulation that allow passage of air to surface being insulated.

3.04 PIPING INSULATION SCHEDULE

- A. Refrigerant Suction and Hot-Gas Piping: Flexible elastomeric 1 inch thick.

END OF SECTION 23 07 19

SECTION 23 08 00
COMMISSIONING OF HVAC

PART 1 - GENERAL

1.01 SUMMARY

- A. Section includes commissioning process requirements for HVAC&R systems, assemblies, and equipment.
- B. Related Sections:
 - 1. Section 01 91 13 "General Commissioning Requirements" for general commissioning process requirements.

1.02 DEFINITIONS

- A. Commissioning Plan: A document that outlines the organization, schedule, allocation of resources, and documentation requirements of the commissioning process.
- B. CxA: Commissioning Authority.
- C. HVAC&R: Heating, Ventilating, Air Conditioning, and Refrigeration.
- D. Systems, Subsystems, Equipment, and Components: Where these terms are used together or separately, they shall mean "as-built" systems, subsystems, equipment, and components.

1.03 INFORMATIONAL SUBMITTALS

- A. Certificates of readiness.
- B. Certificates of completion of installation, prestart, and startup activities.

1.04 CONTRACTOR'S RESPONSIBILITIES

- A. Perform commissioning tests at the direction of the CxA.
- B. Attend construction phase controls coordination meeting.
- C. Attend testing, adjusting, and balancing review and coordination meeting.
- D. Participate in HVAC&R systems, assemblies, equipment, and component maintenance orientation and inspection as directed by the CxA.
- E. Provide information requested by the CxA for final commissioning documentation.

- F. Provide measuring instruments and logging devices to record test data, and provide data acquisition equipment to record data for the complete range of testing for the required test period.

1.05 CxA'S RESPONSIBILITIES

- A. Provide Project-specific construction checklists and commissioning process test procedures for actual HVAC&R systems, assemblies, equipment, and components to be furnished and installed as part of the construction contract.
- B. Direct commissioning testing.
- C. Verify testing, adjusting, and balancing of Work are complete.
- D. Provide test data, inspection reports, and certificates in Systems Manual.

1.06 COMMISSIONING DOCUMENTATION

- A. Provide the following information to the CxA for inclusion in the commissioning plan:
 - 1. Plan for delivery and review of submittals, systems manuals, and other documents and reports.
 - 2. Identification of installed systems, assemblies, equipment, and components including design changes that occurred during the construction phase.
 - 3. Process and schedule for completing construction checklists and manufacturer's prestart and startup checklists for HVAC&R systems, assemblies, equipment, and components to be verified and tested.
 - 4. Certificate of readiness, signed by the Contractor, certifying that HVAC&R systems, assemblies, equipment, components, and associated controls are ready for testing.
 - 5. Certificate of completion certifying that installation, prestart checks, and startup procedures have been completed.
 - 6. Test and inspection reports and certificates.
 - 7. Corrective action documents.
 - 8. Verification of testing, adjusting, and balancing reports.

PART 2 - PRODUCTS (Not Used)

PART 3 - EXECUTION

3.01 TESTING PREPARATION

- A. Certify that HVAC&R systems, subsystems, and equipment have been installed, calibrated, and started and are operating according to the Contract Documents.

- B. Certify that HVAC&R instrumentation and control systems have been completed and calibrated, that they are operating according to the Contract Documents, and that pretest set points have been recorded.
- C. Certify that testing, adjusting, and balancing procedures have been completed and that testing, adjusting, and balancing reports have been submitted, discrepancies corrected, and corrective work approved.
- D. Set systems, subsystems, and equipment into operating mode to be tested (e.g., normal shutdown, normal auto position, normal manual position, unoccupied cycle, emergency power, and alarm conditions).
- E. Inspect and verify the position of each device and interlock identified on checklists.
- F. Check safety cutouts, alarms, and interlocks with smoke control and life-safety systems during each mode of operation.
- G. Testing Instrumentation: Install measuring instruments and logging devices to record test data as directed by the CxA.

3.02 Testing AND BALANCING VERIFICATION

- A. Prior to performance of testing and balancing Work, provide copies of reports, sample forms, checklists, and certificates to the CxA.
- B. Notify the CxA at least 10 days in advance of testing and balancing Work, and provide access for the CxA to witness testing and balancing Work.
- C. Provide technicians, instrumentation, and tools to verify testing and balancing of HVAC&R systems at the direction of the CxA.
 - 1. The CxA will notify testing and balancing Subcontractor 10 days in advance of the date of field verification. Notice will not include data points to be verified.
 - 2. The testing and balancing Subcontractor shall use the same instruments (by model and serial number) that were used when original data were collected.
 - 3. Failure of an item includes, other than sound, a deviation of more than 10 percent. Failure of more than 10 percent of selected items shall result in rejection of final testing, adjusting, and balancing report. For sound pressure readings, a deviation of 3 dB shall result in rejection of final testing. Variations in background noise must be considered.
 - 4. Remedy the deficiency and notify the CxA so verification of failed portions can be performed.

3.03 GENERAL TESTING REQUIREMENTS

- A. Provide technicians, instrumentation, and tools to perform commissioning test at the direction of the CxA.
- B. Scope of HVAC&R testing shall include entire HVAC&R installation. Testing shall include measuring capacities and effectiveness of operational and control functions.

- C. Test all operating modes, interlocks, control responses, and responses to abnormal or emergency conditions, and verify proper response of building automation system controllers and sensors.
- D. The CxA along with the HVAC&R Subcontractor, testing and balancing Subcontractor, and HVAC&R Instrumentation and Control Subcontractor shall prepare detailed testing plans, procedures, and checklists for HVAC&R systems, subsystems, and equipment.
- E. Tests will be performed using design conditions whenever possible.
- F. Simulated conditions may need to be imposed using an artificial load when it is not practical to test under design conditions. Before simulating conditions, calibrate testing instruments. Provide equipment to simulate loads. Set simulated conditions as directed by the CxA and document simulated conditions and methods of simulation. After tests, return settings to normal operating conditions.
- G. The CxA may direct that set points be altered when simulating conditions is not practical.
- H. The CxA may direct that sensor values be altered with a signal generator when design or simulating conditions and altering set points are not practical.
- I. If tests cannot be completed because of a deficiency outside the scope of the HVAC&R system, document the deficiency and report it to the Owner. After deficiencies are resolved, reschedule tests.
- J. If the testing plan indicates specific seasonal testing, complete appropriate initial performance tests and documentation and schedule seasonal tests.

3.04 HVAC&R systems, subsystems, and equipment Testing Procedures

- A. HVAC&R Instrumentation and Control System Testing: Field testing plans and testing requirements are specified in Section 23 09 00 "Instrumentation and Control for HVAC" Assist the CxA with preparation of testing plans.
- B. Refrigeration System Testing: Provide technicians, instrumentation, tools, and equipment to test performance of refrigerant compressors and condensers, VRF fan coils, and other refrigeration systems. The CxA shall determine the sequence of testing and testing procedures for each equipment item and pipe section to be tested.
- C. HVAC&R Distribution System Testing: Provide technicians, instrumentation, tools, and equipment to test performance of air distribution systems; special exhaust; and other distribution systems, including HVAC&R terminal equipment and unitary equipment.
- D. Vibration and Sound Tests: Provide technicians, instrumentation, tools, and equipment to test performance of vibration isolation and seismic controls.

END OF SECTION 23 08 00

SECTION 23 09 00
INSTRUMENTATION AND CONTROL FOR HVAC

PART 1 - GENERAL

1.01 SUMMARY

- A. This Section includes control equipment for HVAC systems and components, including control components for terminal heating and cooling units not supplied with factory-wired controls.
- B. The VRF Controls submitted with the VRF equipment shall interface with the BMS system provided as defined on the drawings and these specifications. Reference Sections 236200 and 238219 for controls supplied with VRF equipment.

1.02 ACTION SUBMITTALS

- A. Product Data: For each control device indicated.
- B. Shop Drawings:
 - 1. Schematic flow diagrams.
 - 2. Power, signal, and control wiring diagrams.
 - 3. Details of control panel faces.
 - 4. Damper schedule.
 - 5. DDC System Hardware: Wiring diagrams, schematic floor plans, and schematic control diagrams.
 - 6. Control System Software: Schematic diagrams, written descriptions, and points list.

1.03 INFORMATIONAL SUBMITTALS

- A. Field quality-control test reports.

1.04 CLOSEOUT SUBMITTALS

- A. Operation and maintenance data.
- B. Software and firmware operational documentation.

1.05 QUALITY ASSURANCE

- A. Electrical Components, Devices, and Accessories: Listed and labeled as defined in NFPA 70, Article 100, by a testing agency acceptable to authorities having jurisdiction, and marked for intended use.

PART 2 - PRODUCTS

2.01 MANUFACTURERS

- A. In other Part 2 articles where titles below introduce lists, the following requirements apply to product selection:
 - 1. Manufacturers: Subject to compliance with requirements, provide products by Johnson Metasys or a compatible equal to KCMO municipal building systems.

2.02 CONTROL SYSTEM

- A. Control system shall consist of sensors, indicators, actuators, final control elements, interface equipment, other apparatus, and accessories to control mechanical systems.
- B. Control system shall consist of sensors, indicators, actuators, final control elements, interface equipment, other apparatus, accessories, and software connected to distributed controllers operating in multiuser, multitasking environment on token-passing network and programmed to control mechanical systems. An operator workstation permits interface with the network via dynamic color graphics with each mechanical system, building floor plan, and control device depicted by point-and-click graphics.
- C. Control system communication protocol to comply with ASHRAE 135: 2010 – BACnet communication.

2.03 DDC EQUIPMENT

- A. Operator Workstation: PC-based microcomputer with minimum configuration as follows:
 - 1. Motherboard: With 8 integrated USB 2.0 ports, integrated Intel Pro 10/100 (Ethernet), integrated audio, bios, and hardware monitoring.
 - 2. Processor: Intel Core i3 or greater
 - 3. Random-Access Memory: 4 GB.
 - 4. Graphics: Video adapter, minimum [1600 x 1200] pixels
 - 5. Monitor: 19 inches LCD color.
 - 6. Keyboard: QWERTY, 105 keys in ergonomic shape.
 - 7. Hard-Disk Drive: 500 GB.
 - 8. CD-ROM Read/Write Drive
 - 9. Mouse: Three button, optical.
 - 10. Uninterruptible Power Supply: 2 kVa.

11. Operating System: Microsoft Windows 7 Professional with high-speed Internet access.
- B. Control Units: Modular, comprising processor board with programmable, nonvolatile, random-access memory; local operator access and display panel; integral interface equipment; and backup power source.
1. Units monitor or control each I/O point; process information; execute commands from other control units, devices, and operator stations; and download from or upload to operator workstation.
 2. Stand-alone mode control functions operate regardless of network status. Functions include the following:
 - a. Global communications.
 - b. Discrete/digital, analog, and pulse I/O.
 - c. Monitoring, controlling, or addressing data points.
 - d. Software applications, scheduling, and alarm processing.
 - e. Testing and developing control algorithms without disrupting field hardware and controlled environment.
- C. Local Control Units: Modular, comprising processor board with electronically programmable, nonvolatile, read-only memory; and backup power source.
1. Units monitor or control each I/O point, process information, and download from or upload to operator workstation or diagnostic terminal unit.
 2. Stand-alone mode control functions operate regardless of network status. Functions include the following:
 - a. Global communications.
 - b. Discrete/digital, analog, and pulse I/O.
 - c. Monitoring, controlling, or addressing data points.
 3. Local operator interface provides for download from or upload to operator workstation.
- D. I/O Interface: Hardwired inputs and outputs may tie into system through controllers. Protect points so that shorting will cause no damage to controllers.
1. Binary Inputs: Allow monitoring of on-off signals without external power.
 2. Pulse Accumulation Inputs: Accept up to 10 pulses per second.
 3. Analog Inputs: Allow monitoring of low-voltage (0- to 10-V dc), current (4 to 20 mA), or resistance signals.
 4. Binary Outputs: Provide on-off or pulsed low-voltage signal, selectable for normally open or normally closed operation
 5. Analog Outputs: Provide modulating signal, either low voltage (0- to 10-V dc) or current (4 to 20 mA)
 6. Tri-State Outputs: Provide two coordinated binary outputs for control of three-point, floating-type electronic actuators.
 7. Universal I/Os: Provide software selectable binary or analog outputs.
- E. Power Supplies: Transformers with Class 2 current-limiting type or overcurrent protection; limit connected loads to 80 percent of rated capacity. DC power supply shall match output current and voltage requirements and be full-wave rectifier type with the following:

1. Output ripple of 5.0 mV maximum peak to peak.
 2. Combined 1 percent line and load regulation with 100-mic.sec. response time for 50 percent load changes.
 3. Built-in overvoltage and overcurrent protection and be able to withstand 150 percent overload for at least 3 seconds without failure.
- F. Power Line Filtering: Internal or external transient voltage and surge suppression for workstations or controllers with the following:
1. Minimum dielectric strength of 1000 V.
 2. Maximum response time of 10 nanoseconds.
 3. Minimum transverse-mode noise attenuation of 65 dB.
 4. Minimum common-mode noise attenuation of 150 dB at 40 to 100 Hz.

2.04 UNITARY CONTROLLERS

- A. Unitized, capable of stand-alone operation with sufficient memory to support its operating system, database, and programming requirements, and with sufficient I/O capacity for the application.
1. Configuration: Local keypad and display; diagnostic LEDs for power, communication, and processor; wiring termination to terminal strip or card connected with ribbon cable; memory with bios; and 72 hour battery backup.
 2. Operating System: Manage I/O communication to allow distributed controllers to share real and virtual object information and allow central monitoring and alarms. Perform automatic system diagnostics; monitor system and report failures.
 3. Enclosure: Dustproof rated for operation at 32 to 120 deg F (0 to 50 deg C).

2.05 ANALOG CONTROLLERS

- A. Step Controllers: 6- or 10-stage type, with heavy-duty switching rated to handle loads and operated by electric motor.
- B. Electric, Outdoor-Reset Controllers: Remote-bulb or bimetal rod-and-tube type, proportioning action with adjustable throttling range, adjustable set point, scale range minus 10 to plus 70 deg F (minus 23 to plus 21 deg C), and single- or double-pole contacts.
- C. Electronic Controllers: Wheatstone-bridge-amplifier type, in steel enclosure with provision for remote-resistance readjustment. Identify adjustments on controllers, including proportional band and authority.
1. Single controllers can be integral with control motor if provided with accessible control readjustment potentiometer.

2.06 TIME CLOCKS

- A. Seven-day, programming-switch timer with synchronous-timing motor and seven-day dial; continuously charged, nickel-cadmium-battery-driven, eight-hour, power-failure

carryover; multiple-switch trippers; minimum of two and maximum of eight signals per day with two normally open and two normally closed output contacts.

- B. Solid-state, programmable time control with 4 separate programs each with up to 100 on-off operations; 1-second resolution; lithium battery backup; keyboard interface and manual override; individual on-off-auto switches for each program; 365-day calendar with 20 programmable holidays; choice of fail-safe operation for each program; system fault alarm; and communications package allowing networking of time controls and programming from PC.

2.07 ELECTRONIC SENSORS

- A. Description: Vibration and corrosion resistant; for wall, immersion, or duct mounting as required.

- B. Thermistor Temperature Sensors and Transmitters:

1. Accuracy: Plus or minus 0.5 deg F (0.3 deg C) at calibration point.
2. Wire: Twisted, shielded-pair cable.
3. Insertion Elements in Ducts: Single point, 8 inches (200 mm) long; use where not affected by temperature stratification or where ducts are smaller than 9 sq. ft. (0.84 sq. m).
4. Averaging Elements in Ducts: 36 inches (915 mm) long, flexible; use where prone to temperature stratification or where ducts are larger than 10 sq. ft. (1 sq. m).
5. Insertion Elements for Liquids: Brass or stainless-steel socket with minimum insertion length of 2-1/2 inches (64 mm).
6. Room Sensor Cover Construction: Manufacturer's standard locking covers.
 - a. Set-Point Adjustment: Concealed.
 - b. Set-Point Indication: Exposed.
 - c. Thermometer: Exposed.
 - d. Color: <Insert color from manufacturer's full range.>
7. Outside-Air Sensors: Watertight inlet fitting, shielded from direct sunlight.
8. Room Security Sensors: Stainless-steel cover plate with insulated back and security screws.

- C. RTDs and Transmitters:

1. Accuracy: Plus or minus 0.2 percent at calibration point.
2. Wire: Twisted, shielded-pair cable.
3. Insertion Elements in Ducts: Single point, 8 inches (200 mm) long; use where not affected by temperature stratification or where ducts are smaller than 9 sq. ft. (0.84 sq. m).
4. Averaging Elements in Ducts: 18 inches (460 mm) long, rigid; use where prone to temperature stratification or where ducts are larger than 9 sq. ft. (0.84 sq. m); length as required.
5. Insertion Elements for Liquids: Brass socket with minimum insertion length of 2-1/2 inches (64 mm).
6. Room Sensor Cover Construction: Manufacturer's standard locking covers.
 - a. Set-Point Adjustment: Concealed.

- b. Set-Point Indication: Exposed.
- c. Thermometer: Exposed.
- 7. Outside-Air Sensors: Watertight inlet fitting, shielded from direct sunlight.
- 8. Room Security Sensors: Stainless-steel cover plate with insulated back and security screws.

D. Room sensor accessories include the following:

- 1. Insulating Bases: For sensors located on exterior walls.
- 2. Guards: Locking; heavy-duty, transparent plastic; mounted on separate base or Locking, solid metal, ventilated.
- 3. Adjusting Key: As required for calibration and cover screws.

2.08 STATUS SENSORS

- A. Status Inputs for Fans: Differential-pressure switch with pilot-duty rating and with adjustable range of 0- to 5-inch wg (0 to 1240 Pa).
- B. Status Inputs for Pumps: Differential-pressure switch with pilot-duty rating and with adjustable pressure-differential range of 8 to 60 psig (55 to 414 kPa), piped across pump.
- C. Status Inputs for Electric Motors: Comply with ISA 50.00.01, current-sensing fixed- or split-core transformers with self-powered transmitter, adjustable and suitable for 175 percent of rated motor current.
- D. Voltage Transmitter (100- to 600-V ac): Comply with ISA 50.00.01, single-loop, self-powered transmitter, adjustable, with suitable range and 1 percent full-scale accuracy.
- E. Power Monitor: 3-phase type with disconnect/shorting switch assembly, listed voltage and current transformers, with pulse kilowatt hour output and 4- to 20-mA kW output, with maximum 2 percent error at 1.0 power factor and 2.5 percent error at 0.5 power factor.
- F. Current Switches: Self-powered, solid-state with adjustable trip current, selected to match current and system output requirements.
- G. Electronic Valve/Damper Position Indicator: Visual scale indicating percent of travel and 2- to 10-V dc, feedback signal.
- H. Water-Flow Switches: Bellows-actuated mercury or snap-acting type with pilot-duty rating, stainless-steel or bronze paddle, with appropriate range and differential adjustment, in NEMA 250, Type 1 enclosure.

2.09 THERMOSTATS

- A. Electric, solid-state, microcomputer-based room thermostat with remote sensor.
 - 1. Automatic switching from heating to cooling.
 - 2. Preferential rate control to minimize overshoot and deviation from set point.

3. Set up for four separate temperatures per day.
 4. Instant override of set point for continuous or timed period from 1 hour to 31 days.
 5. Short-cycle protection.
 6. Programming based on [weekday, Saturday, and Sunday] [every day of week].
 7. Selection features include degree F or degree C display, 12- or 24-hour clock, keyboard disable, remote sensor, and fan on-auto.
 8. Battery replacement without program loss.
 9. Thermostat display features include the following:
 - a. Time of day.
 - b. Actual room temperature.
 - c. Programmed temperature.
 - d. Programmed time.
 - e. Duration of timed override.
 - f. Day of week.
 - g. System mode indications include "heating," "off," "fan auto," and "fan on."
- B. Low-Voltage, On-Off Thermostats: NEMA DC 3, 24-V, bimetal-operated, mercury-switch type, with adjustable or fixed anticipation heater, concealed set-point adjustment, **55 to 85 deg F (13 to 30 deg C)** set-point range, and **2 deg F (1 deg C)** maximum differential.
- C. Line-Voltage, On-Off-Auto Thermostats: Bimetal-actuated, open contact or bellows-actuated, enclosed, snap-switch or equivalent solid-state type, with heat anticipator; listed for electrical rating; with concealed set-point adjustment, **55 to 85 deg F (13 to 30 deg C)** set-point range, and **2 deg F (1 deg C)** maximum differential.
1. Electric Heating Thermostats: Equip with off position on dial wired to break ungrounded conductors.
 2. Selector Switch: Integral, manual on-off-auto.
- D. Remote-Bulb Thermostats: On-off or modulating type, liquid filled to compensate for changes in ambient temperature; with copper capillary and bulb, unless otherwise indicated.
1. Bulbs in water lines with separate wells of same material as bulb.
 2. Bulbs in air ducts with flanges and shields.
 3. Averaging Elements: Copper tubing with either single- or multiple-unit elements, extended to cover full width of duct or unit; adequately supported.
 4. Scale settings and differential settings are clearly visible and adjustable from front of instrument.
 5. On-Off Thermostat: With precision snap switches and with electrical ratings required by application.
 6. Modulating Thermostats: Construct so complete potentiometer coil and wiper assembly is removable for inspection or replacement without disturbing calibration of instrument.
- E. Fire-Protection Thermostats: Listed and labeled by an NRTL acceptable to authorities having jurisdiction; with fixed or adjustable settings to operate at not less than **75 deg F (24 deg C)** above normal maximum operating temperature, and the following:
1. Reset: Manual.

2. Reset: Automatic, with control circuit arranged to require manual reset at central control panel; with pilot light and reset switch on panel labeled to indicate operation.
- F. Airstream Thermostats: Two-pipe, fully proportional, single-temperature type; with adjustable set point in middle of range, adjustable throttling range, plug-in test fitting or permanent pressure gage, remote bulb, bimetal rod and tube, or averaging element.
- G. Electric, Low-Limit Duct Thermostat: Snap-acting, single-pole, single-throw, manual- or automatic- reset switch that trips if temperature sensed across any **12 inches (300 mm)** of bulb length is equal to or below set point.
1. Bulb Length: Minimum **20 feet (6 m)**.
 2. Quantity: One thermostat for every **20 sq. ft. (2 sq. m)** of coil surface.
- H. Electric, High-Limit Duct Thermostat: Snap-acting, single-pole, single-throw, manual- or automatic- reset switch that trips if temperature sensed across any **12 inches (300 mm)** of bulb length is equal to or above set point.
1. Bulb Length: Minimum **20 feet (6 m)**.
 2. Quantity: One thermostat for every **20 sq. ft. (2 sq. m)** of coil surface.

2.10 ACTUATORS

- A. Electronic Actuators: Direct-coupled type designed for minimum 60,000 full-stroke cycles at rated torque.
1. Valves: Size for torque required for valve close off at maximum pump differential pressure.
 2. Dampers: Size for running torque calculated as follows:
 - a. Parallel-Blade Damper with Edge Seals: **7 inch-lb/sq. ft. (86.8 kg-cm/sq. m)** of damper.
 - b. Opposed-Blade Damper with Edge Seals: **5 inch-lb/sq. ft. (62 kg-cm/sq. m)** of damper.
 - c. Parallel-Blade Damper without Edge Seals: **4 inch-lb/sq. ft (49.6 kg-cm/sq. m)** of damper.
 - d. Opposed-Blade Damper without Edge Seals: **3 inch-lb/sq. ft. (37.2 kg-cm/sq. m)** of damper.
 - e. Dampers with **2- to 3-Inch wg (500 to 750 Pa)** of Pressure Drop or Face Velocities of **1000 to 2500 fpm (5 to 13 m/s)**: Increase running torque by 1.5.
 - f. Dampers with **3- to 4-Inch wg (750 to 1000 Pa)** of Pressure Drop or Face Velocities of **2500 to 3000 fpm (13 to 15 m/s)**: Increase running torque by 2.0.
 3. Coupling: V-bolt and V-shaped, toothed cradle.
 4. Overload Protection: Electronic overload or digital rotation-sensing circuitry.
 5. Fail-Safe Operation: Mechanical, spring-return mechanism. Provide external, manual gear release on nonspring-return actuators.
 6. Power Requirements (Two-Position Spring Return): 24 -V ac.
 7. Power Requirements (Modulating): Maximum 10 VA at 24-V ac or 8 W at 24-V dc.

8. Proportional Signal: 2- to 10-V dc or 4 to 20 mA, and 2- to 10-V dc position feedback signal.
9. Temperature Rating: 0 to 104 deg F (5 to 40 deg C).
10. Run Time: 60 seconds .

2.11 DAMPERS

- A. Dampers: AMCA-rated, opposed-blade design; 0.108-inch- (2.8-mm-) minimum thick, galvanized-steel or 0.125-inch- (3.2-mm-) minimum thick, extruded-aluminum frames with holes for duct mounting; damper blades shall not be less than 0.064-inch- (1.6-mm-) thick galvanized steel with maximum blade width of 8 inches (200 mm) and length of 48 inches (1220 mm).
 1. Secure blades to 1/2-inch- (13-mm-) diameter, zinc-plated axles using zinc-plated hardware, with nylon blade bearings, blade-linkage hardware of zinc-plated steel and brass, ends sealed against spring-stainless-steel blade bearings, and thrust bearings at each end of every blade.
 2. Operating Temperature Range: From minus 40 to plus 200 deg F (minus 40 to plus 93 deg C).
 3. Edge Seals, Standard Pressure Applications: Closed-cell neoprene.
 4. Edge Seals, Low-Leakage Applications: Use inflatable blade edging or replaceable rubber blade seals and spring-loaded stainless-steel side seals, rated for leakage at less than 10 cfm per sq. ft. (50 L/s per sq. m) of damper area, at differential pressure of 4-inch wg (1000 Pa) when damper is held by torque of 50 in. x lbf (5.6 N x m); when tested according to AMCA 500D.

2.12 CONTROL CABLE

- A. Electronic and fiber-optic cables for control wiring are specified in Section 27 15 00 "Communications Horizontal Cabling."

PART 3 - EXECUTION

3.01 INSTALLATION

- A. Verify location of thermostats and other exposed control sensors with Drawings and room details before installation. Install devices 48 inches (1220 mm) above the floor.
 1. Install averaging elements in ducts and plenums in crossing or zigzag pattern.
- B. Install guards on thermostats in the following locations:
 1. Entrances.
 2. Public areas.
 3. Where indicated.
- C. Install automatic dampers according to Section 23 33 00 "Air Duct Accessories."

- D. Install damper motors on outside of duct in warm areas, not in locations exposed to outdoor temperatures.
- E. Install labels and nameplates to identify control components according to Section 23 05 53 "Identification for HVAC Piping and Equipment."
- F. Install refrigerant instrument wells, valves, and other accessories according to Section 23 23 00 "Refrigerant Piping."
- G. Install duct volume-control dampers according to Section 23 31 13 "Metal Ducts" and Section 23 31 16 "Nonmetal Ducts."
- H. Install electronic and fiber-optic cables according to Section 27 15 00 "Communications Horizontal Cabling."

3.02 ELECTRICAL WIRING AND CONNECTION INSTALLATION

- A. Install raceways, boxes, and cabinets according to Section 26 05 33 "Raceways and Boxes for Electrical Systems."
- B. Install building wire and cable according to Section 26 05 19 "Low-Voltage Electrical Power Conductors and Cables."
- C. Install signal and communication cable according to Section 27 15 00 "Communications Horizontal Cabling."
 - 1. Conceal cable, except in mechanical rooms and areas where other conduit and piping are exposed.
 - 2. Install exposed cable in raceway.
 - 3. Install concealed cable in raceway.
 - 4. Install concealed, accessible cable in open plenum; cable must be plenum rated.
 - 5. Bundle and harness multiconductor instrument cable in place of single cables where several cables follow a common path.
 - 6. Fasten flexible conductors, bridging cabinets and doors, along hinge side; protect against abrasion. Tie and support conductors.
 - 7. Number-code or color-code conductors for future identification and service of control system, except local individual room control cables.
 - 8. Install wire and cable with sufficient slack and flexible connections to allow for vibration of piping and equipment.
- D. Connect manual-reset limit controls independent of manual-control switch positions. Automatic duct heater resets may be connected in interlock circuit of power controllers.
- E. Connect hand-off-auto selector switches to override automatic interlock controls when switch is in hand position.

3.03 FIELD QUALITY CONTROL

- A. Manufacturer's Field Service: Engage a factory-authorized service representative to inspect, test, and adjust field-assembled components and equipment installation, including connections, and to assist in field testing. Report results in writing.
- B. Perform the following field tests and inspections and prepare test reports:
 - 1. Operational Test: After electrical circuitry has been energized, start units to confirm proper unit operation. Remove and replace malfunctioning units and retest.
 - 2. Test and adjust controls and safeties.
 - 3. Test calibration of controllers by disconnecting input sensors and stimulating operation with compatible signal generator.
 - 4. Test each point through its full operating range to verify that safety and operating control set points are as required.
 - 5. Test each control loop to verify stable mode of operation and compliance with sequence of operation. Adjust PID actions.
 - 6. Test each system for compliance with sequence of operation.
 - 7. Test software and hardware interlocks.
- C. DDC Verification:
 - 1. Verify that instruments are installed before calibration, testing, and loop or leak checks.
 - 2. Check instruments for proper location and accessibility.
 - 3. Check instrument installation for direction of flow, elevation, orientation, insertion depth, and other applicable considerations.
 - 4. Check instrument tubing for proper fittings, slope, material, and support.
 - 5. Check pressure instruments, piping slope, installation of valve manifold, and self-contained pressure regulators.
 - 6. Check temperature instruments and material and length of sensing elements.
 - 7. Check control valves. Verify that they are in correct direction.
 - 8. Check air-operated dampers. Verify that pressure gages are provided and that proper blade alignment, either parallel or opposed, has been provided.
 - 9. Check DDC system as follows:
 - a. Verify that DDC controller power supply is from emergency power supply, if applicable.
 - b. Verify that wires at control panels are tagged with their service designation and approved tagging system.
 - c. Verify that spare I/O capacity has been provided.
 - d. Verify that DDC controllers are protected from power supply surges.
- D. Replace damaged or malfunctioning controls and equipment and repeat testing procedures.

3.04 DEMONSTRATION

- A. Engage a factory-authorized service representative to train Owner's maintenance personnel to adjust, operate, and maintain HVAC instrumentation and controls. Refer to Section 01 79 00 "Demonstration and Training."

END OF SECTION 23 09 00

SECTION 23 11 23
FACILITY NATURAL-GAS PIPING

PART 1 - GENERAL

1.01 SUMMARY

- A. Section Includes:
1. Pipes, tubes, and fittings.
 2. Piping specialties.
 3. Piping and tubing joining materials.
 4. Valves.
 5. Pressure regulators.

1.02 PERFORMANCE REQUIREMENTS

- A. Minimum Operating-Pressure Ratings:
1. Piping and Valves: **100 psig (690 kPa)** minimum unless otherwise indicated.
 2. Service Regulators: **100 psig (690 kPa)** minimum unless otherwise indicated.
- B. Natural-Gas System Pressure within Buildings: **0.5 psig (3.45 kPa)** or less.
- C. Natural-Gas System Pressures within Buildings: Two pressure ranges. Primary pressure is more than **0.5 psig (3.45 kPa)** but not more than **2 psig (13.8 kPa)**, and is reduced to secondary pressure of **0.5 psig (3.45 kPa)** or less.
- D. Delegated Design: Design restraints and anchors for natural-gas piping and equipment, including comprehensive engineering analysis by a qualified professional engineer, using performance requirements and design criteria indicated.

1.03 ACTION SUBMITTALS

- A. Product Data: For each type of product indicated.

1.04 INFORMATIONAL SUBMITTALS

- A. Welding certificates.
- B. Field quality-control reports.

1.05 CLOSEOUT SUBMITTALS

- A. Operation and maintenance data.

1.06 QUALITY ASSURANCE

- A. Steel Support Welding Qualifications: Qualify procedures and personnel according to AWS D1.1/D1.1M, "Structural Welding Code - Steel."
- B. Pipe Welding Qualifications: Qualify procedures and operators according to ASME Boiler and Pressure Vessel Code.
- C. Electrical Components, Devices, and Accessories: Listed and labeled as defined in NFPA 70, by a qualified testing agency, and marked for intended location and application.

PART 2 - PRODUCTS

2.01 PIPES, TUBES, AND FITTINGS

- A. Steel Pipe: ASTM A 53/A 53M, black steel, Schedule 40, Type E or S, Grade B.
 - 1. Malleable-Iron Threaded Fittings: ASME B16.3, Class 150, standard pattern.
 - 2. Wrought-Steel Welding Fittings: ASTM A 234/A 234M for butt welding and socket welding.
 - 3. Unions: ASME B16.39, Class 150, malleable iron with brass-to-iron seat, ground joint, and threaded ends.
 - 4. Protective Coating for Underground Piping: Factory-applied, three-layer coating of epoxy, adhesive, and PE.
 - a. Joint Cover Kits: Epoxy paint, adhesive, and heat-shrink PE sleeves.
- B. Corrugated, Stainless-Steel Tubing: Comply with ANSI/IAS LC 1.
 - 1. Tubing: ASTM A 240/A 240M, corrugated, Series 300 stainless steel.
 - 2. Coating: PE with flame retardant.
 - a. Surface-Burning Characteristics: As determined by testing identical products according to ASTM E 84 by a qualified testing agency. Identify products with appropriate markings of applicable testing agency.
 - 1) Flame-Spread Index: 25 or less.
 - 2) Smoke-Developed Index: 50 or less.
 - 3. Fittings: Copper-alloy mechanical fittings with ends made to fit and listed for use with corrugated stainless-steel tubing and capable of metal-to-metal seal without gaskets. Include brazing socket or threaded ends complying with ASME B1.20.1.
 - 4. Striker Plates: Steel, designed to protect tubing from penetrations.
 - 5. Manifolds: Malleable iron or steel with factory-applied protective coating. Threaded connections shall comply with ASME B1.20.1 for pipe inlet and corrugated tubing outlets.
 - 6. Operating-Pressure Rating: 5 psig (34.5 kPa).
- C. Annealed-Temper Copper Tube: Comply with ASTM B 88, Type K (ASTM B 88M, Type A).
 - 1. Copper Fittings: ASME B16.22, wrought copper, and streamlined pattern.

2. Flare Fittings: Comply with ASME B16.26 and SAE J513.
 - a. Copper fittings with long nuts.
 - b. Metal-to-metal compression seal without gasket.
 - c. Dryseal threads complying with ASME B1.20.3.
 3. Protective Coating for Underground Tubing: Factory-applied, extruded PE a minimum of **0.022 inch (0.56 mm)** thick.
- D. PE Pipe: ASTM D 2513, SDR 11.
1. PE Fittings: ASTM D 2683, socket-fusion type or ASTM D 3261, butt-fusion type with dimensions matching PE pipe.
 2. PE Transition Fittings: Factory-fabricated fittings with PE pipe complying with ASTM D 2513, SDR 11; and steel pipe complying with ASTM A 53/A 53M, black steel, Schedule 40, Type E or S, Grade B.
 3. Anodeless Service-Line Risers: Factory fabricated and leak tested.
 - a. Underground Portion: PE pipe complying with ASTM D 2513, SDR 11 inlet.
 - b. Casing: Steel pipe complying with ASTM A 53/A 53M, Schedule 40, black steel, Type E or S, Grade B, with corrosion-protective coating covering. Vent casing aboveground.
 - c. Aboveground Portion: PE transition fitting.
 - d. Outlet shall be threaded or suitable for welded connection.
 - e. Tracer wire connection.
 - f. Ultraviolet shield.
 - g. Stake supports with factory finish to match steel pipe casing or carrier pipe.
 4. Transition Service-Line Risers: Factory fabricated and leak tested.
 - a. Underground Portion: PE pipe complying with ASTM D 2513, SDR 11 inlet connected to steel pipe complying with ASTM A 53/A 53M, Schedule 40, Type E or S, Grade B, with corrosion-protective coating for aboveground outlet.
 - b. Outlet shall be threaded or suitable for welded connection.
 - c. Bridging sleeve over mechanical coupling.
 - d. Factory-connected anode.
 - e. Tracer wire connection.
 - f. Ultraviolet shield.
 - g. Stake supports with factory finish to match steel pipe casing or carrier pipe.

2.02 PIPING SPECIALTIES

- A. Appliance Flexible Connectors:
1. Indoor, Fixed-Appliance Flexible Connectors: Comply with ANSI Z21.24.
 2. Indoor, Movable-Appliance Flexible Connectors: Comply with ANSI Z21.69.
 3. Outdoor, Appliance Flexible Connectors: Comply with ANSI Z21.75.
 4. Corrugated stainless-steel tubing with polymer coating.
 5. Operating-Pressure Rating: **0.5 psig (3.45 kPa)**.
 6. End Fittings: Zinc-coated steel.
 7. Threaded Ends: Comply with ASME B1.20.1.
 8. Maximum Length: **72 inches (1830 mm.)**

- B. Quick-Disconnect Devices: Comply with ANSI Z21.41.
 - 1. Copper-alloy convenience outlet and matching plug connector.
 - 2. Nitrile seals.
 - 3. Hand operated with automatic shutoff when disconnected.
 - 4. For indoor or outdoor applications.
 - 5. Adjustable, retractable restraining cable.

- C. Y-Pattern Strainers:
 - 1. Body: ASTM A 126, Class B, cast iron with bolted cover and bottom drain connection.
 - 2. End Connections: Threaded ends for NPS 2 (DN 50) and smaller.
 - 3. Strainer Screen: 60-mesh startup strainer, and perforated stainless-steel basket with 50 percent free area.
 - 4. CWP Rating: 125 psig (862 kPa).

- D. Weatherproof Vent Cap: Cast- or malleable-iron increaser fitting with corrosion-resistant wire screen, with free area at least equal to cross-sectional area of connecting pipe and threaded-end connection.

2.03 JOINING MATERIALS

- A. Joint Compound and Tape: Suitable for natural gas.

- B. Welding Filler Metals: Comply with AWS D10.12/D10.12M for welding materials appropriate for wall thickness and chemical analysis of steel pipe being welded.

- C. Brazing Filler Metals: Alloy with melting point greater than 1000 deg F (540 deg C) complying with AWS A5.8/A5.8M. Brazing alloys containing more than 0.05 percent phosphorus are prohibited.

2.04 MANUAL GAS SHUTOFF VALVES

- A. See "Underground Manual Gas Shutoff Valve Schedule" and "Aboveground Manual Gas Shutoff Valve Schedule" Articles for where each valve type is applied in various services.

- B. General Requirements for Metallic Valves, NPS 2 (DN 50) and Smaller: Comply with ASME B16.33.
 - 1. CWP Rating: 125 psig (862 kPa).
 - 2. Threaded Ends: Comply with ASME B1.20.1.
 - 3. Dryseal Threads on Flare Ends: Comply with ASME B1.20.3.
 - 4. Tamperproof Feature: Locking feature for valves indicated in "Underground Manual Gas Shutoff Valve Schedule" and "Aboveground Manual Gas Shutoff Valve Schedule" Articles.
 - 5. Listing: Listed and labeled by an NRTL acceptable to authorities having jurisdiction for valves 1 inch (25 mm) and smaller.
 - 6. Service Mark: Valves 1-1/4 inches (32 mm) to NPS 2 (DN 50) shall have initials "WOG" permanently marked on valve body.

- C. Two-Piece, Regular-Port Bronze Ball Valves with Bronze Trim: MSS SP-110.
1. Body: Bronze, complying with ASTM B 584.
 2. Ball: Chrome-plated bronze.
 3. Stem: Bronze; blowout proof.
 4. Seats: Reinforced TFE.
 5. Packing: Threaded-body packnut design with adjustable-stem packing.
 6. Ends: Threaded, flared, or socket as indicated in "Underground Manual Gas Shutoff Valve Schedule" and "Aboveground Manual Gas Shutoff Valve Schedule" Articles.
 7. CWP Rating: 600 psig (4140 kPa).
 8. Listing: Valves NPS 1 (DN 25) and smaller shall be listed and labeled by an NRTL acceptable to authorities having jurisdiction.
 9. Service: Suitable for natural-gas service with "WOG" indicated on valve body.
- D. Bronze Plug Valves: MSS SP-78.
1. Body: Bronze, complying with ASTM B 584.
 2. Plug: Bronze.
 3. Ends: Threaded, socket, as indicated in "Underground Manual Gas Shutoff Valve Schedule" and "Aboveground Manual Gas Shutoff Valve Schedule" Articles.
 4. Operator: Square head or lug type with tamperproof feature where indicated.
 5. Pressure Class: 125 psig (862 kPa).
 6. Listing: Valves NPS 1 (DN 25) and smaller shall be listed and labeled by an NRTL acceptable to authorities having jurisdiction.
 7. Service: Suitable for natural-gas service with "WOG" indicated on valve body.
- E. PE Ball Valves: Comply with ASME B16.40.
1. Body: PE.
 2. Ball: PE.
 3. Stem: Acetal.
 4. Seats and Seals: Nitrile.
 5. Ends: Plain or fusible to match piping.
 6. CWP Rating: 80 psig (552 kPa).
 7. Operating Temperature: Minus 20 to plus 140 deg F (Minus 29 to plus 60 deg C).
 8. Operator: Nut or flat head for key operation.
 9. Include plastic valve extension.
 10. Include tamperproof locking feature for valves where indicated on Drawings.

2.05 PRESSURE REGULATORS

- A. General Requirements:
1. Single stage and suitable for natural gas.
 2. Steel jacket and corrosion-resistant components.
 3. Elevation compensator.
 4. End Connections: Threaded for regulators NPS 2 (DN 50) and smaller.
- B. Appliance Pressure Regulators: Comply with ANSI Z21.18.
1. Body and Diaphragm Case: Die-cast aluminum.
 2. Springs: Zinc-plated steel; interchangeable.

3. Diaphragm Plate: Zinc-plated steel.
4. Seat Disc: Nitrile rubber.
5. Seal Plug: Ultraviolet-stabilized, mineral-filled nylon.
6. Factory-Applied Finish: Minimum three-layer polyester and polyurethane paint finish.
7. Regulator may include vent limiting device, instead of vent connection, if approved by authorities having jurisdiction.
8. Maximum Inlet Pressure: 1 psig (6.9 kPa).

2.06 DIELECTRIC UNIONS

A. Dielectric Unions:

1. Description:
 - a. Standard: ASSE 1079.
 - b. Pressure Rating: 125 psig (860 kPa) minimum at 180 deg F (82 deg C).
 - c. End Connections: Solder-joint copper alloy and threaded ferrous.

2.07 LABELING AND IDENTIFYING

- A. Detectable Warning Tape: Acid- and alkali-resistant, PE film warning tape manufactured for marking and identifying underground utilities, a minimum of 6 inches (150 mm) wide and 4 mils (0.1 mm) thick, continuously inscribed with a description of utility, with metallic core encased in a protective jacket for corrosion protection, detectable by metal detector when tape is buried up to 30 inches (750 mm) deep; colored yellow.

PART 3 - EXECUTION

3.01 OUTDOOR PIPING INSTALLATION

- A. Comply with the 2012 International Fuel Gas Code for installation and purging of natural-gas piping.
- B. Install underground, natural-gas piping buried at least 36 inches (900 mm) below finished grade. Comply with requirements in Section 31 20 00 "Earth Moving" for excavating, trenching, and backfilling.
 1. If natural-gas piping is installed less than 36 inches (900 mm) below finished grade, install it in containment conduit.
- C. Install underground, PE, natural-gas piping according to ASTM D 2774.
- D. Steel Piping with Protective Coating:
 1. Apply joint cover kits to pipe after joining to cover, seal, and protect joints.
 2. Repair damage to PE coating on pipe as recommended in writing by protective coating manufacturer.
 3. Replace pipe having damaged PE coating with new pipe.

- E. Copper Tubing with Protective Coating:
 - 1. Apply joint cover kits over tubing to cover, seal, and protect joints.
 - 2. Repair damage to PE coating on pipe as recommended in writing by protective coating manufacturer.
- F. Install fittings for changes in direction and branch connections.
- G. Install pressure gage downstream from each service regulator.

3.02 INDOOR PIPING INSTALLATION

- A. Comply with the 2012 International Fuel Gas Code for installation and purging of natural-gas piping.
- B. Drawing plans, schematics, and diagrams indicate general location and arrangement of piping systems. Indicated locations and arrangements are used to size pipe and calculate friction loss, expansion, and other design considerations. Install piping as indicated unless deviations to layout are approved on Coordination Drawings.
- C. Arrange for pipe spaces, chases, slots, sleeves, and openings in building structure during progress of construction, to allow for mechanical installations.
- D. Install piping in concealed locations unless otherwise indicated and except in equipment rooms and service areas.
- E. Install piping indicated to be exposed and piping in equipment rooms and service areas at right angles or parallel to building walls. Diagonal runs are prohibited unless specifically indicated otherwise.
- F. Install piping above accessible ceilings to allow sufficient space for ceiling panel removal.
- G. Locate valves for easy access.
- H. Install natural-gas piping at uniform grade of 2 percent down toward drip and sediment traps.
- I. Install piping free of sags and bends.
- J. Install fittings for changes in direction and branch connections.
- K. Verify final equipment locations for roughing-in.
- L. Comply with requirements in Sections specifying gas-fired appliances and equipment for roughing-in requirements.
- M. Drips and Sediment Traps: Install drips at points where condensate may collect, including service-meter outlets. Locate where accessible to permit cleaning and emptying. Do not install where condensate is subject to freezing.

1. Construct drips and sediment traps using tee fitting with bottom outlet plugged or capped. Use nipple a minimum length of 3 pipe diameters, but not less than 3 inches (75 mm) long and same size as connected pipe. Install with space below bottom of drip to remove plug or cap.
 - N. Extend relief vent connections for service regulators, line regulators, and overpressure protection devices to outdoors and terminate with weatherproof vent cap.
 - O. Conceal pipe installations in walls, pipe spaces, utility spaces, above ceilings, below grade or floors, and in floor channels unless indicated to be exposed to view.
 - P. Use eccentric reducer fittings to make reductions in pipe sizes. Install fittings with level side down.
 - Q. Connect branch piping from top or side of horizontal piping.
 - R. Install unions in pipes NPS 2 (DN 50) and smaller, adjacent to each valve, at final connection to each piece of equipment.
 - S. Do not use natural-gas piping as grounding electrode.
 - T. Install strainer on inlet of each line-pressure regulator and automatic or electrically operated valve.
 - U. Install pressure gage upstream and downstream from each line regulator.
 - V. Install sleeves for piping penetrations of walls, ceilings, and floors.
 - W. Install sleeve seals for piping penetrations of concrete walls and slabs.
 - X. Install escutcheons for piping penetrations of walls, ceilings, and floors.
- 3.03 VALVE INSTALLATION
- A. Install manual gas shutoff valve for each gas appliance ahead of corrugated stainless-steel tubing or copper connector.
 - B. Install underground valves with valve boxes.
 - C. Install regulators and overpressure protection devices with maintenance access space adequate for servicing and testing.
 - D. Install earthquake valves aboveground outside buildings according to listing.
 - E. Install anode for metallic valves in underground PE piping.
- 3.04 PIPING JOINT CONSTRUCTION
- A. Ream ends of pipes and tubes and remove burrs.

- B. Remove scale, slag, dirt, and debris from inside and outside of pipe and fittings before assembly.
- C. Threaded Joints:
 - 1. Thread pipe with tapered pipe threads complying with ASME B1.20.1.
 - 2. Cut threads full and clean using sharp dies.
 - 3. Ream threaded pipe ends to remove burrs and restore full inside diameter of pipe.
 - 4. Apply appropriate tape or thread compound to external pipe threads unless dryseal threading is specified.
 - 5. Damaged Threads: Do not use pipe or pipe fittings with threads that are corroded or damaged. Do not use pipe sections that have cracked or open welds.
- D. Welded Joints:
 - 1. Construct joints according to AWS D10.12/D10.12M, using qualified processes and welding operators.
 - 2. Bevel plain ends of steel pipe.
 - 3. Patch factory-applied protective coating as recommended by manufacturer at field welds and where damage to coating occurs during construction.
- E. Brazed Joints: Construct joints according to AWS's "Brazing Handbook," "Pipe and Tube" Chapter.
- F. Flared Joints: Cut tubing with roll cutting tool. Flare tube end with tool to result in flare dimensions complying with SAE J513. Tighten finger tight, then use wrench. Do not overtighten.
- G. PE Piping Heat-Fusion Joints: Clean and dry joining surfaces by wiping with clean cloth or paper towels. Join according to ASTM D 2657.
 - 1. Plain-End Pipe and Fittings: Use butt fusion.
 - 2. Plain-End Pipe and Socket Fittings: Use socket fusion.

3.05 HANGER AND SUPPORT INSTALLATION

- A. Comply with requirements for pipe hangers and supports specified in Section 23 05 29 "Hangers and Supports for HVAC Piping and Equipment."
- B. Install hangers for horizontal steel piping with the following maximum spacing and minimum rod sizes:
 - 1. **NPS 1 (DN 25)** and Smaller: Maximum span, **96 inches (2438 mm)**; minimum rod size, **3/8 inch (10 mm)**.
 - 2. **NPS 1-1/4 (DN 32)**: Maximum span, **108 inches (2743 mm)**; minimum rod size, **3/8 inch (10 mm)**.
 - 3. **NPS 1-1/2 and NPS 2 (DN 40 and DN 50)**: Maximum span, **108 inches (2743 mm)**; minimum rod size, **3/8 inch (10 mm)**.

3.06 CONNECTIONS

- A. Connect to utility's gas main according to utility's procedures and requirements.
- B. Install natural-gas piping electrically continuous, and bonded to gas appliance equipment grounding conductor of the circuit powering the appliance according to NFPA 70.
- C. Install piping adjacent to appliances to allow service and maintenance of appliances.
- D. Connect piping to appliances using manual gas shutoff valves and unions. Install valve within **72 inches (1800 mm)** of each gas-fired appliance and equipment. Install union between valve and appliances or equipment.
- E. Sediment Traps: Install tee fitting with capped nipple in bottom to form drip, as close as practical to inlet of each appliance.

3.07 LABELING AND IDENTIFYING

- A. Install detectable warning tape directly above gas piping, **12 inches (300 mm)** below finished grade, except **6 inches (150 mm)** below subgrade under pavements and slabs.

3.08 FIELD QUALITY CONTROL

- A. Test, inspect, and purge natural gas according to 2012 International Fuel Gas Code and authorities having jurisdiction.
- B. Natural-gas piping will be considered defective if it does not pass tests and inspections.
- C. Prepare test and inspection reports.

3.09 OUTDOOR PIPING SCHEDULE

- A. Underground natural-gas piping shall be one of the following:
 - 1. PE pipe and fittings joined by heat fusion; service-line risers with tracer wire terminated in an accessible location.
 - 2. Steel pipe with wrought-steel fittings and welded joints. Coat pipe and fittings with protective coating for steel piping.
 - 3. Annealed-temper copper tube with wrought-copper fittings and brazed joints. Coat pipe and fittings with protective coating for copper tubing.
- B. Aboveground natural-gas piping shall be one of the following:
 - 1. Steel pipe with malleable-iron fittings and threaded joints.
 - 2. Steel pipe with wrought-steel fittings and welded joints.
 - 3. Annealed-temper copper tube with wrought-copper fittings and brazed joints.
- C. Containment Conduit: Steel pipe with wrought-steel fittings and welded joints. Coat pipe and fittings with protective coating for steel piping.

3.10 INDOOR PIPING SCHEDULE

- A. Aboveground, branch piping **NPS 1 (DN 25)** and smaller shall be one of the following:
 - 1. Corrugated stainless-steel tubing with mechanical fittings having socket or threaded ends to match adjacent piping.
 - 2. Annealed-temper copper tube with wrought-copper fittings and brazed or flared joints.
 - 3. Steel pipe with malleable-iron fittings and threaded joints.
- B. Aboveground, distribution piping shall be one of the following:
 - 1. Steel pipe with malleable-iron fittings and threaded joints.
 - 2. Steel pipe with wrought-steel fittings and welded joints.
- C. Containment Conduit: Steel pipe with wrought-steel fittings and welded joints. Coat pipe and fittings with protective coating for steel piping.
- D. Containment Conduit Vent Piping: Steel pipe with malleable-iron fittings and threaded or wrought-steel fittings with welded joints. Coat underground pipe and fittings with protective coating for steel piping.

3.11 UNDERGROUND MANUAL GAS SHUTOFF VALVE SCHEDULE

- A. Connections to Existing Gas Piping: Use valve and fitting assemblies made for tapping utility's gas mains and listed by an NRTL.
- B. Underground: PE or Bronze plug valves.

3.12 ABOVEGROUND MANUAL GAS SHUTOFF VALVE SCHEDULE

- A. Valves for pipe sizes **NPS 2 (DN 50)** and smaller shall be one of the following:
 - 1. Two-piece, regular-port, bronze ball valves with bronze trim.
 - 2. Bronze plug valve.

END OF SECTION 23 11 23

SECTION 23 23 00
REFRIGERANT PIPING

PART 1 - GENERAL

1.01 SUMMARY

- A. This Section includes refrigerant piping used for air-conditioning applications.

1.02 PERFORMANCE REQUIREMENTS

- A. Line Test Pressure for Refrigerant R-410:
1. Suction Lines: 325 psig.
 2. Hot-Gas and Liquid Lines: 325 psig.

1.03 SUBMITTALS

- A. Product Data: For each type of valve and refrigerant piping specialty indicated. Include pressure drop based on manufacturer's test data.
- B. Field quality-control test reports.
- C. Operation and maintenance data.

1.04 QUALITY ASSURANCE

- A. Comply with ASHRAE 15, "Safety Code for Refrigeration Systems."
- B. Comply with ASME B31.5, "Refrigeration Piping and Heat Transfer Components."

1.05 PRODUCT STORAGE AND HANDLING

- A. Store piping in a clean and protected area with end caps in place to ensure that piping interior and exterior are clean when installed.

PART 2 - PRODUCTS

2.01 COPPER TUBE AND FITTINGS

- A. Copper Tube: ASTM B 280, Type ACR.
- B. Wrought-Copper Fittings: ASME B16.22.

- C. Wrought-Copper Unions: ASME B16.22.
- D. Solder Filler Metals: ASTM B 32. Use 95-5 tin antimony or alloy HB solder to join copper socket fittings on copper pipe.
- E. Brazing Filler Metals: AWS A5.8.
- F. Flexible Connectors:
 - 1. Body: Tin-bronze bellows with woven, flexible, tinned-bronze-wire-reinforced protective jacket.
 - 2. End Connections: Socket ends.
 - 3. Offset Performance: Capable of minimum 3/4-inch misalignment in minimum 7-inch- (180-mm-) long assembly.
 - 4. Pressure Rating: Factory test at minimum 500 psig.
 - 5. Maximum Operating Temperature: 250 deg F).

2.02 VALVES AND SPECIALTIES

- A. Check Valves:
 - 1. Body: Ductile iron, forged brass, or cast bronze; globe pattern.
 - 2. Bonnet: Bolted ductile iron, forged brass, or cast bronze; or brass hex plug.
 - 3. Piston: Removable polytetrafluoroethylene seat.
 - 4. Closing Spring: Stainless steel.
 - 5. Manual Opening Stem: Seal cap, plated-steel stem, and graphite seal.
 - 6. End Connections: Socket, union, threaded, or flanged.
 - 7. Maximum Opening Pressure: 0.50 psig.
 - 8. Working Pressure Rating: 500 psig.
 - 9. Maximum Operating Temperature: 275 deg F.
- B. Service Valves:
 - 1. Body: Forged brass with brass cap including key end to remove core.
 - 2. Core: Removable ball-type check valve with stainless-steel spring.
 - 3. Seat: Polytetrafluoroethylene.
 - 4. End Connections: Copper spring.
 - 5. Working Pressure Rating: 500 psig.
- C. Solenoid Valves: Comply with ARI 760 and UL 429; listed and labeled by an NRTL.
 - 1. Body and Bonnet: Plated steel.
 - 2. Solenoid Tube, Plunger, Closing Spring, and Seat Orifice: Stainless steel.
 - 3. Seat: Polytetrafluoroethylene.
 - 4. End Connections: Threaded.
 - 5. Electrical: Molded, watertight coil in NEMA 250 enclosure of type required by location with 1/2-inch conduit adapter, and 24-V ac coil.
 - 6. Working Pressure Rating: 400 psig.
 - 7. Maximum Operating Temperature: 240 deg F.
 - 8. Manual operator.

- D. Safety Relief Valves: Comply with ASME Boiler and Pressure Vessel Code; listed and labeled by an NRTL.
1. Body and Bonnet: Ductile iron and steel, with neoprene O-ring seal.
 2. Piston, Closing Spring, and Seat Insert: Stainless steel.
 3. Seat Disc: Polytetrafluoroethylene.
 4. End Connections: Threaded.
 5. Working Pressure Rating: 400 psig.
 6. Maximum Operating Temperature: 240 deg F.
- E. Thermostatic Expansion Valves: Comply with ARI 750.
1. Body, Bonnet, and Seal Cap: Forged brass or steel.
 2. Diaphragm, Piston, Closing Spring, and Seat Insert: Stainless steel.
 3. Packing and Gaskets: Non-asbestos.
 4. Capillary and Bulb: Copper tubing filled with refrigerant charge.
 5. Suction Temperature: 40 deg F.
 6. Superheat: Adjustable.
 7. Reverse-flow option (for heat-pump applications).
 8. End Connections: Socket, flare, or threaded union.
 9. Working Pressure Rating: 450 psig.
- F. Straight-Type Strainers:
1. Body: Welded steel with corrosion-resistant coating.
 2. Screen: 100-mesh stainless steel.
 3. End Connections: Socket or flare.
 4. Working Pressure Rating: 500 psig.
 5. Maximum Operating Temperature: 275 deg F.
- G. Moisture/Liquid Indicators:
1. Body: Forged brass.
 2. Window: Replaceable, clear, fused glass window with indicating element protected by filter screen.
 3. Indicator: Color coded to show moisture content in ppm.
 4. Minimum Moisture Indicator Sensitivity: Indicate moisture above 60 ppm.
 5. End Connections: Socket or flare.
 6. Working Pressure Rating: 500 psig.
 7. Maximum Operating Temperature: 240 deg F
- H. Replaceable-Core Filter Dryers: Comply with ARI 730.
1. Body and Cover: Painted-steel shell with ductile-iron cover, stainless-steel screws, and neoprene gaskets.
 2. Filter Media: 10 micron, pleated with integral end rings; stainless-steel support.
 3. Desiccant Media: Activated alumina or charcoal.
 4. Designed for reverse flow (for heat-pump applications).
 5. End Connections: Socket.
 6. Access Ports: NPS 1/4 connections at entering and leaving sides for pressure differential measurement.
 7. Maximum Pressure Loss: 2 psig.
 8. Rated Flow: 5 tons maximum
 9. Working Pressure Rating: 500 psig.

10. Maximum Operating Temperature: 240 deg F).

PART 3 - EXECUTION

3.01 PIPING APPLICATIONS

- A. Refrigerant lines: Copper, Type ACR, annealed-temper tubing and wrought-copper fittings with brazed or soldered joints.

3.02 VALVE AND SPECIALTY APPLICATIONS (as required or recommended by equipment manufacturer if not supplied with HVAC equipment.)

- A. Install valves in suction and discharge lines of compressor.
- B. Install service valves for gage taps at strainers if they are not an integral part of strainers.
- C. Install a check valve at the compressor discharge and a liquid accumulator at the compressor suction connection.
- D. Except as otherwise indicated, install valves on inlet and outlet side of filter dryers.
- E. Install a full-sized, three-valve bypass around filter dryers.
- F. Install solenoid valves upstream from each expansion valve. Install solenoid valves in horizontal lines with coil at top.
- G. Install thermostatic expansion valves as close as possible to distributors on evaporators.
1. Install valve so diaphragm case is warmer than bulb.
 2. Secure bulb to clean, straight, horizontal section of suction line using two bulb straps. Do not mount bulb in a trap or at bottom of the line.
 3. If external equalizer lines are required, make connection where it will reflect suction-line pressure at bulb location.
- H. Install safety relief valves where required by ASME Boiler and Pressure Vessel Code. Pipe safety-relief-valve discharge line to outside according to ASHRAE 15.
- I. Install moisture/liquid indicators in liquid line at the inlet of the thermostatic expansion valve or at the inlet of the evaporator coil capillary tube.
- J. Install strainers upstream from and adjacent to the following unless they are furnished as an integral assembly for device being protected:
1. Solenoid valves.
 2. Thermostatic expansion valves.
 3. Compressor.

- K. Install filter dryers in liquid line between compressor and thermostatic expansion valve, and in the suction line at the compressor.
- L. Install flexible connectors at compressors.

3.03 PIPING INSTALLATION

- A. Drawing plans, schematics, and diagrams indicate general location and arrangement of piping systems; indicated locations and arrangements were used to size pipe and calculate friction loss, expansion, pump sizing, and other design considerations. Install piping as indicated unless deviations to layout are approved on Shop Drawings.
- B. Install refrigerant piping according to ASHRAE 15.
- C. Install piping in concealed locations unless otherwise indicated and except in equipment rooms and service areas.
- D. Install piping indicated to be exposed and piping in equipment rooms and service areas at right angles or parallel to building walls. Diagonal runs are prohibited unless specifically indicated otherwise.
- E. Install piping adjacent to machines to allow service and maintenance.
- F. Install piping free of sags and bends.
- G. Install fittings for changes in direction and branch connections.
- H. Select system components with pressure rating equal to or greater than system operating pressure.
- I. Install piping as short and direct as possible, with a minimum number of joints, elbows, and fittings.
- J. Install refrigerant piping in rigid or flexible conduit in locations where exposed to mechanical injury.
- K. Slope refrigerant piping as follows:
 - 1. Install horizontal hot-gas discharge piping with a uniform slope downward away from compressor.
 - 2. Install horizontal suction lines with a uniform slope downward to compressor.
 - 3. Install traps and double risers to entrain oil in vertical runs.
 - 4. Liquid lines may be installed level.
- L. When brazing or soldering, remove solenoid-valve coils and sight glasses; also remove valve stems, seats, and packing, and accessible internal parts of refrigerant specialties. Do not apply heat near expansion-valve bulb.
- M. Install piping with adequate clearance between pipe and adjacent walls and hangers or between pipes for insulation installation.

3.04 PIPE JOINT CONSTRUCTION

- A. Soldered Joints: Construct joints according to ASTM B 828 or CDA's "Copper Tube Handbook."
- B. Brazed Joints: Construct joints according to AWS's "Brazing Handbook," Chapter "Pipe and Tube."
 - 1. Use Type BcuP, copper-phosphorus alloy for joining copper socket fittings with copper pipe.
 - 2. Use Type BA_g, cadmium-free silver alloy for joining copper with bronze or steel.

3.05 HANGERS AND SUPPORTS

- A. Install the following pipe attachments:
 - 1. Adjustable steel clevis hangers for individual horizontal runs less than **20 feet** long.
 - 2. Copper-clad hangers and supports for hangers and supports in direct contact with copper pipe.
- B. Install hangers for copper tubing with the following maximum spacing and minimum rod sizes:
 - 1. **NPS 1/2**: Maximum span, **60 inches**; minimum rod size, **1/4 inch**.
 - 2. **NPS 5/8**: Maximum span, **60 inches**; minimum rod size, **1/4 inch**.
 - 3. **NPS 1**: Maximum span, **72 inches**; minimum rod size, **1/4 inch**.
 - 4. **NPS 1-1/4**: Maximum span, **96 inches**; minimum rod size, **3/8 inch**.

3.06 FIELD QUALITY CONTROL

- A. Perform tests and inspections and prepare test reports.
- B. Tests and Inspections:
 - 1. Comply with ASME B31.5, Chapter VI.
 - 2. Test refrigerant piping and specialties. Isolate compressor, condenser, evaporator, and safety devices from test pressure if they are not rated above the test pressure.
 - 3. Test high- and low-pressure side piping of each system separately at not less than the pressures indicated in Part 1 "Performance Requirements" Article.
 - a. Fill system with nitrogen to the required test pressure.
 - b. System shall maintain test pressure at the manifold gage throughout duration of test.
 - c. Test joints and fittings with electronic leak detector or by brushing a small amount of soap and glycerin solution over joints.
 - d. Remake leaking joints using new materials, and retest until satisfactory results are achieved.

3.07 SYSTEM CHARGING

- A. Charge system using the following procedures:
 - 1. Install core in filter dryers after leak test but before evacuation.
 - 2. Evacuate entire refrigerant system with a vacuum pump to **500 micrometers**. If vacuum holds for 12 hours, system is ready for charging.
 - 3. Break vacuum with refrigerant gas, allowing pressure to build up to **2 psig**.
 - 4. Charge system with a new filter-dryer core in charging line.

3.08 ADJUSTING

- A. Adjust thermostatic expansion valve to obtain proper evaporator superheat.
- B. Adjust high- and low-pressure switch settings to avoid short cycling in response to fluctuating suction pressure.
- C. Adjust set-point temperature of air-conditioning or chilled-water controllers to the system design temperature.
- D. Perform the following adjustments before operating the refrigeration system, according to manufacturer's written instructions:
 - 1. Verify that compressor oil level is correct.
 - 2. Open compressor suction and discharge valves.
 - 3. Open refrigerant valves except bypass valves that are used for other purposes.
 - 4. Check open compressor-motor alignment and verify lubrication for motors and bearings.
- E. Replace core of replaceable filter dryer after system has been adjusted and after design flow rates and pressures are established.

END OF SECTION 23 23 00

SECTION 23 31 13**METAL DUCTS**

PART 1 - GENERAL

1.01 SUMMARY

- A. Section Includes:
1. Rectangular ducts and fittings.
 2. Round ducts and fittings
 3. Sheet metal materials.
 4. Sealants and gaskets.
 5. Hangers and supports.

1.02 QUALITY ASSURANCE

- A. Welding Qualifications: Qualify procedures and personnel according to the following:
1. AWS D1.1/D1.1M, "Structural Welding Code - Steel," for hangers and supports.
 2. AWS D1.2/D1.2M, "Structural Welding Code - Aluminum," for aluminum supports.
 3. AWS D9.1M/D9.1, "Sheet Metal Welding Code," for duct joint and seam welding.
- B. ASHRAE/IESNA Compliance: Applicable requirements in ASHRAE/IESNA 90.1, Section 6.4.4 - "HVAC System Construction and Insulation."

PART 2 - PRODUCTS

2.01 RECTANGULAR DUCTS AND FITTINGS

- A. General Fabrication Requirements: Comply with SMACNA's "HVAC Duct Construction Standards - Metal and Flexible" based on indicated static-pressure class unless otherwise indicated.
- B. Transverse Joints: Select joint types and fabricate according to SMACNA's "HVAC Duct Construction Standards - Metal and Flexible," Figure 2-1, "Rectangular Duct/Transverse Joints," for static-pressure class, applicable sealing requirements, materials involved, duct-support intervals, and other provisions in SMACNA's "HVAC Duct Construction Standards - Metal and Flexible."
- C. Longitudinal Seams: Select seam types and fabricate according to SMACNA's "HVAC Duct Construction Standards - Metal and Flexible," Figure 2-2, "Rectangular Duct/Longitudinal Seams," for static-pressure class, applicable sealing requirements, materials involved, duct-support intervals, and other provisions in SMACNA's "HVAC Duct Construction Standards - Metal and Flexible."

- D. Elbows, Transitions, Offsets, Branch Connections, and Other Duct Construction: Select types and fabricate according to SMACNA's "HVAC Duct Construction Standards - Metal and Flexible," Chapter 4, "Fittings and Other Construction," for static-pressure class, applicable sealing requirements, materials involved, duct-support intervals, and other provisions in SMACNA's "HVAC Duct Construction Standards - Metal and Flexible."

2.02 ROUND DUCTS AND FITTINGS

- A. General Fabrication Requirements: Comply with SMACNA's "HVAC Duct Construction Standards - Metal and Flexible," Chapter 3, "Round, Oval, and Flexible Duct," based on indicated static-pressure class unless otherwise indicated.
- B. Transverse Joints: Select joint types and fabricate according to SMACNA's "HVAC Duct Construction Standards - Metal and Flexible," Figure 3-1, "Round Duct Transverse Joints," for static-pressure class, applicable sealing requirements, materials involved, duct-support intervals, and other provisions in SMACNA's "HVAC Duct Construction Standards - Metal and Flexible."
- C. Longitudinal Seams: Select seam types and fabricate according to SMACNA's "HVAC Duct Construction Standards - Metal and Flexible," Figure 3-2, "Round Duct Longitudinal Seams," for static-pressure class, applicable sealing requirements, materials involved, duct-support intervals, and other provisions in SMACNA's "HVAC Duct Construction Standards - Metal and Flexible."
- D. Tees and Laterals: Select types and fabricate according to SMACNA's "HVAC Duct Construction Standards - Metal and Flexible," Figure 3-5, "90 Degree Tees and Laterals," and Figure 3-6, "Conical Tees," for static-pressure class, applicable sealing requirements, materials involved, duct-support intervals, and other provisions in SMACNA's "HVAC Duct Construction Standards - Metal and Flexible."

2.03 SHEET METAL MATERIALS

- A. General Material Requirements: Comply with SMACNA's "HVAC Duct Construction Standards - Metal and Flexible" for acceptable materials, material thicknesses, and duct construction methods unless otherwise indicated. Sheet metal materials shall be free of pitting, seam marks, roller marks, stains, discolorations, and other imperfections.
- B. Galvanized Sheet Steel: Comply with ASTM A 653/A 653M.
- Galvanized Coating Designation: **G90**.
 - Finishes for Surfaces Exposed to View: Mill phosphatized.
- C. Reinforcement Shapes and Plates: ASTM A 36/A 36M, steel plates, shapes, and bars; black and galvanized.
- Where black- and galvanized-steel shapes and plates are used to reinforce aluminum ducts, isolate the different metals with butyl rubber, neoprene, or EPDM gasket materials.

- D. Tie Rods: Galvanized steel, 1/4-inch minimum diameter for lengths 36 inches or less; 3/8-inch minimum diameter for lengths longer than 36 inches.

2.04 SEALANT AND GASKETS

- A. General Sealant and Gasket Requirements: Surface-burning characteristics for sealants and gaskets shall be a maximum flame-spread index of 25 and a maximum smoke-developed index of 50 when tested according to UL 723; certified by an NRTL.
- B. Two-Part Tape Sealing System:
1. Tape: Woven cotton fiber impregnated with mineral gypsum and modified acrylic/silicone activator to react exothermically with tape to form hard, durable, airtight seal.
 2. Tape Width: 4 inches.
 3. Sealant: Modified styrene acrylic.
 4. Water resistant.
 5. Mold and mildew resistant.
 6. Maximum Static-Pressure Class: 10-inch wg, positive and negative.
 7. Service: Indoor and outdoor.
 8. Service Temperature: Minus 40 to plus 200 deg F.
 9. Substrate: Compatible with galvanized sheet steel (both PVC coated and bare), stainless steel, or aluminum.

2.05 HANGERS AND SUPPORTS

- A. Hanger Rods for Noncorrosive Environments: Cadmium-plated steel rods and nuts.
- B. Hanger Rods for Corrosive Environments: Electrogalvanized, all-thread rods or galvanized rods with threads painted with zinc-chromate primer after installation.
- C. Strap and Rod Sizes: Comply with SMACNA's "HVAC Duct Construction Standards - Metal and Flexible," Table 5-1, "Rectangular Duct Hangers Minimum Size," and Table 5-2, "Minimum Hanger Sizes for Round Duct."
- D. Steel Cables for Galvanized-Steel Ducts: Galvanized steel complying with ASTM A 603.
- E. Steel Cable End Connections: Cadmium-plated steel assemblies with brackets, swivel, and bolts designed for duct hanger service; with an automatic-locking and clamping device.
- F. Duct Attachments: Sheet metal screws, blind rivets, or self-tapping metal screws; compatible with duct materials.
- G. Trapeze and Riser Supports:
1. Supports for Galvanized-Steel Ducts: Galvanized-steel shapes and plates.
 2. Supports for Aluminum Ducts: Aluminum or galvanized steel coated with zinc chromate.

PART 3 - EXECUTION**3.01 DUCT INSTALLATION**

- A. Install ducts according to SMACNA's "HVAC Duct Construction Standards - Metal and Flexible" unless otherwise indicated.
- B. Install ducts with fewest possible joints.
- C. Install factory- or shop-fabricated fittings for changes in direction, size, and shape and for branch connections.
- D. Unless otherwise indicated, install ducts vertically and horizontally, and parallel and perpendicular to building lines.
- E. Install ducts close to walls, overhead construction, columns, and other structural and permanent enclosure elements of building.
- F. Install ducts with a clearance of **1 inch**, plus allowance for insulation thickness.
- G. Route ducts to avoid passing through transformer vaults and electrical equipment rooms and enclosures.
- H. Where ducts pass through non-fire-rated interior partitions and exterior walls and are exposed to view, cover the opening between the partition and duct or duct insulation with sheet metal flanges of same metal thickness as the duct. Overlap openings on four sides by at least **1-1/2 inches**.

3.02 INSTALLATION OF EXPOSED DUCTWORK

- A. Protect ducts exposed in finished spaces from being dented, scratched, or damaged.
- B. Trim duct sealants flush with metal. Create a smooth and uniform exposed bead. Do not use two-part tape sealing system.
- C. Grind welds to provide smooth surface free of burrs, sharp edges, and weld splatter. When welding stainless steel with a No. 3 or 4 finish, grind the welds flush, polish the exposed welds, and treat the welds to remove discoloration caused by welding.
- D. Maintain consistency, symmetry, and uniformity in the arrangement and fabrication of fittings, hangers and supports, duct accessories, and air outlets.
- E. Repair or replace damaged sections and finished work that does not comply with these requirements.

3.03 DUCT SEALING

- A. Seal ducts for duct static-pressure, seal classes, and leakage classes specified in "Duct Schedule" Article according to SMACNA's "HVAC Duct Construction Standards - Metal and Flexible."
- B. Seal ducts to the following seal classes according to SMACNA's "HVAC Duct Construction Standards - Metal and Flexible":
 - 1. Conditioned Space, Supply-Air Ducts in Pressure Classes **2-Inch wg** and Lower: Seal Class C.
 - 2. Conditioned Space, Exhaust Ducts: Seal Class B.
 - 3. Conditioned Space, Return-Air Ducts: Seal Class C.

3.04 HANGER AND SUPPORT INSTALLATION

- A. Comply with SMACNA's "HVAC Duct Construction Standards - Metal and Flexible," Chapter 5, "Hangers and Supports."
- B. Building Attachments: Concrete inserts, powder-actuated fasteners, or structural-steel fasteners appropriate for construction materials to which hangers are being attached.
 - 1. Where practical, install concrete inserts before placing concrete.
 - 2. Install powder-actuated concrete fasteners after concrete is placed and completely cured.
 - 3. Use powder-actuated concrete fasteners for standard-weight aggregate concretes or for slabs more than **4 inches** thick.
 - 4. Do not use powder-actuated concrete fasteners for lightweight-aggregate concretes or for slabs less than **4 inches** thick.
 - 5. Do not use powder-actuated concrete fasteners for seismic restraints.
- C. Hanger Spacing: Comply with SMACNA's "HVAC Duct Construction Standards - Metal and Flexible," **Table 5-1**, "Rectangular Duct Hangers Minimum Size," and Table 5-2, "Minimum Hanger Sizes for Round Duct," for maximum hanger spacing; install hangers and supports within **24 inches** of each elbow and within **48 inches** of each branch intersection.
- D. Hangers Exposed to View: Threaded rod and angle or channel supports.
- E. Support vertical ducts with steel angles or channel secured to the sides of the duct with welds, bolts, sheet metal screws, or blind rivets; support at each floor and at a maximum intervals of **16 feet**).
- F. Install upper attachments to structures. Select and size upper attachments with pull-out, tension, and shear capacities appropriate for supported loads and building materials where used.

3.05 CONNECTIONS

- A. Make connections to equipment with flexible connectors complying with Section 23 33 00 "Air Duct Accessories."
- B. Comply with SMACNA's "HVAC Duct Construction Standards - Metal and Flexible" for branch, outlet and inlet, and terminal unit connections.

3.06 START UP

- A. Air Balance: Comply with requirements in Section 23 05 93 "Testing, Adjusting, and Balancing for HVAC."

END OF SECTION 23 31 13

SECTION 23 31 16**NONMETAL DUCTS**

PART 1 - GENERAL

1.01 RELATED DOCUMENTS

- A. Drawings and general provisions of the Contract, including General and Supplementary Conditions and Division 01 Specification Sections, apply to this Section.

1.02 SUMMARY

- A. Section Includes:
 - 1. PVC ducts and fittings for underground duct to pits

1.03 PERFORMANCE REQUIREMENTS

- A. Delegated Duct Design: Duct construction, including duct closure, reinforcements, and hangers and supports, shall comply with SMACNA's "Fibrous Glass Duct Construction Standards" and performance requirements and design criteria indicated.
 - 1. Static-Pressure Classes:
 - a. Exhaust Ducts (Negative Pressure): 1-inch wg (250 Pa).
- B. Airstream Surfaces: Surfaces in contact with the airstream shall comply with requirements in ASHRAE 62.1.

1.04 ACTION SUBMITTALS

- A. Product Data: For each type of the following products:
 - 1. PVC duct materials.
- B. LEED Submittals:
 - 1. Product Data for Prerequisite IEQ 1: Documentation indicating that duct systems comply with ASHRAE 62.1, Section 5 - "Systems and Equipment."
- C. Field quality-control reports.

1.05 QUALITY ASSURANCE

- A. ASHRAE Compliance: Applicable requirements in ASHRAE 62.1, Section 5 - "Systems and Equipment" and Section 7 - "Construction and System Start-up."

PART 2 - PRODUCTS

2.01 PVC DUCTS AND FITTINGS

A. Duct and Fittings:

1. Round Duct: Comply with cell Classification 12454-B in ASTM D 1784, with external loading properties of ASTM D 2412.
2. Round Fittings: Socket end molded of same material, pressure class, and joining method as duct.

B. Joining Materials: PVC solvent cement complying with ASTM D 2564.

1. PVC solvent cement shall have a VOC content of 510 g/L or less when calculated according to 40 CFR 59, Subpart D (EPA Method 24).
2. Adhesive primer shall have a VOC content of 550 g/L or less when calculated according to 40 CFR 59, Subpart D (EPA Method 24).
3. Solvent cement and adhesive primer shall comply with the testing and product requirements of the California Department of Health Services' "Standard Practice for the Testing of Volatile Organic Emissions from Various Sources Using Small-Scale Environmental Chambers."

C. Fabrication:

1. Fabricate joints, seams, transitions, reinforcement, elbows, branch connections, and access doors and panels according to SMACNA's "Thermoplastic Duct (PVC) Construction Manual," Chapter 3, "Standards of Construction for PVC Duct Systems."
2. Fabricate 90-degree rectangular mitered elbows to include turning vanes, 90-degree round elbows with a minimum of three segments for 12 inches (300 mm) and smaller and a minimum of five segments for 14 inches (350 mm) and larger.

PART 3 - EXECUTION

3.01 DUCT INSTALLATION

- A. Install ducts with fewest possible joints.
- B. Unless otherwise indicated, install ducts vertically and horizontally, and parallel and perpendicular to building lines.
- C. Install ducts with a clearance of 1 inch (25 mm), plus allowance for insulation thickness.
- D. Install PVC ducts and fittings to comply with SMACNA's "Thermoplastic Duct (PVC) Construction Manual."

3.02 FIELD QUALITY CONTROL

- A. Perform tests and inspections.

- B. Leakage Tests:
 - 1. Comply with SMACNA's "HVAC Air Duct Leakage Test Manual." Submit a test report for each test.
 - 2. Disassemble, reassemble, and seal segments of systems to accommodate leakage testing and for compliance with test requirements.
 - 3. Conduct tests at static pressures equal to maximum design pressure of system or section being tested. If static-pressure classes are not indicated, test entire system at maximum system design pressure.
- C. Duct System Cleanliness Tests:
 - 1. Visually inspect duct system to ensure that no visible contaminants are present.
- D. Duct system will be considered defective if it does not pass tests and inspections.
- E. Prepare test and inspection reports.

3.03 START UP

- A. Air Balance: Comply with requirements in Section 23 05 93 "Testing, Adjusting, and Balancing for HVAC."

3.04 DUCT SCHEDULE

- A. Underground Ducts: PVC Round Ducts and Fittings:

END OF SECTION 23 31 16

SECTION 23 33 00
AIR DUCT ACCESSORIES

PART 1 - GENERAL

1.01 SUMMARY

- A. Section Includes:
1. Backdraft and pressure relief dampers.
 2. Manual volume dampers.
 3. Control dampers.
 4. Fire dampers.
 5. Flange connectors.
 6. Turning vanes.
 7. Duct-mounted access doors.
 8. Flexible connectors.
 9. Flexible ducts.
 10. Duct accessory hardware.

1.02 SUBMITTALS

- A. Product Data: For each type of product.
- B. Operation and maintenance data.

PART 2 - PRODUCTS

2.01 BACKDRAFT AND PRESSURE RELIEF DAMPERS

- A. Description: Gravity balanced.
- B. Frame: Hat-shaped, 0.05-inch- (1.3-mm-) thick, galvanized sheet steel, with welded corners or mechanically attached and mounting flange.
- C. Blades: Multiple single-piece blades, center pivoted, maximum 6-inch (150-mm) width, 0.025-inch- (0.6-mm-) thick, roll-formed aluminum with sealed edges.
- D. Blade Action: Parallel.
- E. Blade Seals: Extruded vinyl, mechanically locked or Neoprene, mechanically locked.
- F. Blade Axles:
1. Material: Plated steel.
 2. Diameter: 0.20 inch (5 mm).

- G. Tie Bars and Brackets: Aluminum or Galvanized steel.
- H. Return Spring: Adjustable tension.
- I. Bearings: Steel ball or synthetic pivot bushings.
- J. Accessories:
 - 1. Adjustment device to permit setting for varying differential static pressure.
 - 2. Counterweights and spring-assist kits for vertical airflow installations.

2.02 MANUAL VOLUME DAMPERS

- A. Standard, Steel, Manual Volume Dampers:
 - 1. Standard leakage rating, with linkage outside airstream.
 - 2. Suitable for horizontal or vertical applications.
 - 3. Frames:
 - a. Frame: Hat-shaped, 0.094-inch- (2.4-mm-) thick, galvanized sheet steel.
 - b. Mitered and welded corners.
 - c. Flanges for attaching to walls and flangeless frames for installing in ducts.
 - 4. Blades:
 - a. Multiple or single blade.
 - b. Parallel- or opposed-blade design.
 - c. Stiffen damper blades for stability.
 - d. Galvanized-steel, 0.064 inch (1.62 mm) thick.
 - 5. Blade Axles: Galvanized steel.
 - 6. Bearings:
 - a. Oil-impregnated bronze.
 - b. Dampers in ducts with pressure classes of 3-inch wg (750 Pa) or less shall have axles full length of damper blades and bearings at both ends of operating shaft.
 - 7. Tie Bars and Brackets: Galvanized steel.

2.03 CONTROL DAMPERS

- A. Frames:
 - 1. Hat, U or Angle shaped.
 - 2. 0.094-inch- (2.4-mm-) thick, galvanized sheet steel.
 - 3. Mitered and welded or Interlocking, gusseted corners.
- B. Blades:
 - 1. Multiple blade with maximum blade width of 6 inches (152 mm).
 - 2. Parallel- and opposed-blade design.
 - 3. Galvanized-steel. 0.064 inch (1.62 mm) thick single skin or 0.0747-inch- (1.9-mm-) thick dual skin .

4. Blade Edging: Closed-cell neoprene or PVC.
 5. Blade Edging: Inflatable seal blade edging, or replaceable rubber seals.
- C. Blade Axles: **1/2-inch- (13-mm-)** diameter; galvanized steel; blade-linkage hardware of zinc-plated steel and brass; ends sealed against blade bearings.
1. Operating Temperature Range: From **minus 40 to plus 200 deg F (minus 40 to plus 93 deg C)**.
- D. Bearings:
1. Oil-impregnated bronze or Molded synthetic.
 2. Dampers in ducts with pressure classes of **3-inch wg (750 Pa)** or less shall have axles full length of damper blades and bearings at both ends of operating shaft.
 3. Thrust bearings at each end of every blade.

2.04 FIRE DAMPERS

- A. Type: Static; rated and labeled according to UL 555 by an NRTL.
- B. Closing rating in ducts up to **4-inch wg (1-kPa)** static pressure class and minimum **2000-fpm (10-m/s)** velocity.
- C. Fire Rating: 1-1/2 hours.
- D. Frame: Curtain type with blades outside airstream except when located behind grille where blades may be inside airstream]; fabricated with roll-formed, **0.034-inch- (0.85-mm-)** thick galvanized steel; with mitered and interlocking corners.
- E. Mounting Sleeve: Factory- or field-installed, galvanized sheet steel.
1. Minimum Thickness: **0.138 inch (3.5 mm)** thick, as indicated, and of length to suit application.
 2. Exception: Omit sleeve where damper-frame width permits direct attachment of perimeter mounting angles on each side of wall or floor; thickness of damper frame must comply with sleeve requirements.
- F. Mounting Orientation: Vertical or horizontal as indicated.
- G. Blades: Roll-formed, interlocking, **0.034-inch- (0.85-mm-)** thick, galvanized sheet steel. In place of interlocking blades, use full-length, **0.034-inch- (0.85-mm-)** thick, galvanized-steel blade connectors.
- H. Horizontal Dampers: Include blade lock and stainless-steel closure spring.
- I. Heat-Responsive Device: Replaceable, **165 deg F (74 deg C)** rated, fusible links.

2.05 FLANGE CONNECTORS

- A. Description: Add-on or roll-formed, factory-fabricated, slide-on transverse flange connectors, gaskets, and components.

- B. Material: Galvanized steel.
- C. Gage and Shape: Match connecting ductwork.

2.06 TURNING VANES

- A. Manufactured Turning Vanes for Metal Ducts: Curved blades of galvanized sheet steel; support with bars perpendicular to blades set; set into vane runners suitable for duct mounting.
 - 1. Acoustic Turning Vanes: Fabricate airfoil-shaped aluminum extrusions with perforated faces and fibrous-glass fill.
- B. Manufactured Turning Vanes for Nonmetal Ducts: Fabricate curved blades of resin-bonded fiberglass with acrylic polymer coating; support with bars perpendicular to blades set; set into vane runners suitable for duct mounting.
- C. General Requirements: Comply with SMACNA's "HVAC Duct Construction Standards - Metal and Flexible"; Figures 4-3, "Vaness and Vane Runners," and 4-4, "Vane Support in Elbows."
- D. Vane Construction: Single wall.

2.07 DUCT-MOUNTED ACCESS DOORS

- A. Duct-Mounted Access Doors: Fabricate access panels according to SMACNA's "HVAC Duct Construction Standards - Metal and Flexible"; Figures 7-2 (7-2M), "Duct Access Doors and Panels," and 7-3, "Access Doors - Round Duct."
 - 1. Door:
 - a. Double wall, rectangular.
 - b. Galvanized sheet metal with insulation fill and thickness as indicated for duct pressure class.
 - c. Vision panel.
 - d. Hinges and Latches: 1-by-1-inch (25-by-25-mm) butt or piano hinge and cam latches.
 - e. Fabricate doors airtight and suitable for duct pressure class.
 - 2. Frame: Galvanized sheet steel, with bend-over tabs and foam gaskets.
 - 3. Number of Hinges and Locks:
 - a. Access Doors Less Than 12 Inches (300 mm) Square: No hinges and two sash locks.
 - b. Access Doors up to 18 Inches (460 mm) Square: Continuous and two sash locks.
 - c. Access Doors up to 24 by 48 Inches (600 by 1200 mm): Continuous and two compression latches with outside and inside handles.
 - d. Access Doors Larger Than 24 by 48 Inches (600 by 1200 mm): Continuous and two compression latches with outside and inside handles.

2.08 DUCT ACCESS PANEL ASSEMBLIES

- A. Labeled according to UL 1978 by an NRTL.
- B. Panel and Frame: Minimum thickness 0.0528-inch (1.3-mm) carbon steel.
- C. Fasteners: Carbon steel. Panel fasteners shall not penetrate duct wall.
- D. Gasket: Comply with NFPA 96; grease-tight, high-temperature ceramic fiber, rated for minimum 2000 deg F (1093 deg C).
- E. Minimum Pressure Rating: 10-inch wg (2500 Pa), positive or negative.

2.09 FLEXIBLE CONNECTORS

- A. Materials: Flame-retardant or noncombustible fabrics.
- B. Coatings and Adhesives: Comply with UL 181, Class 1.
- C. Metal-Edged Connectors: Factory fabricated with a fabric strip 5-3/4 inches (146 mm) wide attached to two strips of 2-3/4-inch- (70-mm-) wide, 0.028-inch- (0.7-mm-) thick, galvanized sheet steel or 0.032-inch- (0.8-mm-) thick aluminum sheets. Provide metal compatible with connected ducts.
- D. Indoor System, Flexible Connector Fabric: Glass fabric double coated with neoprene.
 - 1. Minimum Weight: 26 oz./sq. yd. (880 g/sq. m).
 - 2. Tensile Strength: 480 lbf/inch (84 N/mm) in the warp and 360 lbf/inch (63 N/mm) in the filling.
 - 3. Service Temperature: Minus 40 to plus 200 deg F (Minus 40 to plus 93 deg C).
- E. Outdoor System, Flexible Connector Fabric: Glass fabric double coated with weatherproof, synthetic rubber resistant to UV rays and ozone.
 - 1. Minimum Weight: 24 oz./sq. yd. (810 g/sq. m).
 - 2. Tensile Strength: 530 lbf/inch (93 N/mm) in the warp and 440 lbf/inch (77 N/mm) in the filling.
 - 3. Service Temperature: Minus 50 to plus 250 deg F (Minus 45 to plus 121 deg C).

2.10 FLEXIBLE DUCTS

- A. Noninsulated, Flexible Duct: UL 181, Class 1, 2-ply vinyl film supported by helically wound, spring-steel wire.
 - 1. Pressure Rating: 10-inch wg (2500 Pa) positive and 1.0-inch wg (250 Pa) negative.
 - 2. Maximum Air Velocity: 4000 fpm (20 m/s).
 - 3. Temperature Range: Minus 10 to plus 160 deg F (Minus 23 to plus 71 deg C).

- B. Insulated, Flexible Duct: UL 181, Class 1, aluminum laminate and polyester film with latex adhesive supported by helically wound, spring-steel wire; fibrous-glass insulation; polyethylene vapor-barrier film.
1. Pressure Rating: 10-inch wg (2500 Pa) positive and 1.0-inch wg (250 Pa) negative.
 2. Maximum Air Velocity: 4000 fpm (20 m/s).
 3. Temperature Range: Minus 20 to plus 210 deg F (Minus 29 to plus 99 deg C).
 4. Insulation R-value: Comply with ASHRAE/IESNA 90.1.
- C. Flexible Duct Connectors:
1. Clamps: Stainless-steel band with cadmium-plated hex screw to tighten band with a worm-gear action in sizes 3 through 18 inches (75 through 460 mm), to suit duct size.
 2. Non-Clamp Connectors: Liquid adhesive plus tape or Adhesive plus sheet metal screws.

2.11 DUCT ACCESSORY HARDWARE

- A. Instrument Test Holes: Cast iron or cast aluminum to suit duct material, including screw cap and gasket. Size to allow insertion of pitot tube and other testing instruments and of length to suit duct-insulation thickness.
- B. Adhesives: High strength, quick setting, neoprene based, waterproof, and resistant to gasoline and grease.

PART 3 - EXECUTION

3.01 INSTALLATION

- A. Install duct accessories according to applicable details in SMACNA's "HVAC Duct Construction Standards - Metal and Flexible" for metal ducts and in NAIMA AH116, "Fibrous Glass Duct Construction Standards," for fibrous-glass ducts.
- B. Install duct accessories of materials suited to duct materials; use galvanized-steel accessories in galvanized-steel and stainless-steel accessories in stainless-steel ducts.
- C. Install dampers at inlet of exhaust fans or exhaust ducts as close as possible to exhaust fan unless otherwise indicated.
- D. Install volume dampers at points on supply, return, and exhaust systems where branches extend from larger ducts.
1. Install steel volume dampers in steel ducts.
- E. Set dampers to fully open position before testing, adjusting, and balancing.
- F. Install test holes at fan inlets and outlets and elsewhere as indicated.

- G. Install fire dampers according to UL listing.
- H. Install duct access doors on sides of ducts to allow for inspecting, adjusting, and maintaining accessories and equipment at the following locations:
 - 1. At outdoor-air intakes and mixed-air plenums.
 - 2. At drain pans and seals.
 - 3. Adjacent to and close enough to fire dampers, to reset or reinstall fusible links. Access doors for access to fire dampers having fusible links shall be pressure relief access doors and shall be outward operation for access doors installed upstream from dampers and inward operation for access doors installed downstream from dampers.
 - 4. Control devices requiring inspection.
 - 5. Elsewhere as indicated.
- I. Install access doors with swing against duct static pressure.
- J. Access Door Sizes:
 - 1. One-Hand or Inspection Access: 8 by 5 inches (200 by 125 mm).
 - 2. Two-Hand Access: 12 by 6 inches (300 by 150 mm).
 - 3. Head and Hand Access: 18 by 10 inches (460 by 250 mm).
- K. Label access doors according to Section 23 05 53 "Identification for HVAC Piping and Equipment" to indicate the purpose of access door.
- L. Install flexible connectors to connect ducts to equipment.
- M. Connect terminal units to supply ducts directly or with maximum 12-inch (300-mm) lengths of flexible duct. Do not use flexible ducts to change directions.
- N. Connect diffusers or light troffer boots to ducts with maximum 60-inch (1500-mm) lengths of flexible duct clamped or strapped in place.
- O. Install duct test holes where required for testing and balancing purposes.

3.02 FIELD QUALITY CONTROL

- A. Tests and Inspections:
 - 1. Operate dampers to verify full range of movement.
 - 2. Inspect locations of access doors and verify that purpose of access door can be performed.
 - 3. Operate fire and smoke dampers to verify full range of movement and verify that proper heat-response device is installed.
 - 4. Inspect turning vanes for proper and secure installation.

END OF SECTION 23 33 00

SECTION 23 34 23
HVAC POWER VENTILATORS

PART 1 - GENERAL

1.01 SUMMARY

- A. Section Includes:
1. Centrifugal roof ventilators.
 2. In-line centrifugal fans.

1.02 SUBMITTALS

- A. Product Data: For each type of product indicated.
- B. Shop Drawings: Include plans, elevations, sections, details, and attachments to other work.
1. Detail equipment assemblies and indicate dimensions, weights, loads, required clearances, method of field assembly, components, and location and size of each field connection.
 2. Wiring Diagrams: For power, signal, and control wiring.
- C. Operation and maintenance data.

1.03 QUALITY ASSURANCE

- A. Electrical Components, Devices, and Accessories: Listed and labeled as defined in NFPA 70, by a qualified testing agency, and marked for intended location and application.
- B. AMCA Compliance: Fans shall have AMCA-Certified performance ratings and shall bear the AMCA-Certified Ratings Seal.

PART 2 - PRODUCTS

2.01 CENTRIFUGAL ROOF VENTILATORS

- A. Housing: Removable, spun-aluminum, dome top and outlet baffle extruded-aluminum; square, one-piece, aluminum base with venturi inlet cone.
- B. Fan Wheels: Aluminum hub and wheel with backward-inclined blades.
- C. Belt Drives:

1. Resiliently mounted to housing.
2. Fan Shaft: Turned, ground, and polished steel; keyed to wheel hub.
3. Shaft Bearings: Permanently lubricated, permanently sealed, self-aligning ball bearings.
4. Pulleys: Cast-iron, adjustable-pitch motor pulley.
5. Fan and motor isolated from exhaust airstream.

D. Accessories:

1. Disconnect Switch: Nonfusible type, with thermal-overload protection mounted inside fan housing, factory wired through an internal aluminum conduit.
2. Bird Screens: Removable, **1/2-inch** mesh, aluminum or brass wire.
3. Dampers: Counterbalanced, parallel-blade, backdraft dampers mounted in curb base; factory set to close when fan stops.
4. Motorized Dampers: Parallel-blade dampers mounted in curb base with electric actuator; wired to close when fan stops.

E. Roof Curbs: Galvanized steel; mitered and welded corners; **1-1/2-inch-thick**, rigid, fiberglass insulation adhered to inside walls; and **1-1/2-inch** wood nailer. Size as required to suit roof opening and fan base.

1. Configuration: Built-in raised cant and mounting flange.
2. Overall Height: **12 inches**.
3. Sound Curb: Curb with sound-absorbing insulation.
4. Pitch Mounting: Manufacture curb for roof slope.
5. Metal Liner: Galvanized steel.
6. Burglar Bars: 1/2 inch thick steel bars welded in place to form **6-inch** squares.
7. Mounting Pedestal: Galvanized steel with removable access panel.
8. Vented Curb: Unlined with louvered vents in vertical sides.

F. Capacities and Characteristics: as scheduled on drawings

2.02 IN-LINE CENTRIFUGAL FANS

- A. Housing: Split, spun aluminum with aluminum straightening vanes, inlet and outlet flanges, and support bracket adaptable to floor, side wall, or ceiling mounting.
- B. Direct-Drive Units: Motor mounted in airstream, factory wired to disconnect switch located on outside of fan housing; with wheel, inlet cone, and motor on swing-out service door.
- C. Belt-Driven Units: Motor mounted on adjustable base, with adjustable sheaves, enclosure around belts within fan housing, and lubricating tubes from fan bearings extended to outside of fan housing.
- D. Fan Wheels: Aluminum, airfoil blades welded to aluminum hub.
- E. Accessories:
1. Volume-Control Damper: Manually operated with quadrant lock, located in fan outlet.
 2. Companion Flanges: For inlet and outlet duct connections.

3. Fan Guards: 1/2- by 1-inch mesh of galvanized steel in removable frame. Provide guard for inlet or outlet for units not connected to ductwork.
4. Motor and Drive Cover (Belt Guard): Epoxy-coated steel.

F. Capacities and Characteristics: as scheduled on drawings

2.03 MOTORS

A. Comply with NEMA designation, temperature rating, service factor, enclosure type, and efficiency requirements for motors specified in Section 23 05 13 "Common Motor Requirements for HVAC Equipment."

1. Motor Sizes: Minimum size as indicated. If not indicated, large enough so driven load will not require motor to operate in service factor range above 1.0.

B. Enclosure Type: Totally enclosed, fan cooled.

2.04 SOURCE QUALITY CONTROL

A. Certify fan performance ratings, including flow rate, pressure, power, air density, speed of rotation, and efficiency by factory tests according to AMCA 210, "Laboratory Methods of Testing Fans for Aerodynamic Performance Rating." Label fans with the AMCA-Certified Ratings Seal.

PART 3 - EXECUTION

3.01 INSTALLATION

- A. Secure roof-mounted fans to roof curbs with cadmium-plated hardware. See Section 07 72 00 "Roof Accessories" for installation of roof curbs.
- B. Ceiling Units: Suspend units from structure; use steel wire or metal straps.
- C. Support suspended units from structure using threaded steel rods and elastomeric hangers or spring hangers having a static deflection of 1 inch. Install units with clearances for service and maintenance.

3.02 CONNECTIONS

- A. Drawings indicate general arrangement of ducts and duct accessories. Make final duct connections with flexible connectors. Flexible connectors are specified in Section 23 33 00 "Air Duct Accessories."
- B. Install ducts adjacent to power ventilators to allow service and maintenance.
- C. Ground equipment according to Section 26 05 26 "Grounding and Bonding for Electrical Systems."

- D. Connect wiring according to Section 26 05 19 "Low-Voltage Electrical Power Conductors and Cables."

3.03 FIELD QUALITY CONTROL

A. Tests and Inspections:

1. Verify that shipping, blocking, and bracing are removed.
2. Verify that unit is secure on mountings and supporting devices and that connections to ducts and electrical components are complete. Verify that proper thermal-overload protection is installed in motors, starters, and disconnect switches.
3. Verify that cleaning and adjusting are complete.
4. Disconnect fan drive from motor, verify proper motor rotation direction, and verify fan wheel free rotation and smooth bearing operation. Reconnect fan drive system, align and adjust belts, and install belt guards.
5. Adjust belt tension.
6. Adjust damper linkages for proper damper operation.
7. Verify lubrication for bearings and other moving parts.
8. Verify that manual and automatic volume control and fire and smoke dampers in connected ductwork systems are in fully open position.
9. Disable automatic temperature-control operators, energize motor and adjust fan to indicated rpm, and measure and record motor voltage and amperage.
10. Shut unit down and reconnect automatic temperature-control operators.
11. Remove and replace malfunctioning units and retest as specified above.

- B. Test and adjust controls and safeties. Replace damaged and malfunctioning controls and equipment.

- C. Prepare test and inspection reports.

3.04 ADJUSTING

- A. Adjust damper linkages for proper damper operation.
- B. Adjust belt tension.
- C. Comply with requirements in Section 23 05 93 "Testing, Adjusting, and Balancing for HVAC" for testing, adjusting, and balancing procedures.
- D. Replace fan and motor pulleys as required to achieve design airflow.
- E. Lubricate bearings.

END OF SECTION 23 34 23

SECTION 23 37 13**DIFFUSERS, REGISTERS, AND GRILLES**

PART 1 - GENERAL

1.01 SUMMARY

- A. Section Includes:
1. Rectangular and square ceiling diffusers.
 2. Perforated diffusers.
 3. Adjustable bar registers and grilles.
 4. Fixed face registers and grilles.

1.02 SUBMITTALS

- A. Product Data: For each type of product indicated, include the following:
1. Data Sheet: For each type of diffuser, register or grill, indicate materials of construction, finish, and mounting details; and performance data including throw and drop, static-pressure drop, and noise ratings.

PART 2 - PRODUCTS

2.01 CEILING DIFFUSERS

- A. Rectangular and Square Ceiling Diffusers:
1. Material: Steel.
 2. Finish: Baked enamel, white.
 3. Face Size: 24 by 24 inches (600 by 600 mm) nominal.
 4. Face Style: Three cone.
 5. Mounting: suitable for lay in ceiling.
 6. Pattern: Fixed.
 7. Dampers: Radial opposed blade or Butterfly.
 8. Accessories:
 - a. Equalizing grid.
 - b. Plaster ring.
 - c. Safety chain.
 - d. Wire guard.
 - e. Sectorizing baffles.
 - f. Operating rod extension.
- B. Perforated Diffuser:
1. Devices shall be specifically designed for variable-air-volume flows.

2. Material: Steel backpan and pattern controllers, with steel face.
3. Finish: Baked enamel, white.
4. Face Size: 24 by 24 inches (600 by 600 mm) nominal.
5. Duct Inlet: Round.
6. Face Style: Flush.
7. Mounting: suitable for lay in ceiling.
8. Pattern Controller: Four louvered deflector patches
9. Dampers: Opposed blade, Radial opposed blade or Butterfly.
10. Accessories:
 - a. Equalizing grid.
 - b. Plaster ring.
 - c. Safety chain.
 - d. Wire guard.
 - e. Sectorizing baffles.
 - f. Operating rod extension.

2.02 REGISTERS AND GRILLES

A. Adjustable Bar Register:

1. Material: Steel.
2. Finish: Baked enamel, white.
3. Face Blade Arrangement: Vertical spaced 3/4 inch (19 mm) apart.
4. Core Construction: Removable.
5. Rear-Blade Arrangement: Horizontal spaced 3/4 inch (19 mm) apart.
6. Frame: 1 inch (25 mm) wide.
7. Mounting: Countersunk screw.
8. Damper Type: Adjustable opposed blade.
9. Accessories:
 - a. Front-blade gang operator.

B. Fixed Bar Register (ER-1):

1. Material: Steel.
2. Finish: Baked enamel, white.
3. Face Blade Arrangement: Horizontal spaced 3/4 inch (19 mm) apart.
4. Core Construction: Removable.
5. Rear-Blade Arrangement: none
6. Frame: 1 inch (25 mm) wide.
7. Mounting: Countersunk screw or Concealed.
8. Damper Type: Adjustable opposed blade.

C. Fixed Face Grille (RG-1):

1. Material: Steel.
2. Finish: Baked enamel, white.
3. Face Arrangement: Perforated core.
4. Core Construction: Integral.
5. Frame: 1 inch (25 mm) wide.
6. Mounting: Lay in.

- D. Fixed Face Grille (RG-2):
1. Material: Steel.
 2. Finish: Baked enamel, white.
 3. Face Arrangement: 1/2-by-1/2-by-1/2-inch (13-by-13-by-13-mm) grid core.
 4. Core Construction: Integral.
 5. Frame: 1 inch (25 mm) wide.
 6. Mounting: Lay in.

2.03 SOURCE QUALITY CONTROL

- A. Verification of Performance: Rate diffusers, registers, and grilles according to ASHRAE 70, "Method of Testing for Rating the Performance of Air Outlets and Inlets."

PART 3 - EXECUTION

3.01 INSTALLATION

- A. Install diffusers, registers, and grilles level and plumb.
- B. Ceiling-Mounted Outlets and Inlets: Drawings indicate general arrangement of ducts, fittings, and accessories. Air outlet and inlet locations have been indicated to achieve design requirements for air volume, noise criteria, airflow pattern, throw, and pressure drop. Make final locations where indicated, as much as practical. For units installed in lay-in ceiling panels, locate units in the center of panel. Where architectural features or other items conflict with installation, notify Architect for a determination of final location.
- C. Install diffusers, registers, and grilles with airtight connections to ducts and to allow service and maintenance of dampers, air extractors, and fire dampers.

3.02 ADJUSTING

- A. After installation, adjust diffusers, registers, and grilles to air patterns indicated, or as directed, before starting air balancing.

END OF SECTION 23 37 13

SECTION 23 51 00**BREECHINGS, CHIMNEYS, AND STACKS****PART 1 - GENERAL****1.01 SUMMARY**

A. This Section includes the following:

1. Listed double-wall vents.

1.02 ACTION SUBMITTALS

A. Product Data: For the following:

1. Gas vents.
2. Flue Stacks

B. Shop Drawings: For vents and stacks. Include plans, elevations, sections, details, and attachments to other work.

PART 2 - PRODUCTS**2.01 LISTED TYPE B AND BW VENTS**

A. Description: Double-wall metal vents tested according to UL 441 and rated for **480 deg F (248 deg C)** continuously for Type B, or **550 deg F (288 deg C)** continuously for Type BW; with neutral or negative flue pressure complying with NFPA 211.

B. Construction: Inner shell and outer jacket separated by at least a **1/4-inch (6-mm)** airspace.

C. Inner Shell: **ASTM B 209 (ASTM B 209M)**, Type 1100 aluminum

D. Outer Jacket: Galvanized or Aluminized steel.

E. Accessories: Tees, elbows, increasers, draft-hood connectors, terminations, adjustable roof flashings, storm collars, support assemblies, thimbles, firestop spacers, and fasteners; fabricated from similar materials and designs as vent-pipe straight sections; all listed for same assembly.

1. Termination: Round chimney top designed to exclude minimum 98 percent of rainfall.

PART 3 - EXECUTION**3.01 APPLICATION**

- A. Listed Type B and BW Vents: Vents for certified gas appliances.

3.02 INSTALLATION OF LISTED VENTS

- A. Locate to comply with minimum clearances from combustibles and minimum termination heights according to product listing or NFPA 211, whichever is most stringent.
- B. Seal between sections of positive-pressure vents and grease exhaust ducts according to manufacturer's written installation instructions, using sealants recommended by manufacturer.
- C. Support vents at intervals recommended by manufacturer to support weight of vents and all accessories, without exceeding appliance loading.
- D. Slope breechings down in direction of appliance, with condensate drain connection at lowest point piped to nearest drain.
- E. Lap joints in direction of flow.
- F. After completing system installation, including outlet fittings and devices, inspect exposed finish. Remove burrs, dirt, and construction debris and repair damaged finishes.
- G. Clean breechings internally, during and after installation, to remove dust and debris. Clean external surfaces to remove welding slag and mill film. Grind welds smooth and apply touchup finish to match factory or shop finish.
- H. Provide temporary closures at ends of breechings, chimneys, and stacks that are not completed or connected to equipment.

END OF SECTION 23 51 00

SECTION 23 55 23.13**LOW-INTENSITY, GAS-FIRED, RADIANT HEATERS**

PART 1 - GENERAL

1.01 SUMMARY

- A. Section includes low-intensity, gas-fired, forced-draft radiant heaters.

1.02 ACTION SUBMITTALS

- A. Product Data: For each type of product.
 - 1. Include rated capacities, operating characteristics, electrical characteristics, and furnished specialties and accessories.
- B. Shop Drawings:
 - 1. Include details of equipment assemblies. Indicate dimensions, weights, loads, required clearances, method of field assembly, components, and location and size of each field connection.
 - 2. Include diagrams for power, signal, and control wiring.

1.03 INFORMATIONAL SUBMITTALS

- A. Field quality-control reports.

1.04 CLOSEOUT SUBMITTALS

- A. Operation and maintenance data.

1.05 WARRANTY

- A. Manufacturer's Special Warranty: Manufacturer agrees to repair or replace components of radiant heaters that fail in materials or workmanship within specified warranty period.
 - 1. Warranty Period: All warranty periods listed below are from date of Substantial Completion.
 - a. Burner Assembly: Three years.
 - b. Combustion and Emitter Tubes: Three years.
 - c. Heater Controls: One year.

PART 2 - PRODUCTS**2.01 PERFORMANCE REQUIREMENTS**

- A. CSA certified, with CSA Seal and certification number clearly visible on units indicating compliance with ANSI Z83.20/CSA 2.34.
- B. UL listed and labeled, with UL label clearly visible on units indicating compliance with ANSI Z83.20/CSA 2.34.
- C. Electrical Components, Devices, and Accessories: Listed and labeled as defined in NFPA 70, by a qualified testing agency, and marked for intended location and application.

2.02 FORCED-DRAFT HEATERS

- A. Description: Factory-assembled, indoor, overhead-mounted, electrically controlled, low-intensity, infrared radiant heating units using gas combustion. Heater to have all necessary factory-installed wiring and piping required prior to field installation and startup.
- B. Fuel Type: Design burner for natural gas having characteristics same as those of gas available at Project site.
- C. Burner Assembly:
 - 1. Combustion-Air Inlet: Ducted horizontal to outdoors through sidewall with vent caps.
 - 2. Ignition System: 115/120-V ac with flame rod sensing capabilities and self-diagnostic control module.
- D. Combustion Chamber: 4-inch- (100-mm-) diameter, 16-gage, aluminized -steel tubing with high-emissivity, high-temperature, corrosion-resistant external finish.
- E. Emitter Tube: 4-inch- (100-mm-) diameter, 16-gage, aluminized-steel tubing with high-emissivity, high-temperature, corrosion-resistant external finish. Emitter tubing shall be equipped with baffles to maximize heating efficiency.
 - 1. Tubing Connections: Compression couplings made from aluminized or stainless steel.
 - 2. 90-degree-bend emitter steel tubing with high-emissivity, high-temperature, corrosion-resistant external finish.
- F. Reflector: Polished aluminum, with end caps. Shape to control radiation from tubing for uniform intensity at floor level with 100 percent cutoff above centerline of tubing. Reflectors or entire heater shall accommodate rotational adjustment from horizontal to a minimum 30-degree tilt from vertical.
- G. Capacities and Characteristics: As Scheduled on the Drawings

2.03 CONTROLS AND SAFETIES

- A. Gas Control Valve: Single-stage, regulated redundant 24-V ac gas valve that contains pilot solenoid valve, electric gas valve, pilot filter, pressure regulator, pilot shutoff, and manual shutoff all in one body.
- B. Failure Safeguards: 100 percent shutoff of gas flow in the event of flame or power failure.
- C. Prepurge of 30 seconds of air control system prior to burner ignition.
- D. Safety lockout of burner after three consecutive ignition failures.
- E. Blocked Vent Safety: Differential pressure switch in burner safety circuit to stop burner operation with high discharge or suction pressure.
- F. Control Panel Interlock: Stops burner if panel is open.
- G. Indicator Lights: "Airflow-on" and "burner-on" indicator lights.
- H. Thermostat: Single-stage, wall-mounted type with 50 to 90 deg F (10 to 32 deg C) operating range and fan on switch.
 - 1. Control Transformer: Integrally mounted.

PART 3 - EXECUTION

3.01 INSTALLATION

- A. Equipment Installation: Install gas-fired, radiant heaters and associated gas features and systems according to NFPA 54.
- B. Suspended Units: Suspend from substrate using chain hanger kits and building attachments or Mount to substrate using manufacturer's rigid mounting kits or custom fabricated brackets.
 - 1. Comply with requirements for hangers and supports specified in Section 23 05 29 "Hangers and Supports for HVAC Piping and Equipment."
- C. Maintain manufacturers' recommended clearances for combustibles.
- D. Gas Piping: Comply with Section 23 11 23 "Facility Natural-Gas Piping." Connect gas piping to gas train inlet; provide union with enough clearance for burner removal and service.
 - 1. Gas Connections: Connect gas piping to radiant heaters according to NFPA 54.
- E. Where installing piping adjacent to gas-fired, radiant heaters, allow space for service and maintenance.

- F. Vent Connections: Comply with Section 23 31 13 "Metal Ducts" and with Section 23 51 00 "Vents and Flues"
- G. Electrical Connections: Comply with applicable requirements in Section 26 05 19 "Low-Voltage Electrical Power Conductors and Cables."
 - 1. Install electrical devices furnished with heaters but not specified to be factory mounted.

3.02 FIELD QUALITY CONTROL

- A. Perform the following tests and inspections:
 - 1. Test and adjust controls and safeties. Replace damaged and malfunctioning controls and equipment.
 - 2. Verify bearing lubrication.
 - 3. Verify proper motor rotation.
 - 4. Test Reports: Prepare a written report to record the following:
 - a. Test procedures used.
 - b. Test results that comply with requirements.
 - c. Test results that do not comply with requirements and corrective action taken to achieve compliance with requirements.
- B. Gas-fired, radiant heaters will be considered defective if they do not pass tests and inspections.
- C. Prepare test and inspection reports.

3.03 ADJUSTING

- A. Adjust initial-temperature set points.
- B. Adjust burner and other unit components for optimum heating performance and efficiency.

END OF SECTION 23 55 23.13

SECTION 23 62 00**PACKAGED COMPRESSOR AND CONDENSER UNITS**

PART 1 - GENERAL

1.01 SUMMARY

- A. Section includes packaged, air-cooled, refrigerant compressor and condenser units for both the DOAS system and the VRF system.

1.02 ACTION SUBMITTALS

- A. Product Data: For each type of product indicated.
- B. LEED Submittals:
 - 1. Product Data for Prerequisite EA 2: Documentation indicating that units comply with applicable requirements in ASHRAE/IESNA 90.1.
 - 2. Product Data for Credit EA 4: Documentation indicating that compressor and condenser units and refrigerants comply.
- C. Shop Drawings: For compressor and condenser units. Include plans, elevations, sections, details, and attachments to other work.
 - 1. Wiring Diagrams: For power, signal, and control wiring.

1.03 QUALITY ASSURANCE

- A. Electrical Components, Devices, and Accessories: Listed and labeled as defined in NFPA 70, by a qualified testing agency, and marked for intended location and application.
- B. Fabricate and label refrigeration system according to ASHRAE 15, "Safety Standard for Refrigeration Systems."
- C. ASHRAE/IESNA 90.1 Compliance: Applicable requirements in ASHRAE/IESNA 90.1, Section 6, "Heating, Ventilating, and Air-Conditioning."

1.04 WARRANTY

- A. Special Warranty: Manufacturer's standard form in which manufacturer agrees to repair or replace components of compressor and condenser units that fail in materials or workmanship within specified warranty period.
 - 1. Failures include, but are not limited to, the following:
 - a. Compressor failure.

- b. Condenser coil leak.
2. Warranty Period: Five years from date of Substantial Completion.

PART 2 - PRODUCTS

2.01 VRF OUTDOOR UNITS (CU-1, CU-2)

- A. General: Condensing units for the VRF system shall be same manufacture as the VRF fan coil units specified in Section 23 82 19. The PURY outdoor units shall be equipped with multiple circuit boards that interface to the M-NET controls system and shall perform all functions necessary for operation. Each outdoor unit module shall be completely factory assembled, piped and wired and run tested at the factory.
 1. The model nomenclature and unit requirements are shown on the drawings. Outdoor unit shall have a sound rating no higher than 60 dB(A) individually or 64 dB(A) twinned. Units shall have a sound rating no higher than 50 dB(A) individually or 53 dB(A) twinned while in night mode operation. If an alternate manufacturer is selected, any additional material, cost, and labor to meet published sound levels shall be incurred by the contractor.
 2. Both refrigerant lines from the outdoor unit to the BC (Branch Circuit) Controller (Single or Main) shall be insulated.
 3. There shall be no more than 3 branch circuit controllers connected to any one outdoor unit.
 4. The outdoor unit shall have an accumulator with refrigerant level sensors and controls.
 5. The outdoor unit shall have a high pressure safety switch, over-current protection, crankcase heater and DC bus protection.
 6. The outdoor unit shall be capable of operating in heating mode down to -4°F ambient temperatures or cooling mode down to 23°F ambient temperatures, without additional low ambient controls. If an alternate manufacturer is selected, any additional material, cost, and labor to meet low ambient operating condition and performance shall be incurred by the contractor.
 7. The outdoor unit shall have a high efficiency oil separator plus additional logic controls to ensure adequate oil volume in the compressor is maintained.
 8. The outdoor unit shall be provided with a manufacturer supplied 20 gauge hot dipped galvanized snow/hail guard.
 9. Unit must defrost all circuits simultaneously in order to resume full heating more quickly. Partial defrost which may extend "no or reduced heating" periods shall not be allowed.
- B. Unit Cabinet:
 1. The casing(s) shall be fabricated of galvanized steel, bonderized and finished.
- C. Fan:
 1. Each outdoor unit module shall be furnished with one direct drive, variable speed propeller type fan. The fan shall be factory set for operation under 0 in. WG external static pressure, but capable of normal operation under a maximum of 0.24 in. WG external static pressure via dipswitch.

2. All fan motors shall have inherent protection, have permanently lubricated bearings, and be completely variable speed.
3. All fan motors shall be mounted for quiet operation.
4. All fans shall be provided with a raised guard to prevent contact with moving parts.
5. The outdoor unit shall have vertical discharge airflow.

D. Refrigerant

1. R410A refrigerant shall be required

E. Polyolester (POE) oil shall be required.

F. Coil:

1. The outdoor coil shall be of nonferrous construction with lanced or corrugated plate fins on copper tubing.
2. The coil fins shall have a factory applied corrosion resistant blue-fin finish.
3. The coil shall be protected with an integral metal guard.
4. Refrigerant flow from the outdoor unit shall be controlled by means of an inverter driven compressor.
5. The outdoor coil shall include 4 circuits with two position valves for each circuit, except for the last stage.

G. Compressor:

1. Each outdoor unit module shall be equipped with one inverter driven scroll hermetic compressor. Non inverter-driven compressors, which cause inrush current (demand charges) and require larger wire sizing, shall not be allowed.
2. A crankcase heater(s) shall be factory mounted on the compressor(s).
3. The outdoor unit compressor shall have an inverter to modulate capacity. The capacity shall be completely variable with a turndown of 19%-5% of rated capacity, depending upon unit size.
4. The compressor will be equipped with an internal thermal overload.
5. The compressor shall be mounted to avoid the transmission of vibration.

H. Controls:

1. The outdoor unit shall have the capability of up to 8 levels of demand control for each refrigerant system

I. Electrical:

1. The outdoor unit electrical power shall be 480volts, 3-phase, 60 hertz.
2. The outdoor unit shall be controlled by integral microprocessors.
3. The control circuit between the indoor units, BC Controller and the outdoor unit shall be 24VDC completed using a 2-conductor, twisted pair shielded cable to provide total integration of the system.

2.02 Branch CIRCUIT (BC) controllers FOR R2-SERIES SYSTEMS

- A. General: The BC (Branch Circuit) Controllers shall include multiple branches to allow simultaneous heating and cooling by allowing either hot gas refrigerant to flow to indoor

unit(s) for heating or subcooled liquid refrigerant to flow to indoor unit(s) for cooling. Refrigerant used for cooling must always be subcooled for optimal indoor unit LEV performance; alternate branch devices with no subcooling risk bubbles in liquid supplied to LEV and are not allowed.

The BC (Branch Circuit) Controllers shall be specifically used with R410A R2-Series systems. These units shall be equipped with a circuit board that interfaces to the M-NET controls system and shall perform all functions necessary for operation. The unit shall have a galvanized steel finish. The BC Controller shall be completely factory assembled, piped and wired. Each unit shall be run tested at the factory. This unit shall be mounted indoors, with access and service clearance provided for each controller. The sum of connected capacity of all indoor air handlers shall range from 50% to 150% of rated capacity.

B. BC Unit Cabinet:

1. The casing shall be fabricated of galvanized steel or factory standard baked enamel finish
2. Each cabinet shall house a liquid-gas separator and multiple refrigeration control valves.
3. The unit shall house tube-in-tube heat exchangers.

C. Refrigerant

1. R410A refrigerant shall be required.

D. Refrigerant valves:

1. The unit shall be furnished with multiple branch circuits which can individually accommodate up to 54,000 BTUH and up to three indoor units. Branches may be twinned to allow more than 54,000 BTUH.
2. Each branch shall have multiple two-position valves to control refrigerant flow.
3. Service shut-off valves shall be field-provided/installed for each branch to allow service to any indoor unit without field interruption to overall system operation.
4. Linear electronic expansion valves shall be used to control the variable refrigerant flow.

E. Future Use

1. Each VRF system shall include at least one (1) unused branches or branch devices for future use. Branches shall be fully installed & wired in central location with capped service shutoff valve & service port.

F. Integral Drain Pan:

1. 1. An Integral drain pan and drain shall be provided

G. Electrical:

1. The unit electrical power shall be 480 volts, 1 phase, 60 Hertz.
2. The BC Controller shall be controlled by integral microprocessors
3. The control circuit between the indoor units and outdoor units shall be 24VDC completed using a 2-conductor, twisted pair shielded cable to provide total integration of the system.

2.03 COMPRESSOR AND CONDENSER UNITS, AIR COOLED (CU-3)

- A. Refrigerant: R-410A.
- B. Condenser Coil: Seamless copper-tube, aluminum-fin coil, including subcooling circuit and backseating liquid-line service access valve. Factory pressure test coils, then dehydrate by drawing a vacuum and fill with a holding charge of nitrogen or refrigerant.
- C. Condenser Fan: Propeller-type vertical discharge; either directly or belt driven. Include the following:
 - 1. Permanently lubricated, ball-bearing totally enclosed motors.
 - 2. Separate motor for each fan.
 - 3. Dynamically and statically balanced fan assemblies.
- D. Operating and safety controls include the following:
 - 1. Manual-reset, high-pressure cutout switches.
 - 2. Automatic-reset, low-pressure cutout switches.
 - 3. Low-oil-pressure cutout switch.
 - 4. Compressor-winding thermostat cutout switch.
 - 5. Three-leg, compressor-overload protection.
 - 6. Control transformer.
 - 7. Magnetic contactors for compressor and condenser fan motors.
 - 8. Timer to prevent excessive compressor cycling.
- E. Accessories:
 - 1. Low-Ambient Controller: Controls condenser fan speed to permit operation down to **minus 20 deg F (minus 29 deg C)** with time-delay relay to bypass low-pressure switch.
 - 2. Gage Panel: Package with refrigerant circuit suction and discharge gages.
 - 3. Part-winding-start timing relay, circuit breakers, and contactors.
- F. Unit Casings: Designed for outdoor installation with weather protection for components and controls and with removable panels for required access to compressors, controls, condenser fans, motors, and drives. Additional features include the following:
 - 1. Steel, galvanized or zinc coated, for exposed casing surfaces; treated and finished with manufacturer's standard paint coating.
 - 2. Perimeter base rail with forklift slots and lifting holes to facilitate rigging.
 - 3. Gasketed control panel door.
 - 4. Nonfused disconnect switch, factory mounted and wired, for single external electrical power connection. If factory mounted is not available, provide disconnect for mounting in the field by Division 23 contractor.
 - 5. Condenser coil grille.
- G. Capacities and Characteristics: As Scheduled on the Drawings

2.04 SOURCE QUALITY CONTROL

- A. Energy Efficiency: Equal to or greater than prescribed by ASHRAE/IESNA 90.1, "Energy Efficient Design of New Buildings except Low-Rise Residential Buildings," Section 6, "Heating, Ventilating, and Air-Conditioning."
- B. Testing Requirements: Factory test sound-power-level ratings according to ARI 270.

PART 3 - EXECUTION

3.01 INSTALLATION

- A. Install units level and plumb, firmly anchored in locations indicated.
- B. Install roof-mounting units on equipment supports specified in Section 07 72 00 "Roof Accessories."
- C. Maintain manufacturer's recommended clearances for service and maintenance.
- D. Loose Components: Install electrical components, devices, and accessories that are not factory mounted.

3.02 CONNECTIONS

- A. Comply with requirements for piping in Section 23 21 13 "Hydronic Piping" and Section 23 21 16 "Hydronic Piping Specialties." Section 15179 "Hydronic Piping Specialties." Drawings indicate general arrangement of piping, fittings, and specialties.
- B. Where installing piping adjacent to equipment, allow space for service and maintenance of equipment.
- C. Connect precharged refrigerant tubing to unit's quick-connect fittings. Install tubing so it does not interfere with access to unit. Install furnished accessories.
- D. Connect refrigerant piping to condenser units; maintain required access to unit. Install furnished field-mounted accessories. Refrigerant piping and specialties are specified in Section 23 23 00 "Refrigerant Piping."

3.03 FIELD QUALITY CONTROL

- A. Perform tests and inspections.
- B. Tests and Inspections: Provide factory representative startup and first year warranty site visits
 - 1. Perform each visual and mechanical inspection and electrical test. Certify compliance with test parameters.

2. Leak Test: After installation, charge system with refrigerant and oil and test for leaks. Repair leaks, replace lost refrigerant and oil, and retest until no leaks exist.
 3. Operational Test: After electrical circuitry has been energized, start units to confirm proper motor operation and unit operation, product capability, and compliance with requirements.
 4. Test and adjust controls and safeties. Replace damaged and malfunctioning controls and equipment.
 5. Verify proper airflow over coils.
- C. Verify that vibration isolation and flexible connections properly dampen vibration transmission to structure.

END OF SECTION 23 62 00

SECTION 23 74 33**DEDICATED OUTDOOR-AIR UNITS**

PART 1 - GENERAL

1.01 RELATED DOCUMENTS

- A. Drawings and general provisions of the Contract, including General and Supplementary Conditions and Division 01 Specification Sections, apply to this Section.

1.02 SUMMARY

- A. Section includes factory-packaged units capable of supplying up to 100 percent outdoor air and providing cooling and heating.

1.03 ACTION SUBMITTALS

- A. Product Data: For each type of product. Include rated capacities, operating characteristics, and furnished specialties and accessories.

- B. LEED Submittals:

1. Product Data for Prerequisite EA 2: Documentation indicating that units comply with applicable requirements in ASHRAE/IESNA 90.1.
2. Product Data for Prerequisite EA 3: Documentation indicating that refrigerants comply.
3. Product Data for Credit EA 4: Documentation indicating that equipment and refrigerants comply.
4. Product Data for Prerequisite IEQ 1: Documentation indicating that units comply with ASHRAE 62.1, Section 5 - "Systems and Equipment."
5. Product Data for Credit IEQ 1: Documentation indicating that units are equipped with a direct outdoor airflow-measuring device capable of measuring the minimum outdoor airflow with accuracy within 15 percent of the design minimum airflow rate, as defined by ASHRAE 62.1.
6. Product Data for Credit IEQ 4.1: For solvent cements and adhesive primers, documentation including printed statement of VOC content.
7. Laboratory Test Reports for Credit IEQ 4: For solvent cements and adhesive primers, documentation indicating that products comply with the testing and product requirements of the California Department of Health Services' "Standard Practice for the Testing of Volatile Organic Emissions from Various Sources Using Small-Scale Environmental Chambers."
8. Product Data for Credit IEQ 5: Documentation indicating that units include MERV 13 filters rated according to ASHRAE 52.2.

- C. Shop Drawings:

1. Include plans, elevations, sections, and attachment details.
2. Include details of equipment assemblies. Indicate dimensions, weights, loads, required clearances, method of field assembly, components, and location and size of each field connection.
3. Prepare the following by or under the supervision of a qualified professional engineer:
 - a. Mounting Details: For securing and flashing roof curb to roof structure. Indicate coordinating requirements with roof membrane system.
 - b. Include diagrams for power, signal, and control wiring.
 - c. Calculate requirements for selecting vibration isolators and seismic restraints and for designing vibration isolation bases.
 - d. Indicate compliance with "Performance Requirements" article.

1.04 INFORMATIONAL SUBMITTALS

- A. Coordination Drawings: Roof-curb mounting details, drawn to scale, on which the following items are shown and coordinated with each other, using input from installers of the items involved:
 1. Size and location of unit-mounted rails and anchor points and methods for anchoring units to roof curb.
 2. Required roof penetrations for ducts, pipes, and electrical raceways, including size and location of each penetration.
- B. Seismic Qualification Certificates: For dedicated outdoor-air units, accessories, and components, from manufacturer.
 1. Basis for Certification: Indicate whether withstand certification is based on actual test of assembled components or on calculation.
 2. Dimensioned Outline Drawings of Equipment Unit: Identify center of gravity and locate and describe mounting and anchorage provisions.
 3. Detailed description of equipment anchorage devices on which the certification is based and their installation requirements.
- C. Startup service reports.
- D. Sample Warranty: For special warranty.

1.05 CLOSEOUT SUBMITTALS

- A. Operation and Maintenance Data: For units to include in emergency, operation, and maintenance manuals.

1.06 MAINTENANCE MATERIAL SUBMITTALS

- A. Furnish extra materials that match products installed and that are packaged with protective covering for storage and identified with labels describing contents.

1. Fan Belts: One set for each belt-driven fan.
2. Filters: One set.

1.07 WARRANTY

- A. Special Warranty: Manufacturer agrees to replace components of units that fail in materials or workmanship within specified warranty period.
1. Warranty Period for Compressors: Five years from date of Substantial Completion.
 2. Warranty Period for Heat Exchangers: Five years from date of Substantial Completion.

PART 2 - PRODUCTS

2.01 MANUFACTURERS

- A. Basis-of-Design Product: Subject to compliance with requirements, provide comparable product by one of the following:
1. AAON.
 2. Addison.
 3. Desert Aire.
 4. Engineered Air.
 5. Munters Corporation, Dehumidification Division; Des Champs Products.
 6. Thomas & Betts Corporation; Reznor HVAC Division.

2.02 PERFORMANCE REQUIREMENTS

- A. General Fabrication Requirements: Comply with requirements in ASHRAE 62.1, Section 5 - "Systems and Equipment," and Section 7 - "Construction and System Start-up."
- B. Seismic Performance: Units shall withstand the effects of earthquake motions determined according to ASCE/SEI 7.
1. The term "withstand" means "the unit will remain in place without separation of any parts when subjected to the seismic forces specified and the unit will be fully operational after the seismic event."
- C. Cabinet Thermal Performance:
1. Maximum Overall U-Value: Comply with requirements in ASHRAE/IESNA 90.1.
 2. Include effects of metal-to-metal contact and thermal bridges in the calculations.
- D. Cabinet Surface Condensation:

1. Cabinet shall have additional insulation and vapor seals if required to prevent condensation on the interior and exterior of the cabinet.
 2. Portions of cabinet located downstream from the cooling coil shall have a thermal break at each thermal bridge between the exterior and interior casing to prevent condensation from occurring on the interior and exterior surfaces. The thermal break shall not compromise the structural integrity of the cabinet.
- E. Maximum Cabinet Leakage: 0.5 percent of the total supply-air flow at a pressure rating equal to the fan shut-off pressure.
- F. Cabinet Deflection Performance:
1. Walls and roof deflection shall be within 1/200 of the span at the design working pressure equal to the fan shut-off pressure. Deflection limits shall be measured at any point on the surface.
 2. Floor deflections shall be within 1/300 of the span considering the worst-case condition caused by the following:
 - a. Service personnel.
 - b. Internal components.
 - c. Design working pressure defined for the walls and roof.
- G. Electrical components, devices, and accessories: Listed and labeled as defined in NFPA 70, by a qualified testing agency, and marked for intended location and application.
- H. Capacities and Characteristics: As scheduled on the drawings

2.03 CABINET

- A. Construction: double wall.
- B. Exterior Casing Material: Galvanized steel with paint finish.
- C. Interior Casing Material: Galvanized steel.
- D. Lifting and Handling Provisions: Factory-installed shipping skids and lifting lugs.
- E. Base Rails: Galvanized-steel rails for mounting on roof curb or pad as indicated.
- F. Access for Inspection, Cleaning, and Maintenance: Comply with requirements in ASHRAE 62.1.
1. Service Doors: Hinged access doors with gaskets. Material and construction of doors shall match material and construction of cabinet in which doors are installed.
- G. Floor: Reinforced, metal surface; reinforced to limit deflection when walked on by service personnel. Insulation shall be below metal walking surface.
- H. Cabinet Insulation:

1. Type: Fibrous-glass duct lining complying with ASTM C 1071, Type II or flexible elastomeric insulation complying with ASTM C 534, Type II, sheet materials.
2. Thickness: 2 inches (50 mm).
3. Insulation Adhesive: Comply with ASTM C 916, Type I.
4. Mechanical Fasteners: Suitable for adhesive, mechanical, or welding attachment to casing without damaging liner and without causing air leakage when applied as recommended by manufacturer.

I. Condensate Drain Pans:

1. Shape: Rectangular, with 1 percent slope in at least two planes to direct water toward drain connection.
2. Size: Large enough to collect condensate from cooling coils including coil piping connections, coil headers, and return bends.
 - a. Length: Extend drain pan downstream from leaving face to comply with ASHRAE 62.1.
 - b. Depth: A minimum of 2 inches (50 mm) deep.
3. Configuration: Single wall.
4. Configuration: Double wall, with space between walls filled with foam insulation and moisture-tight seal.
5. Material: Galvanized-steel sheet with asphaltic waterproofing compound coating on pan top surface.
6. Material: Stainless-steel sheet.
7. Drain Connection:
 - a. Located on one end of pan, at lowest point of pan.
 - b. Terminated with threaded nipple.
 - c. Minimum Connection Size: NPS 1 (DN 25).
8. Units with stacked coils shall have an intermediate drain pan to collect condensate from top coil.

J. Surfaces in Contact with Airstream: Comply with requirements in ASHRAE 62.1 for resistance to mold and erosion.

2.04 SUPPLY FAN

A. Forward-Curved Fan Type: Centrifugal; statically and dynamically balanced.

1. Fan Wheel Material: Galvanized or Painted steel, mounted on solid-steel shaft.
2. Bearings: Self-aligning, permanently lubricated ball bearings or Pillow-block bearings rated L₅₀ for 200,000 hours and having external grease fittings.

B. Plenum Fan Type: Single width, non-overloading, with backward-inclined or airfoil blades.

1. Fan Wheel Material: Aluminum; attached directly to motor shaft.
2. Fan Wheel Drive and Arrangement: Direct drive, AMCA Arrangement 4.

3. Fan panel and frame Material: Powder-coated steel, stainless steel, or aluminum.
 4. Fan Enclosure: Easily removable enclosure around rotating parts.
 5. Fan Balance: Precision balance fan below 0.08 inch/s (2.0 mm/s) at design speed with filter in.
- C. Service Factor for Belt Drive Applications: Multiple V-belt drive with matching fan pulley and adjustable motor sheaves and belt assembly with minimum 1.5 service factor.
- D. Motor: Comply with NEMA designation, temperature rating, service factor, enclosure type, and efficiency requirements for high efficient motors per Section 23 05 13 "COMMON MOTOR REQUIREMENTS FOR HVAC."
1. Enclosure Type: Totally enclosed, fan cooled.
 2. NEMA Premium (TM) efficient motors as defined in NEMA MG 1.
 3. Motor Sizes: Minimum size as indicated. If not indicated, large enough so driven load will not require motor to operate in service factor range above 1.0.
 4. Controllers, Electrical Devices, and Wiring: Comply with requirements for electrical devices and connections specified in electrical Sections.
 5. Mount unit-mounted disconnect switches on exterior of unit.
- E. Mounting: Fan wheel, motor, and drives shall be mounted to fan casing with spring isolators.

2.05 COOLING COILS

- A. Capacity Ratings: Comply with ASHRAE 33 and ARI 410 and coil bearing the ARI label.
- B. Coil Casing Material: Manufacturer's standard material.
- C. Tube Material: Copper.
- D. Tube Header Material: Manufacturer's standard material.
- E. Fin Material: Aluminum or Copper.
- F. Fin and Tube Joints: Mechanical bond.
- G. Leak Test: Coils shall be leak tested with air underwater.
- H. Refrigerant Coil Capacity Reduction: Circuit coils for face, row or interleaved control.
- I. Refrigerant Coil Suction and Distributor Header Materials: Seamless copper tube with brazed joints.
- J. Coating: Phenolic epoxy corrosion-protection coating after assembly.

2.06 REFRIGERATION SYSTEM

- A. Comply with requirements in ASHRAE 15, "Safety Standard for Refrigeration Systems."

- B. Refrigerant Charge: Factory charged with refrigerant and filled with oil.
- C. Compressors: Scroll compressors with integral vibration isolators, internal overcurrent and overtemperature protection, internal pressure relief, and crankcase heater.
- D. Refrigerant: R-410A.
 - 1. Classified as Safety Group A1 according to ASHRAE 34.
 - 2. Provide unit with operating charge of refrigerant.
- E. Refrigeration System Specialties:
 - 1. Expansion valve with replaceable thermostatic element.
 - 2. Refrigerant dryer.
 - 3. High-pressure switch.
 - 4. Low-pressure switch.
 - 5. Thermostat for coil freeze-up protection during low ambient temperature operation or loss of air.
 - 6. Brass service valves installed in discharge and liquid lines.
- F. Capacity Control:
 - 1. Hot-gas bypass refrigerant control for capacity control with continuous dehumidification on a single compressor.
 - 2. Patented, Rawal APR control with zero to 100 percent modulating capacity control using hot-gas bypass. Evaporator coil shall be continuously active for dehumidification.
 - 3. Single compressor with evaporator and condenser coil within the refrigerant section to provide initial pre-cooling and to reheat for humidity control.
 - 4. Heat-pipe heat exchanger wrapped around the evaporator coil to pre-cool the air entering the evaporator coil and reheat the air leaving the evaporator coil to control humidity.
- G. Refrigerant reheat condenser coils:
 - 1. Capacity Ratings: Complying with ASHRAE 33 and ARI 410 and coil bearing the ARI label.
 - 2. Tube Material: Copper.
 - 3. Fin Material: Aluminum or Copper.
 - 4. Fin and Tube Joint: Mechanical bond.
 - 5. Leak Test: Coils shall be leak tested with air underwater.
 - 6. Coating: Phenolic epoxy corrosion-protection coating after assembly.
- H. Safety Controls:
 - 1. Compressor motor and condenser coil fan motor low ambient lockout.
 - 2. Overcurrent protection for compressor motor.

2.07 INDIRECT-FIRED GAS FURNACE HEATING

A. Furnace Assembly:

1. Factory assembled, piped, and wired.
2. Comply with requirements in NFPA 54, "National Fuel Gas Code," and ANSI Z21.47, "Gas-Fired Central Furnaces."
3. AGA Approval: Designed and certified by and bearing label of AGA.

B. Burners:

1. Heat-Exchanger Material: Aluminized steel with stainless-steel inserts with a minimum thermal efficiency of 90 percent.
2. Fuel: Natural gas.
3. Ignition: Electronically controlled electric spark with flame sensor.

C. Heat-Exchanger Drain Pan Material: Stainless steel.

D. Venting: Power vent with integral, motorized centrifugal fan interlocked with gas valve. Provide both PVC flue and combustion air for connection to combination flue/combustion air for high efficiency furnace.

E. Safety Controls:

1. Gas Control Valve: Two stage.
2. Gas Train: Single-body, regulated, redundant, 24-V ac gas valve assembly containing pilot solenoid valve, pilot filter, pressure regulator, pilot shutoff, and manual shutoff.

2.08 FILTERS

A. Disposable Panel Filters:

1. Comply with NFPA 90A.
2. Factory-fabricated, viscous-coated, flat-panel type.
3. Thickness: 2 inches (50 mm).
4. Minimum Efficiency: 35%.
5. Media: Interlaced glass fibers sprayed with nonflammable adhesive.

B. Extended-Surface, Disposable Panel Filters:

1. Comply with NFPA 90A.
2. Factory-fabricated, dry, extended-surface type.
3. Thickness: 12 inches (600 mm).
4. Minimum efficiency: 85%
5. Media: Fibrous material formed into deep-V-shaped pleats and held by self-supporting wire grid.

C. Mounting Frames:

1. Panel filters arranged for flat or angular orientation, with access doors on both sides of unit. Filters shall be removable from one side or from access plenum.
2. Extended surface filters arranged for flat orientation, removable from access plenum.
3. Galvanized or stainless steel with gaskets and fasteners, suitable for bolting together into built-up filter banks with space for prefilter.

2.09 ELECTRICAL POWER CONNECTIONS

- A. General Electrical Power Connection Requirements: Factory-installed and -wired switches, motor controllers, transformers, and other necessary electrical devices shall provide a single-point field power connection to unit.
- B. Enclosure: NEMA 250, Type 3R, mounted in unit with hinged access door in unit cabinet having a lock and key or padlock and key,
- C. Wiring: Numbered and color-coded to match wiring diagram.
- D. Wiring Location: Install factory wiring outside an enclosure in a raceway.
- E. Power Interface: Field power interface shall be to NEMA KS 1, heavy-duty, nonfused disconnect switch.
- F. Factory Wiring: Branch power circuit to each motor and to controls with one of the following disconnecting means:
 1. NEMA KS 1, heavy-duty, fusible switch with rejection-type fuse clips rated for fuses. Select and size fuses to provide Type 2 protection according to IEC 60947-4-1.
 2. NEMA KS 1, heavy-duty, nonfusible switch.
 3. UL 489, motor-circuit protector (circuit breaker) with field-adjustable, short-circuit trip coordinated with motor locked-rotor amperes.
- G. Factory-Mounted, Overcurrent-Protection Service: For each motor.
- H. Transformer: Factory mounted with primary and secondary fuses and sized with enough capacity to operate electrical load plus spare capacity.
- I. Controls: Factory wire unit-mounted controls where indicated.
- J. Lights: Factory wire unit-mounted lights.
- K. Receptacle: Factory wire unit-mounted, ground fault interrupt (GFI) duplex receptacle.
- L. Control Relays: Auxiliary and adjustable time-delay relays.

2.10 CONTROLS

- A. Control equipment and sequence of operation are specified in Section 23 09 00 "Instrumentation and Control for HVAC."

- B. Control Wiring: Factory wire connection for controls' power supply.

PART 3 - EXECUTION

3.01 EXAMINATION

- A. Examine substrates, areas, and conditions, with Installer present, for compliance with requirements for installation tolerances and other conditions affecting performance of the Work.
- B. Examine roughing-in for piping, ducts, and electrical systems to verify actual locations of connections before equipment installation.
- C. Examine roof curbs and equipment supports for suitable conditions where units will be installed.
- D. Proceed with installation only after unsatisfactory conditions have been corrected.

3.02 INSTALLATION

- A. Comply with manufacturer's rigging and installation instructions for unloading units and moving to final locations.
- B. Equipment Mounting:
 - 1. Install air units on cast-in-place concrete equipment bases. Comply with requirements for equipment bases and foundations specified in Section 03 30 00 "Cast-in-Place Concrete."
 - 2. Comply with requirements for vibration isolation and seismic control devices specified in Section 23 05 48 "Vibration and Seismic Controls for HVAC."
- C. Install wall- and duct-mounted sensors furnished by manufacturer for field installation. Install control wiring and make final connections to control devices and unit control panel.
- D. Comply with requirements for gas-fired furnace installation in NFPA 54, "National Fuel Gas Code."
- E. Install separate devices furnished by manufacturer and not factory installed.
- F. Install new filters at completion of equipment installation and before testing, adjusting, and balancing.
- G. Install drain pipes from unit drain pans to sanitary drain.
 - 1. Drain Piping: Drawn-temper copper water tubing complying with **ASTM B 88, Type L (ASTM B 88M, Type B)**, with soldered joints.
 - 2. Drain Piping: Schedule 40 PVC pipe complying with ASTM D 1785, with solvent-welded fittings.

- a. PVC solvent cement shall have a VOC content of 510 g/L or less when calculated according to 40 CFR 59, Subpart D (EPA Method 24).
 - b. Adhesive primer shall have a VOC content of 550 g/L or less when calculated according to 40 CFR 59, Subpart D (EPA Method 24).
 - c. Solvent cement and adhesive primer shall comply with the testing and product requirements of the California Department of Health Services' "Standard Practice for the Testing of Volatile Organic Emissions from Various Sources Using Small-Scale Environmental Chambers."
3. Pipe Size: Same size as condensate drain pan connection.

3.03 CONNECTIONS

- A. Where installing piping adjacent to units, allow space for service and maintenance.
- B. Refrigerant Piping Connections:
1. Comply with requirements in Section 23 23 00 "Refrigerant Piping."
- C. Gas Piping Connections:
1. Comply with requirements in Section 23 11 23 "Facility Natural-Gas Piping."
 2. Connect gas piping to furnace, full size of gas train inlet, and connect with union, and shutoff valve with sufficient clearance for burner removal and service.
 3. Install AGA-approved flexible connectors.
- D. Duct Connections:
1. Comply with requirements in Section 23 31 13 "Metal Ducts."
 2. Drawings indicate the general arrangement of ducts.
 3. Connect ducts to units with flexible duct connectors. Comply with requirements for flexible duct connectors in Section 23 33 00 "Air Duct Accessories."
- E. Electrical Connections: Comply with requirements for power wiring, switches, and motor controls in electrical Sections.
1. Install electrical devices furnished by unit manufacturer but not factory mounted.

3.04 STARTUP SERVICE

- A. Perform startup service.
1. Complete installation and startup checks according to manufacturer's written instructions.
 2. Inspect units for visible damage to furnace combustion chamber.
 3. Perform the following operations for both minimum and maximum firing and adjust burner for peak efficiency:
 - a. Measure gas pressure at manifold.

- b. Measure combustion-air temperature at inlet to combustion chamber.
 - c. Measure flue-gas temperature at furnace discharge.
 - d. Perform flue-gas analysis. Measure and record flue-gas carbon dioxide and oxygen concentration.
 - e. Measure supply-air temperature and volume when burner is at maximum firing rate and when burner is off. Calculate useful heat to supply air.
4. Verify operation of remote panel including pilot-light operation and failure modes. Inspect the following:
 - a. High-limit heat exchanger.
 - b. Alarms.
 5. Inspect units for visible damage to refrigerant compressor, condenser and evaporator coils, and fans.
 6. Start refrigeration system when outdoor-air temperature is within normal operating limits and measure and record the following:
 - a. Cooling coil leaving-air, dry- and wet-bulb temperatures.
 - b. Cooling coil entering-air, dry- and wet-bulb temperatures.
 7. Simulate maximum cooling demand and inspect the following:
 - a. Compressor refrigerant suction and hot-gas pressures.
 - b. Short-circuiting of air through outside coil or from outside coil to outdoor-air intake.
 8. Inspect casing insulation for integrity, moisture content, and adhesion.
 9. Verify that clearances have been provided for servicing.
 10. Verify that controls are connected and operable.
 11. Verify that filters are installed.
 12. Clean coils and inspect for construction debris.
 13. Clean furnace flue and inspect for construction debris.
 14. Inspect operation of power vents.
 15. Purge gas line.
 16. Inspect and adjust vibration isolators and seismic restraints.
 17. Verify bearing lubrication.
 18. Clean fans and inspect fan-wheel rotation for movement in correct direction without vibration and binding.
 19. Adjust fan belts to proper alignment and tension.
 20. Start unit.
 21. Inspect and record performance of interlocks and protective devices including response to smoke detectors by fan controls and fire alarm.
 22. Operate unit for run-in period.
 23. Calibrate controls.
 24. Adjust and inspect high-temperature limits.
 25. Inspect outdoor-air dampers for proper stroke.
 26. Verify operational sequence of controls.
 27. Measure and record the following airflows. Plot fan volumes on fan curve.
 - a. Supply-air volume.

- b. Return-air flow.
 - c. Outdoor-air flow.
- B. After startup, change filters, verify bearing lubrication, and adjust belt tension.
 - C. Remove and replace components that do not properly operate and repeat startup procedures as specified above.
 - D. Prepare written report of the results of startup services.

3.05 ADJUSTING

- A. Adjust initial temperature and humidity set points.
- B. Set field-adjustable switches and circuit-breaker trip ranges as indicated.
- C. Occupancy Adjustments: When requested within 12 months from date of Substantial Completion, provide on-site assistance in adjusting system to suit actual occupied conditions. Provide up to two visits to Project during other-than-normal occupancy hours for this purpose.

3.06 DEMONSTRATION

- A. Train Owner's maintenance personnel to adjust, operate, and maintain units.

END OF SECTION 23 74 33

SECTION 23 82 19**FAN COIL UNITS****PART 1 - GENERAL****1.01 SUMMARY**

- A. Section includes fan coil units and accessories for Variable Refrigerant Flow (VRF) units.
- B. The variable capacity, heat pump heat recovery air conditioning system shall be equal to a Mitsubishi VRFZ (Variable Refrigerant Flow Zoning), which is the basis of design. Other manufacturers include Daikin, LG and Sanyo. If system configuration and other parameters are changed to meet equal manufacturer standards, changes to plans shall be the responsibility of the manufacturer and shall be submitted at the Action and Informational Submittal Phases for engineer and architect review.
- C. The system shall consist of a outdoor unit (CU-1 & CU-2 specified in Section 23 62 00), BC (Branch Circuit) Controller or controllers, multiple indoor units, and BACNET based (BTL Listed) DDC (Direct Digital Controls). Each indoor unit or group of indoor units shall be capable of operating in any mode independently of other indoor units or groups. System shall be capable of changing mode (cooling to heating, heating to cooling) with no interruption to system operation. To ensure owner comfort, each indoor unit or group of indoor units shall be independently controlled and capable of changing mode automatically when zone temperature strays 1.8 degrees F from set point for ten minutes. The sum of connected capacity of all indoor air handlers shall range from 50% to 150% of outdoor rated capacity.

1.02 ACTION SUBMITTALS

- A. Product Data: For each type of product.
- B. LEED Submittals:
 - 1. Product Data for Prerequisite IEQ 1: Documentation indicating that units comply with ASHRAE 62.1, Section 5 - "Systems and Equipment."
- C. Shop Drawings:
 - 1. Include details of equipment assemblies. Indicate dimensions, weights, loads, required clearances, method of field assembly, components, and location and size of each field connection.
 - 2. Include diagrams for power, signal, and control wiring.
- D. Samples: For units with factory-applied color finishes.

1.03 INFORMATIONAL SUBMITTALS

- A. Coordination Drawings: If system is of different manufacture than basis of design and layout or design is different than that shown on drawings, submit drawings showing unit layout, locations, branch controllers number and locations, refrigerant pipe routings and piping schematics, etc. This will include a revised drawing similar to Drawing M401.
- B. Seismic Qualification Certificates: For fan coil units, accessories, and components, from manufacturer.
- C. Field quality-control reports.
- D. Sample warranty.

1.04 CLOSEOUT SUBMITTALS

- A. Operation and maintenance data.

1.05 QUALITY ASSURANCE

- A. Comply with NFPA 70.
- B. ASHRAE Compliance: Applicable requirements in ASHRAE 62.1, Section 5 - "Systems and Equipment" and Section 7 - "Construction and Startup."
- C. ASHRAE/IES 90.1 Compliance: Applicable requirements in ASHRAE/IES 90.1, Section 6 - "Heating, Ventilating, and Air-Conditioning."
- D. The units shall be listed by Electrical Testing Laboratories (ETL) and bear the ETL label.
- E. All wiring shall be in accordance with the National Electrical Code (N.E.C.).
- F. The units shall be manufactured in a facility registered to ISO 9001 and ISO14001 which is a set of standards applying to environmental protection set by the International Standard Organization (ISO).
- G. All units must meet or exceed the 2010 Federal minimum efficiency requirements and the proposed ASHRAE 90.1 efficiency requirements for VRF systems. Efficiency shall be published in accordance with the DOE alternative test procedure, which is based on the Air-Conditioning, Heating, and Refrigeration Institute (AHRI) Standards 340/360, 1230 and ISO Standard 13256-1.
- H. A full charge of R-410A for the condensing unit only shall be provided in the condensing unit.

PART 2 - PRODUCTS**2.01 SYSTEM DESCRIPTION**

- A. Electrical Components, Devices, and Accessories: Listed and labeled as defined in NFPA 70, by a qualified testing agency, and marked for intended location and application.
- B. Factory-packaged and -tested units rated according to AHRI 440, ASHRAE 33, and UL 1995.

2.02 4-WAY CEILING-RECESSED CASSETTE WITH GRILLE

- A. This unit shall be a four-way cassette style indoor unit that recesses into the ceiling with a ceiling grille. The indoor unit shall be factory assembled, wired and run tested. Contained within the unit shall be all factory wiring, piping, electronic modulating linear expansion device, control circuit board and fan motor. The unit shall have a self-diagnostic function, 3-minute time delay mechanism, an auto restart function, an emergency operation function, a test run switch, and the ability to adjust airflow patterns for different ceiling heights. Indoor unit and refrigerant pipes shall be charged with dehydrated air before shipment from the factory.
- B. Unit Cabinet:
 - 1. The cabinet shall be space-saving ceiling-recessed cassette.
 - 2. The cabinet panel shall have provisions for a field installed filtered outside air intake.
 - 3. Branch ducting shall be allowed from cabinet.
 - 4. Four-way grille shall be fixed to bottom of cabinet allowing two, three or four-way blow.
 - 5. The grille vane angles shall be individually adjustable from the wired remote controller to customize the airflow pattern for the conditioned space
- C. Fan:
 - 1. The indoor fan shall be an assembly with a turbo fan direct driven by a single motor.
 - 2. The indoor fan shall be statically and dynamically balanced to run on a motor with permanently lubricated bearings.
 - 3. The indoor fan shall consist of five (5) speed settings, Low, Mid1, Mid2, High and Auto.
 - 4. The fan shall have a selectable Auto fan setting that will adjust the fan speed based on the difference between controller set-point and space temperature.
 - 5. The indoor unit shall have an adjustable air outlet system offering 4-way airflow, 3-way airflow, or 2-way airflow.
 - 6. The indoor unit shall have switches that can be set to provide optimum airflow based on ceiling height and number of outlets used.
 - 7. The indoor unit vanes shall have 5 fixed positions and a swing feature that shall be capable of automatically swinging the vanes up and down for uniform air distribution.

- D. The vanes shall have an Auto-Wave selectable option in the heating mode that shall randomly cycle the vanes up and down to evenly heat the space. Filter:
 - 1. Return air shall be filtered by means of a long-life washable filter
- E. Coil:
 - 1. The indoor coil shall be of nonferrous construction with smooth plate fins on copper tubing.
 - 2. The tubing shall have inner grooves for high efficiency heat exchange.
 - 3. All tube joints shall be brazed with phos-copper or silver alloy.
 - 4. The coils shall be pressure tested at the factory.
 - 5. A condensate pan and drain shall be provided under the coil.
 - 6. The unit shall be provided with an integral condensate lift mechanism that will be able to raise drain water 33 inches above the condensate pan.
 - 7. Both refrigerant lines to the PLFY indoor units shall be insulated.

2.03 4-WAY CEILING-RECESSED CASSETTE WITH GRILLE INDOOR UNIT

- A. General: This shall be a four-way cassette style indoor unit that recesses into the ceiling with a ceiling grille. The indoor unit shall be factory assembled, wired and run tested. Contained within the unit shall be all factory wiring, piping, electronic modulating linear expansion device, control circuit board and fan motor. The unit shall have a self-diagnostic function, 3-minute time delay mechanism, an auto restart function, an emergency operation function and a test run switch. Indoor unit and refrigerant pipes shall be charged with dehydrated air before shipment from the factory.
- B. Unit Cabinet:
 - 1. The cabinet shall be a compact 22-7/16" wide x 22-7/16" deep so it will fit within a standard 24" square suspended ceiling grid.
 - 2. The cabinet panel shall have provisions for a field installed filtered outside air intake.
 - 3. Four-way grille shall be fixed to bottom of cabinet allowing two, three or four-way blow.
- C. Fan:
 - 1. The indoor fan shall be an assembly with a turbo fan direct driven by a single motor.
 - 2. The indoor fan shall be statically and dynamically balanced to run on a motor with permanently lubricated bearings.
 - 3. The indoor fan shall consist of three (3) speeds, Low, Mid, and High.
 - 4. The indoor unit shall have an adjustable air outlet system offering 4-way airflow, 3-way airflow, or 2-way airflow.
 - 5. The auto air swing vanes shall be capable of automatically swinging up and down for uniform air distribution.
- D. Filter:
 - 1. Return air shall be filtered by means of a long-life washable filter.
- E. Coil:

1. The indoor coil shall be of nonferrous construction with smooth plate fins on copper tubing.
2. The tubing shall have inner grooves for high efficiency heat exchange.
3. All tube joints shall be brazed with phos-copper or silver alloy.
4. The coils shall be pressure tested at the factory.
5. A condensate pan and drain shall be provided under the coil.
6. The unit shall be provided with an integral condensate lift mechanism that will be able to raise drain water 19-3/4" inches above the condensate pan.
7. Both refrigerant lines to the PLFY indoor units shall be insulated.

2.04 1-WAY CEILING-RECESSED CASSETTE WITH GRILLE INDOOR UNIT

- A. General: This shall be a one-way cassette indoor unit that recesses into the ceiling with a ceiling grille and shall have a modulating linear expansion device. The indoor unit shall be factory assembled, wired and run tested. Contained within the unit shall be all factory wiring, piping, electronic modulating linear expansion device, control circuit board and fan motor. The unit shall have a self-diagnostic function, 3-minute time delay mechanism, an auto restart function, an emergency operation function and a test run switch. Indoor unit and refrigerant pipes shall be charged with dehydrated air before shipment from the factory.
- B. Unit Cabinet:
1. The cabinet shall be space-saving ceiling recessed.
 2. The cabinet panel shall have provisions for a field installed filtered outside air intake.
 3. Branch ducting shall be allowed from cabinet.
 4. The one-way grille shall be fixed to bottom of cabinet allowing for one-way airflow.
- C. Fan:
1. The indoor fan shall be an assembly with one line-flow fan direct driven by a single motor.
 2. The indoor fan shall be statically and dynamically balanced to run on a motor with permanently lubricated bearings.
 3. The indoor fan shall consist of four (4) speeds, Low, Mid1, Mid2, and High.
- D. Filter:
1. Return air shall be filtered by means of a long-life washable permanent filter.
- E. Coil:
1. The indoor coil shall be of nonferrous construction with smooth plate fins on copper tubing.
 2. The tubing shall have inner grooves for high efficiency heat exchange.
 3. All tube joints shall be brazed with phos-copper or silver alloy.
 4. The coils shall be pressure tested at the factory.
 5. A condensate pan and drain shall be provided under the coil.
 6. The unit shall be provided with an integral condensate lift mechanism able to raise drain water 23 inches above the condensate pan.

7. Both refrigerant lines to the PMFY indoor units shall be insulated.

2.05 CEILING-CONCEALED DUCTED INDOOR UNIT

- A. General: This shall be a ceiling-concealed ducted indoor fan coil design that mounts above the ceiling with a 2-position, field adjustable return and a fixed horizontal discharge supply and shall have a modulating linear expansion device. The PEFY shall be used with the R2-Series outdoor unit and BC Controller, Y-Series outdoor unit, or S-Series outdoor unit. The PEFY shall support individual control using M-NET DDC controllers.
- B. Indoor Unit: The indoor unit shall be factory assembled, wired and run tested. Contained within the unit shall be all factory wiring, piping, electronic modulating linear expansion device, control circuit board and fan motor. The unit shall have a self-diagnostic function, 3-minute time delay mechanism, and an auto restart function. Indoor unit and refrigerant pipes shall be charged with dehydrated air before shipment from the factory.
- C. Unit Cabinet:
 1. The unit shall be, ceiling-concealed, ducted.
 2. The cabinet panel shall have provisions for a field installed filtered outside air intake.
- D. Fan:
 1. Concealed ducted models shall feature external static pressure settings from 0.14 to 0.60 in. WG.
 2. The indoor unit fan shall be an assembly with one or two Sirocco fan(s) direct driven by a single motor.
 3. The indoor fan shall be statically and dynamically balanced and run on a motor with permanently lubricated bearings.
 4. The indoor fan shall consist of three (3) speeds, High, Mid, and Low plus the Auto-Fan function
 5. The indoor unit shall have a ducted air outlet system and ducted return air system.
- E. Filter:
 1. Return air shall be filtered by means of a standard factory installed return air filter.
 2. Optional return filter box (rear or bottom placement) with high-efficiency filter shall be available for all PEFY indoor units.
- F. Coil:
 1. The indoor coil shall be of nonferrous construction with smooth plate fins on copper tubing.
 2. The tubing shall have inner grooves for high efficiency heat exchange.
 3. All tube joints shall be brazed with phos-copper or silver alloy.
 4. The coils shall be pressure tested at the factory.
 5. A condensate pan and drain shall be provided under the coil.

6. The condensate shall be gravity drained from the fan coil.
 7. Both refrigerant lines to the PEFY indoor units shall be insulated.
- G. Electrical:
1. The unit electrical power shall be 208/230 volts, 1-phase, 60 hertz.
 2. The system shall be capable of satisfactory operation within voltage limits of 187-228 volts (208V/60Hz) or 207-253 volts (230V/60Hz).
- H. Controls:
1. This unit shall use controls provided by Mitsubishi Electric Cooling & Heating to perform functions necessary to operate the system. Please refer to Part 5 of this guide specification for details on controllers and other control options.
 2. Indoor unit shall compensate for the higher temperature sensed by the return air sensor compared to the temperature at level of the occupant when in HEAT mode. Disabling of compensation shall be possible for individual units to accommodate instances when compensation is not required.
 3. Control board shall include contacts for control of external heat source. External heat may be energized as second stage with 1.8°F – 9.0°F adjustable deadband from set point.
 4. Indoor unit shall include no less than four (4) digital inputs capable of being used for customizable control strategies.
 5. Indoor unit shall include no less than three (3) digital outputs capable of being used for customizable control strategies.
- I. Capacities and Characteristics: as scheduled on drawings.

PART 3 - EXECUTION

3.01 INSTALLATION

- A. Install fan coil units level and plumb.
- B. Install fan coil units to comply with NFPA 90A.
- C. Suspend fan coil VRF units from structure with elastomeric hangers.
- D. Verify locations of thermostats, humidistats, and other exposed control sensors with Drawings and room details before installation. Install devices **48 inches (1220 mm)** above finished floor.
- E. Install new filters in each fan coil unit within two weeks after Substantial Completion.
- F. Piping installation requirements are specified in other Sections. Drawings indicate general arrangement of piping, fittings, and specialties. Specific connection requirements are as follows:
 1. Install piping adjacent to machine to allow service and maintenance.
 2. Connect piping to fan coil unit factory DX piping package. Install piping package if shipped loose.

3. Connect ductwork to concealed units as required by MFR.
4. Connect condensate drain to indirect waste.
 - a. Install condensate trap of adequate depth to seal against fan pressure. Install cleanouts in piping at changes of direction.
- G. Ground equipment according to Section 26 05 26 "Grounding and Bonding for Electrical Systems."
- H. Connect wiring according to Section 26 05 19 "Low-Voltage Electrical Power Conductors and Cables."

3.02 FIELD QUALITY CONTROL

- A. Perform the following tests and inspections[with the assistance of a factory-authorized service representative]:
 1. Operational Test: After electrical circuitry has been energized, start units to confirm proper motor rotation and unit operation.
 2. Test and adjust controls and safety devices. Replace damaged and malfunctioning controls and equipment.
- B. Remove and replace malfunctioning units and retest as specified above.
- C. Prepare test and inspection reports.

3.03 ADJUSTING

- A. Adjust initial temperature and humidity set points.
- B. Occupancy Adjustments: When requested within 12 months of date of Substantial Completion, provide on-site assistance in adjusting system to suit actual occupied conditions.

END OF SECTION 23 82 19

SECTION 26 05 00.13**SYSTEMWIDE ELECTRICAL GENERAL REQUIREMENTS FOR SYSTEMS****PART 1 - GENERAL****1.1 SUMMARY**

- A. This Section covers general electrical requirements for furnishing and installation of embedded and exposed raceways, junction boxes, manholes, handholes, and ductbanks. This Work includes, but is not limited to, the following:
1. The installation of a mainline ductbank system located 24 inches from finished grade under the centerline of the track-slab. The configuration will consist of two-four inch schedule 40 polyvinyl chloride (PVC) and one multi-cell raceway with four-1 1/2" schedule 40 PVC conduits embedded in sand or Controlled Density Fill (CDF).
 2. The continuation of the mainline ductbank system across the Main Street Viaduct and Delaware bridge structures using three four inch FRE raceways attached to the bridge structure.
 3. The continuation of the mainline ductbank system across the I-670 bridge structure using three four inch PVC conduits embedded in the east sidewalk of the bridge.
 4. Embedded and exposed lateral raceways for Traction Electrification, Signal and Communication Systems located along and near the track alignment and station platforms.
 5. Embedded lateral raceway from platform communication handhole to future TVM location, and station marker.
 6. Embedded lateral raceway from platform communication handhole to shelter column for all platforms with shelters
 7. Embedded Signal/Communication manholes along the alignment located between track rails in the track-slab.
 8. Signal/Communication and Traction Electrification manholes along the alignment not in the track-slab.
 9. Testing of all systems that are installed under this Contract.

1.2 RELATED SECTIONS

- A. SECTION 01 33 00 – Submittal Procedures
- B. SECTION 01 78 39 – Project Record Documents

1.3 REFERENCES AND STANDARDS

- A. The Contractor shall comply with applicable standards as specified within these documents:
1. American National Standards Institute (ANSI)
 - a. ANSI/IEEE C2 National Electrical Safety Code

2. National Fire Protection Association (NFPA)
 - a. NFPA 70 National Electrical Code (NEC)
 - b. NFPA 101 Life Safety Code
3. National Electrical Manufacturers Association (NEMA)
 - a. NEMA 250 Enclosures for Electrical Equipment (1000 V Maximum)
 - b. NEMA KS1 Enclosed and Miscellaneous Distribution Equipment Switches (600 V Maximum)
 - c. NEMA WD1 General Color Requirements for Wiring Devices
4. Institute of Electrical and Electronics Engineers (IEEE)
5. National Electrical Contractors Association (NECA) Standard of Installation
6. National Electrical Testing Association (NETA)
7. Underwriters Laboratories (UL)
8. Insulated Cable Engineers Association (ICEA)
9. The Occupational Safety and Health Act (OSHA)
10. Standard for Fixed Guideway Transit and Passenger Rail Systems (NFPA-130)
11. International Building Code (IBC)
12. National, State and Local Construction Codes
13. National, State and Local Laws and Ordinances
14. Local Utility Requirements

1.4 QUALITY ASSURANCE

- A. Quality assurance planning, implementation and reporting shall be in conformance with Contract Documents.

1.5 SUBMITTALS

- A. SECTION 01 33 00 – Submittal Procedures..
- B. Items required to be submitted by the Contractor for Approval include, but are not limited to, the following:
 1. As-Built Drawings
 2. Shop drawings for the following equipment:
 - a. Manholes, Handholes, Frames and Covers
 - b. Raceways
 - c. Junction Boxes

3. Mandrel Log
 4. The Contractor shall submit the manufacturer's name, product designation and catalog numbers for testing equipment including calibration certification expiration date.
- C. Prior to submittal and at the engineer's discretion, all shop drawings shall be checked for accuracy and Contract requirements. Shop drawings shall bear the date checked. In addition, each shop drawing submitted shall include a copy of the applicable sections, with addendum updates included, with each paragraph check-marked to indicated specification compliance or marked to indicate requested deviations from specification requirements. Check marks shall denote full compliance with a paragraph as a whole. If deviations from the specifications are indicated and upon request shall be submitted with each deviation underlined and denoted by a number in the margin to the right of the identified paragraph. The remaining portions of paragraph not underlined will signify compliance with the specifications. The submittal shall be accompanied by detailed written justification for each deviation. Failure to include a copy of the marked-up specification sections along with justifications for any requested deviations to the specification requirements with the submittal shall be sufficient cause for rejection of the entire submittal with no further consideration.
- D. Shop Drawings - Submit shop drawings showing equipment layouts and fabricated work being provided under these Specifications. Submit such drawings before rough-in work, fabrication, and within ample time to prevent delays in the Work. Include electrical diagrams for equipment and equipment installation.

1.6 GENERAL REQUIREMENTS

- A. Wherever the requirements of these Contract Documents exceed those of the governing codes and regulations, the requirements of these Contract Documents shall govern. Nothing in these Contract Documents shall be construed as relieving the Contractor from complying with any requirements of governing codes or regulations.
- B. All conflicts occurring between codes, regulations, and these Contract Documents will be resolved by the Engineer.
- C. Inspection
1. All materials, equipment, and workmanship are subject to inspection at any time by the Engineer. Any Work, materials or equipment not in accordance with the Contract or found to be deficient or defective shall be corrected by the Contractor at no additional cost to KCMO.
- D. Listing and Labeling
1. Electrical equipment and material shall be listed and labeled by organizations such as UL, which are acceptable to the authority having jurisdiction.

1.7 DEFINITIONS

- A. The following definitions shall apply:
1. "Furnish" means supply and delivery to the work site or location where material is to be installed.
 2. "Install" means build into the Work, complete and ready for use intended.
 3. "Provide" means furnish and install complete and ready for use intended.

4. "Contract Drawings" means drawings included in Contract Documents.
5. "Contract Specifications" means Specifications included in Contract Documents.

1.8 LICENSING AND CERTIFICATION REQUIREMENTS

- A. All Electrical Work installed shall be performed by licensed Electricians as applicable by State, county, or city law.

1.9 CONTRACT DRAWINGS AND CONTRACT DOCUMENTS

- A. Intent of Contract Drawings
 1. Verify all dimensions before proceeding with the Work.
 2. The electrical Contract Drawings do not indicate all fittings, hardware or appurtenances required for a complete operating installation.
 3. One-line and riser diagrams are schematic and do not show physical arrangement of equipment.
 4. Layout plans are diagrammatic, i.e. the location of the devices, ducts, and raceways are approximate. Contractor shall make minor field adjustment not deviating from codes, standards and typical details provided in the Contract Drawings. Prior to making any significant changes, the Contractor shall obtain Approval from the Engineer.
- B. Departures from Contract Documents
 1. Departures from the Contract Documents include any deviations from Contract Drawings, Contract Specifications, Contract Provisions, or General Provisions of the Contract.
 2. Departures from the Contract Documents shall not be made without a statement of "no objection" from the Engineer.
 3. Proposed departures shall be submitted to the Engineer in accordance with the procedures outlined under Contract Provisions, Change Orders in the Work, and General Provisions, Change Order Procedures.

1.10 PRODUCT SELECTION

- A. For products specified by referenced standards only, select any product meeting the referenced standards, by any manufacturer. Provide documentation with submittals demonstrating that the product meets the requirements of the referenced standards.
- B. For products specified by one or more manufacturer's name(s), whether or not followed by the words "or equal", select the specified product by one of the listed manufacturers, or submit a substitution request for any product or manufacturer not specifically named.

1.11 DELIVERY, STORAGE AND HANDLING

- A. Delivery, storage, and handling shall be carried out in accordance with the Contract Requirements.
- B. All material shall be delivered to the site in the manufacturers' original packing, except less than carton quantities may be repacked in other containers by the Contractor or the Contractor's suppliers.
- C. All material shall be stored in an environment recommended by the manufacturer of that product and in accordance with any additional requirements specified herein.

- D. All material shall be handled as recommended by the manufacturer of the product and in accordance with any additional requirements specified herein.
- E. Protection during construction
 - 1. Throughout this Contract, provide protection for materials and equipment against loss or damage.
 - 2. Protect materials and equipment from the effects of weather. Prior to installation, store items in clean, indoor and dry location. Items subject to corrosion under damp conditions and items containing insulation such as conductors shall be stored in a clean, indoor, heated and dry location.
 - 3. Following installation, protect materials and equipment from corrosion, dust, dirt, physical damage and the effects of moisture. Energize any space heaters in equipment or provide temporary heat. Cap raceway runs with manufactured seals. Keep openings in boxes or equipment closed during construction.

1.12 CODES, INSPECTIONS AND FEES

- A. The Contractor shall obtain all necessary permits, inspections, certificates of acceptance, certificates of occupancy, etc. Contractor shall pay all fees related to these items. Contractor shall submit to the authority having jurisdiction the necessary drawings in the size and quantity as required by the authority having jurisdiction. These permits, inspections, and certificates shall cover all aspects of the electrical system. The permits, inspections and certificates shall be obtained by contractor from the appropriate authority having jurisdiction including, but not limited to, building departments, inspection authorities, plan review examiners, fire marshals, insurers, etc
- B. The Contractor shall obtain required inspection stickers indicating installation suitability from the local authority having jurisdiction. Install as directed by authority having jurisdiction.

1.13 AS-BUILT DRAWINGS

- A. The Contractor shall maintain and keep current a set of project records and as-built Contract Drawings. In accordance with SECTION 01 78 39 – Project Record Documents, as-built drawings are to be submitted for Approval before project close-out.

PART 2 - PRODUCTS

2.1 GENERAL

- A. All material and products shall be new and unused.
- B. Provide materials and equipment that will fit within the space provided.
- C. Electrical equipment and material shall be listed and labeled by a nationally recognized electrical testing laboratory acceptable to the authority having jurisdiction.
- D. Where two or more units of the same class of material or equipment are required, provide products of a single manufacturer. Incidental component parts of equipment are not required to be the products of the same manufacturer.
- E. Provide materials and equipment that are standard products of manufacturers regularly engaged in the production of such material and equipment. Provide the manufacturer's latest standard design that conforms to these Specifications.

- F. Where the finish of equipment or material is referenced or stated, provide the finish exactly as shown or specified. Where no finish or color is listed, provide the manufacturer's standard finish, suitable for the environment intended.
- G. Material and equipment shall be designed to ensure satisfactory operation and operational life in the environmental conditions which will prevail where the material or equipment is installed.

PART 3 - EXECUTION

3.1 GENERAL

- A. The work under DIVISION 26 SYSTEMWIDE ELECTRICAL shall be performed in accordance with the NEC, local codes and regulations, manufacturers' recommendations and in accordance with these Specifications.
- B. The Engineer reserves the right to require minor changes in location of raceways without incurring any additional costs or charges to KCMO.
- C. Install Work using procedures defined in NECA Standard of Installation.
- D. Coordinate the Work of this Section with the other Sections of Division 26 as required to provide a complete and operable electrical installation.
- E. Coordinate also with the Sections for Signals, which require electrical equipment and services as part of the signal installation.
- F. Coordinate with work completed or in progress or to be performed under other Sections of these Specifications or by other contractors. Make indicated connections to previously completed work. Where future connections to or extensions of the work are indicated, provide safe and convenient provisions for such future connections and extensions.

3.2 TESTING

- A. Perform testing for all systems furnished under Division 26 as specified in each Section.

PART 4 - MEASUREMENT AND PAYMENT

4.1 MEASUREMENT

- A. The quantities of accepted work will be measured in the following units. All measurements will be plan measure except for authorized changes.
 - 1. Description: Lump Sum

4.2 PAYMENT

- A. Payment will be made at the respective unit or lump-sum price listed in the proposal and shall be full compensation for all labor, materials, and equipment necessary to complete the respective unit in place. There will be no separate measurement or payment for any item of work not specifically identified and listed in the proposal, and all such work shall be considered a subsidiary item with all costs pertaining thereto included in the prices for other items listed in the proposal. At the Engineer's option, partial payment may be made for any lump sum item listed in the proposal, providing that the Contractor is diligently and satisfactorily pursuing full completion of such partially complete item in accordance with the approved job progress schedule.

END OF SECTION

SECTION 26 05 19.13**SYSTEMWIDE ELECTRICAL LOW-VOLTAGE ELECTRICAL POWER CONDUCTORS AND CABLES FOR SYSTEMS****PART 1 - GENERAL****1.1 SUMMARY**

- A. This Work includes providing wire and cable rated 600 Volts, and associated splices and terminations for electrical systems.

1.2 RELATED SECTIONS

- A. SECTION 01 43 00 – Systems Quality Assurance
- B. SECTION 26 05 00.13 – Systemwide Electrical General Requirements for Systems
- C. SECTION 26 08 10 – Systemwide Electrical Testing for Systems

1.3 REFERENCES AND STANDARDS

- A. National Electrical Manufacturer's Association (NEMA)
 - 1. NEMA WC 70 Nonshielded 0-2kv Cables
- B. National Fire Protection Association (NFPA)
 - 1. NFPA 70 National Electrical Code (NEC)
- C. Underwriters Laboratory (UL)
 - 1. UL 493 Thermoplastic-Insulated Underground Feeder and Branch-Circuit Cables
- D. National Electrical Contractors Association (NECA)
 - 1. NECA 1 Standard Practices for Good Workmanship in Electrical Contracting

1.4 QUALITY ASSURANCE/QUALITY CONTROL

- A. Quality Assurance/Quality Control shall be carried out in accordance with the requirements of SECTION 01 43 00 – Systems Quality Assurance.

1.5 SUBMITTALS

- A. Submittals shall be made in accordance with the requirements of SECTION 26 05 00.13 – Systemwide Electrical General Requirements for Systems, except as modified herein.
- B. Items required to be submitted by the Contractor for Approval include, but are not limited to, the following:
 - 1. Product data on each type of wire and cable, including:
 - a. Manufacturer of the wire and cable
 - b. Number and size of strands composing each conductor

- c. Conductor insulation composition and thickness
 - d. Average overall diameter of finished wire and cable
 - e. Conductor ampacity at 60 degrees Celsius ambient for three current-carrying conductors in raceway or cable
 - f. Shield material (if any) and thickness
2. Product data on splicing and termination materials
 3. Field quality control test reports

1.6 DELIVERY, STORAGE AND HANDLING

- A. Ship each unit securely wrapped, packaged, and labeled for safe handling in shipment and to avoid damage.
- B. Store wire and cable in secure and dry storage facility, in accordance with NECA 1

PART 2 - PRODUCTS

2.1 GENERAL REQUIREMENTS

- A. All conductors shall be stranded. Size and type of insulation shall be as indicated.
- B. Minimum size – No. 12 AWG unless otherwise indicated.
- C. Wire and cable markings shall be in accordance with applicable NEMA and NEC requirements.

2.2 600 VOLT WIRE AND CABLE

- A. Subject to compliance with requirements, provide products by one of the following or approved equal:
 1. American Insulated Wire Corp; a Leviton Company
 2. General Cable Corporation
 3. Senator Wire and Cable Company
 4. Southwire Company
- B. All conductors shall be 99% conductivity copper with insulation rated 90 degrees Celsius, wet or dry.
- C. All wire and cable, including grounding conductors, shall have type XHHW-2 insulation, unless otherwise shown.
- D. Type USE (Underground Service Entrance) cable shall be in accordance to UL 493.

2.3 600 VOLT TERMINATIONS

- A. Terminations No. 8 and larger shall use tin or silver plated copper compression type lugs with NEMA bolt hole patterns as manufactured by Thomas and Betts, Burndy, or approved equal. Aluminum or aluminum alloy terminals shall not be used.

PART 3 - EXECUTION**3.1 GENERAL INSTALLATION REQUIREMENTS**

- A. Provide and install conductors of the sizes and types shown.
- B. Inspect all wire and cable for damage prior to installation. Damaged cable shall not be installed.

3.2 600 VOLT TERMINATIONS

- A. Soldering of conductors is not permitted.

3.3 COLOR CODING

- A. All wiring shall be color coded.
- B. 208Y/120V or 120/240V systems shall be A-phase black, B-phase red, C-phase blue, neutral white, and ground green.
- C. 277V/480V systems shall be A-phase brown, B-phase orange, C-phase yellow, neutral grey, and ground green.

3.4 TESTS

- A. Tests shall be performed in accordance with SECTION 26 08 10 – Systemwide Electrical Testing For Systems.

PART 4 - MEASUREMENT AND PAYMENT**4.1 MEASUREMENT**

- A. The quantities of accepted work will be measured in the following units. All measurements will be plan measure except for authorized changes.
 - 1. Description: Lump Sum

4.2 PAYMENT

- A. Payment will be made at the respective unit or lump-sum price listed in the proposal and shall be full compensation for all labor, materials, and equipment necessary to complete the respective unit in place. There will be no separate measurement or payment for any item of work not specifically identified and listed in the proposal, and all such work shall be considered a subsidiary item with all costs pertaining thereto included in the prices for other items listed in the proposal. At the Engineer's option, partial payment may be made for any lump sum item listed in the proposal, providing that the Contractor is diligently and satisfactorily pursuing full completion of such partially complete item in accordance with the approved job progress schedule.

END OF SECTION

THIS PAGE INTENTIONALLY LEFT BLANK

SECTION 26 05 19**LOW-VOLTAGE ELECTRICAL POWER CONDUCTORS AND CABLES****PART 1 - GENERAL****1.01 SUMMARY**

- A. This Section includes the following:
 - 1. Building wires and cables rated 600 V and less.
 - 2. Connectors, splices, and terminations rated 600 V and less.

1.02 ACTION SUBMITTALS

- A. Product Data: For each type of product indicated.

1.03 INFORMATIONAL SUBMITTALS

- A. Field quality-control test reports.

1.04 QUALITY ASSURANCE

- A. Electrical Components, Devices, and Accessories: Listed and labeled as defined in NFPA 70, Article 100, by a testing agency acceptable to authorities having jurisdiction, and marked for intended use.
- B. Comply with NFPA 70.

PART 2 - PRODUCTS**2.01 CONDUCTORS AND CABLES**

- A. Copper Conductors: Comply with NEMA WC 70.
- B. Conductor Insulation: Comply with NEMA WC 70 for Types THHN-THWN.
- C. Multiconductor Cable: Comply with NEMA WC 70 for nonmetallic-sheathed cable, Type NM with ground wire.

2.02 CONNECTORS AND SPLICES

- A. Available Manufacturers: Subject to compliance with requirements, manufacturers offering products that may be incorporated into the Work include, but are not limited to, the following:
1. AFC Cable Systems, Inc.
 2. Hubbell Power Systems, Inc.
 3. O-Z/Gedney; EGS Electrical Group LLC.
 4. 3M; Electrical Products Division.
 5. Tyco Electronics Corp.
- B. Description: Factory-fabricated connectors and splices of size, ampacity rating, material, type, and class for application and service indicated.

PART 3 - EXECUTION

3.01 CONDUCTOR MATERIAL APPLICATIONS

- A. Feeders: Copper. Solid for No. 10 AWG and smaller; stranded for No. 8 AWG and larger.
- B. Branch Circuits: Copper. Solid for No. 10 AWG and smaller; stranded for No. 8 AWG and larger.

3.02 CONDUCTOR INSULATION AND MULTICONDUCTOR CABLE APPLICATIONS AND WIRING METHODS

- A. Service Entrance: Type THHN-THWN, single conductors in raceway.
- B. Exposed Feeders: Type THHN-THWN, single conductors in raceway.
- C. Feeders Concealed in Ceilings, Walls, Partitions, and Crawlspace: Type THHN-THWN, single conductors in raceway.
- D. Feeders Below Slabs-on-Grade, and Underground: Type THHN-THWN, single conductors in raceway.
- E. Exposed Branch Circuits, Including in Crawlspace: Type THHN-THWN, single conductors in raceway.
- F. Branch Circuits Concealed in Ceilings, Walls, and Partitions: Type THHN-THWN, single conductors in raceway.
- G. Branch Circuits Concealed Below Slabs-on-Grade, and Underground: Type THHN-THWN, single conductors in raceway.
- H. Cord Drops and Portable Appliance Connections: Type SO, hard service cord with stainless-steel, wire-mesh, strain relief device at terminations to suit application.

- I. Class 1 Control Circuits: Type THHN-THWN, in raceway.
- J. Class 2 Control Circuits: Type THHN-THWN, in raceway.

3.03 INSTALLATION OF CONDUCTORS AND CABLES

- A. Conceal cables in finished walls, ceilings, and floors, unless otherwise indicated.
- B. Use manufacturer-approved pulling compound or lubricant where necessary; compound used must not deteriorate conductor or insulation. Do not exceed manufacturer's recommended maximum pulling tensions and sidewall pressure values.
- C. Use pulling means, including fish tape, cable, rope, and basket-weave wire/cable grips, that will not damage cables or raceway.
- D. Install exposed cables parallel and perpendicular to surfaces of exposed structural members, and follow surface contours where possible.
- E. Support cables according to Division 26 Sections "Hangers and Supports for Electrical Systems."
- F. Identify and color-code conductors and cables according to Division 26 Section "Identification for Electrical Systems."
- G. Tighten electrical connectors and terminals according to manufacturer's published torque-tightening values. If manufacturer's torque values are not indicated, use those specified in UL 486A and UL 486B.
- H. Make splices and taps that are compatible with conductor material and that possess equivalent or better mechanical strength and insulation ratings than unspliced conductors.
- I. Wiring at Outlets: Install conductor at each outlet, with at least 6 inches of slack.

3.04 SLEEVE AND SLEEVE-SEAL INSTALLATION FOR ELECTRICAL PENETRATIONS

- A. Install sleeves and sleeve seals at penetrations of exterior floor and wall assemblies. Comply with requirements in Division 26 Section "Sleeves and Sleeve Seals for Electrical Raceways and Cabling."

3.05 FIELD QUALITY CONTROL

- A. Perform tests and inspections and prepare test reports.
- B. Tests and Inspections:
 - 1. Perform each visual and mechanical inspection and electrical test stated in NETA Acceptance Testing Specification. Certify compliance with test parameters.

- C. Test Reports: Prepare a typed report to record the following:
1. Test procedures used.
 2. Test results that comply with requirements.
 3. Test results that do not comply with requirements and corrective action taken to achieve compliance with requirements.
- D. Remove and replace malfunctioning units and retest as specified above.
- E. Provide a copy of the Meg readings of all electrical cables to design professional for review and comment. If any current leakage is found from the Meg reading, it must be corrected.

END OF SECTION 26 05 19

SECTION 26 05 26.13**SYSTEMWIDE ELECTRICAL GROUNDING FOR SYSTEMS****PART 1 - GENERAL****1.1 SUMMARY**

- A. This Work includes providing ground cables and wires, bonding wires and cables, ground rods, exothermic welds, ground lugs and fittings for all manholes as required by the National Electrical Code (NEC), these Specifications, and the Drawings. Grounding requirements for Overhead Contact System (OCS) poles, and signal houses shall be found in their respective Systems Specifications. Fence and gate grounding shall be found in the Civil Design Drawings.

1.2 RELATED SECTIONS

- A. SECTION 26 05 00.13 – Systemwide Electrical General Requirements for Systems

1.3 REFERENCES AND STANDARDS

- A. American Society for Testing and Material (ASTM)
 - 1. ASTM B3 Specifications for Soft or Annealed Copper Wire
 - 2. ASTM B187 Copper Bus Bar, Rod and Shapes
- B. National Fire Protection Association (NFPA)
 - 1. NFPA 70 National Electrical Code (NEC)

1.4 QUALITY ASSURANCE/QUALITY CONTROL

- A. Quality Assurance/Quality Control shall be in accordance with the requirements of the Special Conditions.

1.5 SUBMITTALS

- A. The Contractor shall submit test reports in conformance with SECTION 26 05 00.13 – Systemwide Electrical General Requirements for Systems, and the Contract requirements.
- B. Items required to be submitted by the Contractor for Approval include, but are not limited to the following:
 - 1. Product data on exothermic welding process, materials and molds
 - 2. Product data on grounding and bonding conductors
 - a. Product data on connectors, bushings and fittings
 - b. Product data on ground rods
- C. Provide test reports in accordance with the requirements of SECTION 26 05 00.13 – Systemwide Electrical General Requirements for Systems.
- D. Shop Drawings: Where grounding system is not detailed on the Contract Drawings, submit shop drawings showing locations of ground rods and grounding connections.. Drawings shall also indicate locations of test points to measure grounding resistance.

1.6 AS-BUILT DRAWINGS

- A. As-built drawings of all grounding systems as actually installed under this Contract shall be provided in accordance with SECTION 26 05 00.13 – Systemwide Electrical General Requirements for Systems.

1.7 DELIVERY, STORAGE AND HANDLING

- A. Ship each item of equipment and materials securely wrapped, packaged, and labeled for safe handling in shipment and to avoid damage.
- B. Store equipment and materials in secure and dry storage facility in accordance of SECTION 26 05 00.13 – Systemwide Electrical General Requirements for Systems.

PART 2 - PRODUCTS**2.1 BASIC GROUNDING MATERIALS**

- A. Bare conductors shall be “Class B” stranded, annealed copper, and conform to ASTM B3. Provide the size shown on the Contract Drawings. Aluminum conductors shall not be used.
- B. Single insulated conductors shall conform to the requirements of the NEC for 600 Volt insulated conductors. Provide green insulation for conductors No. 2 AWG or smaller and black insulation with ends green taped for larger sizes.
- C. Ground rods shall be steel with copper-cladding applied by the molten weld casting process. Use 3/4-inch diameter by 10 foot long rods with 10 mils minimum copper thickness except where otherwise indicated.
- D. Bus bar shall conform to ASTM B187, 99% conductivity copper, size as shown on the Contract Drawings.
- E. Lugs shall be suitable for attaching a ground conductor to equipment or metallic surfaces, and shall be NEMA two-hole, compression type, tin or silver plated copper, hydraulic tool applied, as manufactured by Thomas and Betts, Burndy, or approved equal.
- F. Bolts and miscellaneous hardware for grounding shall be silicon bronze or stainless steel.
- G. Jumpers shall be tin-plated copper, braided and flexible.
- H. Compression connectors for grounding in above ground dry locations, shall be Burndy YG Series, or approved equal.
- I. Mechanical connectors for grounding above ground in dry locations, and for attachment to equipment, boxes, or finished electrical products, shall be Burndy GB, GC, or approved equal.
- J. Connection to fence post above ground shall be Burndy GD or approved equal.

2.2 EXOTHERMIC WELDING PROCESS

- A. Exothermic welding process shall consist of a system of standard manufactured molds for each type of weld to be made and powdered metals, which are placed in the mold along with the conductors to be welded. Ignition of the powder shall produce molten copper which welds the conductors to each other and to a surface, as the case may be. Exothermic materials and products shall be Cadweld as manufactured by ERICO Products, Inc., Thermoweld, or approved equal.

PART 3 - EXECUTION**3.1 GENERAL GROUNDING REQUIREMENTS**

- A. Provide all grounding as specified and shown in the Contract Documents.
- B. Unless otherwise indicated, all underground grounding connections shall be by exothermic welding. Unless otherwise indicated, all connections located outdoors, or above ground in damp, or wet locations shall be by exothermic welding. Grounding connections shall not be soldered. Compression type grounding will be allowed only in station platforms upon Engineer's approval.
- C. Grounding conductors shall be protected from physical and environmental damage. Wherever possible, grounding electrode and bonding conductors shall be enclosed in a non-metallic raceway. Exposed conductors which must extend from a concrete surface shall be located as close as possible to a corner. Where conductors are required to be exposed, as in the connection to the main ground bus, grounding conductors shall be supported by corrosion resistant metallic hardware at 4-foot intervals or less.
- D. Oxide inhibiting compound shall be used for all mechanical connections where copper to aluminum or copper to steel connections are made. The compound shall be applied to all copper, aluminum, and steel parts. In addition, all aluminum contact surfaces shall be abraded after application of the inhibiting compound, and before attachment of the bolted connection.
- E. All metallic objects within 15 feet of the centerline of nearest rail and outside the platform boundaries shall be grounded and the ground resistance shall not exceed 25 Ohms.

3.2 RACEWAY GROUNDING

- A. All metallic raceway systems shall be bonded together to provide a continuous electrical ground path. Metallic raceways shall be bonded to other raceway components using insulated grounding bushings. Grounding bushings shall be connected to the grounding system using conductors sized in compliance with the NEC and as otherwise shown.

3.3 GROUND RODS

- A. Provide and install ground rods where shown on the Contract Documents. Connect the grounding conductor to each ground rod using exothermic welds.
- B. Bury ground rods vertically with rod top a minimum of 2 feet below grade. If extensive rock formation is encountered, the Contractor shall inform the Engineer and relocate ground rods, or provide supplemental ground rods as directed by the Engineer. If in bedrock, drill a 6-inch diameter hole for each ground rod, pack with clay and install the ground rod.
- C. Ground rods shall be installed in undisturbed earth.
- D. Install supplemental ground rods only as needed in addition to the grounding system as shown or specified, to make the grounding system conform to the required test results.

3.4 EXOTHERMIC WELDING

- A. The surface to be welded shall be clean and dry. Wire brush or file the point of contact to a clean bare metal surface.
- B. Use welding cartridges and molds for the type of weld shown on the Contract Documents, and perform welding in accordance with the manufacturer's recommendations. Worn or damaged molds shall not be used.

- C. After welds have been completed and cooled, brush slag from the weld area and thoroughly clean the joint.
- D. Where exothermic grounding connections made between copper wire and steel surfaces are directly buried, coat the connection with a coal tar epoxy coating per manufacturers recommendations before backfilling. Also coat the entire area of the steel surface disturbed by the exothermic welding.
- E. Unless otherwise indicated, use exothermic welding for all underground cable to cable splices, tees, crosses, etc and all cable connections to ground rods, ground rod splices, cable to steel and cast iron, and underground cable lug terminations.
- F. Test all welds by striking with a 2-pound steel hammer. Replace any defective weld and molds.
- G. Where exothermic welds are made to a galvanized surface, remove the galvanizing using a grinding wheel to expose a clean surface. After welding, touch up the steel surface with zinc rich primer.
- H. Exposed exothermic welds associated with the OCS grounding conductor on the bridges shall be wrapped with 2kV insulating tape.

3.5 INSPECTION AND TESTS

- A. Perform grounding tests of the completed ground system.
- B. Notify the Engineer prior to backfilling or pouring concrete over grounding connections, a ground mat, or a grounding system. Place no backfill or concrete until inspection and Approval by the Engineer.
- C. Test the continuity and resistance prior to backfilling or pouring concrete.
- D. Test the grounding and bonding continuity of each equipment and device installed.

PART 4 - MEASUREMENT AND PAYMENT

4.1 MEASUREMENT

- A. The quantities of accepted work will be measured in the following units. All measurements will be plan measure except for authorized changes.

1. Description: Lump Sum

4.2 PAYMENT

- A. Payment will be made at the respective unit or lump-sum price listed in the proposal and shall be full compensation for all labor, materials, and equipment necessary to complete the respective unit in place. There will be no separate measurement or payment for any item of work not specifically identified and listed in the proposal, and all such work shall be considered a subsidiary item with all costs pertaining thereto included in the prices for other items listed in the proposal. At the Engineer's option, partial payment may be made for any lump sum item listed in the proposal, providing that the Contractor is diligently and satisfactorily pursuing full completion of such partially complete item in accordance with the approved job progress schedule.

END OF SECTION

SECTION 26 05 26**GROUNDING AND BONDING FOR ELECTRICAL SYSTEMS**

PART 1 - GENERAL

1.01 SUMMARY

- A. Section Includes: Grounding systems and equipment.

1.02 ACTION SUBMITTALS

- A. Product Data: For each type of product indicated.

1.03 INFORMATIONAL SUBMITTALS

- A. Field quality-control reports.

1.04 QUALITY ASSURANCE

- A. Electrical Components, Devices, and Accessories: Listed and labeled as defined in NFPA 70, by a qualified testing agency, and marked for intended location and application.
- B. Comply with UL 467 for grounding and bonding materials and equipment.

PART 2 - PRODUCTS

2.01 CONDUCTORS

- A. Insulated Conductors: Copper wire or cable insulated for 600 V unless otherwise required by applicable Code or authorities having jurisdiction.
- B. Bare Copper Conductors:
 - 1. Solid Conductors: ASTM B 3.
 - 2. Stranded Conductors: ASTM B 8.
 - 3. Bonding Cable: 28 kcmil, 14 strands of No. 17 AWG conductor, 1/4 inch in diameter.
 - 4. Bonding Conductor: No. 4 or No. 6 AWG, stranded conductor.
 - 5. Bonding Jumper: Copper tape, braided conductors terminated with copper ferrules; 1-5/8 inches wide and 1/16 inch thick.
 - 6. Tinned Bonding Jumper: Tinned-copper tape, braided conductors terminated with copper ferrules; 1-5/8 inches wide and 1/16 inch thick.

2.02 CONNECTORS

- A. Listed and labeled by an NRTL acceptable to authorities having jurisdiction for applications in which used and for specific types, sizes, and combinations of conductors and other items connected.
- B. Bolted Connectors for Conductors and Pipes: Copper or copper alloy, pressure type with at least two bolts.
 - 1. Pipe Connectors: Clamp type, sized for pipe.
- C. Welded Connectors: Exothermic-welding kits of types recommended by kit manufacturer for materials being joined and installation conditions.

2.03 GROUNDING ELECTRODES

- A. Ground Rods: Copper-clad steel; 3/4 inch by 10 feet in diameter.

PART 3 - EXECUTION

3.01 APPLICATIONS

- A. Conductors: Install solid conductor for No. 8 AWG and smaller, and stranded conductors for No. 6 AWG and larger unless otherwise indicated.
- B. Underground Grounding Conductors: Install bare copper conductor, No. 2/0 AWG minimum. Bury at least 24 inches below grade.
- C. Isolated Grounding Conductors: Green-colored insulation with continuous yellow stripe. On feeders with isolated ground, identify grounding conductor where visible to normal inspection, with alternating bands of green and yellow tape, with at least three bands of green and two bands of yellow.
- D. Conductor Terminations and Connections:
 - 1. Pipe and Equipment Grounding Conductor Terminations: Bolted connectors.
 - 2. Underground Connections: Welded connectors except at test wells and as otherwise indicated.
 - 3. Connections to Structural Steel: Welded connectors.

3.02 EQUIPMENT GROUNDING

- A. Install insulated equipment grounding conductors with the following items, in addition to those required by NFPA 70:

PART 4 - Retain applicable subparagraphs below.

- 1. Feeders and branch circuits.

2. Lighting circuits.
 3. Receptacle circuits.
 4. Single-phase motor and appliance branch circuits.
 5. Three-phase motor and appliance branch circuits.
 6. Flexible raceway runs.
 7. Armored and metal-clad cable runs.
 8. Computer and Rack-Mounted Electronic Equipment Circuits: Install insulated equipment grounding conductor in branch-circuit runs from equipment-area power panels and power-distribution units.
- B. Air-Duct Equipment Circuits: Install insulated equipment grounding conductor to duct-mounted electrical devices operating at 120 V and more, including air cleaners, heaters, dampers, humidifiers, and other duct electrical equipment. Bond conductor to each unit and to air duct and connected metallic piping.
- C. Water Heater, Heat-Tracing, and Anti-frost Heating Cables: Install a separate insulated equipment grounding conductor to each electric water heater and heat-tracing cable. Bond conductor to heater units, piping, connected equipment, and components.
- D. Signal and Communication Equipment: In addition to grounding and bonding required by NFPA 70, provide a separate grounding system complying with requirements in TIA/ATIS J-STD-607-A.
1. For telephone, alarm, voice and data, and other communication equipment, provide No. 4 AWG minimum insulated grounding conductor in raceway from grounding electrode system to each service location, terminal cabinet, wiring closet, and central equipment location.
 2. Service and Central Equipment Locations and Wiring Closets: Terminate grounding conductor on a 1/4-by-4-by-12-inch grounding bus.
 3. Terminal Cabinets: Terminate grounding conductor on cabinet grounding terminal.

4.02 INSTALLATION

- A. Grounding Conductors: Route along shortest and straightest paths possible unless otherwise indicated or required by Code. Avoid obstructing access or placing conductors where they may be subjected to strain, impact, or damage.
- B. Ground Rods: Drive rods until tops are 2 inches below finished floor or final grade unless otherwise indicated.
1. Interconnect ground rods with grounding electrode conductor below grade and as otherwise indicated. Make connections without exposing steel or damaging coating if any.
- C. Bonding Straps and Jumpers: Install in locations accessible for inspection and maintenance except where routed through short lengths of conduit.
1. Bonding to Structure: Bond straps directly to basic structure, taking care not to penetrate any adjacent parts.

2. Bonding to Equipment Mounted on Vibration Isolation Hangers and Supports: Install bonding so vibration is not transmitted to rigidly mounted equipment.
3. Use exothermic-welded connectors for outdoor locations; if a disconnect-type connection is required, use a bolted clamp.

D. Grounding and Bonding for Piping:

1. Metal Water Service Pipe: Install insulated copper grounding conductors, in conduit, from building's main service equipment, or grounding bus, to main metal water service entrances to building. Connect grounding conductors to main metal water service pipes; use a bolted clamp connector or bolt a lug-type connector to a pipe flange using one of the lug bolts of the flange. Where a dielectric main water fitting is installed, connect grounding conductor on street side of fitting. Bond metal grounding conductor conduit or sleeve to conductor at each end.
2. Water Meter Piping: Use braided-type bonding jumpers to electrically bypass water meters. Connect to pipe with a bolted connector.
3. Bond each above ground portion of gas piping system downstream from equipment shutoff valve.

E. Bonding Interior Metal Ducts: Bond metal air ducts to equipment grounding conductors of associated fans, blowers, electric heaters, and air cleaners. Install bonding jumper to bond across flexible duct connections to achieve continuity.

4.03 LABELING

- A. Comply with requirements in Division 26 Section "Identification for Electrical Systems" Article for instruction signs. The label or its text shall be green.
- B. Install labels at the telecommunications bonding conductor and grounding equalizer and at the grounding electrode conductor where exposed.
 1. Label Text: "If this connector or cable is loose or if it must be removed for any reason, notify the facility manager."

4.04 FIELD QUALITY CONTROL

- A. Perform the following tests and inspections and prepare test reports:
 1. After installing grounding system but before permanent electrical circuits have been energized, test for compliance with requirements.
 2. Inspect physical and mechanical condition. Verify tightness of accessible, bolted, electrical connections with a calibrated torque wrench according to manufacturer's written instructions.
 3. Test completed grounding system at each location where a maximum ground-resistance level is specified, at service disconnect enclosure grounding terminal. Make tests at ground rods before any conductors are connected.

PART 5 - See Division 01 Section "Quality Requirements" for retesting and reinspecting requirements and Division 01 Section "Execution" for requirements for correcting the Work.

- A. Excessive Ground Resistance: If resistance to ground exceeds 5 ohms, notify Design Professional promptly and include recommendations to reduce ground resistance.

END OF SECTION 26 05 26

SECTION 26 05 29.13**SYSTEMWIDE ELECTRICAL RACEWAY AND EQUIPMENT SUPPORTS FOR SYSTEMS****PART 1 - GENERAL****1.1 SUMMARY**

- A. This Work includes providing complete raceway and equipment supports as shown and as specified.
- B. Construction requirements for concrete bases

1.2 RELATED SECTIONS

- A. SECTION 26 05 00.13 – Systemwide Electrical General Requirements for Systems
- B. SECTION 03 30 00 – Cast-in-place Concrete

1.3 REFERENCED STANDARDS

- A. American Welding Society (AWS)
 - 1. AWS D1.1/D1.1M Structural Welding Code - Steel
- B. SMACMA - Seismic Restraint Manual - Guidelines for Mechanical Systems
- C. National Fire Protection Agency (NFPA)
 - 1. NFPA 70 National Electrical Code (NEC)
- D. American Society for Testing and Materials (ASTM)
 - 1. ASTM A325 Standard Specification For Structural Bolts, Steel, Heat Treated, 120/105 KSI Minimum Tensile Strength
 - 2. ASTM A780 Standard Practice for Repair of Damaged and Uncoated Areas of Hot-Dip Galvanized Coatings
- E. Society for Protective Coatings (SSPC)
 - 1. SSPC PA 1 Shop, Field, and Maintenance Painting of Steel
- F. National Electrical Contractors Association (NECA)
 - 1. NECA 1 Standard Practice of Good Workmanship in Electrical Contracting
 - 2. NECA 101 Standard for Installing Steel Conduits (Rigid, IMC, EMT)

1.4 QUALITY ASSURANCE

- A. Qualify procedures and personnel according to AWS D1.1/D1.1M
- B. Comply with NFPA 70.

1.5 SUBMITTALS

- A. Submittals shall be made in accordance with the requirements of SECTION 26 05 00.13 – Systemwide Electrical General Requirements, except as modified herein.
- B. Items required to be submitted by the Contractor for Approval include, but are not limited to, the following:
 - 1. Product data on concrete expansion anchors
 - 2. Product data on channel system, including clamps and fittings
 - 3. Product data on concrete inserts
 - 4. Product data on trapeze hangers
 - 5. Product data on equipment supports
 - 6. Anchor bolt calculations
- C. Welding certificates

PART 2 - PRODUCTS

2.1 SEISMIC DESIGN

- A. All equipment and conduits shall be adequately restrained and supported to resist seismic forces. Restraint devices shall be designed and selected to meet seismic requirements as defined in the latest issue of the International Building Code, and applicable State and Local codes.
- B. Anchor bolt calculations, signed and stamped by a Professional Engineer registered in the State of Missouri, shall be submitted showing required bolt numbers, sizes, types, and spacing. Stamped calculations shall also be furnished for anchors on restraint devices, cables, isolators, and rigidly mounted equipment.

2.2 RACEWAY SUPPORTS

- A. Raceway clamps shall be bolted type, hot-dip or mechanically galvanized one hole, heavy gauge steel, or galvanized malleable iron with clamp back. Caddy Clips shall not be used.
- B. Hanger rod shall be galvanized steel or electro-galvanized and zinc chromate coated steel, 3/8-inch diameter minimum.
- C. Channels and channel fittings, and clamps and accessories, shall be hot-dip galvanized steel. Channels shall be 14-gauge minimum, 1-5/8 inch deep by 1-5/8 inch wide minimum. Channel system shall be by Unistrut, Powerstrut, B-Line, O-Strut, or approved equal.
- D. Where heavy-duty racks are required, channel shall be 12-gauge, 1-5/8 inch deep by 1-5/8 inch wide minimum. Channel, raceway clamps and accessories shall be hot-dip galvanized steel. Aluminum, and light gauge strength metals or materials shall not be used.

2.3 ANCHORS

- A. Provide anchors with sufficient strength to support four times the load.
 - 1. Hollow Masonry – Toggle bolt type expansion anchors

2. Solid Masonry – Concrete expansion anchors
3. Metal Surfaces – Machine screws, bolts or welded studs
4. Wood Surfaces – Wood screws or lag bolts
5. Concrete Surfaces – Concrete expansion anchors shall be wedge type and shall be Phillips Red-Head, Hilti, or approved equal
6. Powder driven studs shall not be used

2.4 CONCRETE INSERTS

- A. Continuous slot-channel inserts shall be fabricated from 12-gauge steel, rated for loads of 2,400 pounds per foot, Unistrut, Allied Powerstrut or approved equal.
- B. Spot inserts shall be rated for a load of 1,000 pounds or greater each, Unistrut, Allied Powerstrut or approved equal.
- C. Finish shall be hot-dip galvanized.

2.5 FASTENERS AND HARDWARE

- A. Fasteners and hardware shall be suitable for the use and environment intended. All fasteners shall be corrosion resistant, protected by hot-dip galvanizing after fabrication or stainless steel. Unplated steel shall not be used. Caddy Clips shall not be used.
- B. Provide stainless steel fasteners in manholes, handholes or splice boxes, where exposed to weather, or in damp or wet locations.

PART 3 - EXECUTION

3.1 INSTALLATION OF RACEWAY RACKS

- A. Multiple runs of exposed raceway shall be grouped and supported on raceway racks constructed from channels, raceway clamps and fittings. Caddy Clips shall not be used. Raceway racks shall be trapeze style constructed from steel channels, supported by 3/8-inch or 1/2-inch rods and concrete expansion anchors.
- B. Provide raceway rack as indicated and with a minimum of 25% spare capacity.
- C. Raceway racks may be used for support of vertical or horizontal raceway runs, except where otherwise specified.
- D. Where raceways 2 inches or larger are supported by racks, use heavy-duty channel clamps and accessories.

3.2 INSTALLATION OF CONCRETE EXPANSION ANCHORS

- A. Concrete expansion anchors shall be used wherever a bolted attachment to concrete is required. Holes for anchors shall be driven perpendicular to the concrete surface, and the anchor installed in accordance with manufacturer's instructions.
- B. Anchors installed at an angle to the surface, or anchors protruding from the surface, shall be replaced.
- C. Anchors shall not be spaced closer than six times the diameter of the hole, center to center.

3.3 INSTALLATION OF CONCRETE INSERTS

- A. Concrete inserts may be installed for supporting raceway and equipment wherever concrete anchors are required.
- B. Inserts may be inspected by the Engineer at his/her option before concrete is poured. Notify the Engineer 7 days in advance of pouring.

3.4 INSTALLATION OF FASTENERS AND HARDWARE

- A. Install fasteners and hardware suitable for the environment and use intended. Caddy Clips shall not be used. Where fasteners exhibit corrosion, replace at no additional cost to KCMO.

3.5 INSTALLATION OF SEISMIC BRACING

- A. Provide seismic restraints, supports, and attachments in accordance with Seismic Hazard Level (SHL) "B" as recommended in the *Seismic Restraint Manual: Guidelines for Mechanical Systems* (SMACMA), latest Edition.
- B. Design and obtain approval of seismic design from the authority having jurisdiction over seismic restraint hangers and supports for conduits and equipment.

PART 4 - MEASUREMENT AND PAYMENT**4.1 MEASUREMENT**

- A. The quantities of accepted work will be measured in the following units. All measurements will be plan measure except for authorized changes.
 - 1. Description: Lump Sum

4.2 PAYMENT

- A. Payment will be made at the respective unit or lump-sum price listed in the proposal and shall be full compensation for all labor, materials, and equipment necessary to complete the respective unit in place. There will be no separate measurement or payment for any item of work not specifically identified and listed in the proposal, and all such work shall be considered a subsidiary item with all costs pertaining thereto included in the prices for other items listed in the proposal. At the Engineer's option, partial payment may be made for any lump sum item listed in the proposal, providing that the Contractor is diligently and satisfactorily pursuing full completion of such partially complete item in accordance with the approved job progress schedule.

END OF SECTION

SECTION 26 05 29**HANGERS AND SUPPORTS FOR ELECTRICAL SYSTEMS**

PART 1 - GENERAL

1.01 SUMMARY

- A. Section includes:
 - 1. Hangers and supports for electrical equipment and systems.
 - 2. Construction requirements for concrete bases.

1.02 PERFORMANCE REQUIREMENTS

- A. Design equipment supports capable of supporting combined operating weight of supported equipment and connected systems and components.
- B. Rated Strength: Adequate in tension, shear, and pullout force to resist maximum loads calculated or imposed for this Project, with a minimum structural safety factor of five times the applied force.

1.03 ACTION SUBMITTALS

- A. Product Data: For steel slotted support systems.
- B. Shop Drawings: Show fabrication and installation details and include calculations for the following:
 - 1. Trapeze hangers. Include Product Data for components.
 - 2. Steel slotted channel systems. Include Product Data for components.
 - 3. Equipment supports.

1.04 INFORMATIONAL SUBMITTALS

- A. Welding certificates.

1.05 QUALITY ASSURANCE

- A. Welding: Qualify procedures and personnel according to AWS D1.1/D1.1M, "Structural Welding Code - Steel."
- B. Comply with NFPA 70.

PART 2 - PRODUCTS

2.01 SUPPORT, ANCHORAGE, AND ATTACHMENT COMPONENTS

- A. Steel Slotted Support Systems: Comply with MFMA-4, factory-fabricated components for field assembly.
1. Available Manufacturers: Subject to compliance with requirements, manufacturers offering products that may be incorporated into the Work include, but are not limited to, the following:
 2. Manufacturers: Subject to compliance with requirements, provide products by one of the following:
 - a. Allied Tube & Conduit.
 - b. Cooper B-Line, Inc.; a division of Cooper Industries.
 - c. ERICO International Corporation.
 - d. GS Metals Corp.
 - e. Thomas & Betts Corporation.
 - f. Unistrut; Tyco International, Ltd.
 3. Metallic Coatings: Hot-dip galvanized after fabrication and applied according to MFMA-4.
 4. Nonmetallic Coatings: Manufacturer's standard PVC, polyurethane, or polyester coating applied according to MFMA-4.
 5. Painted Coatings: Manufacturer's standard painted coating applied according to MFMA-4.
 6. Channel Dimensions: Selected for applicable load criteria.
- B. Raceway and Cable Supports: As described in NECA 1 and NECA 101.
- C. Conduit and Cable Support Devices: Steel and malleable-iron hangers, clamps, and associated fittings, designed for types and sizes of raceway or cable to be supported.
- D. Support for Conductors in Vertical Conduit: Factory-fabricated assembly consisting of threaded body and insulating wedging plug or plugs for non-armored electrical conductors or cables in riser conduits. Plugs shall have number, size, and shape of conductor gripping pieces as required to suit individual conductors or cables supported. Body shall be malleable iron.
- E. Structural Steel for Fabricated Supports and Restraints: ASTM A 36/A 36M, steel plates, shapes, and bars; black and galvanized.
- F. Mounting, Anchoring, and Attachment Components: Items for fastening electrical items or their supports to building surfaces include the following:
1. Powder-Actuated Fasteners: Threaded-steel stud, for use in hardened Portland cement concrete, steel, or wood, with tension, shear, and pullout capacities appropriate for supported loads and building materials where used.
 - a. Available Manufacturers: Subject to compliance with requirements, manufacturers offering products that may be incorporated into the Work include, but are not limited to, the following:

- 1) Hilti Inc.
 - 2) ITW Ramset/Red Head; a division of Illinois Tool Works, Inc.
 - 3) MKT Fastening, LLC.
 - 4) Simpson Strong-Tie Co., Inc.; Masterset Fastening Systems Unit.
2. Mechanical-Expansion Anchors: Insert-wedge-type, steel, for use in hardened Portland cement concrete with tension, shear, and pullout capacities appropriate for supported loads and building materials in which used.
- a. Available Manufacturers: Subject to compliance with requirements, manufacturers offering products that may be incorporated into the Work include, but are not limited to, the following:
 - 1) Cooper B-Line, Inc.; a division of Cooper Industries.
 - 2) Empire Tool and Manufacturing Co., Inc.
 - 3) Hilti Inc.
 - 4) ITW Ramset/Red Head; a division of Illinois Tool Works, Inc.
 - 5) MKT Fastening, LLC.
3. Concrete Inserts: Steel or malleable-iron, slotted support system units similar to MSS Type 18; complying with MFMA-4 or MSS SP-58.
4. Clamps for Attachment to Steel Structural Elements: MSS SP-58, type suitable for attached structural element.
5. Through Bolts: Structural type, hex head, and high strength. Comply with ASTM A 325.
6. Toggle Bolts: All-steel springhead type.
7. Hanger Rods: Threaded steel.

2.02 FABRICATED METAL EQUIPMENT SUPPORT ASSEMBLIES

- A. Description: Welded or bolted, structural-steel shapes, shop or field fabricated to fit dimensions of supported equipment.
- B. Materials: Comply with requirements in Division 05 Section "Metal Fabrications" for steel shapes and plates.

PART 3 - EXECUTION

3.01 APPLICATION

- A. Comply with NECA 1 and NECA 101 for application of hangers and supports for electrical equipment and systems except if requirements in this Section are stricter.
- B. Maximum Support Spacing and Minimum Hanger Rod Size for Raceway: Space supports for EMT, IMC, and RMC as required by NFPA 70. Minimum rod size shall be 1/4 inch in diameter.
- C. Multiple Raceways or Cables: Install trapeze-type supports fabricated with steel slotted or other support system, sized so capacity can be increased by at least 25 percent in future without exceeding specified design load limits.

1. Secure raceways and cables to these supports with two-bolt conduit clamps.
- D. Spring-steel clamps designed for supporting single conduits without bolts may be used for 1-1/2-inch and smaller raceways serving branch circuits and communication systems above suspended ceilings and for fastening raceways to trapeze supports.

3.02 SUPPORT INSTALLATION

- A. Comply with NECA 1 and NECA 101 for installation requirements except as specified in this Article.
- B. Raceway Support Methods: In addition to methods described in NECA 1, EMT and RMC may be supported by openings through structure members, as permitted in NFPA 70.
- C. Strength of Support Assemblies: Where not indicated, select sizes of components so strength will be adequate to carry present and future static loads within specified loading limits. Minimum static design load used for strength determination shall be weight of supported components plus 200 lb.
- D. Mounting and Anchorage of Surface-Mounted Equipment and Components: Anchor and fasten electrical items and their supports to building structural elements by the following methods unless otherwise indicated by code:
1. To Wood: Fasten with lag screws or through bolts.
 2. To New Concrete: Bolt to concrete inserts.
 3. To Masonry: Approved toggle-type bolts on hollow masonry units and expansion anchor fasteners on solid masonry units.
 4. To Existing Concrete: Expansion anchor fasteners.
 5. Instead of expansion anchors, powder-actuated driven threaded studs provided with lock washers and nuts may be used in existing standard-weight concrete 4 inches thick or greater. Do not use for anchorage to lightweight-aggregate concrete or for slabs less than 4 inches thick.
 6. To Steel: Beam clamps (MSS Type 19, 21, 23, 25, or 27) complying with MSS SP-69.
 7. To Light Steel: Sheet metal screws.
 8. Items Mounted on Hollow Walls and Nonstructural Building Surfaces: Mount cabinets, panelboards, disconnect switches, control enclosures, pull and junction boxes, transformers, and other devices on slotted-channel racks attached to substrate.
- E. Drill holes for expansion anchors in concrete at locations and to depths that avoid reinforcing bars.

3.03 INSTALLATION OF FABRICATED METAL SUPPORTS

- A. Comply with installation requirements in Division 05 Section "Metal Fabrications" for site-fabricated metal supports.

- B. Cut, fit, and place miscellaneous metal supports accurately in location, alignment, and elevation to support and anchor electrical materials and equipment.
- C. Field Welding: Comply with AWS D1.1/D1.1M.

3.04 CONCRETE BASES

- A. Construct concrete bases of dimensions indicated but not less than 4 inches larger in both directions than supported unit, and so anchors will be a minimum of 10 bolt diameters from edge of the base.
- B. Use 3,000-psi, 28-day compressive-strength concrete. Concrete materials, reinforcement, and placement requirements are specified in Division 03 Section "Cast-in-Place Concrete."
- C. Anchor equipment to concrete base.
 - 1. Place and secure anchorage devices. Use supported equipment manufacturer's setting drawings, templates, diagrams, instructions, and directions furnished with items to be embedded.
 - 2. Install anchor bolts to elevations required for proper attachment to supported equipment.
 - 3. Install anchor bolts according to anchor-bolt manufacturer's written instructions.

3.05 PAINTING

- A. Touchup: Comply with requirements in Division 09 painting Sections for cleaning and touchup painting of field welds, bolted connections, and abraded areas of shop paint on miscellaneous metal.
- B. Galvanized Surfaces: Clean welds, bolted connections, and abraded areas and apply galvanizing-repair paint to comply with ASTM A 780.

END OF SECTION 26 05 29

SECTION 26 05 33.13**SYSTEMWIDE ELECTRICAL RACEWAYS FOR SYSTEMS****PART 1 - GENERAL****1.1 SUMMARY**

- A. This Work includes providing complete raceway systems as shown and as specified. Raceways assembled into ductbanks shall also meet the requirements of SECTION 26 05 43 – Systemwide Electrical Underground Ductbanks for Systems.
- B. This Section specifies the requirements for coating of metallic conduits.

1.2 RELATED SECTIONS

- A. SECTION 26 05 00.13 – Systemwide Electrical General Requirements for Systems
- B. SECTION 26 05 43 – Systemwide Electrical Underground Ductbanks for Systems
- C. SECTION 31 23 33 – Utility Trenching and Backfilling
- D. SECTION 01 43 00 – Systems Quality Assurance

1.3 REFERENCES AND STANDARDS

- A. American National Standards Institute (ANSI)
 - 1. ANSI C80.1 Specifications for Rigid Steel Conduit, Zinc Coated
- B. National Electrical Manufacturers Association (NEMA)

4. ASTM D3035 Standard Specification for Polyethylene (PE) Plastic Pipe (DR-PR) Based on Controlled Outside Diameter
5. ASTM D3350 Standard Specification for Polyethylene Plastics Pipe and Fittings Materials

1.4 QUALITY ASSURANCE

- A. Comply with NFPA 70.
- B. Quality assurance planning, implementation and reporting shall be in conformance with SECTION 01 43 00 – Systems Quality Assurance, except as modified herein.

1.5 SUBMITTALS

- A. Submittals shall be made in accordance with the requirements of SECTION 26 05 00.13 – Systemwide Electrical General Requirements For Systems, except as modified herein.
- B. Items required to be submitted by the Contractor for Approval include, but are not limited to, the following:
 1. Product data on raceways
 2. Product data on fittings
 3. Product data on metallic joint compounds, caulking and sealing compounds
 4. Product data on pull cords
 5. Product data on raceway tags and labels
 6. Product data on conduit mandrels and brushes
 7. Product data on warning tape
 8. Product data on polyvinyl chloride (PVC) conduit joint cleaning solvent and cement
 9. Product data on PVC/GRSC (galvanized rigid steel conduit) coating patching compound

PART 2 - PRODUCTS

2.1 GALVANIZED RIGID STEEL CONDUIT (GRSC)

- A. Conduit shall comply with ANSI C80.1 and shall be hot-dip galvanized inside and out. Threaded ends shall be galvanized using a zinc metallizing process which sprays or blasts molten or semi-molten zinc on the threaded area. Minimum size shall be 3/4-inch.
- B. Approved manufacturers are LTV, Triangle, Allied or approved equal.

2.2 PVC SCHEDULE 40 CONDUIT (PVC)

- A. Conduit shall comply with NEMA TC 2, rigid polyvinyl chloride, Schedule 40. Conduit shall be sunlight resistant and suitable for 90 degrees Celsius conductors and exposed locations. Minimum size shall be 1 inch.
- B. Approved manufacturers are Carlon, PW Pipe, Western Plastics or approved equal.

2.3 PVC SCHEDULE 80 CONDUIT (PVC 80)

- A. Conduit shall comply with NEMA TC 2, rigid polyvinyl chloride, Schedule 80. Conduit shall be sunlight resistant and suitable for 90 degrees Celsius conductors and exposed locations. Minimum size shall be 2 inches.
- B. Approved manufacturers are Carlon, PW Pipe, Western Plastics or approved equal.

2.4 PVC COATED GALVANIZED RIGID STEEL CONDUIT (PVC/GRSC OR PGRSC)

- A. Conduit shall comply with ANSI C80.1 and NEMA RN 1, and shall be hot-dipped galvanized inside and out. Threaded ends shall be galvanized using a zinc metalizing process which sprays or blasts molten or semi-molten zinc on the threaded area. Minimum size shall be 3/4-inch.
- B. The galvanized surface shall be coated with an epoxy-acrylic primer to insure a bond between steel and plastic.
- C. The plastic coating on the exterior of conduit shall be applied by the plastisol method, to 40 mils minimum thickness.

2.5 PVC SCHEDULE 40 MULTI-CELL CONDUIT (QUAD-DUCT)

- A. The multicelled conduit system shall consist of four schedule 40 PVC color-coded conduits and shall be as follows:
 - 1. Nominal size of 1 ½ inches.
 - 2. Nominal I.D. of 1.57 inches.
 - 3. Maximum O.D. of 1.91 inches.
 - 4. Supplied in straight four-way lengths of 10 or 20 feet.
 - 5. Colors: Grey, White, Blue, and Orange.
 - 6. Smooth walled inside and outside.
 - 7. Each conduit shall have a ¼ inch rope installed by the manufacturer.
- B. The conduit system shall be a complete system with all the following fittings:
 - 1. Bell ends.
 - 2. Manhole terminator rings.
 - 3. Conduit spacers.
 - 4. Fixed elbows of radius shown in Table C of 26 05 33.
 - 5. Fixed elbows shall be offered in 11 ¼, 22 ½, 45, and 90 degree bends.
 - 6. Conduit duct plugs shall be installed on empty ducts.
- C. Conduit system shall be installed according to the manufacturer's instructions.
- D. Approved manufacturers are Carlon Intra-Gard Multi-Duct Raceway, or approved equal.

2.6 GRSC CONDUIT FITTINGS

- A. Conduit fittings shall be steel or cast malleable iron and shall be hot-dip or mechanically galvanized. Die-cast zinc fittings shall not be used.
- B. Bushings and grounding bushings shall have molded phenolic or nylon insulating collars. Grounding bushings shall have a "lay-in" tin-plated copper lug.
- C. Expansion fittings for exposed conduit runs shall be weatherproof with external bonding jumper, providing up to 4 inches longitudinal movement with bushed conduit ends.
- D. Deflection/Expansion fittings for exposed conduit shall be weatherproof, providing up to 30 degrees of deflection from the normal in all directions.
- E. Watertight split couplings or three-piece ('Ericson') couplings shall be O-Z/Gedney, or approved equal.
- F. Running thread or set screw type fittings shall not be used.
- G. Locknuts 2 inches and smaller shall be heavy galvanized steel. Locknuts larger than 2 inches shall be galvanized malleable iron.
- H. Hubs shall be galvanized steel or galvanized malleable iron, with insulating inserts and sealing rings. Hubs shall provide watertight conduit connections to boxes and enclosures.
- I. Conduit outlet bodies shall be cast ferrous alloy, with gasketed ferrous alloy cover, hot-dip or mechanically galvanized. Aluminum or aluminum alloy conduit bodies are not acceptable. "Short" conduit bodies such as SLB's are not acceptable. Acceptable manufacturers are O-Z/Gedney, Crouse-Hinds, Appleton or approved equal.

2.7 PVC COATED GALVANIZED RIGID STEEL CONDUIT FITTINGS

- A. Fittings for PVC/GRSC (PGRS) shall be by the same manufacturer and specifications as for PVC/GRSC conduit.

2.8 PVC CONDUIT FITTINGS

- A. Fittings for PVC conduit shall comply with NEMA TC 3. PVC conduit fittings shall be of the same manufacturer and type as the conduit.
- B. Expansion fittings shall be Carlon E945 Series, or approved equal.

2.9 RACEWAY TAGS AND LABELS FOR ABOVE GRADE RACEWAYS

- A. Tags and labels shall be made from nonferrous metals with raceway designations stamped by steel dies. This does not apply to conduits in ductbank.

2.10 CONDUIT MANDRELS AND BRUSHES

- A. Conduit brushes shall use round wire bristles for maximum cleaning of sand, grit, and obstructions from the conduit. They shall have a pulling eye on one end, and a smaller twisted eye on the other end, which shall allow for bi-directional pulling. Conduit brushes shall be sized as shown in Table A.

**TABLE A
CONDUIT BRUSH SIZES**

Duct Size (inches)	Diameter (inches)	Working Load (pounds)
2.0	1.87	200
2.5	2.38	200
3.0	2.87	200
3.5	3.38	200
4.0	3.87	200
5.0	4.87	200
6.0	5.87	200

- B. Conduit mandrels shall be flexible, and manufactured for cleaning out mud, dirt and light obstacles from ducts before the installation of cable. Mandrels shall be suitable for pulling around tight bends, and use a tapered profile which allows pulling in either direction. Pulling eyes shall be furnished on each end. The mandrel shall be fabricated from polyurethane, or an approved equal material, and shall not damage conduit inner walls. Conduit mandrels shall be sized per Table B or as Approved by the Engineer.

**TABLE B
CONDUIT MANDREL SIZES**

Duct Size (inches)	Diameter (inches)	Working Load (pounds)
2.0	1.88	2,330
2.5	2.19	2,330
3.0	2.81	2,330
3.5	3.25	4,800
4.0	3.75	4,800
5.0	4.69	4,800
6.0	5.81	4,800

- C. Conduit brushes and mandrels shall be manufactured for the purpose by a company regularly engaged in the production of electrical equipment, Greenlee Textron, Inc., or approved equal. Mandrels shall not be fabricated by the Contractor in the shop or field.

2.11 WARNING TAPE

- A. Tape shall be heavy-gauge, yellow and plastic for direct burial, 6-inch minimum width for use in trenches containing electric circuits. Tape shall be made of material resistant to corrosive soil. Tape shall have printed warning that an electric circuit is located below the tape. Approved manufacturers and types are ITT Blackburn Type YT, Griffolyn Co., Terra-Tape or approved equal.

2.12 DIRECTIONAL BORING

- A. General – Directional boring equipment shall consist of a directional boring rig of sufficient capacity to perform the bore and pull back the pipe, a boring fluid mixing and delivery system of adequate capacity to successfully complete the crossing, a guidance system to accurately guide boring operations and trained and competent personnel to operate the system.
- B. Boring System – The directional boring machine shall consist of a hydraulically powered system to rate, push and pull hollow drill pipe into the ground at a variable angle while delivering a pressurized fluid mixture to a guidable drill head. The machine shall be anchored to the ground to withstand the pulling, pushing and rotating pressure required to complete the crossing. Hydraulic systems shall be free of leaks. Rig shall have a system to monitor and record maximum pull-back pressure during pull-back operations. The rig shall be grounded during boring and pull-back operations.
- C. Bore head – The bore head shall be steerable by changing its rotation and shall provide the necessary cutting surfaces and boring fluid jets.
- D. Mud motors (if required) – Mud motors shall be of adequate power to turn the required boring tools.
- E. Drill Pipe – Pipe shall be constructed of high quality 4130 seamless tubing, grade D or better, with threaded box and pins. Tool joints should be hardened to 32-36RC.
- F. Guidance System – System shall be of a proven type and shall be setup and operated by personnel trained and experienced with this system. The operator shall be aware of any magnetic anomalies and shall consider such influences in the operation of the guidance system if using a magnetic system
- G. Boring Fluid (Mud) System
 - 1. Mixing System – A self-contained, closed, boring fluid mixing system shall of sufficient size to mix and deliver boring fluid composed of bentonite clay, potable water and appropriate additives. Mixing system shall be able to molecularly shear individual bentonite particles from the dry powder to avoid clumping and ensure thorough mixing. The boring fluid reservoir tank shall be large enough to accommodate the necessary fluid amount. Mixing system shall continually agitate the boring fluid during operation.
 - 2. Boring Fluid – Drilling fluid shall be composed of clean water and an appropriate additive. Water shall be from a clean source with a pH of 8.5-10. Water of a lower pH or with excessive calcium shall be treated with the appropriate amount of sodium carbonate or equal. The water and additives shall be mixed thoroughly and be absent of any clumps or clods. No hazardous additives may be used. Boring fluid shall be maintained at a viscosity sufficient to suspend cuttings and main the integrity of bore wall.

PART 3 - EXECUTION

3.1 GENERAL INSTALLATION REQUIREMENTS

- A. Many raceways will remain empty, with conductors installed in another Contract. All raceways installed for future use shall have a 1/4-inch nylon pull-cord installed and secured at each end.
- B. Install raceways with not more than 270 degrees of bend, total, in each raceway run between boxes, manholes, handholes and raceway terminations.
- C. Unless otherwise noted, minimum raceway size shall be 1 inch for underground raceways.

- D. Cut raceway ends square, ream and extend maximum distance into all couplings and connectors. Tighten all fittings securely. Filed cut threads and reamed ends in metal conduit shall be protected from corrosion immediately after cutting, reaming and cleaning by application of a zinc rich coating.
- E. Metallic raceway joints shall be electrically continuous by use of conductive joint compounds, Thomas & Betts "Kopr-Shield" or approved equal.
- F. Install manufactured end caps or plugs on all raceway ends immediately after installation to prevent the entrance of liquids or foreign materials.
- G. Bends in GRSC shall be factory pre-fabricated 90 degree bends or field bent. Field bending shall be done using one-shot or segment benders which do not decrease the raceway cross-section. Bending shall be done in accordance with manufacturer's instructions.
- H. Minimum bend radius for raceways within structures shall be in accordance with Table 2, Chapter 9, in the NEC.
- I. Minimum bend radius for raceways installed underground shall be as shown in Table C, except where otherwise indicated.

TABLE C
UNDERGROUND CONDUIT MINIMUM BENDING RADIUS

Conduit Size (inches)	Conduit Radius (inches)
1.0	14
1.25	18
1.5	18
2.0	24
2.5	27
3.0	30
3.5	33
4.0	36
5.0	42
6.0	48

- J. Route raceways to avoid structural obstructions and to minimize crossovers. Should core drilling or installation of sleeves not shown on the Contract Drawings be desired by the Contractor, such proposed penetrations shall be submitted to the Engineer prior to any core drilling or sleeving.
- K. Install expansion fittings with grounding jumpers where raceways cross expansion joints, construction joints, sawn joints, and where shown.
- L. All connections shall be watertight, except for non-liquid tight flexible metal conduit.
- M. Install PVC conduit in accordance with manufacturer's instructions. Cut the conduit ends square, and apply an approved solvent to clean the joint. Apply approved cement and allow to set 24 hours before mandrelling, brushing and installing conductors.

- N. This paragraph covers bends in PVC conduit runs underground but not in ductbanks. See SECTION 26 05 43 – Systemwide Electrical Underground Ductbanks For Systems, for bends in PVC conduit runs in ductbanks. PVC/GRSC shall be used for conduit bends 30 degrees or greater in PVC conduit runs underground but not in ductbanks. Bends in PVC conduit runs underground but not in ductbanks that are less than 30 degrees shall be factory PVC prefabricated bends or field bent PVC conduit. Field bends in PVC conduit with a radius of 100 feet or less shall be formed hot using only a heater recommended by the conduit manufacturer. Use conduit plugs during bending for conduit 2 inches and larger. Remove plugs only after conduit has cooled. Field bends (sweeps) with radius greater than 100 feet may be formed cold.
- O. All PVC conduits entering manholes or handholes shall be terminated with bell-end fittings or Term-a-duct.
- P. PVC/GRSC and fittings require special installation methods, and shall be installed in strict accordance with the manufacturer's instructions. Provide PVC boot to cover all exposed threads. Touch-up minor slice, nick, or abrasion damage to PVC coating with patching compound approved by the conduit manufacturer. Slices more than 10 mils in depth, and nicks and abrasions more than 10 mils in depth or 1/4-inch in diameter are considered major damage. Patching compound shall not be used to correct major damage. Conduits and fittings with major damage shall be replaced. The Engineer shall be the sole judge of whether coating damage is minor or major.

3.2 COATING OF METALLIC CONDUIT

- A. Wherever GRSC or GRS conduits are shown on the Contract Drawings or otherwise specified, the conduits and fittings shall be PVC/GRSC (PGRS), unless specifically called out as being uncoated.

3.3 REQUIREMENTS FOR RACEWAY TYPES

- A. For concrete encased conduits in underground ductbanks, provide Schedule 40 PVC conduit and raceway.
- B. For direct buried underground conduit, not in ductbank, installed in trackway or under track crossing provide PVC/GRSC.
- C. For direct buried underground conduit, not in a ductbank and not installed in the trackway or under track crossing provide Schedule 40 PVC conduit.
- D. For conduits installed in Overhead Contact System (OCS) feeder pole foundations, provide PVC conduit and elbows.
- E. For conduits installed in signal pole foundations, provide Schedule 40 PVC conduit and elbows.
- F. For conduits installed through traction power substation foundation walls, provide term-a-duct watertight duct connection.

3.4 RACEWAYS INSTALLED UNDERGROUND

- A. Slope raceways entering manholes and handholds to drain towards them. Slope raceways to drain away from buildings.
- B. Install raceways a minimum of 24 inches below final grade unless otherwise indicated.

- C. Dewater all excavations and raceways.
- D. Install yellow warning tape 12 inches above direct buried raceways.
- E. Direct buried conduit shall be encased and embedded in 4 inches of clean sharp sand on all sides of the raceway.

3.5 SLEEVES

- A. All sleeves shall be PVC/GRSC or Schedule 40 PVC as noted in Contract Drawings.
- B. Install, in advance of pouring concrete, all sleeves where shown. Sleeves shall terminate flush with the surface of the concrete with a coupling.

3.6 RACEWAYS STUBBED UP THROUGH FLOORS, WALLS, FOOTINGS OR FOUNDATIONS

- A. Install at such depth that the exposed raceway is vertical and no curved section of the elbow is visible.
- B. PVC/GRSC shall be provided for all raceways installed through floors, walls, footings or foundations. PVC conduit shall not be stubbed through floors, walls, footings or foundations. PVC conduit may be terminated in vault walls as shown on the Contract Drawings.

3.7 CONDUIT MANDRELLING AND CLEANING

- A. A log shall be kept for all conduits mandrelled. The mandrel log shall contain the following information in tabular format for each conduit mandrelled:
 - 1. Conduit designation
 - 2. Conduit endpoints
 - 3. Conduit size
 - 4. Date mandrelled
 - 5. Pass/fail for specified mandrel
- B. After final assembly is in place, all conduit 2 inches and larger shall be thoroughly mandrelled and cleaned prior to installing wires or pull cords. Each conduit shall be mandrelled by pulling a mandrel sized in accordance with these Specifications through the conduits, followed by a steel bristle brush to clean the conduit.
- C. After final assembly is in place, all conduits smaller than 2 inches shall be thoroughly cleaned and mandrelled by one of the following methods:
 - 1. Pulling through the conduits a mandrel and wire brush sized 1/4 inch maximum less than the inside diameter of the conduit for 1-1/2 inch and 1-1/4 inch conduits, and 1/8 inch maximum less than the inside diameter of the conduit for 1-inch and smaller conduits.
 - 2. Pulling through the conduits a cloth rag or conductor bundle sized 1/4 inch maximum less than the inside diameter of the conduit for 1-1/2 inch and 1-1/4 inch conduits, and 1/8 inch maximum less than the inside diameter of the conduit for 1-inch and smaller conduits.
- D. At the completion of mandrelling and cleaning, and before Final Acceptance, a 1/8 inch nylon pull cord shall be installed in each empty conduit. The pull cord shall remain accessible from each end at all times.

- E. If requested by the Engineer, mandrelling and cleaning shall be done in the presence of the Engineer. Notify the Engineer 7 days in advance of mandrelling.
- F. Where raceways are stubbed and capped, the pull cord shall extend through a drilled hole in the cap.
- G. Raceways which cannot meet the requirements for mandrelling shall be deemed defective, and shall be replaced as directed by the Engineer.

3.8 INSTALLATION AND OPERATION OF DIRECTIONAL BORING

- A. All personnel shall be fully trained in their respective duties as part of the directional boring crew and in safety. Training shall be provided specific to the project if any potential hazards may be encountered which has not already been included in personnel's training.
- B. Prior to any alterations to the work-site, the Contractor shall photograph the work area, including entry and exit points. Work site as indicated on the Contract Drawings, within right-of-way, shall be graded or filled to provide a level working area. No alterations beyond what is required for operations are to be made. The Contractor shall confine all activities to designated work areas.
- C. Entire drill path shall be accurately surveyed with entry and exit stakes placed in the appropriate locations within the areas indicated on the Contract Drawings. If the Contractor is using a magnetic guidance system, drill path will be surveyed for any surface geomagnetic variations or anomalies.
- D. The Contractor shall place silt fence between all boring operations and any drainage, wetland, waterway or other area designated for such protection by the Contract Documents, State, Federal and Local regulations. Additional environmental protection necessary to contain any hydraulic or boring fluid spills shall be put in place, including berms, liners, turbidity curtains and other measures. The Contractor shall adhere to all applicable environmental regulations. Fuel or oil may not be stored in bulk containers within 200 feet of any water-body or wetland.
- E. The Contractor shall notify all companies with underground utilities in the work area to obtain utility locates. Once the utilities have been located, the Contractor shall physically identify the exact location of the utilities by vacuum or hand excavation, when possible, in order to determine the actual location and path of any underground utilities which might be within 20 feet of the bore path. The Contractor shall not commence boring operations until the location of all underground utilities within the work area have been verified.
- F. Pipe shall be connected together in one length prior to pull-back operations, if space permits. Steel pipe welds will be x-rayed prior to being placed in bore hole. Pipe will be placed on pipe rollers before pulling into bore hole with rollers spaced close enough to prevent excessive sagging of pipe.
- G. Upon successful completion of pilot hole, the Contractor will ream bore hole to a minimum of 25% greater than outside diameter of pipe using the appropriate tools. The Contractor will not attempt to ream at one time more than the boring equipment and mud system are designed to safely handle.
- H. After reaming bore hole to the required diameter, the Contractor will pull the pipe through the bore hole. In front of the pipe will be a swivel. Once pull-back operations have commenced, operations must continue without interruption until pipe is completely pulled into bore hole. During pull-back operations the Contractor will not apply more than the maximum safe pipe pull pressure at any time. In the event that pipe becomes stuck, the Contractor will cease pulling operations to allow any potential hydro-lock to subside and will commence pulling operations.

- I. Following boring operations, the Contractor will de-mobilize equipment and restore the work-site to original condition. All excavations will be backfilled and compacted to 95% of original density. Landscaping will be restored to original.

PART 4 - MEASUREMENT AND PAYMENT

4.1 MEASUREMENT

- A. The quantities of accepted work will be measured in the following units. All measurements will be plan measure except for authorized changes.
 1. Description: Lump Sum

4.2 PAYMENT

- A. Payment will be made at the respective unit or lump-sum price listed in the proposal and shall be full compensation for all labor, materials, and equipment necessary to complete the respective unit in place. There will be no separate measurement or payment for any item of work not specifically identified and listed in the proposal, and all such work shall be considered a subsidiary item with all costs pertaining thereto included in the prices for other items listed in the proposal. At the Engineer's option, partial payment may be made for any lump sum item listed in the proposal, providing that the Contractor is diligently and satisfactorily pursuing full completion of such partially complete item in accordance with the approved job progress schedule.

END OF SECTION

THIS PAGE INTENTIONALLY LEFT BLANK

SECTION 26 05 33**RACEWAYS AND BOXES FOR ELECTRICAL SYSTEMS**

PART 1 - GENERAL

1.01 SUMMARY

A. Section Includes:

1. Metal conduits, tubing, and fittings.
2. Nonmetal conduits, tubing, and fittings.
3. Metal wireways and auxiliary gutters.
4. Nonmetal wireways and auxiliary gutters.
5. Surface raceways.
6. Boxes, enclosures, and cabinets.
7. Handholes and boxes for exterior underground cabling.

B. Related Requirements:

1. Division 26 Section "Underground Ducts and Raceways for Electrical Systems" for exterior ductbanks, manholes, and underground utility construction.
2. Division 27 Section "Pathways for Communications Systems" for conduits, wireways, surface pathways, innerduct, boxes, faceplate adapters, enclosures, cabinets, and handholes serving communications systems.

1.02 ACTION SUBMITTALS

A. Product Data: For surface raceways, wireways and fittings, floor boxes, hinged-cover enclosures, and cabinets.

B. Shop Drawings: For custom enclosures and cabinets. Include plans, elevations, sections, and attachment details.

C. LEED Submittals:

1. Product Data for Credit IEQ 4.1: For solvent cements and adhesive primers, documentation including printed statement of VOC content.
2. Laboratory Test Reports for IEQ 4: For solvent contents and adhesive primers, documentation indicating that products comply with the testing and product requirements of the California Department of Health Services' "Standard Practice for the Testing of Volatile Organic Emissions from Various Sources Using Small-Scale Environmental Chambers."

1.03 INFORMATIONAL SUBMITTALS

- A. Coordination Drawings: Conduit routing plans, drawn to scale, on which the following items are shown and coordinated with each other, using input from installers of items involved:
 - 1. Structural members in paths of conduit groups with common supports.
 - 2. HVAC and plumbing items and Design Professional features in paths of conduit groups with common supports.

PART 2 - PRODUCTS

2.01 METAL CONDUITS, TUBING, AND FITTINGS

- A. Listing and Labeling: Metal conduits, tubing, and fittings shall be listed and labeled as defined in NFPA 70, by a qualified testing agency, and marked for intended location and application.
- B. GRC: Comply with ANSI C80.1 and UL 6.
- C. IMC: Comply with ANSI C80.6 and UL 1242.
- D. PVC-Coated Steel Conduit: PVC-coated rigid steel conduit.
 - 1. Comply with NEMA RN 1.
 - 2. Coating Thickness: 0.040 inch, minimum.
- E. EMT: Comply with ANSI C80.3 and UL 797.
- F. FMC: Comply with UL 1; zinc-coated steel.
- G. LFMC: Flexible steel conduit with PVC jacket and complying with UL 360.
- H. Fittings for Metal Conduit: Comply with NEMA FB 1 and UL 514B.
 - 1. Conduit Fittings for Hazardous (Classified) Locations: Comply with UL 886 and NFPA 70.
 - 2. Fittings for GRC, IMC, EMT:
 - a. Material: Steel.
 - b. Type: Compression. Set screw type fittings shall not be allowed.
 - 3. Expansion Fittings: PVC or steel to match conduit type, complying with UL 651, rated for environmental conditions where installed, and including flexible external bonding jumper.
 - 4. Coating for Fittings for PVC-Coated Conduit: Minimum thickness of 0.040 inch, with overlapping sleeves protecting threaded joints.
- I. Joint Compound for IMC, or GRC: Approved, as defined in NFPA 70, by authorities having jurisdiction for use in conduit assemblies, and compounded for use to lubricate and protect threaded conduit joints from corrosion and to enhance their conductivity.

2.02 NONMETALLIC CONDUITS, TUBING, AND FITTINGS

- A. Listing and Labeling: Nonmetallic conduits, tubing, and fittings shall be listed and labeled as defined in NFPA 70, by a qualified testing agency, and marked for intended location and application.
- B. RNC: Type EPC-40-PVC, complying with NEMA TC 2 and UL 651 unless otherwise indicated.
- C. LFNC: Comply with UL 1660.
- D. Continuous HDPE: Comply with UL 651B.
- E. Coilable HDPE: Preassembled with conductors or cables, and complying with ASTM D 3485.
- F. Fittings for RNC: Comply with NEMA TC 3; match to conduit or tubing type and material.
- G. Fittings for LFNC: Comply with UL 514B.
- H. Solvent cements and adhesive primers shall have a VOC content of 510 and 550 g/L or less, respectively, when calculated according to 40 CFR 59, Subpart D (EPA Method 24).

2.03 METAL WIREWAYS AND AUXILIARY GUTTERS

- A. Description: Sheet metal, complying with UL 870 and NEMA 250, Type 1 or Type 3R unless otherwise indicated, and sized according to NFPA 70.
 - 1. Metal wireways installed outdoors shall be listed and labeled as defined in NFPA 70, by a qualified testing agency, and marked for intended location and application.
- B. Fittings and Accessories: Include covers, couplings, offsets, elbows, expansion joints, adapters, hold-down straps, end caps, and other fittings to match and mate with wireways as required for complete system.

2.04 SURFACE RACEWAYS

- A. Listing and Labeling: Surface raceways poles shall be listed and labeled as defined in NFPA 70, by a qualified testing agency, and marked for intended location and application.
- B. Surface Metal Raceways: Galvanized steel with snap-on covers complying with UL 5.
- C. Surface Nonmetallic Raceways: Two- or three-piece construction, complying with UL 5A, and manufactured of rigid PVC. Product shall comply with UL 94 V-0 requirements for self-extinguishing characteristics.

2.05 BOXES, ENCLOSURES, AND CABINETS

- A. General Requirements for Boxes, Enclosures, and Cabinets: Boxes, enclosures, and cabinets installed in wet locations shall be listed for use in wet locations.
- B. Sheet Metal Outlet and Device Boxes: Comply with NEMA OS 1 and UL 514A.
- C. Cast-Metal Outlet and Device Boxes: Comply with NEMA FB 1, ferrous alloy, Type FD, with gasketed cover.
- D. Nonmetallic Outlet and Device Boxes: Comply with NEMA OS 2 and UL 514C.
- E. Luminaire Outlet Boxes: Nonadjustable, designed for attachment of luminaire weighing a 50 lb. Outlet boxes designed for attachment of luminaires weighing more than 50 lb shall be listed and marked for the maximum allowable weight.
- F. Small Sheet Metal Pull and Junction Boxes: NEMA OS 1.
- G. Cast-Metal Access, Pull, and Junction Boxes: Comply with NEMA FB 1 and UL 1773, galvanized, cast iron with gasketed cover.
- H. Box extensions used to accommodate new building finishes shall be of same material as recessed box.
- I. Device Box Dimensions: 4 inches square by 2-1/8 inches deep.
- J. Gangable boxes are allowed.
- K. Hinged-Cover Enclosures: Comply with UL 50 and NEMA 250, Type 1 or Type 3R with continuous-hinge cover with flush latch unless otherwise indicated.
 - 1. Metal Enclosures: Steel, finished inside and out with manufacturer's standard enamel.
 - 2. Nonmetallic Enclosures: Plastic.
 - 3. Interior Panels: Steel; all sides finished with manufacturer's standard enamel.
- L. Cabinets:
 - 1. NEMA 250, Type 1 or Type 3R galvanized-steel box with removable interior panel and removable front, finished inside and out with manufacturer's standard enamel.
 - 2. Hinged door in front cover with flush latch and concealed hinge.
 - 3. Key latch to match panelboards.
 - 4. Metal barriers to separate wiring of different systems and voltage.
 - 5. Accessory feet where required for freestanding equipment.
 - 6. Nonmetallic cabinets shall be listed and labeled as defined in NFPA 70, by a qualified testing agency, and marked for intended location and application.

2.06 HANDHOLES AND BOXES FOR EXTERIOR UNDERGROUND WIRING

- A. General Requirements for Handholes and Boxes:

1. Boxes and handholes for use in underground systems shall be designed and identified as defined in NFPA 70, for intended location and application.
 2. Boxes installed in wet areas shall be listed and labeled as defined in NFPA 70, by a qualified testing agency, and marked for intended location and application.
- B. Polymer-Concrete Handholes and Boxes with Polymer-Concrete Cover: Molded of sand and aggregate, bound together with polymer resin, and reinforced with steel, fiberglass, or a combination of the two.
1. Standard: Comply with SCTE 77.
 2. Configuration: Designed for flush burial with open bottom unless otherwise indicated.
 3. Cover: Weatherproof, secured by tamper-resistant locking devices and having structural load rating consistent with enclosure and handhole location.
 4. Cover Finish: Nonskid finish shall have a minimum coefficient of friction of 0.50.
 5. Cover Legend: Molded lettering, "ELECTRIC" or as required.
 6. Conduit Entrance Provisions: Conduit-terminating fittings shall mate with entering ducts for secure, fixed installation in enclosure wall.

PART 3 - EXECUTION

3.01 RACEWAY APPLICATION

- A. Outdoors: Apply raceway products as specified below unless otherwise indicated:
1. Exposed Conduit: GRC.
 2. Concealed Conduit, Aboveground: EMT.
 3. Underground Conduit: RNC, Type EPC-40-PVC.
 4. Connection to Vibrating Equipment (Including Transformers and Hydraulic, Pneumatic, Electric Solenoid, or Motor-Driven Equipment): LFMC.
 5. Boxes and Enclosures, Aboveground: NEMA 250, Type 3R.
- B. Indoors: Apply raceway products as specified below unless otherwise indicated.
1. Exposed, Not Subject to Physical Damage: EMT.
 2. Exposed and Subject to Severe Physical Damage: GRC.
 3. Concealed in Ceilings and Interior Walls and Partitions: EMT.
 4. Connection to Vibrating Equipment (Including Transformers and Hydraulic, Pneumatic, Electric Solenoid, or Motor-Driven Equipment): FMC, except use LFMC in damp or wet locations.
 5. Damp or Wet Locations: GRC.
 6. Boxes and Enclosures: NEMA 250, Type 1, except use NEMA 250, Type 4 stainless steel in institutional and commercial kitchens and damp or wet locations.
- C. Minimum Raceway Size: 3/4-inch trade size.
- D. Raceway Fittings: Compatible with raceways and suitable for use and location.
1. Rigid and Intermediate Steel Conduit: Use threaded rigid steel conduit fittings unless otherwise indicated. Comply with NEMA FB 2.10.

2. PVC Externally Coated, Rigid Steel Conduits: Use only fittings listed for use with this type of conduit. Patch and seal all joints, nicks, and scrapes in PVC coating after installing conduits and fittings. Use sealant recommended by fitting manufacturer and apply in thickness and number of coats recommended by manufacturer.
 3. EMT: Use compression, steel fittings. Comply with NEMA FB 2.10.
 4. Flexible Conduit: Use only fittings listed for use with flexible conduit. Comply with NEMA FB 2.20.
- E. Aluminum conduits shall not be allowed.
- F. Install surface raceways only when recessed is not possible.
- G. Do not install nonmetallic conduit where ambient temperature exceeds 120 deg F.

3.02 INSTALLATION

- A. Comply with NECA 1 and NECA 101 for installation requirements except where requirements on Drawings or in this article are stricter. Comply with NFPA 70 limitations for types of raceways allowed in specific occupancies and number of floors.
- B. Keep raceways at least 6 inches away from parallel runs of flues and steam or hot-water pipes. Install horizontal raceway runs above water and steam piping.
- C. Comply with requirements in Division 26 Section "Hangers and Supports for Electrical Systems" for hangers and supports.
- D. Arrange stub-ups so curved portions of bends are not visible above finished slab.
- E. Install no more than the equivalent of three 90-degree bends in any conduit run except for control wiring conduits, for which fewer bends are allowed. Support within 12 inches of changes in direction.
- F. Conceal conduit and EMT within finished walls, ceilings, and floors unless otherwise indicated. Install conduits parallel or perpendicular to building lines.
- G. Support conduit within 12 inches of enclosures to which attached.
- H. Stub-ups to Above Recessed Ceilings:
1. Use EMT, IMC, or RMC for raceways.
 2. Use a conduit bushing or insulated fitting to terminate stub-ups not terminated in hubs or in an enclosure.
- I. Threaded Conduit Joints, Exposed to Wet, Damp, Corrosive, or Outdoor Conditions: Apply listed compound to threads of raceway and fittings before making up joints. Follow compound manufacturer's written instructions.
- J. Coat field-cut threads on PVC-coated raceway with a corrosion-preventing conductive compound prior to assembly.

- K. Raceway Terminations at Locations Subject to Moisture or Vibration: Use insulating bushings to protect conductors including conductors smaller than No. 4 AWG.
- L. Terminate threaded conduits into threaded hubs or with locknuts on inside and outside of boxes or cabinets. Install bushings on conduits up to 1-1/4-inch trade size and insulated throat metal bushings on 1-1/2-inch trade size and larger conduits terminated with locknuts. Install insulated throat metal grounding bushings on service conduits.
- M. Install pull wires in empty raceways. Use polypropylene or monofilament plastic line with not less than 200-lb tensile strength. Leave at least 12 inches of slack at each end of pull wire. Cap underground raceways designated as spare above grade alongside raceways in use.
- N. Surface Raceways:
 - 1. Install surface raceway with a minimum 2-inch radius control at bend points.
 - 2. Secure surface raceway with screws or other anchor-type devices at intervals not exceeding 48 inches and with no less than two supports per straight raceway section. Support surface raceway according to manufacturer's written instructions. Tape and glue are not acceptable support methods.
- O. Install raceway sealing fittings at accessible locations according to NFPA 70 and fill them with listed sealing compound. For concealed raceways, install each fitting in a flush steel box with a blank cover plate having a finish similar to that of adjacent plates or surfaces.

PART 4 - See Evaluations for discussion of types of and locations for raceway seals.

- A. Install devices to seal raceway interiors at accessible locations. Locate seals so no fittings or boxes are between the seal and the following changes of environments. Seal the interior of all raceways at the following points:
 - 1. Where conduits pass from warm to cold locations, such as boundaries of refrigerated spaces.
 - 2. Where an underground service raceway enters a building or structure.
 - 3. Where otherwise required by NFPA 70.
- B. Expansion-Joint Fittings:
 - 1. Install in each run of aboveground RNC that is located where environmental temperature change may exceed 30 deg F and that has straight-run length that exceeds 25 feet.
 - 2. Install type and quantity of fittings that accommodate temperature change listed for each of the following locations:
 - a. Outdoor Locations Not Exposed to Direct Sunlight: 125 deg F temperature change.
 - b. Outdoor Locations Exposed to Direct Sunlight: 155 deg F temperature change.
 - c. Indoor Spaces Connected with Outdoors without Physical Separation: 125 deg F temperature change.
 - d. Attics: 135 deg F temperature change.

3. Install fitting(s) that provide expansion and contraction for at least 0.00041 inch per foot of length of straight run per degree F of temperature change for PVC conduits.
 4. Install expansion fittings at all locations where conduits cross building or structure expansion joints.
 5. Install each expansion-joint fitting with position, mounting, and piston setting selected according to manufacturer's written instructions for conditions at specific location at time of installation. Install conduit supports to allow for expansion movement.
- C. Flexible Conduit Connections: Comply with NEMA RV 3. Use a maximum of 72 inches of flexible conduit for recessed luminaires, equipment subject to vibration, noise transmission, or movement; and for transformers and motors.
1. Use LFMC in damp or wet locations subject to severe physical damage.
 2. Use LFMC or LFNC in damp or wet locations not subject to severe physical damage.
- D. Mount boxes at heights indicated on Drawings. If mounting heights of boxes are not individually indicated, give priority to ADA requirements. Install boxes with height measured to center of box unless otherwise indicated.
- E. Recessed Boxes in Masonry Walls: Saw-cut opening for box in center of cell of masonry block, and install box flush with surface of wall. Prepare block surfaces to provide a flat surface for a raintight connection between the box and cover plate or the supported equipment and box.
- F. Horizontally separate boxes mounted on opposite sides of walls so they are not in the same vertical channel.
- G. Locate boxes so that cover or plate will not span different building finishes.
- H. Support boxes of three gangs or more from more than one side by spanning two framing members or mounting on brackets specifically designed for the purpose.
- I. Fasten junction and pull boxes to or support from building structure. Do not support boxes by conduits.

4.02 INSTALLATION OF UNDERGROUND CONDUIT

- A. Underground Conduit:
1. Excavate trench bottom to provide firm and uniform support for conduit. Prepare trench bottom as specified in Division 31 Section "Earth Moving" for pipe less than 6 inches in nominal diameter.
 2. Install backfill as specified in Division 31 Section "Earth Moving."
 3. After installing conduit, backfill and compact. Start at tie-in point, and work toward end of conduit run, leaving conduit at end of run free to move with expansion and contraction as temperature changes during this process. Firmly hand tamp backfill around conduit to provide maximum supporting strength. After placing controlled backfill to within 12 inches of finished grade, make final

conduit connection at end of run and complete backfilling with normal compaction as specified in Division 31 Section "Earth Moving."

4. Install manufactured duct elbows for stub-up at poles and equipment and at building entrances through floor unless otherwise indicated. Encase elbows for stub-up ducts throughout length of elbow.
5. Install manufactured rigid steel conduit elbows for stub-ups at poles and equipment and at building entrances through floor.
 - a. Couple steel conduits to ducts with adapters designed for this purpose, and encase coupling with 3 inches of concrete for a minimum of 12 inches on each side of the coupling.
 - b. For stub-ups at equipment mounted on outdoor concrete bases and where conduits penetrate building foundations, extend steel conduit horizontally a minimum of 60 inches from edge of foundation or equipment base. Install insulated grounding bushings on terminations at equipment.
6. Underground Warning Tape: Comply with requirements in Division 26 Section "Identification for Electrical Systems."

4.03 INSTALLATION OF UNDERGROUND HANDHOLES AND BOXES

- A. Install handholes and boxes level and plumb and with orientation and depth coordinated with connecting conduits to minimize bends and deflections required for proper entrances.
- B. Unless otherwise indicated, support units on a level bed of crushed stone or gravel, graded from 1/2-inch sieve to No. 4 sieve and compacted to same density as adjacent undisturbed earth.
- C. Elevation: In paved areas, set so cover surface will be flush with finished grade. Set covers of other enclosures 1 inch above finished grade.
- D. Install handholes with bottom below frost line, below grade.
- E. Field-cut openings for conduits according to enclosure manufacturer's written instructions. Cut wall of enclosure with a tool designed for material to be cut. Size holes for terminating fittings to be used, and seal around penetrations after fittings are installed.

4.04 SLEEVE AND SLEEVE-SEAL INSTALLATION FOR ELECTRICAL PENETRATIONS

- A. Install sleeves and sleeve seals at penetrations of exterior floor and wall assemblies. Comply with requirements in Division 26 Section "Sleeves and Sleeve Seals for Electrical Raceways and Cabling."

4.05 PROTECTION

- A. Protect coatings, finishes, and cabinets from damage and deterioration.

1. Repair damage to galvanized finishes with zinc-rich paint recommended by manufacturer.
2. Repair damage to PVC coatings or paint finishes with matching touchup coating recommended by manufacturer.

END OF SECTION 26 05 33

SECTION 26 05 43**UNDERGROUND DUCTS AND RACEWAYS FOR ELECTRICAL SYSTEMS****PART 1 - GENERAL****1.01 SUMMARY**

- A. This Section includes the following:
 - 1. Conduit, ducts, and duct accessories for direct-buried and concrete-encased duct banks.
 - 2. Handholes and boxes.

1.02 ACTION SUBMITTALS

- A. Product Data: For accessories for manholes, handholes, and boxes.
- B. Shop Drawings for Factory-Fabricated Handholes and Boxes: Include dimensioned plans, sections, and elevations, and fabrication and installation details, including the following:
 - 1. Duct entry provisions, including locations and duct sizes.
 - 2. Cover design.
 - 3. Grounding details.
 - 4. Dimensioned locations of cable rack inserts, and pulling-in and lifting irons.

1.03 INFORMATIONAL SUBMITTALS

- A. Field quality-control test reports.

1.04 QUALITY ASSURANCE

- A. Comply with ANSI C2.
- B. Comply with NFPA 70.

PART 2 - PRODUCTS**2.01 CONDUIT**

- A. RNC: NEMA TC 2, Type EPC-40-PVC, UL 651, with matching fittings by same manufacturer as the conduit, complying with NEMA TC 3 and UL 514B.

2.02 NONMETALLIC DUCTS AND DUCT ACCESSORIES

- A. Available Manufacturers: Subject to compliance with requirements, manufacturers offering products that may be incorporated into the Work include, but are not limited to, the following:
1. ARNCO Corp.
 2. Beck Manufacturing.
 3. Cantex, Inc.
 4. CertainTeed Corp.; Pipe & Plastics Group.
 5. Condux International, Inc.
 6. ElecSys, Inc.
 7. Electri-Flex Company.
 8. IPEX Inc.
 9. Lamson & Sessions; Carlon Electrical Products.
 10. Manhattan/CDT; a division of Cable Design Technologies.
 11. Spiraduct/AFC Cable Systems, Inc.
- B. Underground Plastic Utilities Duct: NEMA TC 6 & 8, Type EB-20-PVC, ASTM F 512, UL 651A, with matching fittings by the same manufacturer as the duct, complying with NEMA TC 9.
- C. Duct Accessories:
1. Duct Separators: Factory-fabricated rigid PVC interlocking spacers, sized for type and sizes of ducts with which used, and selected to provide minimum duct spacings indicated while supporting ducts during concreting or backfilling.
 2. Warning Tape: Underground-line warning tape specified in Division 26 Section "Identification for Electrical Systems."
 3. Concrete Warning Planks: Nominal 12 by 24 by 3 inches in size, manufactured from 6000-psi concrete.
 - a. Color: Red dye added to concrete during batching.
 - b. Mark each plank with "ELECTRIC" in 2-inch- high, 3/8-inch- deep letters.

2.03 HANDHOLES AND BOXES

- A. Description: Comply with SCTE 77.
1. Color: Gray.
 2. Configuration: Units shall be designed for flush burial and have open bottom, unless otherwise indicated.
 3. Cover: Weatherproof, secured by tamper-resistant locking devices and having structural load rating consistent with enclosure.
 4. Cover Finish: Nonskid finish shall have a minimum coefficient of friction of 0.50.
 5. Cover Legend: Molded lettering, "ELECTRIC." Or "TELEPHONE."
 6. Duct Entrance Provisions: Duct-terminating fittings shall mate with entering ducts for secure, fixed installation in enclosure wall.
 7. Handholes 12 inches wide by 24 inches long and larger shall have inserts for cable racks and pulling-in irons installed before concrete is poured.

- B. Fiberglass Handholes and Boxes with Polymer Concrete Frame and Cover: Sheet-molded, fiberglass-reinforced, polyester resin enclosure joined to polymer concrete top ring or frame.
1. Available Manufacturers: Subject to compliance with requirements, manufacturers offering products that may be incorporated into the Work include, but are not limited to, the following:
 - a. Armorcast Products Company.
 - b. Carson Industries LLC.
 - c. Christy Concrete Products.
 - d. Synertech Moulded Products, Inc.; a division of Oldcastle Precast.

PART 3 - EXECUTION

3.01 EARTHWORK

- A. Excavation and Backfill: Comply with Division 31 Section "Earth Moving," but do not use heavy-duty, hydraulic-operated, compaction equipment.
- B. Restore surface features at areas disturbed by excavation and reestablish original grades, unless otherwise indicated. Replace removed sod immediately after backfilling is completed.
- C. Restore areas disturbed by trenching, storing of dirt, cable laying, and other work. Restore vegetation and include necessary topsoiling, fertilizing, liming, seeding, sodding, sprigging, and mulching. Comply with Division 32 Sections "Turf and Grasses" and "Plants."
- D. Cut and patch existing pavement in the path of underground ducts and utility structures according to Division 01 Section "Cutting and Patching."

3.02 DUCT INSTALLATION

- A. Slope: Pitch ducts a minimum slope of 1:300 down toward manholes and handholes and away from buildings and equipment. Slope ducts from a high point in runs between two manholes to drain in both directions.
- B. Curves and Bends: Use 5-degree angle couplings for small changes in direction. Use manufactured long sweep bends with a minimum radius of 48 inches, both horizontally and vertically, at other locations, unless otherwise indicated.
- C. Joints: Use solvent-cemented joints in ducts and fittings and make watertight according to manufacturer's written instructions. Stagger couplings so those of adjacent ducts do not lie in same plane.
- D. Duct Entrances to Manholes and Concrete and Polymer Concrete Handholes: Use end bells, spaced approximately 10 inches o.c. for 5-inch ducts, and vary proportionately for other duct sizes.

1. Begin change from regular spacing to end-bell spacing 10 feet from the end bell without reducing duct line slope and without forming a trap in the line.
 2. Direct-Buried Duct Banks: Install an expansion and deflection fitting in each conduit in the area of disturbed earth adjacent to manhole or handhole.
 3. Grout end bells into structure walls from both sides to provide watertight entrances.
- E. Building Wall Penetrations: Make a transition from underground duct to rigid steel conduit at least 10 feet outside the building wall without reducing duct line slope away from the building, and without forming a trap in the line. Use fittings manufactured for duct-to-conduit transition. Install conduit penetrations of building walls as specified in Division 26 Section "Sleeves and Sleeve Seals for Electrical Raceways and Cabling."
- F. Sealing: Provide temporary closure at terminations of ducts that have cables pulled. Seal spare ducts at terminations. Use sealing compound and plugs to withstand at least 15-psig hydrostatic pressure.
- G. Pulling Cord: Install 100-lbf- test nylon cord in ducts, including spares.
- 3.03 INSTALLATION OF HANDHOLES AND BOXES OTHER THAN PRECAST CONCRETE
- A. Install handholes and boxes level and plumb and with orientation and depth coordinated with connecting ducts to minimize bends and deflections required for proper entrances. Use box extension if required to match depths of ducts, and seal joint between box and extension as recommended by the manufacturer.
- B. Unless otherwise indicated, support units on a level bed of crushed stone or gravel, graded from 1/2-inch sieve to No. 4 sieve and compacted to same density as adjacent undisturbed earth.
- C. Elevation: In paved areas and trafficways, set so cover surface will be flush with finished grade. Set covers of other handholes 1 inch above finished grade.
- D. Install handholes and boxes with bottom below the frost line, below grade.
- E. Install removable hardware, including pulling eyes, cable stanchions, cable arms, and insulators, as required for installation and support of cables and conductors and as indicated. Select arm lengths to be long enough to provide spare space for future cables, but short enough to preserve adequate working clearances in the enclosure.
- F. Field-cut openings for ducts and conduits according to enclosure manufacturer's written instructions. Cut wall of enclosure with a tool designed for material to be cut. Size holes for terminating fittings to be used, and seal around penetrations after fittings are installed.

3.04 GROUNDING

- A. Ground underground ducts and utility structures according to Division 26 Section "Grounding and Bonding for Electrical Systems."

3.05 FIELD QUALITY CONTROL

- A. Perform the following field tests and inspections and prepare test reports:
 - 1. Demonstrate capability and compliance with requirements on completion of installation of underground ducts and utility structures.
 - 2. Pull aluminum or wood test mandrel through duct to prove joint integrity and test for out-of-round duct. Provide mandrel equal to 80 percent fill of duct. If obstructions are indicated, remove obstructions and retest.
 - 3. Test handhole grounding to ensure electrical continuity of grounding and bonding connections. Measure and report ground resistance as specified in Division 26 Section "Grounding and Bonding for Electrical Systems."
- B. Correct deficiencies and retest as specified above to demonstrate compliance.

3.06 CLEANING

- A. Pull leather-washer-type duct cleaner, with graduated washer sizes, through full length of ducts. Follow with rubber duct swab for final cleaning and to assist in spreading lubricant throughout ducts.
- B. Clean internal surfaces of manholes, including sump. Remove foreign material.

END OF SECTION 26 05 43

SECTION 26 05 43**SYSTEMWIDE ELECTRICAL UNDERGROUND DUCTBANKS AND RACEWAYS FOR SYSTEMS****PART 1 - GENERAL****1.1 SUMMARY**

- A. This Work includes providing ductbanks as shown on the Contract Drawings and as specified herein. Ductbanks shall be defined as one or more raceways and fitting combinations embedded in steel reinforced concrete, non-steel reinforced concrete, Controlled Density Fill (CDF) concrete, or sand.
- B. Raceways emerging from ductbanks and direct-buried shall comply with the requirements of SECTION 26 05 00 – Systemwide Electrical General Requirements for Systems and SECTION 26 05 33 – Systemwide Electrical Raceways for Systems.

1.2 RELATED SECTIONS

- A. SECTION 01 43 00 – Systems Quality Assurance
- B. SECTION 03 20 00 – Concrete Reinforcing
- C. SECTION 26 05 00.13 – Systemwide Electrical General Requirements for Systems
- D. SECTION 26 05 33.13 – Systemwide Electrical Raceways for Systems
- E. SECTION 31 23 33 – Utility Trenching and Backfilling

1.3 REFERENCES AND STANDARDS

- A. Institute of Electrical and Electronic Engineers (IEEE)
 - 1. IEEE C2 National Electrical Safety Code (NESC)
- B. National Fire Protection Association (NFPA)
 - 1. NFPA 70 National Electrical Code (NEC)

1.4 QUALITY ASSURANCE/QUALITY CONTROL

- A. Quality Assurance/Quality Control shall be carried out in accordance with the requirements of SECTION 01 43 00 Systems Quality Assurance.
- B. As-built drawings shall be provided in accordance with the requirements of SECTION 26 05 00.13 – Systemwide Electrical General Requirements for Systems, except as modified herein.
- C. As-built drawings shall show the location of all underground ductbanks and the number and size of conduits therein.
- D. Comply with ANSI/IEEE C2.
- E. Comply with NFPA 70.

1.5 SUBMITTALS

- A. Submittals shall be made in accordance with the requirements of SECTION 26 05 00.13 – Systemwide Electrical General Requirements for Systems, except as modified herein.
- B. Mandrel Log

PART 2 - PRODUCTS**2.1 RACEWAYS**

- A. Raceways, fittings and labels shall comply with SECTION 26 05 33.13 – Systemwide Electrical Raceways for Systems.
- B. Raceway spacers shall be plastic, lock together, and be sized to create clear spaces of 3 inches or greater between Traction Electrification (TE) or Medium-Voltage raceways and 1-1/2 inches or greater between all other raceways between raceways as indicated. Approved manufacturers are Carlon, PW Pipe, or approved equal.

2.2 WARNING TAPE

- A. Tape shall be heavy-gauge, yellow, plastic for direct burial, 6-inch minimum width for use in trenches containing electric circuits. Tape shall be made of material resistant to corrosive soil. Tape shall have printed warning that an electric circuit is located below the tape. Approved manufacturers and types are ITT Blackburn Type YT, Griffolyn Co., Terra-Tape, or approved equal.

2.3 ENCASEMENT AND REINFORCEMENT

- A. Concrete encasement and steel reinforcement for lateral ductbank runs shall be in accordance with SECTION 03 20 00 – Concrete Reinforcing.
 - 1. Mainline ductbank runs shall be CDF concrete, or sand.
 - 2. Signals/Communications (SC) lateral runs shall be 1500 psi concrete.
 - 3. Traction Electrification (TE) lateral runs from Substation foundations and DC switches to trackway shall be red 3000 psi concrete and No. 4 steel reinforced.
 - 4. TE lateral runs in trackway shall be red 3000 psi concrete with no steel reinforcement.
 - 5. TE lateral runs from manhole to Overhead Contact System (OCS) pole foundation in trackway shall be red 3000 psi concrete with no steel reinforcement.

2.4 RED CONCRETE

- A. Red concrete shall be made by mixing-in Tilered dye in a ratio of 3 pounds per sack of cement.
- B. Red concrete shall be used to encase all medium, high voltage and TE ductbanks.
- C. Red concrete shall be 3000 psi with 4 inch slump.

PART 3 - EXECUTION**3.1 GENERAL**

- A. Where required to support trench, construct formwork in accordance with SECTION 31 23 33 – Utility Trenching And Backfilling.
- B. Coordinate installation of underground raceways with other construction Work. Maintain any existing utilities in operation unless otherwise directed by the Engineer.
- C. Concrete encasement shall be limited to the neat lines shown on the Contract Documents. The Contractor shall be responsible for coordinating placement of the concrete with other Work. If the ductbank conflicts with other Work it shall be relocated by Contractor at no additional cost to KCMO.
- D. Protect and maintain all new or existing benchmarks or other reference points necessary for the completion of the Work.
- E. Where galvanized rigid steel conduit (GRSC) and fittings are used encased in concrete, use polyvinyl chloride (PVC) coated GRSC in accordance with SECTION 26 05 33.13 – Systemwide Electrical Raceways for Systems.
- F. Many ducts will be empty and conductors will be installed in the future. All ducts installed for future use shall have a nylon pull-cord installed and secured at each end.
- G. All ductbanks shall have a trace wire installed along its entire length initiating from a manhole and terminating at the ductbanks end. Trace wires installed within a manhole shall be terminated within an appropriately rated enclosure on a terminal strip and identified with its corresponding ductbank number. Tie-in trace wires to the existing conduits installed in prior contracts.

3.2 TRENCH EXCAVATION AND BACKFILL

- A. Follow the requirements SECTION 31 23 33 – Utility Trenching And Backfilling, except blasting will not be permitted. Provide a minimum cover of 24 inches over all underground ductbanks unless otherwise indicated. Measurement shall be taken from finished grade of track slab to top of ductbank encasement. Leave minimum 3 inches between track slab bottom and top of ductbank encasement.
- B. When trench walls are stable, use the walls of the trench as forms for concrete encasement. The trench shall be made no wider than necessary to provide the nominal concrete encased ductbank.
- C. Excavations shall be dewatered and the excavation cleaned prior to raceway and concrete placement.
- D. Provide a compacted base under the ductbank.
- E. Install yellow warning tape 3 inches above ductbank encasement.

3.3 REQUIREMENTS FOR RACEWAY TYPES

- A. Galvanized rigid steel conduit (GRSC) or PVC/GRSC shall be used for pre-fabricated 90 degree bends in PVC conduit runs where the bend radius is less than 6 feet. Minimum permissible bend radius is 36 inches.

- B. Schedule 40 PVC conduit may be used for bends in PVC ductbanks if the bend radius is greater than 6 feet (90 degrees of bend in 9.5 feet of conduit length). Bends in PVC conduit shall be factory pre-fabricated bends or field bent. Field bends in PVC conduit with less than a 100-foot radius shall be formed hot using only a heater recommended by the conduit manufacturer. Use conduit plugs during bending for conduit 2 inches and larger. Remove plugs only after conduit has cooled. Field bends with a radius greater than 100 feet may be formed cold. When placing cold bends, maintain adequate spacing from the inside of the bend to excavation walls for the required 3 inches of concrete.

3.4 RACEWAY PLACEMENT

- A. Raceways shall be arranged as shown on the Contract Drawings.
- B. Generally the ductbank is located below the track slab at a minimum depth of 24 inches below finished grade. Leave minimum 3 inches between track slab bottom and top of ductbank encasement. Lateral ductbank crossing below the track is permitted as long as the ductbank meets the minimum depth requirements. Where obstacles are encountered the ductbank shall gradually offset around them and must meet the concrete-encasement and conduit bending requirements.
- C. Traction Electrification ductbank is located below the track slab at a minimum depth of 24 inches below finished grade. Traction Electrification ductbank located outside of the track slab shall be installed at a minimum depth of 24 inches below finished grade.
- D. Ductbanks for utility systems shall maintain a minimum 5 foot horizontal separation unless otherwise indicated on the Contract Drawings or Approved by the Engineer.
- E. Slope all raceway for drainage to manholes or handholes away from buildings.
- F. Raceway spacers shall be placed at maximum 5-foot intervals. Bending radii indicated on the Contract Drawings and specified herein are to be considered minimum, unless noted otherwise.
- G. Terminate all PVC conduit ductbank entering the manholes from the sidewall with approved bell ends glued to the ends of the PVC conduits or term-a-duct.
- H. Secure raceways to prevent displacement during concrete encasement or earth backfilling. Make minor changes in location or cross-section as necessary to avoid obstructions or conflicts. Where raceway runs cannot be installed as shown because of conditions not discoverable prior to trenching, refer the condition to the Engineer for direction before further work is done.
- I. When placing concrete around the raceways, adjust the delivery chute so the fall distance of the concrete into the trench is minimal. Concrete direct fall distance shall be 2 feet or less. Use a splash board to divert the flow of concrete away from the trench sides and avoid dislodging soil and stones.
- J. As concrete is poured, mechanically vibrate the concrete continuously to eliminate voids and consolidate it around the reinforcing steel and conduits. Do not over vibrate.
- K. All plastic raceways may expand or contract as concrete is placed and cured. Therefore, when placing concrete encasement, always encase from one end of the duct section toward the other end to allow the free end to move. Never encase from each end of the section toward the center.
- L. Place concrete continuously between manholes, handholes and pullboxes. If the placement stops for more than 2 hours, 8 foot lengths of No. 4 reinforcement steel shall be placed longitudinally around the perimeter of the concrete envelope on 12 inch centers and with 2 inches minimum cover. Half of each 8-foot length shall be in each pour.

- M. Mandrel raceways and provide seals in accordance with SECTION 26 05 33.13 – Systemwide Electrical Raceways For Systems. Ductbank conduits shall be mandrelled after concrete encasement but before backfilling.

3.5 INSPECTION

- A. Ductbanks shall be inspected by the Engineer before placing concrete encasement. Notify the Engineer before placing concrete. Clean trenches, dewater and adjust clearances as directed to obtain the minimum concrete dimensions shown on the Contract Drawings.

PART 4 - MEASUREMENT AND PAYMENT

4.1 MEASUREMENT

- A. The quantities of accepted work will be measured in the following units. All measurements will be plan measure except for authorized changes.
1. Description: Lump Sum

4.2 PAYMENT

- A. Payment will be made at the respective unit or lump-sum price listed in the proposal and shall be full compensation for all labor, materials, and equipment necessary to complete the respective unit in place. There will be no separate measurement or payment for any item of work not specifically identified and listed in the proposal, and all such work shall be considered a subsidiary item with all costs pertaining thereto included in the prices for other items listed in the proposal. At the Engineer's option, partial payment may be made for any lump sum item listed in the proposal, providing that the Contractor is diligently and satisfactorily pursuing full completion of such partially complete item in accordance with the approved job progress schedule.

END OF SECTION

THIS PAGE INTENTIONALLY LEFT BLANK

SECTION 26 05 44**SLEEVES AND SLEEVE SEALS FOR ELECTRICAL RACEWAYS AND CABLING****PART 1 - GENERAL****1.01 SUMMARY****A. Section Includes:**

1. Sleeves for raceway and cable penetration of non-fire-rated construction walls and floors.
2. Sleeve-seal systems.
3. Sleeve-seal fittings.
4. Grout.
5. Silicone sealants.

B. Related Requirements:

1. Section 07 84 13 "Penetration Firestopping" for penetration firestopping installed in fire-resistance-rated walls, horizontal assemblies, and smoke barriers, with and without penetrating items.

1.02 ACTION SUBMITTALS**A. Product Data:** For each type of product.**B. LEED Submittals:**

1. Product Data for Credit EQ 4.1: For sealants, documentation including printed statement of VOC content.
2. Laboratory Test Reports for Credit EQ 4: For sealants, documentation indicating that products comply with the testing and product requirements of the California Department of Health Services' "Standard Practice for the Testing of Volatile Organic Emissions from Various Sources Using Small-Scale Environmental Chambers."

PART 2 - PRODUCTS**2.01 SLEEVES****A. Wall Sleeves:**

1. Cast-Iron Pipe Sleeves: Cast or fabricated "wall pipe," equivalent to ductile-iron pressure pipe, with plain ends and integral waterstop unless otherwise indicated.

- B. Sleeves for Conduits Penetrating Non-Fire-Rated Gypsum Board Assemblies: Galvanized-steel sheet; 0.0239-inch minimum thickness; round tube closed with welded longitudinal joint, with tabs for screw-fastening the sleeve to the board.
- C. Sleeves for Rectangular Openings:
 - 1. Material: Galvanized sheet steel.
 - 2. Minimum Metal Thickness:
 - a. For sleeve cross-section rectangle perimeter less than 50 inches and with no side larger than 16 inches, thickness shall be 0.052 inch.
 - b. For sleeve cross-section rectangle perimeter 50 inches or more and one or more sides larger than 16 inches, thickness shall be 0.138 inch.

2.02 SLEEVE-SEAL SYSTEMS

- A. Description: Modular sealing device, designed for field assembly, to fill annular space between sleeve and raceway or cable.
 - 1. Manufacturers: Subject to compliance with requirements, available manufacturers offering products that may be incorporated into the Work include, but are not limited to, the following:
 - a. Advance Products & Systems, Inc.
 - b. CALPICO, Inc.
 - c. Metraflex Company (The).
 - d. Pipeline Seal and Insulator, Inc.
 - e. Proco Products, Inc.
 - 2. Sealing Elements: EPDM rubber interlocking links shaped to fit surface of pipe. Include type and number required for pipe material and size of pipe.
 - 3. Pressure Plates: Carbon steel.
 - 4. Connecting Bolts and Nuts: Carbon steel, with corrosion-resistant coating, of length required to secure pressure plates to sealing elements.

2.03 SLEEVE-SEAL FITTINGS

- A. Description: Manufactured plastic, sleeve-type, waterstop assembly made for embedding in concrete slab or wall. Unit shall have plastic or rubber waterstop collar with center opening to match piping OD.
 - 1. Manufacturers: Subject to compliance with requirements, available manufacturers offering products that may be incorporated into the Work include, but are not limited to, the following:
 - a. Presealed Systems.

2.04 GROUT

- A. Description: Nonshrink; recommended for interior and exterior sealing openings in non-fire-rated walls or floors.

- B. Standard: ASTM C 1107/C 1107M, Grade B, post-hardening and volume-adjusting, dry, hydraulic-cement grout.
- C. Design Mix: 5000-psi, 28-day compressive strength.
- D. Packaging: Premixed and factory packaged.

2.05 SILICONE SEALANTS

- A. Silicone Sealants: Single-component, silicone-based, neutral-curing elastomeric sealants of grade indicated below.
 - 1. Grade: Pourable (self-leveling) formulation for openings in floors and other horizontal surfaces that are not fire rated.
 - 2. Sealant shall have VOC content less than when calculated according to 40 CFR 59, Subpart D (EPA Method 24).
 - 3. Sealant shall comply with the testing and product requirements of the California Department of Health Services' "Standard Practice for the Testing of Volatile Organic Emissions from Various Sources Using Small-Scale Environmental Chambers."
- B. Silicone Foams: Multicomponent, silicone-based liquid elastomers that, when mixed, expand and cure in place to produce a flexible, nonshrinking foam.

PART 3 - EXECUTION

3.01 SLEEVE INSTALLATION FOR NON-FIRE-RATED ELECTRICAL PENETRATIONS

- A. Comply with NECA 1.
- B. Comply with NEMA VE 2 for cable tray and cable penetrations.
- C. Sleeves for Conduits Penetrating Above-Grade Non-Fire-Rated Concrete and Masonry-Unit Floors and Walls:
 - 1. Interior Penetrations of Non-Fire-Rated Walls and Floors:
 - a. Seal annular space between sleeve and raceway or cable, using joint sealant appropriate for size, depth, and location of joint. Comply with requirements in Division 07 Section "Joint Sealants."
 - b. Seal space outside of sleeves with mortar or grout. Pack sealing material solidly between sleeve and wall so no voids remain. Tool exposed surfaces smooth; protect material while curing.
 - 2. Use pipe sleeves unless penetration arrangement requires rectangular sleeved opening.
 - 3. Size pipe sleeves to provide 1/4-inch annular clear space between sleeve and raceway or cable unless sleeve seal is to be installed.

4. Install sleeves for wall penetrations unless core-drilled holes or formed openings are used. Install sleeves during erection of walls. Cut sleeves to length for mounting flush with both surfaces of walls. Deburr after cutting.
 5. Install sleeves for floor penetrations. Extend sleeves installed in floors 2 inches above finished floor level. Install sleeves during erection of floors.
- D. Sleeves for Conduits Penetrating Non-Fire-Rated Gypsum Board Assemblies:
1. Use circular metal sleeves unless penetration arrangement requires rectangular sleeved opening.
 2. Seal space outside of sleeves with approved joint compound for gypsum board assemblies.
- E. Roof-Penetration Sleeves: Seal penetration of individual raceways and cables with flexible boot-type flashing units applied in coordination with roofing work.
- F. Aboveground, Exterior-Wall Penetrations: Seal penetrations using cast-iron pipe sleeves and mechanical sleeve seals. Select sleeve size to allow for 1-inch annular clear space between pipe and sleeve for installing mechanical sleeve seals.
- G. Underground, Exterior-Wall and Floor Penetrations: Install cast-iron pipe sleeves. Size sleeves to allow for 1-inch annular clear space between raceway or cable and sleeve for installing sleeve-seal system.

3.02 SLEEVE-SEAL-SYSTEM INSTALLATION

- A. Install sleeve-seal systems in sleeves in exterior concrete walls and slabs-on-grade at raceway entries into building.
- B. Install type and number of sealing elements recommended by manufacturer for raceway or cable material and size. Position raceway or cable in center of sleeve. Assemble mechanical sleeve seals and install in annular space between raceway or cable and sleeve. Tighten bolts against pressure plates that cause sealing elements to expand and make watertight seal.

3.03 SLEEVE-SEAL-FITTING INSTALLATION

- A. Install sleeve-seal fittings in new walls and slabs as they are constructed.
- B. Assemble fitting components of length to be flush with both surfaces of concrete slabs and walls. Position waterstop flange to be centered in concrete slab or wall.
- C. Secure nailing flanges to concrete forms.
- D. Using grout, seal the space around outside of sleeve-seal fittings.

END OF SECTION 26 05 44

SECTION 26 05 44**SYSTEMWIDE ELECTRICAL MANHOLES AND HANDHOLES FOR SYSTEMS****PART 1 - GENERAL****1.1 SUMMARY**

- A. This Work includes providing manholes and handholes as shown and as specified.
- B. Also included are excavation and backfill, accessories including covers, raceway termination and fittings, grounding, cable supports, cable pulling provisions, raceway labeling and drainage.

1.2 RELATED SECTIONS

- A. SECTION 26 05 00.13 – Systemwide Electrical General Requirements for Systems
- B. SECTION 26 05 26.13 – Systemwide Electrical Grounding for Systems
- C. SECTION 01 43 00 – Systems Quality Assurance

1.3 REFERENCES AND STANDARDS

- A. American Association of State Highway and Transportation Officials (AASHTO)
 - 1. AASHTO M 105 Manhole Frames and Covers
- B. American National Standards Institute/Society of Cable Telecommunications Engineers (ANSI/SCTE)
 - 1. ANSI/SCTE 77-2002 Specification for Underground Enclosure Integrity

1.4 QUALITY ASSURANCE

- A. Quality Assurance/Quality Control shall be in accordance with the requirements of SECTION 01 43 00 – Systems Quality Assurance, except as modified herein.

1.5 SUBMITTALS

- A. Submittals shall be made in accordance with the requirements of SECTION 26 05 00.13 – Systemwide Electrical General Requirements For Systems, except as modified herein.
- B. Items required to be submitted by the Contractor for Approval include, but are not limited to, the following:
 - 1. Product data for cable supports (racks)
 - 2. Product data for cable insulators
 - 3. Product data for pulling iron
 - 4. Product data for concrete damp proofing compound
 - 5. Shop drawings for manholes (each type) including cover and frame, cable supports and inserts, and any required extension sections.
 - 6. Shop drawings for handholes and manholes, including cover and frame, and any required extension sections.

PART 2 - PRODUCTS**2.1 PRECAST CONCRETE MANHOLES**

- A. Manholes shall be precast with 28-day, 4,500 psi or greater compressive strength concrete and designed for AASHTO H-20/HS-20 loading. Minimum dimensions for manholes are shown on the Contract Drawings. Extension sections shall be used to increase vertical dimensions to those shown on the Contract Drawings.
- B. Manholes shall provide raceway entrances on all four sides. Knockout panels or precast individual raceway openings may be used. On sides where no raceways are installed, provide knockout panels for future raceway installation. Provide knockout(s) or sleeves for ground rods.
- C. Manhole covers shall be identified by inscription according to the Contract Drawings.
- D. In manholes, provide heavy duty non-metallic cable racks with adjustable arms. Cable racks shall be compatible for use with the specific manhole submitted. Inserts for installation of cable racks shall be installed as an integral part of the manhole by the manufacturer and attachment hardware shall be 316 Stainless Steel. Do not use bolts or studs embedded in concrete for attaching racks. Unless otherwise specified, set racks and inserts on not greater than 3-foot centers around the entire inside perimeter of the manhole, arranged so that all raceway ends are clear for future cable installation. Manhole stanchions shall have two 4-inch arms each. Manhole racking shall comply with the clear working space requirements of ANSI C2 Rule 323B.
- E. For each manhole, provide one pulling iron embedded in the concrete wall near the floor opposite each raceway bank entering manholes in each corner unless otherwise indicated. Use 3/4-inch round stock securely fastened to the overall steel reinforcement before concrete is poured.
- F. Manhole hardware shall be hot-dip galvanized steel.
- G. Damp-proofing compound shall be factory applied, one coat, on all outside surfaces. Damp-proofing shall be coal-tar bitumastic.
- H. Approved manufacturers are Utility Vault Co., Concrete Pipe Inc., Old Castle Precast, or approved equal.

2.2 PRECAST POLYMER CONCRETE HANDHOLES

- A. Handholes shall be precast and meet a minimum ANSI/SCTE 77 rating of Tier 15 with a vertical design load of 15,000 pounds and a lateral design load of 22,500 pounds. All handholes will be open bottom with minimum dimensions shown on the Contract Drawings.
- B. Precast polymer concrete handholes shall not be used in areas subject to deliberate vehicular traffic which require an AASHTO H-20/HS-20 load rating.
- C. Potential installations using precast polymer concrete handholes shall require prior Approval by KCMO regarding location, type, size and load rating.
- D. Handhole covers shall be identified by inscription according to the Contract Drawings. The appropriate identification (electric, signal, communication) shall be cast into the exterior surface.
- E. All handhole hardware shall be of steel, hot-dip galvanized or stainless steel after fabrication.
- F. Precast polymer concrete handholes shall be installed according to manufacturer's instructions.

- G. Approved manufacturers are Quazite, or approved equal.
- H. Locking mechanism shall use stainless steel hex head bolts.

PART 3 - EXECUTION

3.1 INSTALLATION OF PRECAST CONCRETE MANHOLES AND POLYMER HANDHOLES

- A. General
 - 1. Location of manholes/handholes are shown in Contract Drawings
 - 2. Install longer side of the manhole/handhole parallel to tracks
- B. Excavation and Bedding
 - 1. The excavation shall be made to a depth to allow for the overall assembled height and bedding of manholes or handholes as shown on the Contract Drawings. Provide and install risers as shown to bring the manhole or handhole to the required finish grade.
 - 2. Over excavate at least 12 inches around the sidewalls of the manholes and handholes for ease of installation and to prevent sluffage.
 - 3. Bedding for manholes shall consist of 1-foot minimum depth of 3/4-inch minus crushed rock, graded level, and compacted.
- C. Inspection and Setting
 - 1. Excavation must be completely dewatered before setting manholes or handholes.
 - 2. Notify the Engineer 7 days in advance of the installation of each manhole or handhole.
 - 3. Assemble by lowering each section into the excavation.
 - 4. Lower the base section first, set level and firmly position before placing intermediate and top sections.
 - 5. Ensure that the seal surfaces between sections are clean and that the gaskets are in place.
 - 6. Completed manhole shall be inspected by the Engineer before backfilling.
- D. Backfilling
 - 1. Backfill around all manholes and handholes shall consist of approved compactable material such as 3/4-inch minus crushed rock, sand or clean earth fill containing no rocks larger than 3/4-inch. No voids shall remain between the manhole and handhole walls and native soil excavation.
- E. Grouting
 - 1. Grout risers, covers and raceway entering manholes and handholes with non-shrink cement grout consisting of 2 parts sand and 1 part cement and sufficient water to form heavy plastic slurry.
 - 2. Apply grout in a manner to ensure filling of all voids in the joint being sealed.

3.2 GROUNDING

- A. All manholes shall be grounded in accordance with SECTION 26 05 26.13 – Systemwide Electrical Grounding For Systems, and as shown on the Contract Drawings.
- B. All metallic components in each manhole, including covers and cover mounting frames, metallic raceway grounding bushings, cable racks and inserts shall be grounded. Provide a minimum of one driven ground rod. Connect the rod to all metallic parts using a copper bonding conductor. Grounding conductor shall be exothermically welded or connected with approved Burndy Irreversible Compression Fittings to the ground rod. Connection to other metallic parts may be by exothermic welding or bolting using stainless steel hardware.

3.3 IDENTIFICATION

- A. Identify each manhole and handhole with the numbers shown on the Contract Drawings and as required by this Specification.
- B. Identify each manhole with 3-inch high letters stenciled with black paint on white background or engraved on a placard with black letters on a white background. Identification shall be placed just below the cover on the inside wall. Placards shall be secured with stainless steel bolts. Paint shall be exterior latex masonry type.
- C. Handholes shall be identified with 2-inch high letters stenciled with black paint on white paint background on the underside of its cover. Paint shall be exterior latex masonry type.
- D. Identify each ductbank entering a manhole and each raceway within the ductbank as shown on the Contract Drawings. Numbers shall be 2-inches high stenciled with black paint on white paint background or engraved on a placard with black letters on a white background. Placards shall be secured with stainless steel bolts. Paint shall be exterior latex masonry type.
- E. Identify each raceway entering a handhole as shown on the Contract Drawings. Numbers shall be 1 inches high, stenciled with black paint on white paint background or engraved on a placard with black letters on a white background. Placards shall be secured with stainless steel bolts. Paint shall be exterior latex masonry type.

3.4 CABLE SUPPORTS

- A. Cable supports shall be installed by the Contractor.

PART 4 - MEASUREMENT AND PAYMENT**4.1 MEASUREMENT**

- A. The quantities of accepted work will be measured in the following units. All measurements will be plan measure except for authorized changes.
 - 1. Description: Lump Sum

4.2 PAYMENT

- A. Payment will be made at the respective unit or lump-sum price listed in the proposal and shall be full compensation for all labor, materials, and equipment necessary to complete the respective unit in place. There will be no separate measurement or payment for any item of work not specifically identified and listed in the proposal, and all such work shall be considered a subsidiary item with all costs pertaining thereto included in the prices for other items listed in the proposal. At the Engineer's option, partial payment may be made for any lump sum item listed in the proposal, providing that the Contractor is diligently and satisfactorily pursuing full completion of such partially complete item in accordance with the approved job progress schedule.

END OF SECTION

THIS PAGE INTENTIONALLY LEFT BLANK

SECTION 26 05 53**IDENTIFICATION FOR ELECTRICAL SYSTEMS****PART 1 - GENERAL****1.01 SUMMARY**

- A. Section Includes:
1. Identification for raceways.
 2. Identification of power and control cables.
 3. Identification for conductors.
 4. Underground-line warning tape.
 5. Warning labels and signs.
 6. Instruction signs.
 7. Equipment identification labels.
 8. Miscellaneous identification products.

1.02 ACTION SUBMITTALS

- A. Product Data: For each electrical identification product indicated.

1.03 QUALITY ASSURANCE

- A. Comply with ANSI A13.1.
- B. Comply with NFPA 70.
- C. Comply with 29 CFR 1910.144 and 29 CFR 1910.145.
- D. Comply with ANSI Z535.4 for safety signs and labels.
- E. Adhesive-attached labeling materials, including label stocks, laminating adhesives, and inks used by label printers, shall comply with UL 969.

PART 2 - PRODUCTS**2.01 POWER RACEWAY IDENTIFICATION MATERIALS**

- A. Comply with ANSI A13.1 for minimum size of letters for legend and for minimum length of color field for each raceway size.
- B. Colors for Raceways Carrying Circuits at 600 V or Less:
1. Black letters on an orange field.

2. Legend: Indicate voltage.

- C. Self-Adhesive Vinyl Labels for Raceways Carrying Circuits at 600 V or Less: Preprinted, flexible label laminated with a clear, weather- and chemical-resistant coating and matching wraparound adhesive tape for securing ends of legend label.

2.02 ARMORED AND METAL-CLAD CABLE IDENTIFICATION MATERIALS

- A. Comply with ANSI A13.1 for minimum size of letters for legend and for minimum length of color field for each raceway and cable size.
- B. Colors for Raceways Carrying Circuits at 600 V and Less:
1. Black letters on an orange field.
 2. Legend: Indicate voltage.
- C. Self-Adhesive Vinyl Labels: Preprinted, flexible label laminated with a clear, weather- and chemical-resistant coating and matching wraparound adhesive tape for securing ends of legend label.

2.03 POWER AND CONTROL CABLE IDENTIFICATION MATERIALS

- A. Comply with ANSI A13.1 for minimum size of letters for legend and for minimum length of color field for each raceway and cable size.
- B. Self-Adhesive Vinyl Labels: Preprinted, flexible label laminated with a clear, weather- and chemical-resistant coating and matching wraparound adhesive tape for securing ends of legend label.

2.04 CONDUCTOR IDENTIFICATION MATERIALS

- A. Color-Coding Conductor Tape: Colored, self-adhesive vinyl tape not less than 3 mils thick by 1 to 2 inches wide.
- B. Self-Adhesive Vinyl Labels: Preprinted, flexible label laminated with a clear, weather- and chemical-resistant coating and matching wraparound adhesive tape for securing ends of legend label.

2.05 FLOOR MARKING TAPE

- A. 2-inch- wide, 5-mil pressure-sensitive vinyl tape, with black and white stripes and clear vinyl overlay.

2.06 UNDERGROUND-LINE WARNING TAPE

- A. Tape:

1. Recommended by manufacturer for the method of installation and suitable to identify and locate underground electrical and communications utility lines.
2. Printing on tape shall be permanent and shall not be damaged by burial operations.
3. Tape material and ink shall be chemically inert, and not subject to degrading when exposed to acids, alkalis, and other destructive substances commonly found in soils.

B. Color and Printing:

1. Comply with ANSI Z535.1 through ANSI Z535.5.
2. Inscriptions for Red-Colored Tapes: ELECTRIC LINE, HIGH VOLTAGE.
3. Inscriptions for Orange-Colored Tapes: TELEPHONE CABLE, CATV CABLE, COMMUNICATIONS CABLE, OPTICAL FIBER CABLE.

C. Tag: Type I:

1. Pigmented polyolefin, bright-colored, continuous-printed on one side with the inscription of the utility, compounded for direct-burial service.
2. Thickness: 4 mils.
3. Weight: 18.5 lb/1000 sq. ft..
4. 3-Inch Tensile According to ASTM D 882: 30 lbf, and 2500 psi.

2.07 WARNING LABELS AND SIGNS

A. Comply with NFPA 70 and 29 CFR 1910.145.

B. Self-Adhesive Warning Labels: Factory-printed, multicolor, pressure-sensitive adhesive labels, configured for display on front cover, door, or other access to equipment unless otherwise indicated.

C. Metal-Backed, Butyrate Warning Signs:

1. Weather-resistant, nonfading, preprinted, cellulose-acetate butyrate signs with 0.0396-inch galvanized-steel backing; and with colors, legend, and size required for application.
2. 1/4-inch grommets in corners for mounting.
3. Nominal size, 10 by 14 inches.

D. Warning label and sign shall include, but are not limited to, the following legends:

1. Multiple Power Source Warning: "DANGER - ELECTRICAL SHOCK HAZARD - EQUIPMENT HAS MULTIPLE POWER SOURCES."
2. Workspace Clearance Warning: "WARNING - OSHA REGULATION - AREA IN FRONT OF ELECTRICAL EQUIPMENT MUST BE KEPT CLEAR FOR 36 INCHES."

2.08 INSTRUCTION SIGNS

A. Engraved, laminated acrylic or melamine plastic, minimum 1/16 inch thick for signs up to 20 sq. inches and 1/8 inch thick for larger sizes.

1. Engraved legend with black letters on white face.
 2. Punched or drilled for mechanical fasteners.
 3. Framed with mitered acrylic molding and arranged for attachment at applicable equipment.
- B. Adhesive Film Label: Machine printed, in black, by thermal transfer or equivalent process. Minimum letter height shall be 3/8 inch.

2.09 EQUIPMENT IDENTIFICATION LABELS

- A. Screwed in with two screws minimum, Engraved, Laminated Acrylic or Melamine Label: Adhesive backed, with white letters on a dark-gray background. Minimum letter height shall be 3/8 inch.

2.10 MISCELLANEOUS IDENTIFICATION PRODUCTS

- A. Paint: Comply with requirements in Division 09 painting Sections for paint materials and application requirements. Select paint system applicable for surface material and location (exterior or interior).
- B. Fasteners for Labels and Signs: Self-tapping, stainless-steel screws or stainless-steel machine screws with nuts and flat and lock washers.

PART 3 - EXECUTION

3.01 INSTALLATION

- A. Location: Install identification materials and devices at locations for most convenient viewing without interference with operation and maintenance of equipment.
- B. Apply identification devices to surfaces that require finish after completing finish work.
- C. Self-Adhesive Identification Products: Clean surfaces before application, using materials and methods recommended by manufacturer of identification device.
- D. Attach signs and plastic labels that are not self-adhesive type with mechanical fasteners appropriate to the location and substrate.
- E. System Identification Color-Coding Bands for Raceways and Cables: Each color-coding band shall completely encircle cable or conduit. Place adjacent bands of two-color markings in contact, side by side. Locate bands at changes in direction, at penetrations of walls and floors, at 50-foot maximum intervals in straight runs, and at 25-foot maximum intervals in congested areas.
- F. Underground-Line Warning Tape: During backfilling of trenches install continuous underground-line warning tape directly above line at 6 to 8 inches below finished grade. Use multiple tapes where width of multiple lines installed in a common trench or concrete envelope exceeds 16 inches overall.

- G. Painted Identification: Comply with requirements in Division 09 painting Sections for surface preparation and paint application.

3.02 IDENTIFICATION SCHEDULE

- A. Accessible Raceways and Metal-Clad Cables, 600 V or Less, for Service, Feeder, and Branch Circuits More Than 30 A, and 120 V to ground: Install labels at 10-foot maximum intervals.
- B. Accessible Raceways and Cables within Buildings: Identify the covers of each junction and pull box of the following systems with self-adhesive vinyl labels with the wiring system legend and system voltage. System legends shall be as follows:
 - 1. Emergency Power.
 - 2. Normal Power.
 - 3. UPS.
- C. Power-Circuit Conductor Identification, 600 V or Less: For conductors in vaults, pull and junction boxes, manholes, and handholes, use color-coding conductor tape to identify the phase.
 - 1. Color-Coding for Phase and Voltage Level Identification, 600 V or Less: Use colors listed below for ungrounded service conductors.
 - a. Color shall be factory applied.
 - b. Colors for 208/120-V Circuits:
 - 1) Phase A: Black.
 - 2) Phase B: Red.
 - 3) Phase C: Blue.
 - c. Colors for 480/277-V Circuits:
 - 1) Phase A: Brown.
 - 2) Phase B: Orange.
 - 3) Phase C: Yellow.
 - d. Field-Applied, Color-Coding Conductor Tape: Apply in half-lapped turns for a minimum distance of 6 inches from terminal points and in boxes where splices or taps are made. Apply last two turns of tape with no tension to prevent possible unwinding. Locate bands to avoid obscuring factory cable markings.
- D. Install instructional sign including the color-code for grounded and ungrounded conductors using adhesive-film-type labels.
- E. Conductors to Be Extended in the Future: Attach write-on tags to conductors and list source.
- F. Auxiliary Electrical Systems Conductor Identification: Identify field-installed alarm, control, and signal connections.
 - 1. Identify conductors, cables, and terminals in enclosures and at junctions, terminals, and pull points. Identify by system and circuit designation.

2. Use system of marker tape designations that is uniform and consistent with system used by manufacturer for factory-installed connections.
 3. Coordinate identification with Project Drawings, manufacturer's wiring diagrams, and the Operation and Maintenance Manual.
- G. Locations of Underground Lines: Identify with underground-line warning tape for power, lighting, communication, and control wiring and optical fiber cable.
1. Limit use of underground-line warning tape to direct-buried cables.
 2. Install underground-line warning tape for both direct-buried cables and cables in raceway.
- H. Workspace Indication: Install floor marking tape to show working clearances in the direction of access to live parts. Workspace shall be as required by NFPA 70 and 29 CFR 1926.403 unless otherwise indicated. Do not install at flush-mounted panelboards and similar equipment in finished spaces.
- I. Warning Labels for Indoor Cabinets, Boxes, and Enclosures for Power and Lighting: Metal-backed, butyrate warning signs.
1. Comply with 29 CFR 1910.145.
 2. Identify system voltage with black letters on an orange background.
 3. Apply to exterior of door, cover, or other access.
 4. For equipment with multiple power or control sources, apply to door or cover of equipment including, but not limited to, the following:
 - a. Power transfer switches.
 - b. Controls with external control power connections.
- J. Operating Instruction Signs: Install instruction signs to facilitate proper operation and maintenance of electrical systems and items to which they connect. Install instruction signs with approved legend where instructions are needed for system or equipment operation.
- K. Equipment Identification Labels: On each unit of equipment, install unique designation label that is consistent with wiring diagrams, schedules, and the Operation and Maintenance Manual. Apply labels to disconnect switches and protection equipment, central or master units, control panels, control stations, terminal cabinets, and racks of each system. Systems include power, lighting, control, communication, signal, monitoring, and alarm systems unless equipment is provided with its own identification.
1. Labeling Instructions:
 - a. Indoor Equipment: Engraved, laminated acrylic or melamine label. Unless otherwise indicated, provide a single line of text with 1/2-inch- high letters on 1-1/2-inch- high label; where two lines of text are required, use labels 2 inches high.
 - b. Outdoor Equipment: Engraved, laminated acrylic or melamine label.
 - c. Elevated Components: Increase sizes of labels and letters to those appropriate for viewing from the floor.
 - d. Unless provided with self-adhesive means of attachment, fasten labels with appropriate mechanical fasteners that do not change the NEMA or NRTL rating of the enclosure.

END OF SECTION 26 05 53

SECTION 26 05 73**OVERCURRENT PROTECTIVE DEVICE COORDINATION STUDY**

PART 1 - GENERAL

1.01 SUMMARY

- A. This Section includes computer-based, fault-current and overcurrent protective device coordination studies. Protective devices shall be set based on results of the protective device coordination study.
 - 1. Coordination of series-rated devices is permitted where indicated on Drawings.

1.02 ACTION SUBMITTALS

- A. Product Data: For computer software program to be used for studies.
- B. Other Action Submittals: The following submittals shall be made after the approval process for system protective devices has been completed. Submittals shall be in digital form.
 - 1. Coordination-study input data, including completed computer program input data sheets.
 - 2. Study and Equipment Evaluation Reports.
 - 3. Coordination-Study Report.

1.03 INFORMATIONAL SUBMITTALS

- A. Qualification Data: For coordination-study specialist.
- B. Product Certificates: For coordination-study and fault-current-study computer software programs, certifying compliance with IEEE 399.

1.04 QUALITY ASSURANCE

- A. Studies shall use computer programs that are distributed nationally and are in wide use. Software algorithms shall comply with requirements of standards and guides specified in this Section. Manual calculations are not acceptable.
- B. Coordination-Study Specialist Qualifications: An entity experienced in the application of computer software used for studies, having performed successful studies of similar magnitude on electrical distribution systems using similar devices.
 - 1. Professional Design Professional, licensed in the state where Project is located, shall be responsible for the study. All elements of the study shall be performed under the direct supervision and control of Design Professional.

- C. Comply with IEEE 242 for short-circuit currents and coordination time intervals.
- D. Comply with IEEE 399 for general study procedures.

PART 2 - PRODUCTS

2.01 COMPUTER SOFTWARE DEVELOPERS

- A. Available Computer Software Developers: Subject to compliance with requirements, companies offering computer software programs that may be used in the Work include, but are not limited to, the following:
 - 1. CGI CYME.
 - 2. EDSA Micro Corporation.
 - 3. ESA Inc.
 - 4. Operation Technology, Inc.
 - 5. SKM Systems Analysis, Inc.

2.02 COMPUTER SOFTWARE PROGRAM REQUIREMENTS

- A. Comply with IEEE 399.
- B. Analytical features of fault-current-study computer software program shall include "mandatory," "very desirable," and "desirable" features as listed in IEEE 399.
- C. Computer software program shall be capable of plotting and diagramming time-current-characteristic curves as part of its output. Computer software program shall report device settings and ratings of all overcurrent protective devices and shall demonstrate selective coordination by computer-generated, time-current coordination plots.

PART 3 - EXECUTION

3.01 POWER SYSTEM DATA

- A. Gather and tabulate the following input data to support coordination study:
 - 1. Product Data for overcurrent protective devices specified in other Division 26 Sections and involved in overcurrent protective device coordination studies. Use equipment designation tags that are consistent with electrical distribution system diagrams, overcurrent protective device submittals, input and output data, and recommended device settings.
 - 2. Impedance of utility service entrance.
 - 3. Electrical Distribution System Diagram: In hard-copy and electronic-copy formats, showing the following:
 - a. Circuit-breaker and fuse-current ratings and types.
 - b. Relays and associated power and current transformer ratings and ratios.

- c. Transformer kilovolt amperes, primary and secondary voltages, connection type, impedance, and X/R ratios.
 - d. Cables: Indicate conduit material, sizes of conductors, conductor material, insulation, and length.
 - e. Busway ampacity and impedance.
 - f. Motor horsepower and code letter designation according to NEMA MG 1.
4. Data sheets to supplement electrical distribution system diagram, cross-referenced with tag numbers on diagram, showing the following:
- a. Special load considerations, including starting inrush currents and frequent starting and stopping.
 - b. Transformer characteristics, including primary protective device, magnetic inrush current, and overload capability.
 - c. Motor full-load current, locked rotor current, service factor, starting time, type of start, and thermal-damage curve.
 - d. Ratings, types, and settings of utility company's overcurrent protective devices.
 - e. Special overcurrent protective device settings or types stipulated by utility company.
 - f. Time-current-characteristic curves of devices indicated to be coordinated.
 - g. Manufacturer, frame size, interrupting rating in amperes rms symmetrical, ampere or current sensor rating, long-time adjustment range, short-time adjustment range, and instantaneous adjustment range for circuit breakers.
 - h. Manufacturer and type, ampere-tap adjustment range, time-delay adjustment range, instantaneous attachment adjustment range, and current transformer ratio for overcurrent relays.
 - i. Panelboards, switchboards, ampacity, and interrupting rating in amperes rms symmetrical.

3.02 FAULT-CURRENT STUDY

- A. Calculate the maximum available short-circuit current in amperes rms symmetrical at circuit-breaker positions of the electrical power distribution system. The calculation shall be for a current immediately after initiation and for a three-phase bolted short circuit at each of the following:
 1. Distribution panelboard.
 2. Branch circuit panelboard.
- B. Study electrical distribution system from normal and alternate power sources throughout electrical distribution system for Project. Include studies of system-switching configurations and alternate operations that could result in maximum fault conditions.
- C. Calculate momentary and interrupting duties on the basis of maximum available fault current.
- D. Calculations to verify interrupting ratings of overcurrent protective devices shall comply with IEEE 241 and IEEE 242.
 1. Transformers:

- a. ANSI C57.12.22.
 - b. IEEE C57.12.00.
 - c. IEEE C57.96.
 2. Low-Voltage Circuit Breakers: IEEE 1015 and IEEE C37.20.1.
 3. Low-Voltage Fuses: IEEE C37.46.
 - E. Study Report:
 1. Show calculated X/R ratios and equipment interrupting rating (1/2-cycle) fault currents on electrical distribution system diagram.
 - F. Equipment Evaluation Report:
 1. For 600-V overcurrent protective devices, ensure that interrupting ratings are equal to or higher than calculated 1/2-cycle symmetrical fault current.
 2. For devices and equipment rated for asymmetrical fault current, apply multiplication factors listed in the standards to 1/2-cycle symmetrical fault current.
 3. Verify adequacy of phase conductors at maximum three-phase bolted fault currents; verify adequacy of equipment grounding conductors and grounding electrode conductors at maximum ground-fault currents. Ensure that short-circuit withstand ratings are equal to or higher than calculated 1/2-cycle symmetrical fault current.
- 3.03 COORDINATION STUDY
- A. Perform coordination study using approved computer software program. Prepare a written report using results of fault-current study. Comply with IEEE 399.
 1. Calculate the maximum and minimum 1/2-cycle short-circuit currents.
 2. Calculate the maximum and minimum interrupting duty (5 cycles to 2 seconds) short-circuit currents.
 3. Calculate the maximum and minimum ground-fault currents.
 - B. Comply with IEEE 241 and IEEE 242 recommendations for fault currents and time intervals.
 - C. Transformer Primary Overcurrent Protective Devices:
 1. Device shall not operate in response to the following:
 - a. Inrush current when first energized.
 - b. Self-cooled, full-load current or forced-air-cooled, full-load current, whichever is specified for that transformer.
 - c. Permissible transformer overloads according to IEEE C57.96 if required by unusual loading or emergency conditions.
 2. Device settings shall protect transformers according to IEEE C57.12.00, for fault currents.
 - D. Conductor Protection: Protect cables against damage from fault currents according to ICEA P-32-382, ICEA P-45-482, and conductor melting curves in IEEE 242. Demonstrate that equipment withstands the maximum short-circuit current for a time equivalent to the tripping time of the primary relay protection or total clearing time of

the fuse. To determine temperatures that damage insulation, use curves from cable manufacturers or from listed standards indicating conductor size and short-circuit current.

- E. Coordination-Study Report: Prepare a written report indicating the following results of coordination study:
1. Tabular Format of Settings Selected for Overcurrent Protective Devices:
 - a. Device tag.
 - b. Relay-current transformer ratios; and tap, time-dial, and instantaneous-pickup values.
 - c. Circuit-breaker sensor rating; and long-time, short-time, and instantaneous settings.
 - d. Fuse-current rating and type.
 - e. Ground-fault relay-pickup and time-delay settings.
 2. Coordination Curves: Prepared to determine settings of overcurrent protective devices to achieve selective coordination. Graphically illustrate that adequate time separation exists between devices installed in series, including power utility company's upstream devices. Prepare separate sets of curves for the switching schemes and for emergency periods where the power source is local generation. Show the following information:
 - a. Device tag.
 - b. Voltage and current ratio for curves.
 - c. Three-phase and single-phase damage points for each transformer.
 - d. No damage, melting, and clearing curves for fuses.
 - e. Cable damage curves.
 - f. Transformer inrush points.
 - g. Maximum fault-current cutoff point.
- F. Completed data sheets for setting of overcurrent protective devices.

END OF SECTION 26 05 73

SECTION 26 05 74**LOW VOLTAGE ARC FLASH HAZARD ANALYSIS**

PART 1 - GENERAL

1.01 SUMMARY

- A. The scope of this document is to provide requirements for providing a low voltage (600 volts and below) Arc Flash Hazard Analysis and documentation.

1.02 REQUIREMENTS

- A. A low voltage Arc Flash Hazard Analysis shall be provided for this project. The analysis shall be based on the specific equipment installed, and shall be updated to include project "as built" documentation. Where the arc flash hazard/risk category is equal to or greater than level 3, the overcurrent protective device coordination study should be reviewed to reduce the hazard/risk level. The analysis shall be based on the specific devices installed and include (but not be limited to) the following:
1. Service Entrance Equipment.
 - a. All overcurrent protective devices installed in service entrance panels.
 2. Feeder Circuits.
 - a. All three (3) phase Branch circuit overcurrent protective devices installed with a rating equal to or greater than 30 amps.
 3. Branch Circuits.
 - a. All three (3) phase Branch circuit overcurrent protective devices installed with a rating equal to or greater than 30 amps.
 - b. All motor circuit overcurrent protective devices for motors with a rating equal to or greater than 10 horse power.
- B. The project shall include printed waterproof labels for equipment that lists the specific arc flash hazard/risk category at each location.
- C. Format
1. A preliminary Arc Flash Hazard Analysis shall be submitted to the Engineer no later than three (3) weeks after the overcurrent protective device shop drawings have been approved.
 2. The Arc Flash Hazard Analysis shall be reviewed and updated to reflect any changes and corrections to conductor length within one week of the final electrical walk through for punchlist. The low voltage arc flash hazard analysis shall include the stamp or seal and signature of the preparing engineer, and shall be reviewed and approved by the Engineer of Record.
 3. Engineer approved Arc Flash Hazard warning labels shall be furnished and installed prior to project completion.

4. The low voltage arc flash hazard analysis shall be provided using the SKM Systems Analysis, Inc. SKM Power Tools Electrical Engineering Software (PTW 32).
5. Prior to project completion, the low voltage arc flash hazard analysis shall be provided in both hard copy and on computer disk. The hard copy shall clearly show each device set point. The computer disk shall include the complete coordination file including all device curves (use the SKM "Project-Backup" command).

END OF SECTION 26 05 74

SECTION 26 08 10**SYSTEMWIDE ELECTRICAL TESTING FOR SYSTEMS****PART 1 - GENERAL****1.1 SUMMARY**

- A. This Section includes the testing requirements for DIVISION 26 Systemwide Electrical. Included are tests for conductors and electrical material where required in other sections of this Division. This Section shall govern the testing requirement for all groundings required per SECTION 26 05 26.13 Systemwide Electrical Grounding For Systems.

1.2 RELATED SECTIONS

- A. SECTION 01 43 00 – Systems Quality Assurance
- B. SECTION 26 05 00.13 – Systemwide Electrical General Requirements for Systems
- C. SECTION 26 05 26.13 – Systemwide Electrical Grounding for Systems

1.3 REFERENCED STANDARDS

- A. National Electrical Testing Association (NETA)
1. NETA ATS Acceptance Testing Specifications for Electrical Power Distribution Equipment and Systems
- B. Institute of Electrical and Electronics Engineers (IEEE)
1. IEEE 81 Guide for Measuring Ground Impedance of a Ground System

1.4 QUALITY ASSURANCE/QUALITY CONTROL

- A. Quality Assurance/Quality Control shall be carried out in accordance with the requirements of S 01 43 00 Systems Quality Assurance, except as modified herein.
- B. The tests shall be performed by a company, or agency, employed by the Contractor and Approved by the Engineer. Once such a company or agency is approved, they shall not be discharged or otherwise replaced by the Contractor without Approval by the Engineer.
- C. The testing company, agency, or qualified personnel shall be regularly engaged in the field of electrical testing. The employees assigned to the project shall be personnel experienced with electrical testing procedures, electrical instrumentation, and general electrical networks. Testing personnel shall be capable of modifying the procedures specified herein to suit actual field conditions should such modifications become necessary. The testing personnel shall be NETA certified and have at least 5 years of experience in construction acceptance testing.

- D. The number of readings taken to determine an electrical constant or property must be sufficient to assure that random factors due to human error in reading the instruments and transient disturbances in the electrical network have negligible influence on the final results. The adequacy of the data can generally be established by the tester. The data shall be examined to see that removal of either the highest or lowest value will not alter the arithmetic average of the group by more than 5%. If the average is altered by more than 5%, one more set of data shall be taken and the results combined with the first set. If the average of the combined data is still altered by more than 5%, by removal of the highest or lowest value, an unstable condition might exist, and the Engineer shall be notified.
- E. Where called out, testing shall be performed by a certified NETA technician, in accordance with NETA standards.

1.5 SUBMITTALS

- A. Submittals shall be in accordance with the requirements of SECTION 26 05 00.13 Systemwide Electrical General Requirements For Systems, except as modified herein.
- B. Items required to be submitted by the Contractor for Approval include, but are not limited to, the following:
 - 1. Test reports (five copies) within 14 days after completion of each test.
 - 2. Name and qualifications of the testing consultant(s) to be used for this work. Include the full background data of the proposed testing consultant(s), including references to prior work or projects having requirements and/or complexities similar to this project. Include the names and qualifications of the senior engineering and management personnel to be used, both for field and office Work.
 - 3. Detailed written description of the proposed testing plan for a preliminary review and Approval by the Engineer. The Engineer will witness the field tests.
 - 4. List of instruments to be used for the electrical testing. The list shall include the manufacturer's name, model number, serial number and calibration certificate for each instrument. The calibration certificate shall show that each instrument was calibrated by an independent agency within the previous 12 months.
 - 5. Test data sheet showing the proposed format for test data documentation. Weather conditions, including temperature and precipitation during actual testing, shall be documented and submitted with the test results. All test data and calculations shall be submitted to the Engineer for review and Approval.

PART 2 - PRODUCTS

2.1 MEGOHMMETER AND EARTH TESTER

- A. High voltage insulation tester and three-point ground resistance tester shall be subject to the Engineer's Approval.

2.2 MISCELLANEOUS TOOLS

- A. As required for opening test facilities, making wire connections, splicing, etc.

PART 3 - EXECUTION

3.1 WITNESS TESTING

- A. Notify the Engineer prior to performing any test.

- B. The Engineer may witness any and all testing.
- C. Ground resistance test shall not be performed within 24 hours of rainfall or snowfall.

3.2 GROUND RODTEST

- A. Test each new isolated ground rod to determine the ground resistance when the water table elevation is low. The grounding test shall be in accordance with IEEE Standard 81, fall of potential test method. A plot of ground resistance readings for each isolated ground rod or ground mat shall be provided to the Engineer on 8-1/2 x 11 inch graph paper. The current-reference rod shall be driven at least 100 feet from the ground rod or grid under test. Alternatively, an established metallic ground may be used. The measurements shall be made at 10 foot intervals beginning 25 feet from the test electrode and ending 75 feet from it, in direct line between the ground rod and the current reference electrode.
- B. A grounding system that shows greater than 25 Ohm resistance for the flat portion of the plotted data shall be considered inadequately grounded. Add additional, parallel-connected ground rods 10 feet away and/or deeper-driven rods until the ground resistance measurements meet the 25 Ohm requirement. Notify the Engineer for instruction if the measured ground resistance still exceeds 25 Ohms after three additional ground rods have been added and connected. Ground rods required over that specified will be paid for as extra Work. Use of salts, water or compounds to attain the specified ground resistance is not acceptable. Refer to Communications, Overhead Contact System or Traction Power Specifications for respective grounding requirements.
- C. Testing under Subsection 3.2 shall be performed by a Certified NETA Technician in accordance with NETA Standards.

3.3 FALL OF POTENTIAL TEST

- A. Test each new isolated ground rod to determine the ground resistance when the water table elevation is low. The grounding test shall be in accordance with IEEE Standard 81, fall of potential test method. A plot of ground resistance readings for each isolated ground rod or ground mat shall be provided to the Engineer on 8-1/2 x 11 inch graph paper. The current-reference rod shall be driven at least 100 feet from the ground rod or grid under test. Alternatively, an established metallic ground may be used. The measurements shall be made at 10 foot intervals beginning 25 feet from the test electrode and ending 75 feet from it, in direct line between the ground rod and the current reference electrode.
- B. A grounding system that shows greater than specified resistance for the flat portion of the plotted data shall be considered inadequately grounded. Add additional, parallel-connected ground rods 10 feet away and/or deeper-driven rods until the ground resistance measurements meet the specified requirement. Notify the Engineer for instruction if the measured ground resistance still exceeds the specified resistance after three additional ground rods have been added and connected. Ground rods required over that specified will be paid for as extra Work. Use of salts, water or compounds to attain the specified ground resistance is not acceptable. Refer to Communications, Overhead Contact System or Traction Power Specifications for respective grounding requirements.

3.4 MEGGER TEST

- A. Perform insulation resistance (megger) test across each connection point where non-metallic fence section connects to a metallic fence section. Confirm that there is no electrical continuity and a minimum resistance of 500 Ohms.

PART 4 - MEASUREMENT AND PAYMENT**4.1 MEASUREMENT**

A. The quantities of accepted work will be measured in the following units. All measurements will be plan measure except for authorized changes.

1. Description: Lump Sum

4.2 PAYMENT

A. Payment will be made at the respective unit or lump-sum price listed in the proposal and shall be full compensation for all labor, materials, and equipment necessary to complete the respective unit in place. There will be no separate measurement or payment for any item of work not specifically identified and listed in the proposal, and all such work shall be considered a subsidiary item with all costs pertaining thereto included in the prices for other items listed in the proposal. At the Engineer's option, partial payment may be made for any lump sum item listed in the proposal, providing that the Contractor is diligently and satisfactorily pursuing full completion of such partially complete item in accordance with the approved job progress schedule.

END OF SECTION

SECTION 26 09 23
LIGHTING CONTROL DEVICES

PART 1 - GENERAL

1.01 SUMMARY

- A. Section Includes:
1. Time switches
 2. Photoelectric switches.
 3. Indoor occupancy sensors.

1.02 ACTION SUBMITTALS

- A. Product Data: For each type of product.

1.03 INFORMATIONAL SUBMITTALS

- A. Field quality-control reports.

1.04 CLOSEOUT SUBMITTALS

- A. Operation and maintenance data

PART 2 - PRODUCTS

2.01 TIME SWITCHES

- A. Provide time switch as indicated on drawings, or approved equal.
- B. B.Electronic Time Switches: Solid state, programmable, with alphanumeric display; complying with UL 917.
1. Listed and labeled as defined in NFPA 70, by a qualified testing agency, and marked for intended location and application.
 2. Contact Configuration: DPST.
 3. Contact Rating: 30-A inductive or resistive, 277-V ac.
 4. Programs: Eight on-off set points on a 24-hour schedule and an annual holiday schedule that overrides the weekly operation on holidays.
 5. Programs: Two on-off set points on a 24-hour schedule, allowing different set points for each day of the week and an annual holiday schedule that overrides the weekly operation on holidays.

6. Circuitry: Allow connection of a photoelectric relay as substitute for on-off function of a program on selected channels.
7. Astronomic Time: All channels.
8. Automatic daylight savings time changeover.
9. Battery Backup: Not less than seven days reserve, to maintain schedules and time clock.

2.02 OUTDOOR PHOTOELECTRIC SWITCHES

- A. Manufacturers: Subject to compliance with requirements, available manufacturers offering products that may be incorporated into the Work include, but are not limited to, the following:
 1. Cooper Industries, Inc.
 2. Intermatic, Inc.
 3. NSi Industries LLC; TORK Products.
 4. Tyco Electronics; ALR Brand.
- B. Description: Solid state, with SPST dry contacts rated for 1800 VA, to operate connected load, complying with UL 773.
 1. Listed and labeled as defined in NFPA 70, by a qualified testing agency, and marked for intended location and application.
 2. Light-Level Monitoring Range: 1.5 to 10 fc, with an adjustment for turn-on and turn-off levels within that range.
 3. Time Delay: Thirty-second minimum, to prevent false operation.
 4. Lightning Arrester: Air-gap type.
 5. Mounting: Twist lock complying with NEMA C136.10, with base.

2.03 INDOOR OCCUPANCY SENSORS

- A. Manufacturers: Subject to compliance with requirements, available manufacturers offering products that may be incorporated into the Work include, but are not limited to, the following:
 1. Bryant Electric; a Hubbell company.
 2. Cooper Industries, Inc.
 3. Hubbell Building Automation, Inc.
 4. Leviton Mfg. Company Inc.
 5. Lightolier Controls.
 6. Lithonia Lighting; Acuity Lighting Group, Inc.
 7. Lutron Electronics Co., Inc.
 8. NSi Industries LLC; TORK Products.
 9. RAB Lighting.
 10. Sensor Switch, Inc.
 11. Square D; a brand of Schneider Electric.
 12. Watt Stopper.
- B. General Requirements for Sensors: Wall- or ceiling-mounted, solid-state indoor occupancy sensors with a separate power pack.

1. Listed and labeled as defined in NFPA 70, by a qualified testing agency, and marked for intended location and application.
 2. Operation: Unless otherwise indicated, turn lights on when coverage area is occupied, and turn them off when unoccupied; with a time delay for turning lights off, adjustable over a minimum range of 1 to 15 minutes.
 3. Sensor Output: Contacts rated to operate the connected relay, complying with UL 773A. Sensor is powered from the power pack.
 4. Power Pack: Dry contacts rated for 20-A ballast load at 120- and 277-V ac, for 13-A tungsten at 120-V ac, and for 1 hp at 120-V ac. Sensor has 24-V dc, 150-mA, Class 2 power source, as defined by NFPA 70.
 5. Mounting:
 - a. Sensor: Suitable for mounting in any position on a standard outlet box.
 - b. Relay: Externally mounted through a 1/2-inch knockout in a standard electrical enclosure.
 - c. Time-Delay and Sensitivity Adjustments: Recessed and concealed behind hinged door.
 6. Indicator: Digital display, to show when motion is detected during testing and normal operation of sensor.
 7. Bypass Switch: Override the ON or OFF function.
 8. Automatic Light-Level Sensor: Adjustable from 2 to 200 fc; turn lights off when selected lighting level is present.
- C. Dual-Technology Type: Ceiling mounted; detect occupants in coverage area using PIR and ultrasonic detection methods. The particular technology or combination of technologies that control on-off functions is selectable in the field by operating controls on unit.
1. Sensitivity Adjustment: Separate for each sensing technology.
 2. Detector Sensitivity: Detect occurrences of 6-inch- minimum movement of any portion of a human body that presents a target of not less than 36 sq. in., and detect a person of average size and weight moving not less than 12 inches in either a horizontal or a vertical manner at an approximate speed of 12 inches/s.
 3. Detection Coverage (Standard Room): Detect occupancy anywhere within a circular area of 1000 sq. ft. when mounted on a 96-inch- high ceiling.

2.04 LIGHTING CONTRACTORS

- A. Description: Electrically operated and electrically held, combination-type lighting contactors with nonfused disconnect, complying with NEMA ICS 2 and UL 508.
1. Current Rating for Switching: Listing or rating consistent with type of load served, including tungsten filament, inductive, and high-inrush ballast (ballast with 15 percent or less total harmonic distortion of normal load current).
 2. Fault Current Withstand Rating: Equal to or exceeding the available fault current at the point of installation.
 3. Enclosure: Comply with NEMA 250.
 4. Provide with control and pilot devices as indicated on Drawings, matching the NEMA type specified for the enclosure.

2.05 CONDUCTORS AND CABLES

- A. Power Wiring to Supply Side of Remote-Control Power Sources: Not smaller than No. 12 AWG. Comply with requirements in Division 26 Section "Low-Voltage Electrical Power Conductors and Cables."

PART 3 - EXECUTION

3.01 INSTALLATION

- A. Install and aim sensors in locations to achieve not less than 90 percent coverage of areas indicated. Do not exceed coverage limits specified in manufacturer's written instructions.
- B. Occupancy Adjustments: When requested within 12 months from date of Substantial Completion, provide on-site assistance in adjusting sensors to suit actual occupied conditions. Provide up to two visits to Project during other-than-normal occupancy hours for this purpose.
 - 1. For occupancy and motion sensors, verify operation at outer limits of detector range. Set time delay to suit City's operations.
- C. Wiring Method: Comply with Division 26 Section "Low-Voltage Electrical Power Conductors and Cables." Minimum conduit size is 1/2 inch.
- D. Identify components and power and control wiring according to Division 26 Section "Identification for Electrical Systems."

3.02 FIELD QUALITY CONTROL

- A. Evaluate lighting control devices and perform tests and inspections.
- B. Perform the following tests and inspections:
 - 1. Operational Test: After installing time switches and sensors, and after electrical circuitry has been energized, start units to confirm proper unit operation.
 - 2. Test and adjust controls and safeties. Replace damaged and malfunctioning controls and equipment.
- C. Lighting control devices will be considered defective if they do not pass tests and inspections.
- D. Prepare test and inspection reports.

END OF SECTION 26 09 23

SECTION 26 22 00
LOW-VOLTAGE TRANSFORMERS

PART 1 - GENERAL

1.01 SUMMARY

- A. This Section includes the following types of dry-type transformers rated 600 V and less, with capacities up to 1000 kVA:
 - 1. Distribution transformers.
 - 2. Buck-boost transformers.

1.02 ACTION SUBMITTALS

- A. Product Data: For each product indicated.
- B. Shop Drawings: Indicate dimensions and weights.
 - 1. Wiring Diagrams: Power, signal, and control wiring.

1.03 INFORMATIONAL SUBMITTALS

- A. Field quality-control test reports.

1.04 CLOSEOUT SUBMITTALS

- A. Refer to section 01 78 23 Operation and Maintenance data.

1.05 QUALITY ASSURANCE

- A. Electrical Components, Devices, and Accessories: Listed and labeled as defined in NFPA 70, Article 100, by a testing agency acceptable to authorities having jurisdiction, and marked for intended use.
- B. Comply with IEEE C57.12.91, "Test Code for Dry-Type Distribution and Power Transformers."

PART 2 - PRODUCTS

2.01 MANUFACTURERS

- A. Available Manufacturers: Subject to compliance with requirements, manufacturers offering products that may be incorporated into the Work include, but are not limited to, the following:
- B. Manufacturers: Subject to compliance with requirements, provide products by one of the following:
 - 1. ACME Electric Corporation; Power Distribution Products Division.
 - 2. Challenger Electrical Equipment Corp.; a division of Eaton Corp.
 - 3. Controlled Power Company.
 - 4. Eaton Electrical Inc.; Cutler-Hammer Products.
 - 5. Federal Pacific Transformer Company; Division of Electro-Mechanical Corp.
 - 6. General Electric Company.
 - 7. Hammond Co.; Matra Electric, Inc.
 - 8. Magnetek Power Electronics Group.
 - 9. Micron Industries Corp.
 - 10. Myers Power Products, Inc.
 - 11. Siemens Energy & Automation, Inc.
 - 12. Sola/Hevi-Duty.
 - 13. Square D; Schneider Electric.

2.02 GENERAL TRANSFORMER REQUIREMENTS

- A. Description: Factory-assembled and -tested, air-cooled units for 60-Hz service.
- B. Cores: Grain-oriented, non-aging silicon steel.
- C. Coils: Continuous windings without splices except for taps.
 - 1. Internal Coil Connections: Brazed or pressure type.
 - 2. Coil Material: Copper.

2.03 DISTRIBUTION TRANSFORMERS

- A. Comply with NEMA ST 20, and list and label as complying with UL 1561.

PART 3 - Delete first paragraph below if seismic bracing is not required. Coordinate with Parts 1 and 3.

- A. Cores: One leg per phase.
- B. Enclosure: Ventilated, NEMA 250, Type 2.
 - 1. Core and coil shall be encapsulated within resin compound, sealing out moisture and air.

- C. Enclosure: Ventilated, NEMA 250, Type 3R.
 - 1. Core and coil shall be encapsulated within resin compound, sealing out moisture and air.
- D. Transformer Enclosure Finish: Comply with NEMA 250.
 - 1. Finish Color: Gray.
- E. Taps for Transformers Smaller Than 3 kVA: None.
- F. Taps for Transformers 7.5 to 24 kVA: One 5 percent tap above and one 5 percent tap below normal full capacity.
- G. Taps for Transformers 25 kVA and Larger: Two 2.5 percent taps above and two 2.5 percent taps below normal full capacity.
- H. Insulation Class: 220 deg C, UL-component-recognized insulation system with a maximum of 115 deg C rise above 40 deg C ambient temperature.
- I. Energy Efficiency for Transformers Rated 15 kVA and Larger:
 - 1. Complying with NEMA TP 1, Class 1 efficiency levels.
 - 2. Tested according to NEMA TP 2.
- J. Electrostatic Shielding: Each winding shall have an independent, single, full-width copper electrostatic shield arranged to minimize interwinding capacitance.
- K. Wall Brackets: Manufacturer's standard brackets.

3.02 BUCK-BOOST TRANSFORMERS

- A. Description: Self-cooled, two-winding dry type, rated for continuous duty and with wiring terminals suitable for connection as autotransformer. Transformers shall comply with NEMA ST 1 and shall be listed and labeled as complying with UL 506 or UL 1561.
- B. Enclosure: Ventilated, NEMA 250, Type 2.
 - 1. Finish Color: Gray.

PART 4 - EXECUTION

4.01 INSTALLATION

- A. Install wall-mounting transformers level and plumb with wall brackets fabricated by transformer manufacturer.
- B. Construct concrete bases and anchor floor-mounting transformers according to manufacturer's written instructions and requirements in Division 26 Section "Hangers and Supports for Electrical Systems."

4.02 FIELD QUALITY CONTROL

- A. Perform tests and inspections.
- B. Tests and Inspections:
 - 1. Perform each visual and mechanical inspection and electrical test stated in NETA Acceptance Testing Specification. Certify compliance with test parameters.

4.03 ADJUSTING

- A. Adjust transformer taps to provide optimum voltage conditions at secondary terminals. Optimum is defined as not exceeding nameplate voltage plus 10 percent and not being lower than nameplate voltage minus 3 percent at maximum load conditions. Submit recording and tap settings as test results.
- B. Connect buck-boost transformers to provide nameplate voltage of equipment being served, plus or minus 5 percent, at secondary terminals.
- C. Output Settings Report: Prepare a written report recording output voltages and tap settings.

END OF SECTION 26 22 00

SECTION 26 24 13**SWITCHBOARDS**

PART 1 - GENERAL

1.01 SUMMARY

A. Section Includes:

1. Service and distribution switchboards rated 600 V and less.
2. Transient voltage suppression devices.
3. Disconnecting and overcurrent protective devices.
4. Instrumentation.
5. Control power.
6. Accessory components and features.
7. Identification.

1.02 ACTION SUBMITTALS

A. Product Data: For each type of product indicated.

B. Shop Drawings: For each switchboard and related equipment.

1. Include dimensioned plans, elevations, sections, and details, including required clearances and service space around equipment. Show tabulations of installed devices, equipment features, and ratings.
2. Include time-current coordination curves for each type and rating of overcurrent protective device included in switchboards.
3. Include schematic and wiring diagrams for power, signal, and control wiring.

1.03 INFORMATIONAL SUBMITTALS

A. Field quality-control reports.

1.04 CLOSEOUT SUBMITTALS

A. Operation and maintenance data.

1.05 QUALITY ASSURANCE

- A. Electrical Components, Devices, and Accessories: Listed and labeled as defined in NFPA 70, by a qualified testing agency, and marked for intended location and application.
- B. Comply with NEMA PB 2.

- C. Comply with NFPA 70.
- D. Comply with UL 891.

1.06 WARRANTY

- A. Special Warranty: Manufacturer's standard form in which manufacturer agrees to repair or replace transient voltage suppression devices that fail in materials or workmanship within specified warranty period.
 - 1. Warranty Period: Five years from date of Substantial Completion.

PART 2 - PRODUCTS

2.01 MANUFACTURED UNITS

- A. Manufacturers: Subject to compliance with requirements, available manufacturers offering products that may be incorporated into the Work include, but are not limited to, the following:
 - 1. Eaton Electrical Inc.; Cutler-Hammer Business Unit.
 - 2. General Electric Company; GE Consumer & Industrial - Electrical Distribution.
 - 3. Siemens Energy & Automation, Inc.
 - 4. Square D; a brand of Schneider Electric.
- B. Front-Connected, Front-Accessible Switchboards:
 - 1. Main Devices: Fixed, individually mounted.
 - 2. Branch Devices: Panel mounted.
 - 3. Sections front and rear aligned.
- C. Nominal System Voltage: As indicated on plans.
- D. Main-Bus Continuous: Refer to plans.
- E. Enclosure: Steel, NEMA 250, Type 1.
 - 1. Enclosure Finish: Factory-applied finish in manufacturer's standard gray finish over a rust-inhibiting primer on treated metal surface.
 - 2. Enclosure: Flat roof; bolt-on rear covers for each section, with provisions for padlocking.
- F. Bus Transition and Incoming Pull Sections: Matched and aligned with basic switchboard.
- G. Hinged Front Panels: Allow access to circuit breaker, metering, accessory, and blank compartments.
- H. Pull Box on Top of Switchboard:

1. Adequate ventilation to maintain temperature in pull box within same limits as switchboard.
 2. Removable covers shall form top, front, and sides. Top covers at rear shall be easily removable for drilling and cutting.
 3. Bottom shall be insulating, fire-resistive material with separate holes for cable drops into switchboard.
 4. Cable supports shall be arranged to facilitate cabling and adequate to support cables indicated, including those for future installation.
- I. Phase and Neutral Buses and Connections: Three phase, four wire unless otherwise indicated. Hard drawn copper of 98% conductivity with copper circuit-breaker line connections.
1. Ground Bus: 1/4-by-2-inch- minimum size, hard-drawn copper of 98 percent conductivity, equipped with pressure connectors for feeder and branch-circuit ground conductors.
 2. Main Phase Buses and Equipment Ground Buses: Uniform capacity for entire length of switchboard's main and distribution sections. Provide for future extensions from both ends.
 3. Neutral Buses: 100 percent of the ampacity of phase buses unless otherwise indicated, equipped with pressure connectors for outgoing circuit neutral cables.
- J. Future Devices: Equip compartments with mounting brackets, supports, bus connections, and appurtenances at full rating of circuit-breaker compartment.

2.02 TRANSIENT VOLTAGE SUPPRESSION DEVICES

- A. Surge Protection Device Description: IEEE C62.41-compliant, integrally mounted, solid-state, parallel-connected, with sine-wave tracking suppression and filtering modules, UL 1449, third edition, short-circuit current rating matching or exceeding the switchboard short-circuit rating, and with the following features and accessories:
1. Fuses, rated at 200-kA interrupting capacity.
 2. LED indicator lights for power and protection status.
 3. Audible alarm, with silencing switch, to indicate when protection has failed.
 4. Form-C contacts rated at 5 A and 250-V ac, one normally open and one normally closed, for remote monitoring of system operation. Contacts shall reverse position on failure of any surge diversion module or on opening of any current-limiting device.
 5. Transient-event counter set to totalize transient surges.
- B. Peak Single-Impulse Surge Current Rating: 160 kA per mode/320 kA per phase.
- C. Withstand Capabilities: 5000 IEEE C62.41, Category C3 (10 kA), 8-by-20-mic.sec. surges with less than 5 percent change in clamping voltage.
- D. Protection modes and UL 1449 SVR for grounded wye circuits with three-phase, four-wire circuits shall be as follows:
1. Line to Neutral: 800V for 480V and 400 V for 208V.
 2. Line to Ground: 800V for 480V and 400 V for 208V.
 3. Neutral to Ground: 800V for 480V and 400 V for 208V.

2.03 DISCONNECTING AND OVERCURRENT PROTECTIVE DEVICES

- A. Branch Molded-Case Circuit Breaker (MCCB): Comply with UL 489, with interrupting capacity indicated on plans.
1. Thermal-Magnetic Circuit Breakers: Inverse time-current element for low-level overloads, and instantaneous magnetic trip element for short circuits. Adjustable magnetic trip setting for circuit-breaker frame sizes 100 A and larger.
 2. Molded-Case Circuit-Breaker (MCCB) Features and Accessories:
 - a. Standard frame sizes, trip ratings, and number of poles.
 - b. Lugs: Compression style, suitable for number, size, trip ratings, and conductor material.
 - c. Application Listing: Appropriate for application; Type SWD for switching fluorescent lighting loads; Type HID for feeding fluorescent and high-intensity discharge (HID) lighting circuits.
 - d. Ground-Fault Protection: Integrally mounted relay and trip unit with adjustable pickup and time-delay settings, push-to-test feature, and ground-fault indicator.
 - e. Zone-Selective Interlocking: Integral with electronic trip unit; for interlocking ground-fault protection function.
 - f. Communication Capability: Integral communication module with functions and features compatible with power monitoring and control system specified in Section 26 09 13 "Electrical Power Monitoring and Control."
 - g. Shunt Trip: 120-V trip coil energized from separate circuit, set to trip at 75 percent of rated voltage.
 - h. Undervoltage Trip: Set to operate at 35 to 75 percent of rated voltage without intentional time delay.
 - i. Auxiliary Contacts: Two SPDT switches with "a" and "b" contacts; "a" contacts mimic circuit-breaker contacts, "b" contacts operate in reverse of circuit-breaker contacts.
 - j. Key Interlock Kit: Externally mounted to prohibit circuit-breaker operation; key shall be removable only when circuit breaker is in off position.
- B. Main Insulated-Case Circuit Breaker (ICCB): 100 percent rated, sealed, insulated-case power circuit breaker with interrupting capacity rating to meet available fault current.
1. Fixed circuit-breaker mounting.
 2. Two-step, stored-energy closing.
 3. Standard-function, microprocessor-based trip units with interchangeable rating plug, trip indicators, and the following field-adjustable settings:
 - a. Instantaneous trip.
 - b. Long- and short-time time adjustments.
 - c. Ground-fault pickup level, time delay, and I^2t response.
 4. Zone-Selective Interlocking: Integral with electronic trip unit; for interlocking ground-fault protection function.
 5. Remote trip indication and control.
 6. Communication Capability: Integral communication module with functions and features compatible with power monitoring and control system specified in Section 26 09 13 "Electrical Power Monitoring and Control."

7. Key Interlock Kit: Externally mounted to prohibit circuit-breaker operation; key shall be removable only when circuit breaker is in off position.
 8. Control Voltage: 120-V ac.
- C. Bolted-Pressure Contact Switch: Operating mechanism uses rotary-mechanical-bolting action to produce and maintain high clamping pressure on the switch blade after it engages the stationary contacts.
1. Manufacturers: Subject to compliance with requirements, available manufacturers offering products that may be incorporated into the Work include, but are not limited to, the following:
 - a. Boltswitch, Inc.
 - b. Eaton Electrical Inc.; Cutler-Hammer Business Unit.
 - c. Pringle Electrical Manufacturing Company, Inc.
 - d. Siemens Energy & Automation, Inc.
 - e. Square D; a brand of Schneider Electric.
 2. Operating Mechanism: Manual handle operation to close switch; stores energy in mechanism for opening and closing.
 - a. Electrical Trip: Operation of lever or push-button trip switch, or trip signal from ground-fault relay or remote-control device, causes switch to open.
 - b. Mechanical Trip: Operation of mechanical lever, push button, or other device causes switch to open.
 3. Auxiliary Switches: Factory installed, single pole, double throw, with leads connected to terminal block, and including one set more than quantity required for functional performance indicated.
 4. Service-Rated Switches: Labeled for use as service equipment.
 5. Ground-Fault Relay: Comply with UL 1053; self-powered type with mechanical ground-fault indicator, test function, tripping relay with internal memory, and three-phase current transformer/sensor.
 - a. Configuration: Integrally mounted relay and trip unit with adjustable pickup and time-delay settings, push-to-test feature, and ground-fault indicator.
 6. Open-Fuse Trip Device: Arranged to trip switch open if a phase fuse opens.

2.04 INSTRUMENTATION

- A. Instrument Transformers: IEEE C57.13, NEMA EI 21.1, and the following:
1. Current Transformers: IEEE C57.13; 5 A, 60 Hz, secondary and secondary shorting device. Burden and accuracy shall be consistent with connected metering and relay devices.
 2. Control-Power Transformers: Dry type, mounted in separate compartments for units larger than 3 kVA.
 3. Current Transformers for Neutral and Ground-Fault Current Sensing: Connect secondary wiring to ground overcurrent relays, via shorting terminals, to provide selective tripping of main and tie circuit breaker. Coordinate with feeder circuit-breaker, ground-fault protection.

- B. Multifunction Digital-Metering Monitor: Microprocessor-based unit suitable for three- or four-wire systems and with the following features:
1. Switch-selectable digital display of the following values with maximum accuracy tolerances as indicated:
 - a. Phase Currents, Each Phase: Plus or minus 1 percent.
 - b. Phase-to-Phase Voltages, Three Phase: Plus or minus 1 percent.
 - c. Phase-to-Neutral Voltages, Three Phase: Plus or minus 1 percent.
 - d. Megawatts: Plus or minus 2 percent.
 - e. Megavars: Plus or minus 2 percent.
 - f. Power Factor: Plus or minus 2 percent.
 - g. Frequency: Plus or minus 0.5 percent.
 - h. Accumulated Energy, Megawatt Hours: Plus or minus 2 percent; accumulated values unaffected by power outages up to 72 hours.
 - i. Megawatt Demand: Plus or minus 2 percent; demand interval programmable from five to 60 minutes.
 2. Mounting: Display and control unit flush or semiflush mounted in instrument compartment door.

2.05 CONTROL POWER

- A. Control Circuits: 120-V ac, supplied through secondary disconnecting devices from control-power transformer.
- B. Control-Power Fuses: Primary and secondary fuses for current-limiting and overload protection of transformer and fuses for protection of control circuits.
- C. Control Wiring: Factory installed, with bundling, lacing, and protection included. Provide flexible conductors for No. 8 AWG and smaller, for conductors across hinges, and for conductors for interconnections between shipping units.

2.06 ACCESSORY COMPONENTS AND FEATURES

- A. Portable Test Set: For testing functions of solid-state trip devices without removing from switchboard. Include relay and meter test plugs suitable for testing switchboard meters and switchboard class relays.

2.07 IDENTIFICATION

- A. Service Equipment Label: NRTL labeled for use as service equipment for switchboards with one or more service disconnecting and overcurrent protective devices.

PART 3 - EXECUTION**3.01 INSTALLATION**

- A. Receive, inspect, handle, store and install switchboards and accessories according to NECA 400.
- B. Equipment Mounting: Install switchboards on concrete base, 4-inch nominal thickness. Comply with requirements for concrete base specified in Section 03 30 00 "Cast-in-Place Concrete."
 - 1. Install dowel rods to connect concrete base to concrete floor. Unless otherwise indicated, install dowel rods on 18-inch centers around the full perimeter of concrete base.
 - 2. For supported equipment, install epoxy-coated anchor bolts that extend through concrete base and anchor into structural concrete floor.
 - 3. Place and secure anchorage devices. Use setting drawings, templates, diagrams, instructions, and directions furnished with items to be embedded.
 - 4. Install anchor bolts to elevations required for proper attachment to switchboards.
- C. Temporary Lifting Provisions: Remove temporary lifting eyes, channels, and brackets and temporary blocking of moving parts from switchboard units and components.
- D. Install filler plates in unused spaces of panel-mounted sections.
- E. Install overcurrent protective devices, transient voltage suppression devices, and instrumentation.
 - 1. Set field-adjustable switches and circuit-breaker trip ranges.
- F. Comply with NECA 1.
- G. Comply with requirements for terminating feeder bus specified in Section 26 25 00 "Enclosed Bus Assemblies." Drawings indicate general arrangement of bus, fittings, and specialties.

3.02 IDENTIFICATION

- A. Identify field-installed conductors, interconnecting wiring, and components; provide warning signs complying with requirements for identification specified in Section 26 05 53 "Identification for Electrical Systems."
- B. Switchboard Nameplates: Label each switchboard compartment with a nameplate complying with requirements for identification specified in Section 26 05 53 "Identification for Electrical Systems."
- C. Device Nameplates: Label each disconnecting and overcurrent protective device and each meter and control device mounted in compartment doors with a nameplate complying with requirements for identification specified in Section 26 05 53 "Identification for Electrical Systems."

3.03 FIELD QUALITY CONTROL

- A. Acceptance Testing Preparation:
 - 1. Test insulation resistance for each switchboard bus, component, connecting supply, feeder, and control circuit.
 - 2. Test continuity of each circuit.

- B. Tests and Inspections:
 - 1. Perform each visual and mechanical inspection and electrical test stated in NETA Acceptance Testing Specification. Certify compliance with test parameters.
 - 2. Correct malfunctioning units on-site, where possible, and retest to demonstrate compliance; otherwise, replace with new units and retest.
 - 3. Test and adjust controls, remote monitoring, and safeties. Replace damaged and malfunctioning controls and equipment.

- C. Switchboard will be considered defective if it does not pass tests and inspections.

- D. Prepare test and inspection reports, including a certified report that identifies switchboards included and that describes scanning results. Include notation of deficiencies detected, remedial action taken, and observations after remedial action.

END OF SECTION 26 24 13

SECTION 26 24 16**PANELBOARDS**

PART 1 - GENERAL

1.01 SUMMARY

- A. Section includes distribution panelboards and lighting and appliance branch-circuit panelboards.

1.02 ACTION SUBMITTALS

- A. Product Data: For each type of product indicated.
- B. Shop Drawings: For each panelboard and related equipment.
 - 1. Include dimensioned plans, elevations, sections, and details. Show tabulations of installed devices, equipment features, and ratings.
 - 2. Detail enclosure types and details for types other than NEMA 250, Type 1.
 - 3. Detail bus configuration, current, and voltage ratings.
 - 4. Short-circuit current rating of panelboards and overcurrent protective devices.
 - 5. Include evidence of NRTL listing for series rating of installed devices.
 - 6. Detail features, characteristics, ratings, and factory settings of individual overcurrent protective devices and auxiliary components.
 - 7. Include wiring diagrams for power, signal, and control wiring.
 - 8. Include time-current coordination curves for each type and rating of overcurrent protective device included in panelboards.

1.03 INFORMATIONAL SUBMITTALS

- A. Field quality-control reports.
- B. Panelboard schedules for installation in panelboards.

1.04 CLOSEOUT SUBMITTALS

- A. Refer to Section 01 78 23 "Operation and maintenance data".

1.05 QUALITY ASSURANCE

- A. Electrical Components, Devices, and Accessories: Listed and labeled as defined in NFPA 70, by a qualified testing agency, and marked for intended location and application.

- B. Comply with NEMA PB 1.
- C. Comply with NFPA 70.

1.06 WARRANTY

- A. Special Warranty: Manufacturer's standard form in which manufacturer agrees to repair or replace transient voltage suppression devices that fail in materials or workmanship within specified warranty period.
 - 1. Warranty Period: Five years from date of Substantial Completion.

PART 2 - PRODUCTS

2.01 GENERAL REQUIREMENTS FOR PANELBOARDS

- A. Enclosures: Flush- and surface-mounted cabinets.
 - 1. Rated for environmental conditions at installed location.
 - a. Indoor Dry and Clean Locations: NEMA 250, Type 1.
 - b. Outdoor Locations: NEMA 250, Type 3R.
 - c. Other Wet or Damp Indoor Locations: NEMA 250, Type 4.
 - 2. Front: Secured to box with concealed trim clamps. For surface-mounted fronts, match box dimensions; for flush-mounted fronts, overlap box.
 - 3. Hinged Front Cover: Entire front trim hinged to box and with standard door within hinged trim cover.
 - 4. Directory Card: Inside panelboard door, mounted in transparent card holder.
- B. Incoming Mains Location: Top and bottom.
- C. Phase, Neutral, and Ground Buses: Hard-drawn copper, 98 percent conductivity.
- D. Conductor Connectors: Suitable for use with conductor material and sizes.
 - 1. Material: Hard-drawn copper, 98 percent conductivity.
 - 2. Main and Neutral Lugs: Compression type.
 - 3. Ground Lugs and Bus Configured Terminators: Compression type.
 - 4. Feed-Through Lugs: Compression type, suitable for use with conductor material. Locate at opposite end of bus from incoming lugs or main device.
 - 5. Subfeed (Double) Lugs: Compression type suitable for use with conductor material. Locate at same end of bus as incoming lugs or main device.
- E. Service Equipment Label: NRTL labeled for use as service equipment for panelboards with one or more main service disconnecting and overcurrent protective devices.
- F. Future Devices: Mounting brackets, bus connections, filler plates, and necessary appurtenances required for future installation of devices.

- G. Panelboard Short-Circuit Current Rating: Fully rated to interrupt symmetrical short-circuit current available at terminals.

2.02 DISTRIBUTION PANELBOARDS

- A. Manufacturers: Subject to compliance with requirements, available manufacturers offering products that may be incorporated into the Work include, but are not limited to, the following:
 - 1. Eaton Electrical Inc.; Cutler-Hammer Business Unit.
 - 2. General Electric Company; GE Consumer & Industrial - Electrical Distribution.
 - 3. Siemens Energy & Automation, Inc.
 - 4. Square D; a brand of Schneider Electric.
- B. Panelboards: NEMA PB 1, power and feeder distribution type.
- C. Doors: Secured with vault-type latch with tumbler lock; keyed alike.
- D. Mains: Circuit breaker.
- E. Branch Overcurrent Protective Devices: For Circuit-Breaker Frame Sizes 125 A and Smaller: Bolt-on circuit breakers.
- F. Branch Overcurrent Protective Devices: For Circuit-Breaker Frame Sizes Larger Than 125 A: Bolt-on circuit breakers.

2.03 LIGHTING AND APPLIANCE BRANCH-CIRCUIT PANELBOARDS

- A. Manufacturers: Subject to compliance with requirements, available manufacturers offering products that may be incorporated into the Work include, but are not limited to, the following:
 - 1. Eaton Electrical Inc.; Cutler-Hammer Business Unit.
 - 2. General Electric Company; GE Consumer & Industrial - Electrical Distribution.
 - 3. Siemens Energy & Automation, Inc.
 - 4. Square D; a brand of Schneider Electric.
- B. Panelboards: NEMA PB 1, lighting and appliance branch-circuit type.
- C. Mains: Circuit breaker and or main lugs only as indicated on plans.
- D. Branch Overcurrent Protective Devices: Bolt-on circuit breakers, replaceable without disturbing adjacent units.
- E. Contactors in Main Bus: NEMA ICS 2, Class A, electrically held, general-purpose controller, with same short-circuit interrupting rating as panelboard.
 - 1. External Control-Power Source: 120-V branch circuit.
- F. Doors: Concealed hinges; secured with flush latch with tumbler lock; keyed alike.

2.04 DISCONNECTING AND OVERCURRENT PROTECTIVE DEVICES

- A. Manufacturers: Subject to compliance with requirements, available manufacturers offering products that may be incorporated into the Work include, but are not limited to, the following:
1. Eaton Electrical Inc.; Cutler-Hammer Business Unit.
 2. General Electric Company; GE Consumer & Industrial - Electrical Distribution.
 3. Siemens Energy & Automation, Inc.
 4. Square D; a brand of Schneider Electric.
- B. Molded-Case Circuit Breaker (MCCB): Comply with UL 489, with interrupting capacity to meet available fault currents.
1. Thermal-Magnetic Circuit Breakers: Inverse time-current element for low-level overloads, and instantaneous magnetic trip element for short circuits. Adjustable magnetic trip setting for circuit-breaker frame sizes 100 A and larger.
 2. Current-Limiting Circuit Breakers: Frame sizes 400 A and smaller; let-through ratings less than NEMA FU 1, RK-5.
 3. GFCI Circuit Breakers: Single- and two-pole configurations with Class A ground-fault protection (6-mA trip).
 4. Ground-Fault Equipment Protection (GFEP) Circuit Breakers: Class B ground-fault protection (30-mA trip).
 5. Arc-Fault Circuit Interrupter (AFCI) Circuit Breakers: Comply with UL 1699; 120/240-V, single-pole configuration.
 6. Molded-Case Circuit-Breaker (MCCB) Features and Accessories:
 - a. Standard frame sizes, trip ratings, and number of poles.
 - b. Lugs: Compression style, suitable for number, size, trip ratings, and conductor materials.
 - c. Application Listing: Appropriate for application; Type SWD for switching fluorescent lighting loads; Type HID for feeding fluorescent and high-intensity discharge (HID) lighting circuits.
 - d. Communication Capability: Circuit-breaker-mounted communication module with functions and features compatible with power monitoring and control system specified in Division 26 Section "Electrical Power Monitoring and Control."
 - e. Handle Padlocking Device: Fixed attachment, for locking circuit-breaker handle in on position.
 - f. Handle Clamp: Loose attachment, for holding circuit-breaker handle in on position.

2.05 ACCESSORY COMPONENTS AND FEATURES

- A. Portable Test Set: For testing functions of solid-state trip devices without removing from panelboard. Include relay and meter test plugs suitable for testing panelboard meters and switchboard class relays.

PART 3 - EXECUTION**3.01 INSTALLATION**

- A. Receive, inspect, handle, store and install panelboards and accessories according to NECA 407.
- B. Mount top of trim 90 inches above finished floor unless otherwise indicated.
- C. Mount panelboard cabinet plumb and rigid without distortion of box. Mount recessed panelboards with fronts uniformly flush with wall finish and mating with back box.
- D. Install overcurrent protective devices and controllers not already factory installed.
 - 1. Set field-adjustable, circuit-breaker trip ranges.
- E. Install filler plates in unused spaces.
- F. In ceiling areas stub four 1-inch empty conduits from panelboard into accessible ceiling space or space designated to be ceiling space in the future. Stub four 1-inch empty conduits into raised floor space or below slab not on grade.
- G. Arrange conductors in gutters into groups and bundle and wrap with wire ties.
- H. Comply with NECA 1.

3.02 IDENTIFICATION

- A. Identify field-installed conductors, interconnecting wiring, and components; provide warning signs complying with Division 26 Section "Identification for Electrical Systems."
- B. Create a directory to indicate installed circuit loads and incorporating City's final room designations. Obtain approval before installing. Use a computer or typewriter to create directory; handwritten directories are not acceptable.
- C. Panelboard Nameplates: Label each panelboard with a nameplate complying with requirements for identification specified in Division 26 Section "Identification for Electrical Systems."
- D. Device Nameplates: Label each branch circuit device in distribution panelboards with a nameplate complying with requirements for identification specified in Division 26 Section "Identification for Electrical Systems."

3.03 FIELD QUALITY CONTROL

- A. Perform tests and inspections.
- B. Acceptance Testing Preparation:

1. Test insulation resistance for each panelboard bus, component, connecting supply, feeder, and control circuit.
 2. Test continuity of each circuit.
- C. Tests and Inspections:
1. Perform each visual and mechanical inspection and electrical test stated in NETA Acceptance Testing Specification. Certify compliance with test parameters.
 2. Correct malfunctioning units on-site, where possible, and retest to demonstrate compliance; otherwise, replace with new units and retest.
- D. Panelboards will be considered defective if they do not pass tests and inspections.
- E. Prepare test and inspection reports, including a certified report that identifies panelboards included and that describes scanning results. Include notation of deficiencies detected, remedial action taken, and observations after remedial action.

END OF SECTION 26 24 16

SECTION 26 27 26**WIRING DEVICES****PART 1 - GENERAL****1.01 SUMMARY****A. Section Includes:**

1. Receptacles, receptacles with integral GFCI, and associated device plates.
2. Weather-resistant receptacles.
3. Snap switches and wall-box dimmers.
4. Wall-switch and exterior occupancy sensors.
5. Communications outlets.

1.02 ADMINISTRATIVE REQUIREMENTS**A. Coordination:**

1. Receptacles for Owner-Furnished Equipment: Match plug configurations.

1.03 ACTION SUBMITTALS**A. Product Data:** For each type of product.**B. Shop Drawings:** List of legends and description of materials and process used for premarking wall plates.**1.04 INFORMATIONAL SUBMITTALS****A. Field quality-control reports.****1.05 CLOSEOUT SUBMITTALS****A. Operation and maintenance data.****PART 2 - PRODUCTS****2.01 MANUFACTURERS****A. Manufacturers' Names:** Shortened versions (shown in parentheses) of the following manufacturers' names are used in other Part 2 articles:

1. Cooper Wiring Devices; Division of Cooper Industries, Inc. (Cooper).

2. Hubbell Incorporated; Wiring Device-Kellems (Hubbell).
3. Leviton Mfg. Company Inc. (Leviton).
4. Pass & Seymour/Legrand (Pass & Seymour).
5. Or approved equal.

- B. Source Limitations: Obtain each type of wiring device and associated wall plate from single source from single manufacturer.

2.02 GENERAL WIRING-DEVICE REQUIREMENTS

- A. Wiring Devices, Components, and Accessories: Listed and labeled as defined in NFPA 70, by a qualified testing agency, and marked for intended location and application.
- B. Comply with NFPA 70.
- C. Devices that are manufactured for use with modular plug-in connectors may be substituted under the following conditions:
1. Connectors shall comply with UL 2459 and shall be made with stranding building wire.
 2. Devices shall comply with the requirements in this Section.

2.03 STRAIGHT-BLADE RECEPTACLES

- A. Convenience Receptacles, 125 V, 20 A: Comply with NEMA WD 1, NEMA WD 6 Configuration 5-20R, UL 498, and FS W-C-596.
1. Products: Subject to compliance with requirements, available products that may be incorporated into the Work include, but are not limited to, the following:
 - a. Cooper; 5351 (single), CR5362 (duplex).
 - b. Hubbell; HBL5351 (single), HBL5352 (duplex).
 - c. Leviton; 5891 (single), 5352 (duplex).
 - d. Pass & Seymour; 5361 (single), 5362 (duplex).

2.04 GFCI RECEPTACLES

- A. General Description:
1. Straight blade, non-feed-through type.
 2. Comply with NEMA WD 1, NEMA WD 6, UL 498, UL 943 Class A, and FS W-C-596.
 3. Include indicator light that shows when the GFCI has malfunctioned and no longer provides proper GFCI protection.
- B. Duplex GFCI Convenience Receptacles, 125 V, 20 A:
1. Products: Subject to compliance with requirements, available products that may be incorporated into the Work include, but are not limited to, the following:
 - a. Cooper; VGF20.

- b. Hubbell; GFR5352L.
- c. Pass & Seymour; 2095.
- d. Leviton; 7590.

2.05 TOGGLE SWITCHES

- A. Comply with NEMA WD 1, UL 20, and FS W-S-896.
- B. Switches, 120/277 V, 20 A:
 - 1. Products: Subject to compliance with requirements, available products that may be incorporated into the Work include, but are not limited to, the following:
 - a. Single Pole:
 - 1) Cooper; AH1221.
 - 2) Hubbell; HBL1221.
 - 3) Leviton; 1221-2.
 - 4) Pass & Seymour; CSB20AC1.
 - b. Two Pole:
 - 1) Cooper; AH1222.
 - 2) Hubbell; HBL1222.
 - 3) Leviton; 1222-2.
 - 4) Pass & Seymour; CSB20AC2.
 - c. Three Way:
 - 1) Cooper; AH1223.
 - 2) Hubbell; HBL1223.
 - 3) Leviton; 1223-2.
 - 4) Pass & Seymour; CSB20AC3.

2.06 DECORATOR-STYLE DEVICES

- A. Toggle Switches, Square Face, 120/277 V, 15 A: Comply with NEMA WD 1, UL 20, and FS W-S-896.
 - 1. Products: Subject to compliance with requirements, available products that may be incorporated into the Work include, but are not limited to, the following:
 - a. Cooper; 7621 (single pole), 7623 (three way).
 - b. Hubbell; DS115 (single pole), DS315 (three way).
 - c. Leviton; 56291-2 (single pole), 5623-2 (three way).
 - d. Pass & Seymour; 2621 (single pole), 2623 (three way).

2.07 WALL PLATES

- A. Single and combination types shall match corresponding wiring devices.
 - 1. Plate-Securing Screws: Metal with head color to match plate finish.

2. Material for Finished Spaces: Steel with white baked enamel, suitable for field painting.
 3. Material for Unfinished Spaces: Galvanized steel.
 4. Material for Damp Locations: Thermoplastic with spring-loaded lift cover, and listed and labeled for use in wet and damp locations.
- B. Wet-Location, Weatherproof Cover Plates: NEMA 250, complying with Type 3R, weather-resistant thermoplastic with lockable cover.

2.08 FINISHES

- A. Device Color: As selected by Architect.
- B. Wall Plate Color: As selected by Architect.

PART 3 - EXECUTION

3.01 INSTALLATION

- A. Comply with NECA 1.
- B. For mounting heights of devices, refer to Architectural Plan 2A001.
- C. Coordination with Other Trades:
 1. Protect installed devices and their boxes. Do not place wall finish materials over device boxes and do not cut holes for boxes with routers that are guided by riding against outside of boxes.
 2. Keep outlet boxes free of plaster, drywall joint compound, mortar, cement, concrete, dust, paint, and other material that may contaminate the raceway system, conductors, and cables.
 3. Install device boxes in brick or block walls so that the cover plate does not cross a joint unless the joint is troweled flush with the face of the wall.
 4. Install wiring devices after all wall preparation, including painting, is complete.
- D. Conductors:
 1. Do not strip insulation from conductors until right before they are spliced or terminated on devices.
 2. Strip insulation evenly around the conductor using tools designed for the purpose. Avoid scoring or nicking of solid wire or cutting strands from stranded wire.
 3. The length of free conductors at outlets for devices shall meet provisions of NFPA 70, Article 300, without pigtails.
 4. Existing Conductors:
 - a. Cut back and pigtail, or replace all damaged conductors.
 - b. Straighten conductors that remain and remove corrosion and foreign matter.

- c. Pigtailing existing conductors is permitted, provided the outlet box is large enough.

E. Device Installation:

1. Replace devices that have been in temporary use during construction and that were installed before building finishing operations were complete.
2. Keep each wiring device in its package or otherwise protected until it is time to connect conductors.
3. Do not remove surface protection, such as plastic film and smudge covers, until the last possible moment.
4. Connect devices to branch circuits using pigtails that are not less than 6 inches in length.
5. When there is a choice, use side wiring with binding-head screw terminals. Wrap solid conductor tightly clockwise, two-thirds to three-fourths of the way around terminal screw.
6. Use a torque screwdriver when a torque is recommended or required by manufacturer.
7. When conductors larger than No. 12 AWG are installed on 15- or 20-A circuits, splice No. 12 AWG pigtails for device connections.
8. Tighten unused terminal screws on the device.
9. When mounting into metal boxes, remove the fiber or plastic washers used to hold device-mounting screws in yokes, allowing metal-to-metal contact.

F. Receptacle Orientation:

1. Install ground pin of vertically mounted receptacles up, and on horizontally mounted receptacles to the right.

G. Device Plates: Do not use oversized or extra-deep plates. Repair wall finishes and remount outlet boxes when standard device plates do not fit flush or do not cover rough wall opening.

H. Arrangement of Devices: Unless otherwise indicated, mount flush, with long dimension vertical and with grounding terminal of receptacles on top. Group adjacent switches under single, multigang wall plates.

I. Adjust locations of service poles to suit arrangement of partitions and furnishings.

3.02 GFCI RECEPTACLES

- A. Install non-feed-through-type GFCI receptacles where protection of downstream receptacles is not required.

3.03 FIELD QUALITY CONTROL

A. Perform the following tests and inspections:

1. Test Instruments: Use instruments that comply with UL 1436.
2. Test Instrument for Convenience Receptacles: Digital wiring analyzer with digital readout or illuminated digital-display indicators of measurement.

- B. Tests for Convenience Receptacles:
1. Line Voltage: Acceptable range is 105 to 132 V.
 2. Percent Voltage Drop under 15-A Load: A value of 6 percent or higher is unacceptable.
 3. Ground Impedance: Values of up to 2 ohms are acceptable.
 4. GFCI Trip: Test for tripping values specified in UL 1436 and UL 943.
 5. Using the test plug, verify that the device and its outlet box are securely mounted.
 6. Tests shall be diagnostic, indicating damaged conductors, high resistance at the circuit breaker, poor connections, inadequate fault current path, defective devices, or similar problems. Correct circuit conditions, remove malfunctioning units and replace with new ones, and retest as specified above.
- C. Wiring device will be considered defective if it does not pass tests and inspections.
- D. Prepare test and inspection reports.

END OF SECTION 26 27 26

SECTION 26 28 16**ENCLOSED SWITCHES AND CIRCUIT BREAKERS**

PART 1 - GENERAL

1.01 SUMMARY

- A. Section Includes:
 - 1. Fusible switches.
 - 2. Nonfusible switches.
 - 3. Enclosures.

1.02 DEFINITIONS

- A. NC: Normally closed.
- B. NO: Normally open.
- C. SPDT: Single pole, double throw.

1.03 ACTION SUBMITTALS

- A. Product Data: For each type of enclosed switch, circuit breaker, accessory, and component indicated.
- B. Shop Drawings: For enclosed switches and circuit breakers. Include plans, elevations, sections, details, and attachments to other work.
 - 1. Wiring Diagrams: For power, signal, and control wiring.

1.04 INFORMATIONAL SUBMITTALS

- A. Field quality-control reports.

1.05 CLOSEOUT SUBMITTALS

- A. Operation and maintenance data.

1.06 QUALITY ASSURANCE

- A. Electrical Components, Devices, and Accessories: Listed and labeled as defined in NFPA 70, by a qualified testing agency, and marked for intended location and application.

- B. Comply with NFPA 70.

PART 2 - PRODUCTS

2.01 FUSIBLE SWITCHES

- A. Manufacturers: Subject to compliance with requirements, available manufacturers offering products that may be incorporated into the Work include, but are not limited to, the following:
1. Eaton Electrical Inc.; Cutler-Hammer Business Unit.
 2. General Electric Company; GE Consumer & Industrial - Electrical Distribution.
 3. Siemens Energy & Automation, Inc.
 4. Square D; a brand of Schneider Electric.
- B. Type HD, Heavy Duty, Single Throw, 600-V ac, 1200 A and Smaller: UL 98 and NEMA KS 1, horsepower rated, with clips or bolt pads to accommodate specified fuses, lockable handle with capability to accept three padlocks, and interlocked with cover in closed position.
- C. Type HD, Heavy Duty, Six Pole, Single Throw, 600-V ac, 200 A and Smaller: UL 98 and NEMA KS 1, horsepower rated, with clips or bolt pads to accommodate specified fuses, lockable handle with capability to accept three padlocks, and interlocked with cover in closed position.
- D. Type HD, Heavy Duty, Double Throw, 600-V ac, 1200 A and Smaller: UL 98 and NEMA KS 1, horsepower rated, with clips or bolt pads to accommodate specified fuses, lockable handle with capability to accept three padlocks, and interlocked with cover in closed position.
- E. Accessories:
1. Equipment Ground Kit: Internally mounted and labeled for copper and aluminum ground conductors.
 2. Neutral Kit: Internally mounted; insulated, capable of being grounded and bonded; labeled for copper and aluminum neutral conductors.
 3. Class R Fuse Kit: Provides rejection of other fuse types when Class R fuses are specified.
 4. Lugs: Suitable for number, size, and conductor material.

2.02 NONFUSIBLE SWITCHES

- A. Manufacturers: Subject to compliance with requirements, available manufacturers offering products that may be incorporated into the Work include, but are not limited to, the following:
1. Eaton Electrical Inc.; Cutler-Hammer Business Unit.
 2. General Electric Company; GE Consumer & Industrial - Electrical Distribution.
 3. Siemens Energy & Automation, Inc.
 4. Square D; a brand of Schneider Electric.

- B. Type HD, Heavy Duty, Single Throw, 600-V ac, 1200 A and Smaller: UL 98 and NEMA KS 1, horsepower rated, lockable handle with capability to accept three padlocks, and interlocked with cover in closed position.
- C. Type HD, Heavy Duty, Six Pole, Single Throw, 600-V ac, 200 A and Smaller: UL 98 and NEMA KS 1, horsepower rated, lockable handle with capability to accept three padlocks, and interlocked with cover in closed position.
- D. Type HD, Heavy Duty, Double Throw, 600-V ac, 1200 A and Smaller: UL 98 and NEMA KS 1, horsepower rated, lockable handle with capability to accept three padlocks, and interlocked with cover in closed position.
- E. Accessories:
 - 1. Equipment Ground Kit: Internally mounted and labeled for copper and aluminum ground conductors.
 - 2. Neutral Kit: Internally mounted; insulated, capable of being grounded and bonded; labeled for copper and aluminum neutral conductors.
 - 3. Lugs: Suitable for number, size, and conductor material.

2.03 ENCLOSURES

- A. Enclosed Switches and Circuit Breakers: NEMA AB 1, NEMA KS 1, NEMA 250, and UL 50, to comply with environmental conditions at installed location.
 - 1. Indoor, Dry and Clean Locations: NEMA 250, Type 1.
 - 2. Outdoor Locations: NEMA 250, Type 3R.
 - 3. Other Wet or Damp, Indoor Locations: NEMA 250, Type 4.
 - 4. Indoor Locations Subject to Dust, Falling Dirt, and Dripping Noncorrosive Liquids: NEMA 250, Type 12.

PART 3 - EXECUTION

3.01 INSTALLATION

- A. Install individual wall-mounted switches and circuit breakers with tops at uniform height unless otherwise indicated.
- B. Temporary Lifting Provisions: Remove temporary lifting eyes, channels, and brackets and temporary blocking of moving parts from enclosures and components.
- C. Install fuses in fusible devices.
- D. Comply with NECA 1.

3.02 IDENTIFICATION

- A. Comply with requirements in Division 26 Section "Identification for Electrical Systems."

1. Identify field-installed conductors, interconnecting wiring, and components; provide warning signs.
2. Label each enclosure with engraved metal or laminated-plastic nameplate.

3.03 FIELD QUALITY CONTROL

- A. Perform tests and inspections.
- B. Acceptance Testing Preparation:
 1. Test insulation resistance for each enclosed switch and circuit breaker, component, connecting supply, feeder, and control circuit.
 2. Test continuity of each circuit.
- C. Tests and Inspections:
 1. Perform each visual and mechanical inspection and electrical test stated in NETA Acceptance Testing Specification. Certify compliance with test parameters.
 2. Correct malfunctioning units on-site, where possible, and retest to demonstrate compliance; otherwise, replace with new units and retest.
- D. Enclosed switches and circuit breakers will be considered defective if they do not pass tests and inspections.
- E. Prepare test and inspection reports, including a certified report that identifies enclosed switches and circuit breakers and that describes scanning results. Include notation of deficiencies detected, remedial action taken, and observations after remedial action.

END OF SECTION 26 28 16

SECTION 26 29 13
ENCLOSED CONTROLLERS

PART 1 - GENERAL

1.01 SUMMARY

- A. Section includes the following enclosed controllers rated 600 V and less:
 - 1. Full-voltage magnetic.

1.02 DEFINITIONS

- A. CPT: Control power transformer.
- B. MCCB: Molded-case circuit breaker.
- C. MCP: Motor circuit protector.
- D. N.C.: Normally closed.
- E. N.O.: Normally open.
- F. OCPD: Overcurrent protective device.

1.03 ACTION SUBMITTALS

- A. Product Data: For each type of enclosed controller.
- B. Shop Drawings: For each enclosed controller. Include dimensioned plans, elevations, sections, details, and required clearances and service spaces around controller enclosures.
 - 1. Wiring Diagrams: For power, signal, and control wiring.

1.04 INFORMATIONAL SUBMITTALS

- A. Field quality-control reports.

1.05 CLOSEOUT SUBMITTALS

- A. Operation and maintenance data.

1.06 QUALITY ASSURANCE

- A. Electrical Components, Devices, and Accessories: Listed and labeled as defined in NFPA 70, by a qualified testing agency, and marked for intended location and application.
- B. Comply with NFPA 70.

PART 2 - PRODUCTS

2.01 ENCLOSURES

- A. Enclosed Controllers: NEMA ICS 6, to comply with environmental conditions at installed location.
 - 1. Dry and Clean Indoor Locations: Type 1.
 - 2. Outdoor Locations: Type 3R.
 - 3. Other Wet or Damp Indoor Locations: Type 4.
 - 4. Indoor Locations Subject to Dust, Falling Dirt, and Dripping Noncorrosive Liquids: Type 12.

2.02 ACCESSORIES

- A. Push Buttons, Pilot Lights, and Selector Switches: NEMA ICS 5; heavy-duty type; factory installed in controller enclosure cover unless otherwise indicated.
- B. Control Relays: Auxiliary and adjustable time-delay relays.
- C. Phase-Failure, Phase-Reversal, and Undervoltage and Overvoltage Relays: Solid-state sensing circuit with isolated output contacts for hard-wired connections. Provide adjustable undervoltage, overvoltage, and time-delay settings.

PART 3 - EXECUTION

3.01 INSTALLATION

- A. Wall-Mounted Controllers: Install enclosed controllers on walls with tops at uniform height, and with disconnect operating handles not higher than 79 inches above finished floor, unless otherwise indicated, and by bolting units to wall or mounting on lightweight structural-steel channels bolted to wall. For controllers not at walls, provide freestanding racks complying with Division 26 Section "Hangers and Supports for Electrical Systems."
- B. Temporary Lifting Provisions: Remove temporary lifting eyes, channels, and brackets and temporary blocking of moving parts from enclosures and components.
- C. Install fuses in each fusible-switch enclosed controller.

- D. Install fuses in control circuits if not factory installed. Comply with requirements in Division 26 Section "Fuses."
- E. Install heaters in thermal overload relays. Select heaters based on actual nameplate full-load amperes after motors have been installed.
- F. Comply with NECA 1.

3.02 IDENTIFICATION

- A. Identify enclosed controllers, components, and control wiring. Comply with requirements for identification specified in Division 26 Section "Identification for Electrical Systems."
 - 1. Identify field-installed conductors, interconnecting wiring, and components; provide warning signs.
 - 2. Label each enclosure with engraved nameplate.
 - 3. Label each enclosure-mounted control and pilot device.

3.03 CONTROL WIRING INSTALLATION

- A. Bundle, train, and support wiring in enclosures.
- B. Connect selector switches and other automatic-control selection devices where applicable.
 - 1. Connect selector switches to bypass only those manual- and automatic-control devices that have no safety functions when switch is in manual-control position.
 - 2. Connect selector switches with enclosed-controller circuit in both manual and automatic positions for safety-type control devices such as low- and high-pressure cutouts, high-temperature cutouts, and motor overload protectors.

3.04 FIELD QUALITY CONTROL

- A. Perform tests and inspections.
- B. Acceptance Testing Preparation:
 - 1. Test insulation resistance for each enclosed controller, component, connecting supply, feeder, and control circuit.
 - 2. Test continuity of each circuit.
- C. Tests and Inspections:
 - 1. Inspect controllers, wiring, components, connections, and equipment installation. Test and adjust controllers, components, and equipment.
 - 2. Test insulation resistance for each enclosed-controller element, component, connecting motor supply, feeder, and control circuits.
 - 3. Test continuity of each circuit.

4. Verify that voltages at controller locations are within plus or minus 10 percent of motor nameplate rated voltages. If outside this range for any motor, notify City before starting the motor(s).
 5. Test each motor for proper phase rotation.
 6. Perform each electrical test and visual and mechanical inspection stated in NETA Acceptance Testing Specification. Certify compliance with test parameters.
 7. Correct malfunctioning units on-site, where possible, and retest to demonstrate compliance; otherwise, replace with new units and retest.
 8. Test and adjust controls, remote monitoring, and safeties. Replace damaged and malfunctioning controls and equipment.
- D. Enclosed controllers will be considered defective if they do not pass tests and inspections.
- E. Prepare test and inspection reports. Include notation of deficiencies detected, remedial action taken, and observations after remedial action.

3.05 ADJUSTING

- A. Set field-adjustable switches and overload-relay pickup and trip ranges.
- B. Adjust the trip settings of MCPs and thermal-magnetic circuit breakers with adjustable instantaneous trip elements. Initially adjust to six times the motor nameplate full-load ampere ratings and attempt to start motors several times, allowing for motor cooldown between starts. If tripping occurs on motor inrush, adjust settings in increments until motors start without tripping. Do not exceed eight times the motor full-load amperes (or 11 times for NEMA Premium Efficient motors if required). Where these maximum settings do not allow starting of a motor, notify City before increasing settings.

3.06 DEMONSTRATION

- A. Train City's maintenance personnel to adjust, operate, and maintain enclosed controllers.

END OF SECTION 26 29 13

SECTION 26 41 13**LIGHTNING PROTECTION FOR STRUCTURES**

PART 1 - GENERAL

1.01 SUMMARY

- A. Section includes lightning protection for building.

1.02 ACTION SUBMITTALS

- A. Product Data: For each type of product indicated.
- B. Shop Drawings: For air terminals and mounting accessories.
 - 1. Layout of the lightning protection system, along with details of the components to be used in the installation.
 - 2. Include indications for use of raceway, data on how concealment requirements will be met, and calculations required by NFPA 780 for bonding of grounded and isolated metal bodies.

1.03 INFORMATIONAL SUBMITTALS

- A. Field quality-control reports.

1.04 QUALITY ASSURANCE

- A. Installer Qualifications: Certified by LPI as a Master Installer/Designer, trained and approved for installation of units required for this Project.
- B. System Certificate:
 - 1. UL Master Label.
 - 2. LPI System Certificate.
 - 3. UL Master Label Recertification.
- C. Electrical Components, Devices, and Accessories: Listed and labeled as defined in NFPA 780, "Definitions" Article.

PART 2 - PRODUCTS

2.01 LIGHTNING PROTECTION SYSTEM COMPONENTS

- A. Comply with UL 96 and NFPA 780.

- B. Roof-Mounted Air Terminals: NFPA 780, Class I, aluminum unless otherwise indicated.
 - 1. Manufacturers: Subject to compliance with requirements, available manufacturers offering products that may be incorporated into the Work include, but are not limited to, the following:
 - a. East Coast Lightning Equipment Inc.
 - b. ERICO International Corporation.
 - c. Harger.
 - d. Heary Bros. Lightning Protection Co. Inc.
 - e. Independent Protection Co.
 - f. Preferred Lightning Protection.
 - g. Robbins Lightning, Inc.
 - h. Thompson Lightning Protection, Inc.
 - 2. Air Terminals More than 24 Inches (600 mm) Long: With brace attached to the terminal at not less than half the height of the terminal.
 - 3. Single-Membrane, Roof-Mounted Air Terminals: Designed specifically for single-membrane roof system materials. Comply with requirements in roofing Sections.
- C. Main and Bonding Conductors: Copper.
- D. Ground Loop Conductor: The same size and type as the main conductor except tinned.
- E. Ground Rods: Copper-clad steel, sectional type; 3/4 inch (19 mm) in diameter by 10 feet (3 m) long.

PART 3 - EXECUTION

3.01 INSTALLATION

- A. Install lightning protection components and systems according to UL 96A and NFPA 780.
- B. Conceal the following conductors:
 - 1. System conductors.
 - 2. Down conductors.
 - 3. Interior conductors.
 - 4. Conductors within normal view of exterior locations at grade.
- C. Cable Connections: Use crimped or bolted connections for all conductor splices and connections between conductors and other components. Use exothermic-welded connections in underground portions of the system.
- D. Air Terminals on Single-Ply Membrane Roofing: Comply with roofing membrane and adhesive manufacturer's written instructions.
- E. Bond extremities of vertical metal bodies exceeding 60 feet (18 m) in length to lightning protection components.

- F. Ground Loop: Install ground-level, potential equalization conductor and extend around the perimeter of building.
 - 1. Bury ground ring not less than 24 inches (600 mm) from building foundation.
 - 2. Bond ground terminals to the ground loop.
 - 3. Bond grounded building systems to the ground loop conductor within 12 feet (3.6 m) of grade level.
- G. Bond lightning protection components with intermediate-level interconnection loop conductors to grounded metal bodies of building at 60-foot (18-m) intervals.

3.02 SLEEVE AND SLEEVE-SEAL INSTALLATION FOR ELECTRICAL PENETRATIONS

- A. Install sleeves and sleeve seals at penetrations of exterior floor and wall assemblies. Comply with requirements in Section 26 05 44 "Sleeves and Sleeve Seals for Electrical Raceways and Cabling."

3.03 CORROSION PROTECTION

- A. Do not combine materials that can form an electrolytic couple that will accelerate corrosion in the presence of moisture unless moisture is permanently excluded from junction of such materials.
- B. Use conductors with protective coatings where conditions cause deterioration or corrosion of conductors.

3.04 FIELD QUALITY CONTROL

- A. Notify Engineer at least 48 hours in advance of inspection before concealing lightning protection components.
- B. UL Inspection: Meet requirements to obtain a UL Master Label for system.
- C. LPI System Inspection: Meet requirements to obtain an LPI System Certificate.

END OF SECTION 26 41 13

SECTION 26 42 10**TRACK SLAB ELECTRICAL CONTINUITY****PART 1 - GENERAL****1.1 SUMMARY**

- A. Provide a stray current collector system including electrical continuity of the track slab reinforcing steel, permanent test stations for measuring electrical continuity and stray current levels, embedded monitoring components, grounding beds for discharge of stray current, adequate cabling size for short circuit conditions, jumper cables for track slab expansion joints and other electrical discontinuities, and all other Work required to provide complete functioning systems.
- B. This section applies to the supply, installation, and testing of all materials and components necessary for construction of the track slab stray current collection and monitoring systems.

1.2 SUBMITTALS

- A. Submittals shall be made in accordance with SECTION 01 33 00 – Submittal Procedures, except as modified herein.
- B. The Submittals required by this section are summarized below. They are described in detail at the reference location.
 - 1. Testing Firm Qualifications (Ref. 1.04C)
 - 2. Product Data (Ref. 2.01A)
 - 3. Track Slab Electrical Continuity Work Plan (Ref. 3.01A)
 - 4. Test Instrumentation (Ref. 3.03A2)
 - 5. Pre-Embedment Continuity Test Procedure (Ref. 3.03B)
 - 6. Post-Embedment Continuity Test Procedure (Ref. 3.03C)
 - 7. Test Station Verification Test Procedure (Ref. 3.03D)
 - 8. Ground Rod to Earth Resistance Test Procedure (Ref. 3.03E)
 - 9. Pre-Embedment Continuity Test Results (Ref. 3.03B)
 - 10. Post-Embedment Continuity Test Results (Ref. 3.03C)
 - 11. Test Station Verification Test Results (Ref. 3.03D)
 - 12. Ground Rod to Earth Resistance Test Results (Ref. 3.03E)

1.3 QUALITY CONTROL

- A. Utilize an independent corrosion control firm to conduct all testing of the track slab stray current collection system.

- B. The independent corrosion control firm shall have been continuously engaged in the field of corrosion control testing for DC electrified transit systems for a minimum of five years and shall have the following qualifications:
1. Project management and supervision by Registered Professional Corrosion Engineers or NACE International Certified Cathodic Protection Specialists.
 2. Field testing by NACE International Certified Corrosion Technicians and Cathodic Protection Specialists.
 3. Testing personnel shall have at least five years of work experience with testing trackwork stray current and corrosion control systems.
 4. All test equipment shall bear current calibration stickers.
- C. At least thirty days prior to commencement of work, submit testing firm qualifications for Approval, including resumes and certifications for all testing personnel and supervisors.

PART 2 - PRODUCTS

2.1 GENERAL

- A. Submit information for all components and materials, including name and manufacturer, catalog number, size, finish, material characteristics, and any other data necessary for proper identification and to verify conformance with the Contract.

2.2 TRANSVERSE BONDING BARS

- A. Transverse bonding bars shall be standard reinforcing steel as specified for the structural components of the bridge or track slab, equal in size to the longitudinal reinforcement.

2.3 WELDING RODS

- A. Welding rods for electrical continuity welding of the longitudinal lap splices and the transverse bonding bars shall be manufactured in accordance with AWS A-5.1 and shall be compatible with the specified reinforcing steel.

2.4 BONDING CABLES

- A. Stranded copper, AWG No. 1/0 cable with 600 Volt, THWN insulation. Provide appropriate lengths to accommodate maximum design deflections of the joints or structural elements.

2.5 TEST CABLES

- A. Stranded copper, AWG No. 10 cable with 600 Volt, THWN insulation.

2.6 TEST STATIONS

- A. Track slab test stations: Brooks Type 1RT, or approved equal, with phenolic panel board.
- B. Bridge test stations: NEMA 4X, Fiberglass Reinforced Plastic, with stainless steel hardware, Hoffman HJ1210HWPL2LG or approved equal.

2.7 REFERENCE ELECTRODES

- A. Silver/silver-chloride reference electrode with one AWG No. 12 test lead with 600 Volt, THWN insulation: Electrochemical Devices, Inc. Model CB-AGG-CW or approved equal. Lead wires shall extend from the electrode location to the test station location with no splices.

2.8 REBAR PROBES

- A. Custom configuration with two AWG No. 12 test leads with 600 Volt THWN insulation: Electrochemical Devices, Inc. or approved equal. Lead wires shall extend from the embedded probe location to the test station with no splices.

PART 3 - EXECUTION**3.1 GENERAL**

- A. Submit for Approval a comprehensive work plan containing necessary details and procedures related to the planning, construction and testing of the track slab stray current collection system. The submittal shall include drawings which indicate the proposed locations for all transverse bonding bars, test station access boxes, ground rods, and other system components.

3.2 TRACK SLAB ELECTRICAL CONTINUITY

- A. Bottom layer longitudinal reinforcement shall be electrically bonded by welding at the lap joints as shown on the drawings. Bottom layer longitudinal reinforcement shall be made electrically continuous for the entire length of the track slab segment. The electrical resistance of the bottom layer reinforcing steel shall be a maximum of 20% above the calculated longitudinal resistance of the number of installed parallel reinforcing bars in parallel.
- B. Transverse bonding bars shall be installed at each end of the track slab segment and at intermediate locations not to exceed 500 feet. Transverse bonding bars shall be welded to each bottom layer longitudinal reinforcement bar as shown in the drawings. The transverse bonding bar shall be a single bar from end to end.
- C. Track slab expansion joints shall be bonded for electrical continuity through the use of bonding cables, as shown in the drawings. Provide sufficient bonding cables at each location based upon fault condition requirements.
- D. Drain and test lead wires shall be attached to the transverse bonding bars at locations shown on the drawings. Drain and test lead wire attachment shall be made by welding a steel lead rod to the transverse bonding bar, as shown on the drawings.
- E. The silver/silver chloride reference electrode and rebar probe assembly shall be pre-assembled prior to installation. Install the prefabricated assembly at the required locations by welding the frame assembly to the transverse bonding bar, as shown on the drawings.
- F. Ground rods shall be installed as shown on the drawings. The drain cable shall be attached to each ground rod by the use of a mechanical clamp assembly.
- G. Permanent test stations for the stray current collection system shall be installed at the required locations. Test stations shall be located so that they are accessible during rail operations and do not interfere with automobile traffic when accessed for testing.

3.3 TESTING

- A. General
 - 1. Submit for Approval detailed written descriptions of the proposed stray current collection system testing schedules and testing procedures identified herein. Testing procedure submittals shall include the proposed format for test data collection forms.

2. Submit for Approval information regarding all stray current collection system testing instruments. The instrumentation submittal shall include the manufacturer's name, model number, serial number and calibration certificate for each instrument.
 3. Submit for Approval all stray current collection system testing data, records, calculations, results and reports. Test submittals shall include sufficient information so that the results are identifiable and traceable to installed components or locations.
- B. Conduct the Pre-Embedment Continuity Test to verify electrical continuity of each track slab segment prior to placement of concrete.
1. Establish two connections to each transverse collector bar at each end of the section to be tested. Each connection will be verified by measuring the millivolt difference between the two connections at each end. If the voltage measured between the two connection points is less than 1.0 millivolt, the connections can be considered adequate. If the voltage measured between the two connection points measures in excess of 1.0 millivolt, the connections need to be re-worked until an acceptable reading is obtained. A reading in excess of 1.0 millivolt can indicate an electrical discontinuity between the two connection points.
 2. Establish a test current circuit between one connection point at each end of the section to be tested (I1), using a 12 Volt automotive battery or similar power supply.
 3. Establish a voltage measuring circuit between one connection point at each end of the section to be tested (E1). The voltage and current circuits shall utilize different connection points to eliminate lead resistance errors.
 4. With the current circuit (I1) closed, reduce the meter ranges of both circuits until the lowest readable scales are reached. Read and record the "on" values for current and voltage.
 5. Open the current circuit (I1) and immediately read and record the "off" values for current and voltage. Repeat a minimum of three times for accuracy.
 6. Calculate the effective resistance of the reinforcing steel by dividing the summation of change in voltage, $\Sigma\Delta E1$, by the summation of change in current, $\Sigma\Delta I1$.
 7. $R1-1 = \Sigma\Delta E1/\Sigma\Delta I1$ (volt/ampere)
 8. This resistance value represents the resistance of the reinforcement section under test.
 9. The calculated resistance (R1-1) shall be compared with a theoretical value of resistance for the subject test section. The theoretical value of the subject test section shall be computed by calculating the resistance network of the reinforcing bars and bond cables associated with the subject test section. The measured resistance of the test section shall not be greater than the calculated resistance multiplied by 1.2.
 10. The temperature of the reinforcing steel shall be measured and recorded at the start and end of each continuity test. The calculated resistance values shall be compensated for the temperature during the test period.
- C. Conduct the Post-Embedment Continuity Test to verify electrical continuity of each track slab segment after placement of concrete. The test procedure shall be identical to the procedure for the Pre-Embedment Continuity Test, except that the measurements shall be taken between test stations.

- D. Conduct Test Station Verification Test to verify that all required test stations are provided and that all test and drain cables are properly installed. Perform this test at the same time as the Post-Embedment Continuity Test.
 - 1. Verify proper labeling and termination of all test station cables.
 - 2. Test electrical continuity of all test and drain cables.
- E. Ground Rod to Earth Resistance Test
 - 1. Stray current discharge ground mats shall be tested for resistance-to-earth by the fall of potential method described in IEEE Standard 80.
 - 2. The maximum ground rod-to-earth resistance shall be 5 ohms.
 - 3. Additional ground rods shall be installed as necessary to meet the 5 ohm criteria.

PART 4 - MEASUREMENT AND PAYMENT

4.1 MEASUREMENT

- A. The quantities of accepted work will be measured in the following units. All measurements will be plan measure except for authorized changes.
 - 1. Description: Lump Sum

4.2 PAYMENT

- 1. Payment will be made at the respective unit or lump-sum price listed in the proposal and shall be full compensation for all labor, materials, and equipment necessary to complete the respective unit in place. There will be no separate measurement or payment for any item of work not specifically identified and listed in the proposal, and all such work shall be considered a subsidiary item with all costs pertaining thereto included in the prices for other items listed in the proposal. At the Engineer's option, partial payment may be made for any lump sum item listed in the proposal, providing that the Contractor is diligently and satisfactorily pursuing full completion of such partially complete item in accordance with the approved job progress schedule.

END OF SECTION

THIS PAGE INTENTIONALLY LEFT BLANK

SECTION 26 42 12**TRACKWORK ELECTRICAL ISOLATION****PART 1 - GENERAL****1.1 SUMMARY**

- A. This section addresses the requirements for electrical isolation of track, including ballasted track, embedded track, direct fixation track, special trackwork, and insulated rail joints.
- B. Provide all materials, equipment and labor necessary to complete the Work shown on the Contract Drawings and described herein, and any additional requirements necessary for completion of an acceptable track isolation system.

1.2 SUBMITTALS

- A. Submittals shall be made in accordance with the requirements of SECTION 01 33 00 SUBMITTAL PROCEDURES, except as modified herein.
- B. The Submittals required by this section are summarized below. They are described in detail at the reference location.
 - 1. Testing Firm Qualifications (Ref. 1.04D)
 - 2. Rail Boot Quality Assurance Certification (Ref. 1.04E)
 - 3. Product Data, Material Specifications and Shop Drawings (Ref. 2.01B)
 - 4. Test Instrumentation (Ref. 3.06A2)
 - 5. Rail Boot Fabrication Holiday Test Procedure (Ref. 3.06B)
 - 6. Rail Boot Installation Holiday Test Procedure (Ref. 3.06C)
 - 7. Rail Insulating Joint Test Procedure (Ref. 3.06D)
 - 8. Track-to-Earth Resistance Test Procedure (Ref. 3.06E)
 - 9. Rail Boot Fabrication Holiday Test Results (Ref. 3.06B)
 - 10. Rail Boot Installation Holiday Test Results (Ref. 3.06C)
 - 11. Rail Insulating Joint Test Results (Ref. 3.06D)
 - 12. Track-to-Earth Resistance Test Results (Ref. 3.06E)

1.3 QUALITY CONTROL

- A. Utilize an independent corrosion control firm to conduct all testing of the trackwork electrical isolation system.
- B. The independent corrosion control firm shall have been continuously engaged in the field of corrosion control testing for DC electrified transit systems for a minimum of five years and shall have the following qualifications:
 - 1. Project management and supervision by Registered Professional Corrosion Engineers or NACE International Certified Cathodic Protection Specialists.

2. Field testing by NACE International Certified Corrosion Technicians and Cathodic Protection Specialists.
 3. Designated supervisor shall have at least ten years of corrosion control experience, and successful experience of being in responsible charge of work comparable in type and quality to that specified herein.
 4. Testing personnel shall have at least five years of work experience with testing trackwork electrical isolation systems.
 5. All test equipment shall bear current calibration stickers.
- C. The designated corrosion control supervisor shall conduct or directly supervise all on-site testing specified herein.
- D. At least thirty days prior to commencement of work, submit testing firm qualifications for Approval, including resumes and certifications for all testing personnel and supervisors.
- E. Submit certification of quality assurance testing compliance from the rail boot manufacturer.

PART 2 - PRODUCTS

2.1 GENERAL

- A. All materials shall conform to the requirements set forth herein or as designated on the drawings, unless otherwise specified. All materials must be new, free from defects, and shall be of the best commercial quality for the purpose specified. Furnish all necessary items and accessories not shown on the drawings or specified herein, but which are required to fully carry out the specified intent of the Work.
- B. Submit product data, material specifications and shop drawings for all trackwork isolation materials, components and assemblies.

2.2 RAIL BOOT

- A. The rail boot shall be manufactured to fit the rail size as specified in the related trackwork construction specifications. The rail boot shall extend around the rail as shown on the drawings. The rail boot shall be extruded as a dual durometer unit with the rail flange edges and the grade edges extruded with a durometer hardness of Shore D-50, min.
- B. The rail boot shall meet the requirements specified in Section 34 11 29 of these specifications.

2.3 JOINING CUFFS

- A. Joining cuffs shall be manufactured from the same material as the rail boot and shall exhibit the same properties as listed in the rail boot section. The cuffs shall be a minimum of 12 inches in length for all rail boot butt splices. Repair cuffs for rail boot damage shall extend a minimum of 6 inches to each side of a rail boot defect.

2.4 ELASTOMERIC GROUT

- A. Elastomeric grout shall be as specified in Section 34 11 29 and shall exhibit a volume resistivity of 1×10^{12} ohm-centimeters minimum when cured.

2.5 JOINING CUFF ADHESIVE/SEALANT

- A. The joining cuff adhesive/sealant shall be a one-component moisture curing polyurethane sealant.
- B. Sonneborn, type NP-1 or approved equal.

2.6 RAIL CLIP INSULATOR

- A. The rail clip insulators shall be a nylon insulator sized to fit the specific rail base profile and rail clip assemblies.

2.7 RAIL PADS

- A. The rail pads for standard tie and ballast trackwork shall exhibit mechanical properties as required in the trackwork specification section and an electrical resistivity of 1×10^{12} ohm-centimeters in accordance with ASTM D-257.

PART 3 - EXECUTION**3.1 GENERAL**

- A. Fabricate and install trackwork isolation system to provide the following minimum track-to-earth resistance levels:
 - 1. Embedded Track 200 Ohms per 1000 Track Feet
 - 2. Ballasted and Direct Fixation Track 500 Ohms per 1000 Track Feet
- B. Embedded standard track shall utilize a complete rail encapsulation methodology (rail boot) to obtain the required track-to-earth resistance level.
- C. Special trackwork sections shall be insulated from the track slab using insulated anchors on the rail plates and an insulating elastomer between the track slab and the rail.
- D. Rail cable bonds and rail-mounted devices in embedded trackwork shall be electrically isolated within a rail access box.

3.2 STORAGE OF MATERIALS

- A. All materials and equipment to be used in construction shall be stored in such a manner to be protected from detrimental effects from the elements. If warehouse storage cannot be provided, materials and equipment shall be stacked well above ground level and protected from the elements with plastic sheeting or as appropriate.

3.3 RAIL BOOT

- A. The rail boot shall be installed in accordance with the manufacturer's recommendations and as described herein.
- B. The rail boot shall only be installed on clean rail free of dirt and debris. The inside of the rail boot shall be inspected to insure that no rocks, dirt, or other construction debris has fallen into the boot which could cause a puncture.
- C. The boot shall be installed to minimize the number of splice joints required in any length of trackwork.

- D. Extreme care shall be exhibited during all phases of construction with the rail boot. The handling of the boot spools, installation, movement of the rail, installation of the track slab reinforcement and reinforcement welding operations shall be conducted in a manner that will not damage the boot.
- E. The boot shall be held in place with non-conductive tape in accordance with the manufacturer's recommendation.
- F. The use of tie-wire or any metallic hangers against the boot shall be strictly prohibited.
- G. The rail boot shall be installed on the specified ties in the embedded trackwork sections of this project.
- H. The adjustment of the rail by the use of alignment bars against the boot is strictly prohibited. If alignment of the rail is necessary after installation of the boot, wood blocks or other means of contact dissipation shall be used to minimize a concentrated force against the boot.
- I. Holiday testing is required after the initial installation of the rail boot and after the installation of the track slab reinforcement.

3.4 JOINING CUFF

- A. The joining cuff shall be installed at rail boot joints on clean and dry surfaces. The exterior portion of the boot that will be covered by the cuff and the interior of the joining cuff shall be roughened with a wire brush to allow for better adhesion between the cuff and the rail boot. A generous application of polyurethane adhesive/sealant shall be applied to the interior of the cuff and the joining cuff shall be installed and held in place by non-conductive tape until the concrete pour.

3.5 ELASTOMERIC GROUT

- A. Elastomeric grout shall be applied in accordance with the manufacturer's recommendations in areas where the boot must be removed or eliminated.

3.6 TESTING

- A. General
 - 1. Submit for Approval detailed written descriptions of the proposed trackwork isolation testing schedules and testing procedures identified herein. Testing procedure submittals shall include the proposed format for test data collection forms.
 - 2. Submit for Approval information regarding all trackwork isolation testing instruments. The instrumentation submittal shall include the manufacturer's name, model number, serial number and calibration certificate for each instrument. The calibration certificate shall demonstrate that each instrument has been calibrated by an independent agency within 1 year of start of testing. Each instrument shall have a current calibration certification and no instrument shall be used unless calibrated.
 - 3. Submit for Approval all trackwork isolation testing data, records, calculations, results and reports. Test submittals shall include sufficient information so that the results are identifiable and traceable to installed components or locations.

- B. High Voltage Electrical Boot Test (Fabrication Test)
1. The rail boot shall be tested for flaws and damage during the manufacturing process. The manufacturer of the rail boot shall implement high voltage electrical testing using a high voltage holiday detector set at a minimum voltage of 30,000 volts DC. The boot shall be 100% tested as it exits the extrusion machine. All identified flaws shall be removed from the boot material to be shipped to the project site. The electrical testing shall utilize a D. E. Stearns model 10/20 Holiday Detector or approved equal.
- C. High Voltage Electrical Boot Test (Installation Test)
1. The rail boot shall be 100% tested for flaws and damage, during installation, using a high voltage holiday detector at a minimum voltage of 30,000 volts DC. The testing shall be conducted immediately after placement on the rail and again after placement of the track slab reinforcement and formwork. Special attachments may be necessary to insure complete coverage of the high voltage wand over the entire surface of the boot. Any flaws identified in the boot shall be repaired by the use of an exterior cuff applied with an approved adhesive/sealant. The electrical testing shall utilize a D.E. Stearns model 10/20 Holiday Detector or approved equal.
- D. Conduct the Rail Insulating Joint Test at all insulated joint locations prior to the connection of impedance bonds.
1. Measure the resistance between each side of the insulating joint and the joint bar and the resistance across the insulating joint.
 2. Measure the voltage shift of the rail to earth on both sides of the insulating joint while applying a test current to one side of the insulating joint during track-to-earth resistance testing. Also measure the voltage shift across the insulating joint.
- E. Track-to-Earth Resistance Test
1. The track-to-earth resistance testing shall be conducted for all trackwork constructed for this project. Two test methods are described to measure the required track-to-earth resistance, depending on the trackwork configuration encountered during the test. Sections of trackwork shall be tested in maximum increments of 2,000 track feet.
 2. Method 1: Track-to-earth resistance test method 1 is applicable to electrically separated sections of trackwork. Conduct this testing in accordance with ASTM G-165.
 3. Method 2: Track-to-earth resistance test method 2 is applicable to electrically interconnected sections of trackwork. Conduct this testing in accordance with ASTM G-165. For equipment and measurement requirements use the following procedure:
 - a. Establish a current circuit (I1) between the track system and a low resistant earth contact and a track-to-earth voltage measuring circuit (Vg1) using a low resistance earth contact. The voltage circuit earth contact shall not be the same as the earth contact used in the current circuit.
 - b. With the current circuit (I1) closed, reduce the meter ranges of both circuits until the lowest readable scales are reached. Read and record the "on" values for current and voltage.
 - c. Open the current circuit (I1) and immediately read and record the "off" values for current and voltage. Repeat a minimum of three times for accuracy.

- d. Calculate the effective track-to-earth resistance by dividing the summation of change in voltage, $Vg1$, by the summation of change in current, $I1$.

$$Rvg1-1 = \Sigma \Delta Vg1 / \Sigma \Delta I1 \text{ (volt/ampere)}$$

- e. This resistance value represents the apparent resistance of the track section under test in parallel with the adjacent track sections. Usually the composite resistance to earth of the adjacent track sections will be lower than that of the test section because of the greater amount of trackage involved.

- f. Obtain additional track-to-earth couplings at other locations as required.

$$Rvg2-1 = \Sigma \Delta Vg2 / \Sigma \Delta I1 = \text{volt/ampere}$$

$$Rvg3-1 = \Sigma \Delta Vg3 / \Sigma \Delta I1 = \text{volt/ampere}$$

- g. Maintaining the current circuit ($I1$), measure the percentage of change in current flow on the rail at the locations specified using a maximum of 50 feet of rail as a current measuring shunt. The current percentage shall be calculated as follows:

$$\%IA-1 = (\Sigma \Delta EA \times KR \times 100) / \Sigma \Delta I1$$

Where:

$\%IA-1$ = percentage of $I1$ at location "A"

$\Sigma \Delta EA$ = summation of change in EA caused by $I1$, for the total number of readings taken (millivolts).

$\Sigma \Delta I1$ = summation of change in $I1$ for the total number of readings taken (amperes)

KR = conversion factor for the millivolt shunt circuit (amperes/millivolt)

$$KR = 1 / (L \times RR \times 1000 \text{ mv/v})$$

L = length of rail used for the millivolt shunt circuit (feet)

RR = longitudinal resistance of running rail per one foot length (ohms/foot)

Note: Using the theoretical resistance value of 8.68×10^{-6} ohm/foot for 115RE rail, the theoretical KR value for a 50 foot span of single rail is:

$$KR = 2.30 \text{ amperes/millivolt (115RE rail)}$$

(A sufficient sampling of actual longitudinal resistance factors must be measured to establish a statistical mean value for KR used in the preceding calculations.)

- h. Obtain current flow percentages at the locations specified. Calculate the following:

$$\%IB-1 = (\Sigma \Delta EB \times KR \times 100) / \Sigma \Delta I1$$

$$\%IC-1 = (\Sigma \Delta EC \times KR \times 100) / \Sigma \Delta I1$$

$$\%ID-1 = (\Sigma \Delta ED \times KR \times 100) / \Sigma \Delta I1$$

$$\%IE-1 = (\Sigma\Delta EE \times KR \times 100) / \Sigma\Delta I1$$

$$\%IF-1 = (\Sigma\Delta EF \times KR \times 100) / \Sigma\Delta I1$$

$$\%IG-1 = (\Sigma\Delta EG \times KR \times 100) / \Sigma\Delta I1$$

$$\%IH-1 = (\Sigma\Delta EH \times KR \times 100) / \Sigma\Delta I1 \text{ and}$$

$$\%IS-1 = \%IA-1 + \%IB-1 + \%IC-1 + \%ID-1$$

$$\%IR-1 = \%IE-1 + \%IF-1 + \%IG-1 + \%IH-1$$

(A significant difference between the values obtained for %IA-1 through %ID-1 and/or between the values obtained for %IE-1 through %IH-1 may indicate that the electrical conductance-to-earth is not uniform over the entire track section being evaluated.)

- i. Calculate the average resistance-to-earth of the test section

$$RAVG = (RVg1-1 + RVg2-1 + RVg3-1) / 3(\%IS-1 - \%IR-1)$$

Where:

%IS-1 and %IR-1 must be expressed as decimals

- j. Calculate the average track-to-earth resistance for the test section on a 1000 foot of track basis (2 rails).

$$RT = RAVG \times L \times 2 = \text{ohms-1000-feet of track (2 rails)}$$

Where:

L = Length of track in multiples of 1000 feet

PART 4 - MEASUREMENT AND PAYMENT

4.1 MEASUREMENT

- A. The quantities of accepted work will be measured in the following units. All measurements will be plan measure except for authorized changes.

1. Description: Lump Sum

4.2 PAYMENT

- A. Payment will be made at the respective unit or lump-sum price listed in the proposal and shall be full compensation for all labor, materials, and equipment necessary to complete the respective unit in place. There will be no separate measurement or payment for any item of work not specifically identified and listed in the proposal, and all such work shall be considered a subsidiary item with all costs pertaining thereto included in the prices for other items listed in the proposal. At the Engineer's option, partial payment may be made for any lump sum item listed in the proposal, providing that the Contractor is diligently and satisfactorily pursuing full completion of such partially complete item in accordance with the approved job progress schedule.

END OF SECTION

THIS PAGE INTENTIONALLY LEFT BLANK

SECTION 26 42 14**CATHODIC PROTECTION FOR NEW OR RELOCATED WATERLINES****PART 1 - GENERAL****1.1 SUMMARY**

- A. The Work specified in this Section includes the manufacturing, factory testing, delivery, installation, and site testing of the equipment and materials to be provided for cathodic protection systems for the Kansas City Downtown Streetcar Project.
- B. Cathodic protection systems are described for new and relocated buried, pressurized, metallic piping systems.

1.2 RELATED SECTIONS

- A. SECTION 01 33 00 – Submittal Procedures

1.3 REFERENCES

- A. American National Standards Institute (ANSI) B2.1
- B. American Society for Testing and Materials (ASTM) – B418, D621, D638, D648, D695, D785, D790, D1000, D1248
- C. NACE International (formerly The National Association of Corrosion Engineers) – SP0169-2007
- D. American Water Works Association (AWWA) C105
- E. National Electrical Manufacturers Association (NEMA)
- F. SAE International (formerly The Society of Automotive Engineers)
- G. Society for Protective Coatings (SSPC) – SP 2, SP 3 and SP 7
- H. United States Department of Transportation (US DOT) – 192.461

1.4 QUALITY CONTROL

- A. The Contractor shall provide the Work included in this Section in strict accordance with the requirements of the Contractor's Quality Assurance Program as Approved by the Engineer and in compliance with the requirements of these Specifications.
- B. Products and equipment – Incorporate cathodic protection products and systems into the Work that duplicate products and equipment that have been in satisfactory use for a period of at least 5 years.
- C. Supervision – Perform Work under the direction of a corrosion engineer with at least 10 years corrosion control experience and a minimum NACE International certification level of Cathodic Protection Specialist. The supervisor shall monitor the installation and testing of corrosion control products and cathodic protection and stray current systems on site, and shall have successful experience of being in responsible charge of work comparable in type and quality to that specified herein. The certified corrosion engineer shall perform or directly supervise all testing on site.

1.5 SUBMITTALS

- A. Submittals shall be made in accordance with the requirements of SECTION 01 33 00 – Submittal Procedures, except as modified herein.
- B. Product data for all corrosion control products utilized in this Section shall be submitted.
- C. Testing Procedures – The Contractor shall submit a detailed written description of the proposed testing schedule and procedures for preliminary Approval by the Engineer. Proposed modifications to the testing procedures described herein shall be submitted to the Engineer for Approval.
- D. Instrumentation – The Contractor shall submit a list of instruments to be used for the electrical testing. The list shall include the manufacturer's name, model number, serial number and calibration certificate for each instrument. The calibration certificate shall show that each instrument was calibrated by an independent agency within 1 year of start of testing. Each instrument shall have a current calibration and no instrument shall be used unless calibrated.
- E. Documentation – The Contractor shall submit a test data sheet showing the proposed format for test data documentation. All test data and calculations shall be submitted to the Engineer for each required test for review and Approval.

PART 2 - PRODUCTS

2.1 ANODES

- A. General
 - 1. Galvanic anodes shall be of the size indicated by the cathodic protection design. Each anode shall be cast with a steel core and the core shall protrude from one end and shall be of sufficient length to permit attachment of a lead wire.
 - 2. Each anode shall be furnished with a lead wire attached to one end of the steel core, and the wire shall be of sufficient length to attach to the anode terminal block as shown on the Contract Drawings. The wire shall be connected to the steel core by silver soldering, and the connection shall be mechanically secure before soldering with at least three turns of wire at the connection. The entire connection shall be insulated with an electrical potting compound. The cable attached to the anode shall be No. 12 AWG, Type TW or THWN stranded, single conductor copper.
 - 3. The anode shall be prepackaged in a permeable cloth bag filled with a mixture of 75% ground hydrated gypsum, 20% powdered bentonite, and 5% anhydrous sodium sulfate. Backfill shall have a grain size so that 100% is capable of passing through a 100-mesh screen. The mixture shall be firmly packed around the anode within the cloth bag by means of adequate vibration so that the ingot is completely surrounded with a minimum 1-inch of backfill material.

B. High Potential (HI-PO) Magnesium Anode

1. Chemical Composition

Element	Percentage
Aluminum	0.010 Maximum
Manganese	0.50 to 1.30
Copper	0.02 Maximum
Nickel	0.001 Maximum
Zinc	0.05 Maximum
Iron	0.03 Maximum
Silicon	0.05 Maximum
Other	0.05 each or 0.30 Maximum Total
Magnesium	Remainder

2.2 REFERENCE ELECTRODES

- A. Permanent copper-copper sulfate reference electrodes prepackaged in cloth bags filled with low-resistance backfill material.

2.3 POLYETHYLENE ENCASEMENT

- A. Install 8-mil polyethylene in accordance with AWWA C105.
- B. Polyethylene film shall meet the following test requirements:

Test	Requirements
Tensile Strength	1200 psi Minimum
Elongation	300% Minimum
Dielectric Strength	800 V/mil thickness Minimum
Thickness	8 mils Minimum nominal with minus tolerance not exceeding 10% of nominal
Flow Rate	0.4 Maximum

2.4 WIRE AND CABLE

- A. Anode Header Cable – Single conductor, stranded copper, sized as shown with Type TH or THWN insulation, length as shown, required, or specified herein.
- B. Test Wires – Single conductor, stranded copper, with Type TW 600 Volt insulation. Size and color as shown.
- C. Pipe Bond Wire – Single conductor stranded copper, sized as shown, with Type TH or THWN insulation. Length as shown required or specified herein.

2.5 EXOTHERMIC WELDING PROCESS

- A. Exothermic cartridge, type and size suitable for the metals being connected using properly sized molds, disks and sleeves as recommended by the manufacturer's printed materials. Exothermic weld materials and products shall be Cadweld as manufactured by Erico Products, Inc., Thermoweld, or approved equal.

2.6 WELD CAPS

- A. Self-contained combination plastic cap, with elastomeric filler and 4-inch Tac-Tape® base. Royston Handy Cap® or approved equal.
- B. High-density polyethylene weld caps to be used in conjunction with coal tar mastic to coat wire/pipe exothermic welds.

2.7 CABLE WARNING TAPE

- A. Four-inch wide, yellow, with black lettering with the legend "CAUTION, CATHODIC PROTECTION CABLES BURIED BELOW" in 3-inch high lettering printed at a maximum of 7-foot intervals along the entire length of the tape

2.8 WIRE IDENTIFICATION TAGS

- A. White plastic "zip-tie" type straps with a plastic tab of sufficient size to allow the cable designation to be written on the tab with a permanent felt tip marker.

2.9 AT-GRADE TEST BOX

- A. A.B.S. polymer body with heavy duty cast iron pentagon locking lid and flange, supplied with seven post, polyester laminate terminal block as shown, with the following additional requirements:
 - 1. The piping owner's logo and "CP TEST" shall be permanently cast on the test box lid
 - 2. Minimum internal body diameter – 5 inches
 - 3. Supply each test box with a pentagon wrench opening key
 - 4. Terminal bolts, nuts and washers – nickel plated brass, or Type 316 stainless steel

2.10 CURRENT MONITORING SHUNTS

- A. Shunt components mounted on a phenolic or other composite strip designed for use with test station terminal boards, with a rating of 0.01-Ohm, 6-Amp capacity, with 1% accuracy.

2.11 INSULATING FITTINGS

- A. Insulating Flange Kit – Supplied in complete sets from a single manufacturer, securely packaged and clearly labeled as to size, ANSI rating, style and material and with the following provisions:
 - 1. Gasket – Full faced, 1/8-inch (3 millimeters) thick neoprene coated phenolic, size and pressure rating suitable for the application and with the following additional minimum requirements:
 - a. Water Absorption – 1.6% maximum
 - b. Tensile Strength (with grain) – 13,000 psi minimum
 - c. Compressive strength (flatwise) – 39,000 psi minimum
 - d. Dielectric strength (Volts per mil) – 240 minimum

2. Sleeves – NEMA Grade LE laminated phenolic. Size and pressure rating suitable for the application and with the following additional requirements:
 - a. Length – Shall extend through both flanges and insulating washers
 - b. Thickness – 1/32 inch minimum
 - c. Dielectric Strength (Volts per mil) – 400 minimum
 - d. Water absorption – 1.1% maximum
 3. Insulating Washers – Glass mat polyester laminated phenolic, two per stud, size as required for the application, and with the following additional requirements:
 - a. Thickness – 1/8 inch (3 millimeters) minimum
 - b. Dielectric Strength (Volts per mil) – 400 minimum
 - c. Compressive Strength (flat wise) – 40,000 PSI minimum
 - d. Water absorption – 2.0% maximum
 4. Steel Washers – 1/8 inch thick, SAE zinc plated, two per stud
- B. Isolating Compression Coupling – Pre-assembled steel, compression gasket type, factory coated with 12 mils minimum thermosetting epoxy polyamide. Size, temperature and pressure rating suitable for the application, and with the following additional requirements:
1. Coating to meet DOT Federal Regulation 192.461
 2. Isolating gasket to extend entirely under the follower ring
 3. Armored gasket to bond between metal parts and protected piping
 4. Middle isolating sleeve to extend between the pipe ends
- C. Dielectric Union – High test, air refined malleable iron, complete with brass bearing ring and molded nylon insulated material. Size, temperature and pressure rating suitable for the application, and with the following additional requirements:
1. Seating surface to be extra wide ground joint type
 2. Insulating nylon to be molded to the union body to provide integral one-piece construction
 3. Threads to be precision machined meeting ANSI B2.1
- D. Service Insulators – Brass insulating fitting for connecting cathodically protected copper service piping to metallic waterlines. Size suitable for the application, with the following requirements:
1. 150 psi working pressure
 2. Threaded nylon bushing assembled between male and female flare copper adapters
 3. Ford Meter Box Company Model SI or approved equal

2.12 PIPELINE CASING INSULATORS

- A. Band – 14-gauge (.074-inch) steel, hot rolled and pickled. Two-piece through 36-inch carrier pipe size. Width of band as recommended by manufacturer as determined by carrier pipe size.
- B. PVC Liner:

Thickness	0.09-inch minimum
Hardness	Durometer “A” 85-90
Dielectric Strength (1/8 inch thick)	
- Surge Test	60,000 V
- Step by Step Test	58,000 V
Water Absorption	1% maximum
- C. Studs, Nuts and Washers – Stainless steel or cadmium plated. Number, size, and length as required by manufacturer.
- D. Runners – 2 inch wide glass reinforced plastic (G-2), height as required to center the carrier pipe within the casing pipe, and to provide permanent 1 inch minimum clearance between casing and carrier pipe couplings and hubs, and with the following additional requirements:

Characteristic	Reference	Requirement
Tensile Strength	ASTM D638	17,600 psi
Flexural Strength	ASTM D790	25,300 psi
Compression Strength (10% Deformation)	ASTM D695	18,000 psi
Deflection Temperature (@264 psi)	ASTM D648	405 degrees Fahrenheit
Deformation Under Load (@122 degrees Fahrenheit, 2,000 pound load)	ASTM D621	1.2%
- E. Finish – Synthetic enamel with rust inhibiting pigment.

2.13 CASING END SEALS

- A. Synthetic rubber with stainless steel bands for closure around casing and carrier pipes. Model “S” as manufactured by PSI, Inc., or approved equal.

2.14 SOLDER

- A. Wire-to-Copper Pipe Connection – Lead free plumbing solder suitable for sweating joints in a copper water distribution system with a melting range between 420° degrees Fahrenheit and 480 degrees Fahrenheit.
- B. Wire-to-Ring Terminal Connection – Rosin Core 60/40 (60% Tin / 40% Lead) solder suitable for electronic and electrical connections with a melting range between 360 degrees Fahrenheit and 375 degrees Fahrenheit.

2.15 COPPER U-CHANNEL

- A. Copper 1/8-inch x 5/32-inch flat U-channel for holding test wires in place while soldering to copper service piping. Channel is available from stained glass supply retailers.

PART 3 - EXECUTION**3.1 STORAGE OF MATERIALS**

- A. All corrosion control materials and equipment shall be stored in a manner that protects them from the detrimental effects of the elements. If warehouse storage cannot be provided, materials and equipment shall be stacked well above ground level and protected from the elements with plastic sheeting or as appropriate.

3.2 ANODES AND REFERENCE ELECTRODES

- A. Bury anodes of type, size and number at locations shown on the utility plans with the following additional requirements:
1. Wet prepackaged magnesium anodes thoroughly before backfilling hole.
 2. Use fine clay or native soil, free from stones, bricks and organic matter, for backfilling.
 3. Use exothermic welding process to connect anode leads to header cable as shown and route cable as shown on the Contract Drawings. Terminate cables in test boxes at the locations shown on Contract Drawings.

3.3 REFERENCE ELECTRODES

- A. Reference electrodes shall be installed in pipeline backfill material at a distance of 6 inches to 12 inches from the exterior pipeline surface. The reference electrode lead wires shall be routed to the associated test station without splices.

3.4 POLYEHTYLENE ENCASEMENT

- A. All newly installed ductile iron piping shall utilize 8-mil polyethylene encasement as described in AWWA C105.
1. Place tube of polyethylene material around pipe prior to lowering pipe into trench.
 2. Pull the tube over the length of the pipe.
 3. Tape tube to pipe at joint
 4. Fold material around the adjacent spigot end and wrap three circumferential turns of two-inch wide plastic tape to hold plastic tube
 5. Adjacent tube overlaps first tube and is secured with plastic adhesive tape. The polyethylene tube material covering the pipe will be loose.
 6. Excess material shall be neatly drawn up around the pipe barrel, folded into an overlap on top of the pipe, and held in place by means of pieces of the plastic tape at approximately three to five foot intervals.

3.5 WIRE AND CABLE

- A. Electrically bond mechanical joints on metallic piping as shown. Provide test wires of the size and type shown from each bonded facility and terminate at locations shown on the Contract Drawings. Route anode header cables and/or anode lead wires to appropriate test boxes as shown on the Contract Drawings. All wire/structure connections and buried wire and cable splices shall be exothermically welded and coated. Use of compression and split bolt connectors is prohibited. Identify each wire in test boxes using nonmetallic tags or pressure sensitive labels. Ring tongue connectors shall be attached to test wires, for connection to test box terminal board, using a crimping tool specifically designed for use with connectors.

3.6 EXOTHERMIC WELD CONNECTIONS

- A. Molds, weld metal and associated accessories shall be sized and designed for making electrical connections for copper-to-copper, copper-to-steel and copper-to-ductile iron as required.
- B. Place weld cap over completed wire/pipe exothermic welds. The edges of the weld cap shall extend over the existing pipe coating as shown and totally encapsulate the weld, exposed pipe surface, and bare wire. If weld caps with coal tar mastic are used, fill weld cap with coal tar mastic and place over weld, exposed pipe surface and bare wire.
- C. All wire and cable splices, including anode-to-header cable connections, shall be exothermically welded. Connection shall be clean and dry prior to wrapping. Completed weld shall be initially wrapped with three layers of butyl rubber splicing tape, followed by two layers of vinyl plastic tape, using 50% overlap during application.

3.7 CABLE WARNING TAPE

- A. Place cable warning tape over cathodic protection test wires and anode lead wires and/or header cables during backfilling operation. Cover wires and cables with 18 inches of compacted fill prior to placement of warning tape. Ensure warning tape is located directly over the wires prior to backfilling tape.

3.8 WIRE IDENTIFICATION TAGS

- A. Attach wire identification tags on all test wires and cathodic protection component wires a maximum of 6 inches from the terminal board connections. Tags shall be appropriately marked to identify anodes, casings, protected pipe, non-protected pipe and reference electrodes.

3.9 AT-GRADE TEST BOX

- A. Install at locations shown on the Contract Drawings. Route all wires as shown and in a manner that will not cause damage to the wire insulation. Allow enough slack to compensate for soil movements and to extend panel above grade for test access. Coil excess wire inside box. Boxes shall be placed outside of vehicular traffic lanes, and shall be accessible for performing future cathodic protection testing.

3.10 INSULATING FITTINGS

- A. Insulating Flange – Provide appropriately sized flange-to-flange joint and install insulating gasket, sleeves and washers in accordance with the manufacturer's written instructions, using all thread studs. Entire flange, exposed nuts, studs and washers shall be coated with petrolatum coating system as described in Part 3.4.A.2 of this Section.

- B. Isolating Compression Coupling – Install at locations shown on the utility plans, with insulating adapter gasket located away from cathodically protected piping. Install bond wires as shown on the cathodic protection details drawing to electrically connect coupling to cathodically protected piping. Coat all exothermic welds, bare steel and threaded rods with 24 mils DFT coal tar mastic as described in Part 3.4.A.3 of this Section.
- C. Dielectric Unions – Install as required in above ground piping applications in accordance with the manufacturer’s recommendations.
- D. Service Insulators – Install as required in buried copper service piping in accordance with the manufacturer’s recommendations. Coat entire insulator as described in Part 3.4.A.2 of this Section.

3.11 PIPELINE CASING INSULATORS

- A. Install in accordance with the manufacturer’s published instructions, and with the following requirements:
 - 1. Space one insulator 1 foot in from each casing end, and every 10 feet (maximum) thereafter.
 - 2. Additionally, place an insulator 1 foot from each side of each mechanical joint within the casing.
 - 3. All carrier pipe coating shall be tested as required to the satisfaction of the OWNER prior to installation inside the casing pipe. Damage to the pipe coating during the installation process shall be repaired to the satisfaction of the Engineer.

3.12 CASING END SEALS

- A. Install in accordance with manufacturer’s published instructions. Slide end seals over the carrier pipe at the casing entrance during carrier pipe installation. Remove dirt and debris from the carrier pipe and casing surfaces prior to positioning the seal and tightening the stainless steel bands.

3.13 SOLDER CONNECTIONS

- A. Wire-to-Copper Pipe Connection – Use lead-free plumbing solder for connecting test wires to piping. Copper service piping shall not be charged during soldering operation. If charged, drain water prior to soldering.
 - 1. Clean top pipe surface using an abrasive sanding cloth. Apply tinning flux to the cleaned surface.
 - 2. Wire-tie a one-inch length of copper U-channel over the cleaned surface parallel to the longitudinal pipe surface using steel wire
 - 3. Strip 2 inches of insulation from the test wire to be attached. Apply tinning flux to one inch of the wire away from the insulation.
 - 4. Slide wire into the U-channel leaving one inch of bare wire exposed to minimize melting of the insulation during the soldering operation.
 - 5. Apply heat from a propane torch to the pipe and U-channel until the flux bubbles and feed solder into the U-channel holding the torch at the opposite end of the U-channel.
 - 6. Remove heat and allow solder to cool. Solder, exposed wire, and bare pipe surfaces shall be coated with the same material used for coating the pipe.

- B. Wire-to-Ring Terminal Connection – Use rosin core solder for connecting wires to test station terminals.
1. Use a crimping tool specifically designed for use with the type of ring terminals used. Consult manufacturer's recommendations for appropriate crimping tool.
 2. Strip enough insulation from the test wire to extend fully into the ring terminal sleeve and crimp the terminal sleeve as required.
 3. Heat the terminal sleeve using a propane torch and feed the solder into the ring side of the sleeve. Apply enough heat to melt the solder without melting the wire insulation.
 4. Remove the heat and allow the solder to cool.

3.14 TESTING

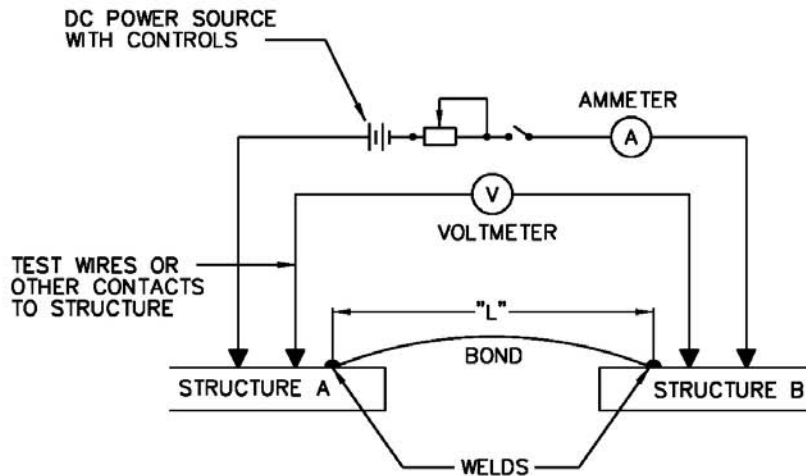

- A. Test Equipment
1. Analog DC Voltmeter – Multi-scale (1 mV to 10 Volt, or 2 mV to 20 Volt), center zero or 10% upscale, accurate to within 0.5% of full scale. Electronic Voltmeter circuit shall provide a minimum input resistance of 10 Megohms for ranges above 20 mV.
 2. Electronic DC Voltmeter (Digital Readout) – Multi-scale (20 mV to 20 Volt), accurate to within 1% of reading + 1 digit, minimum input resistance of 10 Megohms for ranges above 20 mV.
 3. Analog DC Ammeter – Multi-scale (1 mA to 10 Amp, or 2 mA to 20 Amp), center zero or 10% upscale, accurate to within 0.5% of full scale.
 4. Electronic DC Ammeter (Digital Readout) – Multi-scale (20 mA to 20 Amp), accurate to within 1% of reading + 1 digit
 5. Strip Chart Voltage Recorder – Multi-scale, AC/battery powered, with 2.5 Megohms input resistance (minimum), 0.5 second response time [full scale (maximum)], and adjustable chart speed control.
 6. Digital Voltage Recorder – Multi scale, AC/battery powered, data logger with 10 Megohms input resistance (minimum).
 7. DC Power Source – 12 Volt, sealed, rechargeable battery with a minimum 6.5-Ampere/hour capacity. For tests requiring additional current magnitudes, use two or more batteries in series, a DC generator or portable test rectifier.
 8. Test Wires – Insulated, single conductor stranded copper test leads of various sizes and lengths, with appropriate connectors to suit test conditions. At least two hand reels with approximately 500 feet of insulated, stranded copper wire (16 AWG minimum).
 9. Cu/CuSO₄ Reference Electrode – 1.25 inches diameter, 6 inches long with solid copper rod contacting a saturated solution of copper sulfate, with porous plug allowing electrical contact with the soil.
 10. Low Voltage, Wet Sponge Holiday Detector – Portable, battery operated, self-contained unit, with terminal connections for ground wire to the structure, and open cell sponge electrode. Voltage rating shall be between 5 and 90 VDC, providing an audible signal for locating coating faults.

- B. Polyethylene Encasement – Notify the Engineer for inspection of polyethylene encasement installation.
1. After polyethylene encasement installation has been completed, prior to backfilling, a visual inspection of all polyethylene encasement shall be completed.
 2. All punctures and tears shall be repaired to the satisfaction of the Engineer. Piping systems shall not be backfilled until the repairs have been properly installed and verified.
 3. Polyethylene encased piping systems shall be holiday free prior to backfilling.
- C. Exothermic Welds – Test exothermic welds by striking the completed weld with a 2-pound hammer at a 45-degree angle to the pipe surface. If the weld is knocked off or moves at the pipe/weld interface, a new weld connection shall be made.
- D. Electrical Continuity – Test electrically bonded piping prior to and after backfilling between all accessible test points.
1. Test Procedure for Single Bond and Multiple Bonds in Parallel
 - a. Connect instruments across bond as shown on Figure 1. Use separate set of contact points to structures for voltage and current circuits.
 - b. Close switch and observe meter readings. Beginning with the highest scales on voltmeter and ammeter, reduce meter ranges until lowest possible scale is reached, and record ON readings.
 - c. Open circuit and immediately record OFF readings. Obtain a minimum of three ON and three OFF readings.
 - d. Determine incremental change for voltage and current.
 - e. Calculate and record bond resistance for each reading as shown.
 - f. Resistance of bond shall not exceed calculated theoretical resistance by more than 10%.
 2. Test Procedure for Multiple Bonds in Series
 - a. Connect instruments as shown on Figure 2.
 - b. Calculate and record resistance between points A and B, including bonds in series as specified for single bond test.
 - c. Total resistance measured between points A and B shall not exceed the theoretical resistance of the sum of bonds plus theoretical resistance of structure between points A and B by more than 10%.
- E. Insulating Fittings – Test insulating fittings before they are backfilled and again after backfilling.
1. Set up instrumentation as shown on Figure 3. Place reference electrode in contact with the soil adjacent to the fitting if not backfilled, or directly above the buried fitting if backfilled.
 2. Close switch in I1 circuit. Read and record current (I1), and voltage (E1 (c)).
 3. Open switch in I1 circuit. Read and record voltage (E1 (o)).

4. Close switch in I1 circuit. Read and record current (I1), and voltage (E2(c)).
 5. Open switch in I1 circuit. Read and record voltage (E2(o)). The value of E2(c) - E2(o) shall be less than or equal to zero.
- F. Anodes – Test anodes after piping and cathodic protection systems have been completed and backfilled.
1. Structure-to-Anode Resistance Test
 - a. Set up instrumentation as shown on Figure 4.
 - b. Close switch in I1 circuit. Read and record current (I1) and voltage (E1(c))
 - c. Open switch. Read and record voltage (E1(o))
 - d. Repeat and record readings a minimum of three times
 - e. Calculate Structure-to-Anode resistance using formula shown
 2. Anode-to-Earth Resistance Test
 - a. Set up instrumentation as shown on Figure 4.
 - b. Close switch in I1 circuit. Read and record current (I1) and voltage (E2(c))
 - c. Open switch. Read and record voltage (E2(o))
 - d. Repeat and record readings a minimum of three times
 - e. Calculate Anode-to-Earth resistance using formula shown
- G. Reference Electrodes – Follow test procedures used for determining Anode-to-Earth Resistance.
- H. Cathodic Protection Depolarization Test – After completion of testing to verify electrical continuity, structure-to-earth and anode-to-earth resistances, and isolation from unprotected structures, the following test shall be performed to verify adequate cathodic protection has been achieved:
1. Connect all anodes in the system to the structure to be cathodically protected 24 hours prior to performing the following test procedure.
 2. "Zero" the recording voltmeter and allow to run for at least 5 minutes.
 3. Set up instrumentation as shown on Figure 5.
 4. With the switch closed in the I1 circuit, read and record anode output current.
 5. Disconnect all anodes simultaneously by opening the I1 circuit(s).
 6. Allow recorder to run until the cathodic polarization value ("instant off") clearly decays at least 100 millivolts.
 7. Reconnect all anodes and allow recorder to run at least 5 minutes.
 8. Disconnect recorder from test circuit and allow to "zero" for an additional 5 minutes.
 9. Record times, date, scale, chart speed and structure location on the recording chart.

10. If the structure surface potential fails to depolarize the required 100 millivolts, the Contractor shall implement remedial measures, as approved by the Engineer, to achieve adequate cathodic protection of the structure.

FIGURE 1 – SINGLE BOND AND MULTIPLE BONDS IN PARALLEL

FORMULA FOR DETERMINING RESISTANCE OF SINGLE BOND USING TEST DATA:

$$R_T = \Delta E / \Delta i$$

WHERE R_T = RESISTANCE OF ONE BOND (OHM)
 ΔE = INCREMENTAL CHANGE IN POTENTIAL (VOLT)
 Δi = INCREMENTAL CHANGE IN CURRENT (AMPERE)

FORMULA FOR CALCULATING THEORETICAL RESISTANCE OF SINGLE BOND:

$$R_c = (L) \times (R_L)$$

WHERE R_c = CALCULATED RESISTANCE OF ONE BOND (OHM)
 L = LENGTH (METER)
 R_L = RESISTANCE (OHM/METER) FROM WIRE TABLE FOR BOND WIRE USED

FORMULA FOR CALCULATING THEORETICAL RESISTANCE BETWEEN STRUCTURES CONNECTED BY MULTIPLE BONDS IN PARALLEL:

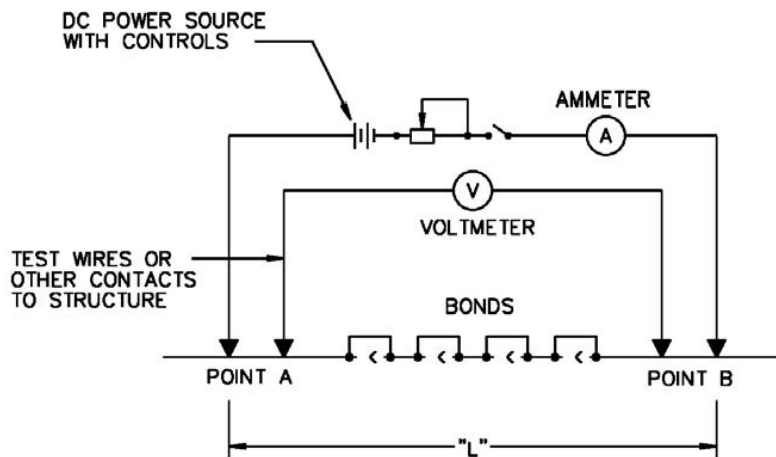

$$R_{cp} = R_c / N$$

WHERE R_{cp} = CALCULATED RESISTANCE OF MULTIPLE BOND WIRE IN PARALLEL (OHM)
 R_c = CALCULATED RESISTANCE OF ONE BOND (OHM)
 N = NUMBER OF BONDS IN PARALLEL

NOTE:

1. VOLTMETER CONTACTS TO STRUCTURE MUST BE CLOSE ENOUGH TO WELDS TO ENSURE THAT STRUCTURE RESISTANCE IS NOT SIGNIFICANT.

FIGURE 2 – MULTIPLE BONDS IN SERIES

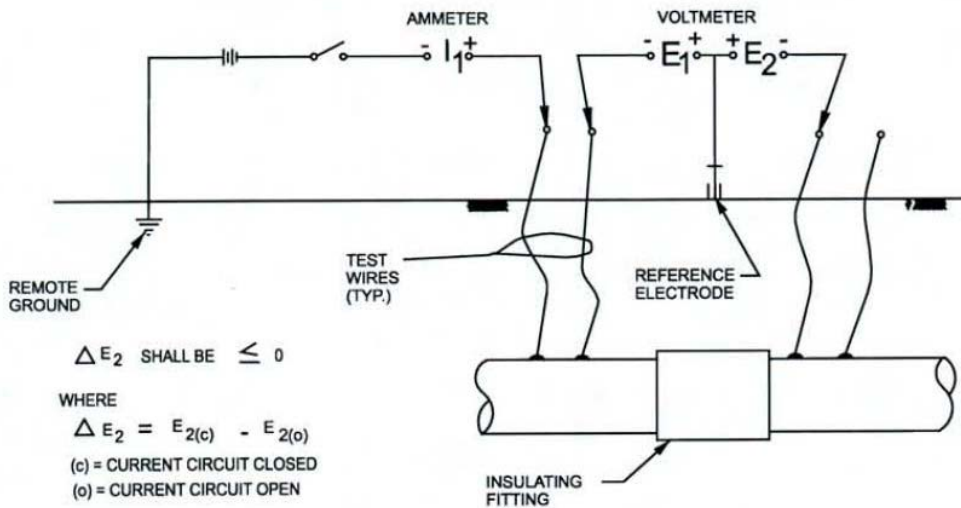

FORMULA FOR CALCULATING THEORETICAL RESISTANCE OF STRUCTURE WITH MULTIPLE BONDS IN SERIES:

$$R_{cs} = R_c \times N \times \rho \frac{L}{A}$$

- WHERE R_{cs} = CALCULATED RESISTANCE OF A NUMBER OF BONDS IN SERIES (OHM)
 R_c = CALCULATED RESISTANCE OF ONE BOND (OHM)
 N = NUMBER OF BONDS IN SERIES
 ρ = RESISTIVITY OF STRUCTURE (OHM-cm)
 L = LENGTH OF STRUCTURE (cm)
 A = CROSS SECTIONAL AREA OF STRUCTURE (cm)²

FIGURE 3 – INSULATING FITTINGS

$$\Delta E_2 \text{ SHALL BE } \leq 0$$

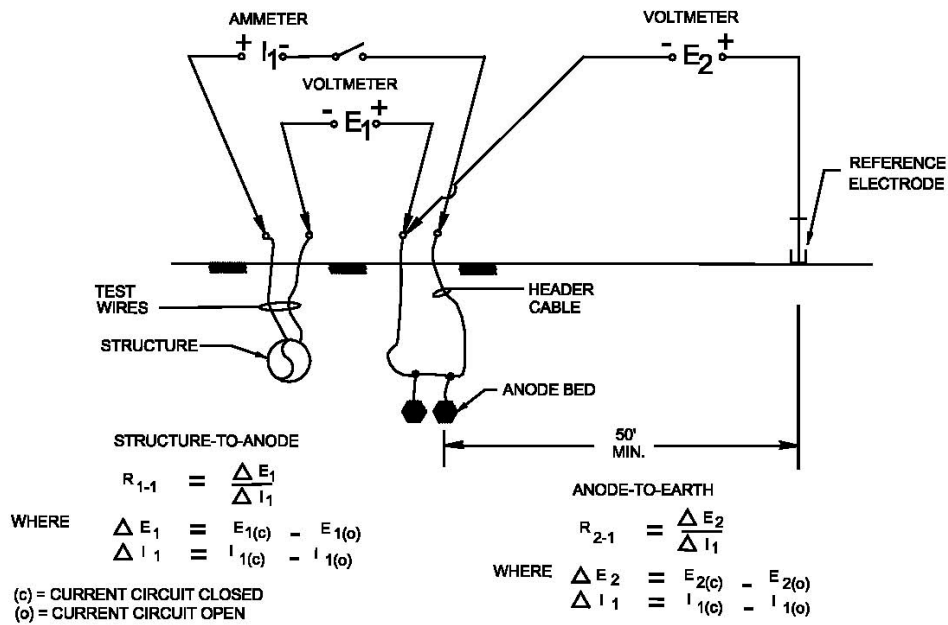

WHERE

$$\Delta E_2 = E_{2(c)} - E_{2(o)}$$

- (c) = CURRENT CIRCUIT CLOSED
(o) = CURRENT CIRCUIT OPEN

BURIED INSULATING FITTING TEST

FIGURE 4 – RESISTANCE TESTS

STRUCTURE-TO-ANODE AND ANODE-TO-EARTH RESISTANCE TESTS

FIGURE 5 – CATHODIC PROTECTION DEPOLARIZATION TEST

CATHODIC PROTECTION DEPOLARIZATION TEST

PART 4 - MEASUREMENT AND PAYMENT**4.1 MEASUREMENT**

A. The quantities of accepted work will be measured in the following units. All measurements will be plan measure except for authorized changes.

1. Description: Lump Sum

4.2 PAYMENT

1. Payment will be made at the respective unit or lump-sum price listed in the proposal and shall be full compensation for all labor, materials, and equipment necessary to complete the respective unit in place. There will be no separate measurement or payment for any item of work not specifically identified and listed in the proposal, and all such work shall be considered a subsidiary item with all costs pertaining thereto included in the prices for other items listed in the proposal. At the Engineer's option, partial payment may be made for any lump sum item listed in the proposal, providing that the Contractor is diligently and satisfactorily pursuing full completion of such partially complete item in accordance with the approved job progress schedule.

END OF SECTION

SECTION 26 43 13**TRANSIENT-VOLTAGE SUPPRESSION FOR PANELBOARDS**

PART 1 - GENERAL

1.01 RELATED DOCUMENTS

- A. Drawings and general provisions of the Contract, including General and Supplementary Conditions and Division 01 Specification Sections, apply to this Section.

1.02 SUMMARY

- A. Section includes TVSS for panelboards.

1.03 DEFINITIONS

- A. ATS: Acceptance Testing Specifications.
- B. SVR: Suppressed voltage rating.
- C. TVSS: Transient voltage surge suppressor(s), both singular and plural; also, transient voltage surge suppression.

1.04 ACTION SUBMITTALS

- A. Product Data: For each type of product indicated. Include rated capacities, operating weights, electrical characteristics, furnished specialties, and accessories.

1.05 INFORMATIONAL SUBMITTALS

- A. Qualification Data: For qualified testing agency.
- B. Product Certificates: For TVSS devices, from manufacturer.
- C. Field quality-control reports.
- D. Warranties: Sample of special warranties.

1.06 CLOSEOUT SUBMITTALS

- A. Operation and Maintenance Data: For TVSS devices to include in emergency, operation, and maintenance manuals.

1.07 MAINTENANCE MATERIAL SUBMITTALS

- A. Furnish extra materials that match products installed and that are packaged with protective covering for storage and identified with labels describing contents.
 - 1. Replaceable Protection Modules: One of each size and type installed.

1.08 QUALITY ASSURANCE

- A. Electrical Components, Devices, and Accessories: Listed and labeled as defined in NFPA 70, by a testing agency, and marked for intended location and application.
- B. Comply with IEEE C62.41.2 and test devices according to IEEE C62.45.
- C. Comply with NEMA LS 1.
- D. Comply with UL 1283 and UL 1449 3rd Edition.
- E. Comply with NFPA 70.

1.09 PROJECT CONDITIONS

- A. Interruption of Existing Electrical Service: Do not interrupt electrical service to facilities occupied by City or others unless permitted under the following conditions and then only after arranging to provide temporary electrical service according to requirements indicated:
 - 1. Notify Owner no fewer than seven days in advance of proposed electrical service interruptions.
 - 2. Do not proceed with interruption of electrical service without Owner's written permission.
- B. Service Conditions: Rate TVSS devices for continuous operation under the following conditions unless otherwise indicated:
 - 1. Maximum Continuous Operating Voltage: Not less than 115 percent of nominal system operating voltage.
 - 2. Operating Temperature: 30 to 120 deg F.
 - 3. Humidity: 0 to 85 percent, noncondensing.
 - 4. Altitude: Less than 20,000 feet above sea level.

1.10 WARRANTY

- A. Special Warranty: Manufacturer's standard form in which manufacturer agrees to repair or replace components of surge suppressors that fail in materials or workmanship within specified warranty period.
 - 1. Warranty Period: Five years from date of Substantial Completion.

PART 2 - PRODUCTS**2.01 PANELBOARD TVSS**

- A. Manufacturers: Subject to compliance with requirements, available manufacturers offering products that may be incorporated into the Work include, but are not limited to, the following:
1. ABB USA.
 2. AC Data Solutions.
 3. Advanced Protection Technologies Inc. (APT).
 4. Atlantic Scientific.
 5. Current Technology Inc.; Danaher Power Solutions.
 6. Danaher Power Solutions; United Power Products.
 7. Eaton Electrical Inc.; Cutler-Hammer Business Unit.
 8. General Electric Company; GE Consumer & Industrial - Electrical Distribution.
 9. Intermatic, Inc.
 10. LEA International.
 11. Leviton Mfg. Company Inc.
 12. Liebert Corporation; a division of Emerson Network Power.
 13. Northern Technologies, Inc.; a division of Emerson Network Power.
 14. Siemens Energy & Automation, Inc.
 15. Square D; a brand of Schneider Electric.
 16. Surge Suppression Incorporated.
- B. Surge Protection Devices:
1. Comply with UL 1449, 3rd Edition.
 2. Modular design (with field-replaceable modules).
 3. Fuses, rated at 200-kA interrupting capacity.
 4. Fabrication using bolted compression lugs for internal wiring.
 5. Integral disconnect switch.
 6. Redundant suppression circuits.
 7. Redundant replaceable modules.
 8. Arrangement with copper bus bars and for bolted connections to phase buses, neutral bus, and ground bus.
 9. Arrangement with wire connections to phase buses, neutral bus, and ground bus.
 10. LED indicator lights for power and protection status.
 11. Audible alarm, with silencing switch, to indicate when protection has failed.
 12. Form-C contacts rated at 5 A and 250-V ac, one normally open and one normally closed, for remote monitoring of protection status. Contacts shall reverse on failure of any surge diversion module or on opening of any current-limiting device. Coordinate with building power monitoring and control system.
 13. Four-digit transient-event counter set to totalize transient surges.
- C. Peak Single-Impulse Surge Current Rating: 320 kA per mode/640 kA per phase.
- D. Minimum single impulse current ratings, using 8-by-20-mic.sec waveform described in IEEE C62.41.2
1. Line to Neutral: 70,000 A.
 2. Line to Ground: 70,000 A.

3. Neutral to Ground: 50,000 A.
- E. Protection modes and UL 1449 SVR for grounded wye circuits with 3-phase, 4-wire circuits shall be as follows:
1. Line to Neutral: 800V for 480V and 400 V for 208V.
 2. Line to Ground: 800V for 480V and 400 V for 208V.
 3. Neutral to Ground: 800V for 480V and 400 V for 208V.
- F. Protection modes and UL 1449 SVR for 240 V, 480 V, or 600 V, 3-phase, 3-wire, delta circuits shall be as follows:
1. Line to Line: 1000 V for 240 V.
 2. Line to Ground: 1000 V for 240 V.

PART 3 - EXECUTION

3.01 INSTALLATION

- A. TVSS shall be factory installed.

3.02 FIELD QUALITY CONTROL

- A. Tests and Inspections:
1. Perform each visual and mechanical inspection and electrical test stated in NETA ATS, "Surge Arresters, Low-Voltage Surge Protection Devices" Section. Certify compliance with test parameters.
 2. After installing TVSS devices but before electrical circuitry has been energized, test for compliance with requirements.
 3. Complete startup checks according to manufacturer's written instructions.
- B. TVSS device will be considered defective if it does not pass tests and inspections.
- C. Prepare test and inspection reports.

3.03 STARTUP SERVICE

- A. Do not perform insulation resistance tests of the distribution wiring equipment with the TVSS installed. Disconnect before conducting insulation resistance tests, and reconnect immediately after the testing is over.

3.04 DEMONSTRATION

- A. Engage a factory-authorized service representative to train Owner's maintenance personnel to maintain TVSS devices.

END OF SECTION 26 43 13

SECTION 26 51 00
INTERIOR LIGHTING

PART 1 - GENERAL

1.01 SUMMARY

A. Section Includes:

1. Interior lighting fixtures, lamps, and ballasts.
2. Exit signs.
3. Lighting fixture supports.

B. Related Sections:

1. Division 26 Section "Lighting Control Devices" for automatic control of lighting, including time switches, photoelectric relays, occupancy sensors, and multipole lighting relays and contactors.

1.02 ACTION SUBMITTALS

A. Product Data: For each type of lighting fixture, arranged in order of fixture designation. Include data on features, accessories, and finishes.

B. Shop Drawings: Show details of nonstandard or custom lighting fixtures. Indicate dimensions, weights, methods of field assembly, components, features, and accessories. **Product Certificates:** For each type of ballast for bi-level and dimmer-controlled fixtures, from manufacturer.

C. Low Mercury Lamps: Low mercury lamps are required for this project. Mercury content shall be less than 90 picograms per lumen-hour. Contractor shall submit manufacturers data for each lamp indicating mercury content is less than 90 picograms per lumen-hour.

1.03 INFORMATIONAL SUBMITTALS

A. Field quality-control reports.

1.04 QUALITY ASSURANCE

A. Electrical Components, Devices, and Accessories: Listed and labeled as defined in NFPA 70, by a qualified testing agency, and marked for intended location and application.

B. Comply with NFPA 70.

PART 2 - PRODUCTS**2.01 MANUFACTURERS**

- A. Products: Subject to compliance with requirements, available products that may be incorporated into the Work include, but are not limited to, product(s) indicated on Drawings.

2.02 GENERAL REQUIREMENTS FOR LIGHTING FIXTURES AND COMPONENTS

- A. Recessed Fixtures: Comply with NEMA LE 4 for ceiling compatibility for recessed fixtures.
- B. HID Fixtures: Comply with UL 1598. Where LER is specified, test according to NEMA LE 5B.
- C. Metal Parts: Free of burrs and sharp corners and edges.
- D. Sheet Metal Components: Steel unless otherwise indicated. Form and support to prevent warping and sagging.
- E. Doors, Frames, and Other Internal Access: Smooth operating, free of light leakage under operating conditions, and designed to permit relamping without use of tools. Designed to prevent doors, frames, lenses, diffusers, and other components from falling accidentally during relamping and when secured in operating position.
- F. Diffusers and Globes:
 - 1. Acrylic Lighting Diffusers: 100 percent virgin acrylic plastic. High resistance to yellowing and other changes due to aging, exposure to heat, and UV radiation.
 - a. Lens Thickness: At least 0.125 inch minimum unless otherwise indicated.
 - b. UV stabilized.
 - 2. Glass: Annealed crystal glass unless otherwise indicated.

2.03 LED LIGHT FIXTURES

- A. Mercury content shall be less than 90 picograms per lumen-hour. Refer to plans for additional LED light fixture requirements.

2.04 EXIT SIGNS

- A. General Requirements for Exit Signs: Comply with UL 924; for sign colors, visibility, luminance, and lettering size, comply with authorities having jurisdiction.
- B. Internally Lighted Signs:
 - 1. Lamps for AC Operation: Fluorescent, two for each fixture, 20,000 hours of rated lamp life.

2. Lamps for AC Operation: LEDs, 50,000 hours minimum rated lamp life.
3. Mercury content shall be less than 90 picograms per lumen-hour.

2.05 LIGHTING FIXTURE SUPPORT COMPONENTS

- A. Comply with Division 26 Section "Hangers and Supports for Electrical Systems" for channel- and angle-iron supports and nonmetallic channel and angle supports.
- B. Single-Stem Hangers: 1/2-inch steel tubing with swivel ball fittings and ceiling canopy. Finish same as fixture.
- C. Twin-Stem Hangers: Two, 1/2-inch steel tubes with single canopy designed to mount a single fixture. Finish same as fixture.
- D. Wires: ASTM A 641/A 641M, Class 3, soft temper, zinc-coated steel, 12 gage.
- E. Wires for Humid Spaces: ASTM A 580/A 580M, Composition 302 or 304, annealed stainless steel, 12 gage.
- F. Rod Hangers: 3/16-inch minimum diameter, cadmium-plated, threaded steel rod.
- G. Hook Hangers: Integrated assembly matched to fixture and line voltage and equipped with threaded attachment, cord, and locking-type plug.

PART 3 - EXECUTION

3.01 INSTALLATION

- A. Lighting fixtures: Set level, plumb, and square with ceilings and walls. Install lamps in each fixture.
- B. Comply with NFPA 70 for minimum fixture supports.
- C. Suspended Lighting Fixture Support:
 1. Pendants and Rods: Where longer than 48 inches, brace to limit swinging.
 2. Stem-Mounted, Single-Unit Fixtures: Suspend with twin-stem hangers.
 3. Continuous Rows: Use tubing or stem for wiring at one point and tubing or rod for suspension for each unit length of fixture chassis, including one at each end.
- D. Adjust aimable lighting fixtures to provide required light intensities.
- E. Connect wiring according to Division 26 Section "Low-Voltage Electrical Power Conductors and Cables."

3.02 FIELD QUALITY CONTROL

- A. Prepare a written report of tests, inspections, observations, and verifications indicating and interpreting results. If adjustments are made to lighting system, retest to demonstrate compliance with standards.

END OF SECTION 26 51 00

SECTION 26 56 00
EXTERIOR LIGHTING

PART 1 - GENERAL

1.01 SUMMARY

- A. Section Includes:
1. Exterior luminaires with lamps and ballasts.
 2. LED lighting
 3. Poles and accessories.

1.02 ACTION SUBMITTALS

- A. Product Data: For each luminaire, pole, and support component, arranged in order of lighting unit designation. Include data on features, accessories, and finishes.
- B. Shop Drawings: Anchor-bolt templates keyed to specific poles and certified by manufacturer.

1.03 QUALITY ASSURANCE

- A. Electrical Components, Devices, and Accessories: Listed and labeled as defined in NFPA 70, by a qualified testing agency, and marked for intended location and application.
- B. Comply with IEEE C2, "National Electrical Safety Code."
- C. Comply with NFPA 70.

PART 2 - PRODUCTS

2.01 MANUFACTURERS

- A. Products: Subject to compliance with requirements, available products that may be incorporated into the Work include, but are not limited to, product(s) indicated on Drawings.

2.02 GENERAL REQUIREMENTS FOR LUMINAIRES

- A. Luminaires shall comply with UL 1598 and be listed and labeled for installation in wet locations by an NRTL acceptable to authorities having jurisdiction.

1. LED fixtures shall meet latest applicable testing standards.
- B. Lateral Light Distribution Patterns: Comply with IESNA RP-8 for parameters of lateral light distribution patterns indicated for luminaires.
- C. Metal Parts: Free of burrs and sharp corners and edges.
- D. Sheet Metal Components: Corrosion-resistant aluminum unless otherwise indicated. Form and support to prevent warping and sagging.
- E. Housings: Rigidly formed, weather- and light-tight enclosures that will not warp, sag, or deform in use. Provide filter/breather for enclosed luminaires.
- F. Doors, Frames, and Other Internal Access: Smooth operating, free of light leakage under operating conditions, and designed to permit relamping without use of tools. Designed to prevent doors, frames, lenses, diffusers, and other components from falling accidentally during relamping and when secured in operating position. Doors shall be removable for cleaning or replacing lenses. Designed to disconnect ballast when door opens.
- G. Exposed Hardware Material: Stainless steel.
- H. Plastic Parts: High resistance to yellowing and other changes due to aging, exposure to heat, and UV radiation.
- I. Light Shields: Factory installed arranged to block light distribution to indicated portion of normally illuminated area or field.
- J. Lenses and Refractors Gaskets: Use heat- and aging-resistant resilient gaskets to seal and cushion lenses and refractors in luminaire doors.
- K. Luminaire Finish: Manufacturer's paint applied to factory-assembled and -tested luminaire before shipping. Where indicated, match finish process and color of pole or support materials.

2.03 BALLASTS FOR HID LAMPS

- A. Electronic Ballast for Metal-Halide Lamps: Include the following features unless otherwise indicated:
 1. Minimum Starting Temperature: Minus 20 deg F for single-lamp ballasts.
 2. Rated Ambient Operating Temperature: 130 deg F.
 3. Lamp end-of-life detection and shutdown circuit.
 4. Sound Rating: Class A.
 5. Total Harmonic Distortion Rating: Less than 20 percent.
 6. Transient Voltage Protection: IEEE C62.41.1 and IEEE C62.41.2, Category A or better.
 7. Lamp Current Crest Factor: 1.5 or less.
 8. Power Factor: 0.90 or higher.
 9. Interference: Comply with 47 CFR 18, Ch. 1, Subpart C, for limitations on electromagnetic and radio-frequency interference for nonconsumer equipment.

10. Protection: Class P thermal cutout.

2.04 HID LAMPS

- A. Metal-Halide Lamps: ANSI C78.43, with minimum CRI 65, and color temperature 4000 K. Mercury content shall be less than 90 picograms per lumen-hour.
- B. Pulse-Start, Metal-Halide Lamps: Minimum CRI 65, and color temperature 4000 K. Mercury content shall be less than 90 picograms per lumen-hour.

2.05 GENERAL REQUIREMENTS FOR POLES AND SUPPORT COMPONENTS

- A. Structural Characteristics: Comply with AASHTO LTS-4-M.

2.06 LED Light Fixtures

- A. UL listed and ARRA compliant. Include the following features unless otherwise indicated:
 - 1. LED color temperature 4,000 K.
 - 2. Entire fixture and LED system 50,000 hour rated.
 - 3. Full cutoff. No lumens above 90 degrees.
 - 4. Minimum Starting Temperature: Minus 22 deg F (Minus 30 deg C).
 - 5. Normal Ambient Operating Temperature: 104 deg F (40 deg C).

PART 3 - EXECUTION

3.01 LUMINAIRE INSTALLATION

- A. Install lamps in each luminaire.
- B. Fasten luminaire to indicated structural supports.
 - 1. Use fastening methods and materials selected to resist seismic forces defined for the application and approved by manufacturer.
- C. Adjust luminaires that require field adjustment or aiming.

3.02 POLE INSTALLATION

- A. Alignment: Align pole foundations and poles for optimum directional alignment of luminaires and their mounting provisions on the pole.
- B. Clearances: Maintain the following minimum horizontal distances of poles from surface and underground features unless otherwise indicated on Drawings:

1. Fire Hydrants and Storm Drainage Piping: 60 inches (1520 mm).
 2. Water, Gas, Electric, Communication, and Sewer Lines: 10 feet (3 m).
 3. Trees: 15 feet (5 m) from tree trunk.
- C. Concrete Pole Foundations: Set anchor bolts according to anchor-bolt templates furnished by pole manufacturer. Concrete materials, installation, and finishing requirements are specified in KCMO APWA.
- D. Foundation-Mounted Poles: Mount pole with leveling nuts, and tighten top nuts to torque level recommended by pole manufacturer.
1. Use anchor bolts and nuts selected to resist seismic forces defined for the application and approved by manufacturer.
 2. Grout void between pole base and foundation. Use nonshrink or expanding concrete grout firmly packed to fill space.
 3. Install base covers unless otherwise indicated.
 4. Use a short piece of 1/2-inch- (13-mm-) diameter pipe to make a drain hole through grout. Arrange to drain condensation from interior of pole.

3.03 CORROSION PREVENTION

- A. Aluminum: Do not use in contact with earth or concrete. When in direct contact with a dissimilar metal, protect aluminum by insulating fittings or treatment.
- B. Steel Conduits: Comply with Section 26 05 33 "Raceways and Boxes for Electrical Systems." In concrete foundations, wrap conduit with 0.010-inch- (0.254-mm-) thick, pipe-wrapping plastic tape applied with a 50 percent overlap.

3.04 GROUNDING

- A. Ground metal poles and support structures according to Section 26 05 26 "Grounding and Bonding for Electrical Systems."
1. Install grounding electrode for each pole unless otherwise indicated.
 2. Install grounding conductor pigtail in the base for connecting luminaire to grounding system.
- B. Ground nonmetallic poles and support structures according to Section 26 05 26 "Grounding and Bonding for Electrical Systems."
1. Install grounding electrode for each pole.
 2. Install grounding conductor and conductor protector.
 3. Ground metallic components of pole accessories and foundations.

SCHEDULE 1 - FIELD QUALITY CONTROL

- A. Inspect each installed fixture for damage. Replace damaged fixtures and components.

- B. Illumination Observations: Verify normal operation of lighting units after installing luminaires and energizing circuits with normal power source.
 - 1. Verify operation of photoelectric controls.
- C. Illumination Tests:
 - 1. Measure light intensities at night. Use photometers with calibration referenced to NIST standards. Comply with the following IESNA testing guide(s):
 - a. IESNA LM-64, "Photometric Measurements of Parking Areas."
 - b. IESNA LM-72, "Directional Positioning of Photometric Data."
- D. Prepare a written report of tests, inspections, observations, and verifications indicating and interpreting results. If adjustments are made to lighting system, retest to demonstrate compliance with standards.

END OF SECTION 26 56 00

SECTION 26 56 10
STATION STOP LIGHTING

PART 1 - GENERAL

1.01 SUMMARY

- A. Section Includes:
1. Exterior luminaires with lamps and ballasts.
 2. LED lighting

1.02 ACTION SUBMITTALS

- A. Product Data: For each luminaire, pole, and support component, arranged in order of lighting unit designation. Include data on features, accessories, and finishes.

1.03 QUALITY ASSURANCE

- A. Electrical Components, Devices, and Accessories: Listed and labeled as defined in NFPA 70, by a qualified testing agency, and marked for intended location and application.
- B. Comply with IEEE C2, "National Electrical Safety Code."
- C. Comply with NFPA 70.

PART 2 - PRODUCTS

2.01 MANUFACTURERS

- A. Products: Subject to compliance with requirements, available products that may be incorporated into the Work include, but are not limited to, product(s) indicated on Drawings.

2.02 GENERAL REQUIREMENTS FOR LUMINAIRES

- A. Luminaires shall comply with UL 1598 and be listed and labeled for installation in wet locations by an NRTL acceptable to authorities having jurisdiction.
1. LED fixtures shall meet latest applicable testing standards.
- B. Lateral Light Distribution Patterns: Comply with IESNA RP-8 for parameters of lateral light distribution patterns indicated for luminaires.

- C. Metal Parts: Free of burrs and sharp corners and edges.
- D. Sheet Metal Components: Corrosion-resistant aluminum unless otherwise indicated. Form and support to prevent warping and sagging.
- E. Housings: Rigidly formed, weather- and light-tight enclosures that will not warp, sag, or deform in use. Provide filter/breather for enclosed luminaires.
- F. Doors, Frames, and Other Internal Access: Smooth operating, free of light leakage under operating conditions, and designed to permit relamping without use of tools. Designed to prevent doors, frames, lenses, diffusers, and other components from falling accidentally during relamping and when secured in operating position. Doors shall be removable for cleaning or replacing lenses. Designed to disconnect ballast when door opens.
- G. Exposed Hardware Material: Stainless steel.
- H. Plastic Parts: High resistance to yellowing and other changes due to aging, exposure to heat, and UV radiation.
- I. Lenses and Refractors Gaskets: Use heat- and aging-resistant resilient gaskets to seal and cushion lenses and refractors in luminaire doors.
- J. Luminaire Finish: Manufacturer's paint applied to factory-assembled and -tested luminaire before shipping. Where indicated, match finish process and color of pole or support materials.

2.03 GENERAL REQUIREMENTS FOR POLES AND SUPPORT COMPONENTS

- A. Structural Characteristics: Comply with AASHTO LTS-4-M.

2.04 LED Light Fixtures

- A. UL listed and ARRA compliant. Include the following features unless otherwise indicated:
 - 1. Entire fixture and LED system 50,000 hour rated.

PART 3 - EXECUTION

3.01 LUMINAIRE INSTALLATION

- A. Install lamps in each luminaire.
- B. Fasten luminaire to indicated structural supports.

1. Use fastening methods and materials selected to resist seismic forces defined for the application and approved by manufacturer.
- C. Adjust luminaires that require field adjustment or aiming.

3.02 CORROSION PREVENTION

- A. Aluminum: Do not use in contact with earth or concrete. When in direct contact with a dissimilar metal, protect aluminum by insulating fittings or treatment.
- B. Steel Conduits: Comply with Section 26 05 33 "Raceways and Boxes for Electrical Systems." In concrete foundations, wrap conduit with 0.010-inch- (0.254-mm-) thick, pipe-wrapping plastic tape applied with a 50 percent overlap.

3.03 GROUNDING

- A. Ground fixtures and support structures according to Section 26 05 26 "Grounding and Bonding for Electrical Systems."
1. Install grounding electrode for each fixture unless otherwise indicated.

SCHEDULE 1 - FIELD QUALITY CONTROL

- A. Inspect each installed fixture for damage. Replace damaged fixtures and components.
- B. Illumination Observations: Verify normal operation of lighting units after installing luminaires and energizing circuits with normal power source.
1. Verify operation of photoelectric controls.
- C. Illumination Tests:
1. Measure light intensities at night. Use photometers with calibration referenced to NIST standards. Comply with the following IESNA testing guide(s):
 - a. IESNA LM-64, "Photometric Measurements of Parking Areas."
 - b. IESNA LM-72, "Directional Positioning of Photometric Data."
- D. Prepare a written report of tests, inspections, observations, and verifications indicating and interpreting results. If adjustments are made to lighting system, retest to demonstrate compliance with standards.

PART IV - MEASUREMENT

4.1 Measurement – No Separate measurement will be made for Work described in this Section.

PART V - PAYMENT

5.1 Payment – Payment for items in this Section will be incidental to the Contract lump sum unit cost of the Station Stops.

END OF SECTION 26 56 10

SECTION 27 51 23**INTERCOMMUNICATIONS AND PROGRAM SYSTEMS**

PART 1 - GENERAL

1.01 SUMMARY

- A. Section Includes: Manually switched intercommunications and program systems with the following components:
 - 1. Paging controller
 - 2. Paging amplifier.
 - 3. Loudspeakers/speaker microphones.
 - 4. Conductors and cables.
 - 5. Raceways.

1.02 ACTION SUBMITTALS

- A. Product Data: For each type of product indicated.
- B. Shop Drawings: For intercommunications and program systems. Include plans, elevations, sections, details, and attachments to other work.
 - 1. Wiring Diagrams: For power, signal, and control wiring.
 - a. Identify terminals to facilitate installation, operation, and maintenance.
 - b. Single-line diagram showing interconnection of components.
 - c. Cabling diagram showing cable routing and conduit.
 - 2. Sound Level Plans: Submit plans indicating sound levels in dBA on 10 ft spacings at 5 ft above floor level in all areas.

1.03 INFORMATIONAL SUBMITTALS

- A. Field quality-control reports.

1.04 CLOSEOUT SUBMITTALS

- A. Operation and maintenance data.

1.05 QUALITY ASSURANCE

- A. Installer Qualifications: Manufacturer's authorized representative who is trained and approved for installation of units required for this Project.

- B. Electrical Components, Devices, and Accessories: Listed and labeled as defined in NFPA 70, by a qualified testing agency, and marked for intended location and application.
- C. Comply with NFPA 70.

PART 2 - PRODUCTS

2.01 MANUFACTURERS

PART 3 - See Editing Instruction No.1 in the Evaluations for cautions about naming manufacturers. Retain paragraph and list of manufacturers below. See Section 01 60 00 "Product Requirements."

- A. Manufacturers: Subject to compliance with requirements, available manufacturers offering products that may be incorporated into the Work include, but are not limited to, the following:
 - 1. Aiphone Corporation.
 - 2. Alpha Communications.
 - 3. Bogen Communications, Inc.
 - 4. Dukane Communication Systems; part of GE Infrastructure, Security.
 - 5. Federal Signal Corporation; Electrical Products Division.
 - 6. Jeron Electronic Systems, Inc.
 - 7. Rauland-Borg Corporation.
 - 8. TOA Electronics, Inc.
 - 9. Valcom, Inc
 - 10. Zenitel USA; the home of STENTOFON brand products.

3.02 FUNCTIONAL DESCRIPTION OF SYSTEMS

- A. Microphone Station:
 - 1. Provide controller and amplifier to connect to telephone board. Telephones shall be utilized for announcements.
- B. Speakers: Free of noise and distortion during operation and when in standby mode.

3.03 GENERAL REQUIREMENTS FOR EQUIPMENT AND MATERIALS

- A. Coordinate features and select components to form an integrated system. Match components and interconnections for optimum performance of specified functions.
- B. Equipment: Modular type using solid-state components, fully rated for continuous duty unless otherwise indicated. Select equipment for normal operation on input power usually supplied at 110 to 130 V, 60 Hz.

- C. Weather-Resistant Equipment: Listed and labeled by an NRTL for duty outdoors or in wet locations as indicated on the plans.

3.04 PAGING CONTROLLER

- A. Three zones, all call, background music input, integrated single/warble tone generators, programmable per zone.

3.05 SPEAKER STATIONS

- A. Mounting: Flush unless otherwise indicated, and suitable for mounting conditions indicated.
- B. Faceplate: Tamperproof mounting screws.
- C. Back Box: Two-gang galvanized steel with 2-1/2-inch (64-mm) minimum depth.
- D. Speaker: permanent magnet.
- E. Tone Annunciation: Recurring momentary tone indicates incoming calls.

3.06 PAGING AMPLIFIER

- A. Input Voltage: 120-V ac, 60 Hz.
- B. Frequency Response: Within plus or minus 3 dB from 60 to 10,000 Hz.
- C. Minimum Signal-to-Noise Ratio: 60 dB, at rated output.
- D. Total Harmonic Distortion: Less than 3 percent at rated power output from 70 to 12,000 Hz.
- E. Output Regulation: Less than 2 dB from full to no load.
- F. Controls: On-off, input levels, and low-cut filter.
- G. Input Sensitivity: Matched to input circuit and to provide full-rated output with sound-pressure level of less than 10 dynes/sq. cm impinging on speaker microphones or handset transmitters.
- H. Amplifier Protection: Prevents damage from shorted or open output.
- I. Output Circuit: 70-V line.
- J. Power output suitable to provide system requirements.

3.07 CONE-TYPE LOUDSPEAKERS

- A. Minimum Axial Sensitivity: 91 dB at one meter, with 1-W input.
- B. Frequency Response: Within plus or minus 3 dB from 70 to 15,000 Hz.
- C. Minimum Dispersion Angle: 100 degrees.
- D. Line Transformer: Maximum insertion loss of 0.5 dB, power rating equal to speaker's, and at least four level taps.
- E. Enclosures: Steel housings or back boxes, acoustically dampened, with front face of steel and whole assembly rust proofed and factory primed; complete with mounting assembly and suitable for surface ceiling, flush ceiling, pendant or wall mounting; with relief of back pressure.

3.08 HORN-TYPE LOUDSPEAKERS

- A. Speakers shall be weatherproof, -4 deg F to 131 deg F rated construction; complete with universal mounting brackets.
- B. Frequency Response: Within plus or minus 3 dB from 275 to 14,000 Hz.
- C. Minimum Power Rating of Driver: 15 W, continuous.
- D. Minimum Dispersion Angle: 110 degrees.
- E. Line Transformer: Maximum insertion loss of 0.5 dB, power rating equal to speaker's, and at least four level taps.

3.09 CONDUCTORS AND CABLES

- A. Conductors: Jacketed, twisted pair and twisted multipair, untinned solid copper. Sizes as recommended by system manufacturer, but no smaller than No. 22 AWG.
- B. Insulation: Thermoplastic, not less than 1/32 inch (0.8 mm) thick.
- C. Shielding: For speaker-microphone leads and elsewhere where recommended by manufacturer; No. 34 AWG, tinned, soft-copper strands formed into a braid or equivalent foil.
 - 1. Minimum Shielding Coverage on Conductors: 60 percent.
- D. Plenum Cable: Listed and labeled for plenum installation.

3.10 RACEWAYS

- A. Intercommunication and Program System Raceways and Boxes: Comply with requirements in Section 26 05 33 "Raceway and Boxes for Electrical Systems."

- B. Outlet boxes shall be not less than 2 inches (50 mm) wide, 3 inches (75 mm) high, and 2-1/2 inches (64 mm) deep.
- C. Flexible metal conduit is prohibited.

PART 4 - EXECUTION

4.01 WIRING METHODS

- A. Wiring Method In Exposed Locations: Install cables in raceways and except within consoles, cabinets, desks, and counters. Conceal raceway and cables except in unfinished spaces.
 - 1. Install plenum cable in environmental air spaces, including plenum ceilings.
 - 2. Comply with requirements for raceways and boxes specified in Section 26 05 33 "Raceway and Boxes for Electrical Systems."
- B. Wiring Method: Conceal conductors and cables in accessible ceilings, walls, and floors where possible.
- C. Wiring within Enclosures: Bundle, lace, and train cables to terminal points with no excess and without exceeding manufacturer's limitations on bending radii. Provide and use lacing bars and distribution spools.

4.02 INSTALLATION OF RACEWAYS

- A. Comply with requirements in Section 26 05 33 "Raceway and Boxes for Electrical Systems" for installation of conduits and wireways.
- B. Install manufactured conduit sweeps and long-radius elbows whenever possible.

4.03 INSTALLATION OF CABLES

- A. Comply with NECA 1.
- B. General Requirements:
 - 1. Terminate conductors; no cable shall contain unterminated elements. Make terminations only at outlets and terminals.
 - 2. Splices, Taps, and Terminations: Arrange on numbered terminal strips in junction, pull, and outlet boxes; terminal cabinets; and equipment enclosures. Cables may not be spliced.
 - 3. Secure and support cables at intervals not exceeding 30 inches (760 mm) and not more than 6 inches (150 mm) from cabinets, boxes, fittings, outlets, racks, frames, and terminals.
 - 4. Bundle, lace, and train conductors to terminal points without exceeding manufacturer's limitations on bending radii. Install lacing bars and distribution spools.

5. Do not install bruised, kinked, scored, deformed, or abraded cable. Do not splice cable between termination, tap, or junction points. Remove and discard cable if damaged during installation and replace it with new cable.
 6. Cold-Weather Installation: Bring cable to room temperature before dereeling. Heat lamps shall not be used.
- C. Open-Cable Installation:
1. Install cabling with horizontal and vertical cable guides in telecommunication spaces with terminating hardware and interconnection equipment.
 2. Suspend speaker cable not in a wireway or pathway a minimum of 8 inches (200 mm) above ceiling by cable supports not more than 60 inches (1524 mm) apart.
 3. Cable shall not be run through structural members or be in contact with pipes, ducts, or other potentially damaging items.
- D. Separation of Wires: Separate speaker-microphone, line-level, speaker-level, and power wiring runs. Install in separate raceways or, where exposed or in same enclosure, separate conductors at least 12 inches (300 mm) apart for speaker microphones and adjacent parallel power and telephone wiring. Separate other intercommunication equipment conductors as recommended by equipment manufacturer.

4.04 INSTALLATION

- A. Match input and output impedances and signal levels at signal interfaces. Provide matching networks where required.
- B. Identification of Conductors and Cables: Color-code conductors and apply wire and cable marking tape to designate wires and cables so they identify media in coordination with system wiring diagrams.
- C. Weatherproof Equipment: For units that are mounted outdoors, in damp locations, or where exposed to weather, install consistent with requirements of weatherproof rating.
- D. Speaker-Line Matching Transformer Connections: Make initial connections using tap settings indicated on Drawings.
- E. Connect wiring according to Section 26 05 19 "Low-Voltage Electrical Power Conductors and Cables."

4.05 GROUNDING

- A. Ground cable shields and equipment to eliminate shock hazard and to minimize ground loops, common-mode returns, noise pickup, cross talk, and other impairments.
- B. Signal Ground Terminal: Locate at main equipment cabinet. Isolate from power system and equipment grounding.
- C. Install grounding electrodes as specified in Section 26 05 26 "Grounding and Bonding for Electrical Systems."

4.06 FIELD QUALITY CONTROL

- A. Perform tests and inspections.
 - 1. Manufacturer's Field Service: Engage a factory-authorized service representative to inspect components, assemblies, and equipment installations, including connections, and to assist in testing.
- B. Tests and Inspections:
 - 1. Schedule tests with at least seven days' advance notice of test performance.
 - 2. After installing intercommunications and program systems and after electrical circuitry has been energized, test for compliance with requirements.
 - 3. Operational Test: Test originating messages at each phone station. Verify proper routing and volume levels and that system is free of noise and distortion. Test each available message path from each station on system.
- C. Inspection: Verify that units and controls are properly labeled and interconnecting wires and terminals are identified. Prepare a list of final tap settings of paging speaker-line matching transformers.
- D. Intercommunications and program systems will be considered defective if they do not pass tests and inspections.
- E. Prepare test and inspection reports.

END OF SECTION 27 51 23

SECTION 28 05 13**CONDUCTORS AND CABLES FOR ELECTRONIC SAFETY AND SECURITY****PART 1 - GENERAL****1.1 RELATED DOCUMENTS**

- A. Drawings and general provisions of the Contract, including General and Supplementary Conditions and Division 01 Specification Sections, apply to this Section.

1.2 SUMMARY

- A. Section Includes:
 - 1. Fire alarm wire and cable.
 - 2. Identification products.

1.3 ACTION SUBMITTALS

- A. Product Data: For each type of product.

1.4 INFORMATIONAL SUBMITTALS

- A. Qualification Data: For qualified layout technician, installation supervisor, and field inspector.
- B. Source quality-control reports.
- C. Field quality-control reports.

1.5 DELIVERY, STORAGE, AND HANDLING

- A. Inspect cables upon receipt at Project site.

1.6 FIELD CONDITIONS

- A. Do not install conductors and cables that are wet, moisture damaged, or mold damaged.
 - 1. Indications that wire and cables are wet or moisture damaged include, but are not limited to, discoloration and sagging of factory packing materials.

PART 2 - PRODUCTS

2.1 PERFORMANCE REQUIREMENTS

- A. Surface-Burning Characteristics: Comply with ASTM E 84; testing by a qualified testing agency. Identify products with appropriate markings of applicable testing agency.
 - 1. Flame-Spread Index: 25 or less.
 - 2. Smoke-Developed Index: 450 or less.
- B. Electrical Components, Devices, and Accessories: Listed and labeled as defined in NFPA 70, by a qualified testing agency, and marked for intended location and application.

2.2 BACKBOARDS

- A. Backboards: Plywood, fire-retardant treated, 3/4 by 48 by 96 inches (19 by 1220 by 2440 mm). Comply with requirements for plywood backing panels in Section 06 10 00 "Rough Carpentry."

2.3 FIRE ALARM WIRE AND CABLE

- A. Manufacturers: Subject to compliance with requirements, available manufacturers offering products that may be incorporated into the Work include, but are not limited to, the following:
 - 1. Comtran Corporation.
 - 2. Draka Cableteq USA.
 - 3. Genesis Cable Products; Honeywell International, Inc.
 - 4. Rockbestos-Suprenant Cable Corp.
 - 5. West Penn Wire.
- B. General Wire and Cable Requirements: NRTL listed and labeled as complying with NFPA 70, Article 760.
- C. Signaling Line Circuits: Twisted, shielded pair, No. 16 AWG.
 - 1. Circuit Integrity Cable: Twisted shielded pair, NFPA 70, Article 760, Classification CI, for power-limited fire alarm signal service Type FPL. NRTL listed and labeled as complying with UL 1424 and UL 2196 for a 2-hour rating.
- D. Non-Power-Limited Circuits: Solid-copper conductors with 600-V rated, 75 deg C, color-coded insulation.
 - 1. Low-Voltage Circuits: No. 16 AWG, minimum.
 - 2. Line-Voltage Circuits: No. 12 AWG, minimum.
 - 3. Multiconductor Armored Cable: NFPA 70, Type MC, copper conductors, Type TFN/THHN conductor insulation, copper drain wire, copper armor with outer jacket with red identifier stripe, NRTL listed for fire alarm and cable tray

installation, plenum rated, and complying with requirements in UL 2196 for a 2-hour rating.

2.4 IDENTIFICATION PRODUCTS

- A. Manufacturers: Subject to compliance with requirements, available manufacturers offering products that may be incorporated into the Work include, but are not limited to, the following:
 - 1. Brady Worldwide, Inc.
 - 2. HellermannTyton North America.
 - 3. Kroy LLC.
 - 4. Panduit Corp.
- B. Comply with UL 969 for a system of labeling materials, including label stocks, laminating adhesives, and inks used by label printers.
- C. Comply with requirements in Section 26 05 53 "Identification for Electrical Systems."

PART 3 - EXECUTION

3.1 INSTALLATION OF HANGERS AND SUPPORTS

- A. Comply with requirements in Section 26 05 29 "Hangers and Supports for Electrical Systems" for installation of supports for cables.

3.2 WIRING METHOD

- A. Install wiring in metal pathways and wireways FOR EXPOSED AREAS.
 - 1. Minimum conduit size shall be 1/2 inch. Control and data transmission wiring shall not share conduit with other building wiring systems.
 - 2. Comply with requirements in Section 26 05 33 "Raceways and Boxes for Electrical Systems."
- B. Install cable, concealed in accessible ceilings, walls, and floors when possible.
- C. Wiring within Enclosures:
 - 1. Bundle, lace, and train conductors to terminal points with no excess and without exceeding manufacturer's limitations on bending radii.
 - 2. Install lacing bars and distribution spools.
 - 3. Separate power-limited and non-power-limited conductors as recommended in writing by manufacturer.
 - 4. Install conductors parallel with or at right angles to sides and back of enclosure.
 - 5. Connect conductors that are terminated, spliced, or interrupted in any enclosure associated with intrusion system to terminal blocks.
 - 6. Mark each terminal according to system's wiring diagrams.

7. Make all connections with approved crimp-on terminal spade lugs, pressure-type terminal blocks, or plug connectors.

3.3 FIRE ALARM WIRING INSTALLATION

- A. Comply with NECA 1 and NFPA 72.
- B. Wiring Method Exposed Indoor & Outdoor Locations: Install wiring in dedicated metal raceway according to Section 26 05 33 "Raceways and Boxes for Electrical Systems."
- C. Wiring Method Concealed Indoor Locations:
 1. Install plenum cable in environmental air spaces, including plenum ceilings.
 2. Fire-Rated Cables: 2-hour, fire-rated fire alarm cables, NFPA 70, Types MI and CI.
- D. Wiring within Enclosures: Separate power-limited and non-power-limited conductors as recommended by manufacturer. Install conductors parallel with or at right angles to sides and back of the enclosure. Bundle, lace, and train conductors to terminal points with no excess. Connect conductors that are terminated, spliced, or interrupted in any enclosure associated with the fire alarm system to terminal blocks. Mark each terminal according to the system's wiring diagrams. Make all connections with approved crimp-on terminal spade lugs, pressure-type terminal blocks, or plug connectors.
- E. Cable Taps: Use numbered terminal strips in junction, pull, and outlet boxes, cabinets, or equipment enclosures where circuit connections are made.
- F. Color-Coding: Color-code fire alarm conductors differently from the normal building power wiring. Use one color-code for alarm circuit wiring and another for supervisory circuits. Color-code audible alarm-indicating circuits differently from alarm-initiating circuits. Use different colors for visible alarm-indicating devices. Paint fire alarm system junction boxes and covers red.
- G. Risers: Install at least two vertical cable risers to serve the fire alarm system. Separate risers in close proximity to each other with a minimum one-hour-rated wall, so the loss of one riser does not prevent the receipt or transmission of signals from other floors or zones.
- H. Wiring to Remote Alarm Transmitting Device: 1-inch (25-mm) conduit between the fire alarm control panel and the transmitter. Install number of conductors and electrical supervision for connecting wiring as needed to suit monitoring function.

3.4 POWER AND CONTROL-CIRCUIT CONDUCTORS

- A. 120-V Power Wiring: Install according to Section 26 05 19 "Low-Voltage Electrical Power Conductors and Cables" unless otherwise indicated.
- B. Minimum Conductor Sizes:
 1. Class 1 remote-control and signal circuits, No. 14 AWG.

2. Class 2 low-energy, remote-control and signal circuits, No. 16 AWG.
3. Class 3 low-energy, remote-control, alarm and signal circuits, No. 12 AWG.

3.5 CONNECTIONS

- A. Comply with requirements in Section 28 31 11 "Digital, Addressable Fire-Alarm System for connecting, terminating, and identifying wires and cables.

3.6 FIRESTOPPING

- A. Comply with requirements in Section 07 84 13 "Penetration Firestopping."
- B. Comply with TIA-569-B, "Firestopping" Annex A.
- C. Comply with BICSI TDMM, "Firestopping Systems" Article.

3.7 GROUNDING

- A. For low-voltage wiring and cabling, comply with requirements in Section 26 05 26 "Grounding and Bonding for Electrical Systems."

3.8 IDENTIFICATION

- A. Identify system components, wiring, and cabling complying with TIA/EIA-606-A. Comply with requirements for identification specified in Section 26 05 53 "Identification for Electrical Systems."

3.9 FIELD QUALITY CONTROL

- A. Perform the following tests and inspections:
 1. Visually inspect cable placement, cable termination, grounding and bonding, equipment and patch cords, and labeling of all components.
- B. Document data for each measurement. Print data for submittals in a summary report that is formatted using Table 10.1 in BICSI TDMM as a guide, or transfer the data from the instrument to the computer, save as text files, print, and submit.
- C. End-to-end cabling will be considered defective if it does not pass inspections.
- D. Prepare inspection reports.

END OF SECTION 28 05 13

SECTION 28 31 11**DIGITAL, ADDRESSABLE FIRE-ALARM SYSTEM**

PART 1 - GENERAL

1.1 SUMMARY

A. Section Includes:

1. Fire-alarm control unit.
2. Manual fire-alarm boxes.
3. System smoke detectors.
4. Heat detectors.
5. Notification appliances.
6. Remote annunciator.
7. Addressable interface device.
8. Digital alarm communicator transmitter.

B. Related Requirements:

1. Section 28 05 13 "Conductors and Cables for Electronic Safety and Security" for cables and conductors for fire-alarm systems.

1.2 ACTION SUBMITTALS

A. Product Data: For each type of product, including furnished options and accessories.

B. Shop Drawings: For fire-alarm system.

1. Comply with recommendations and requirements in the "Documentation" section of the "Fundamentals" chapter in NFPA 72.
2. Include plans, elevations, sections, details, and attachments to other work.
3. Include details of equipment assemblies. Indicate dimensions, weights, loads, required clearances, method of field assembly, components, and locations. Indicate conductor sizes, indicate termination locations and requirements, and distinguish between factory and field wiring.
4. Detail assembly and support requirements.
5. Include voltage drop calculations for notification-appliance circuits.
6. Include battery-size calculations.
7. Include input/output matrix.
8. Include statement from manufacturer that all equipment and components have been tested as a system and meet all requirements in this Specification and in NFPA 72.
9. Include performance parameters and installation details for each detector.
10. Verify that each duct detector is listed for complete range of air velocity, temperature, and humidity possible when air-handling system is operating.

11. Include plans, sections, and elevations of heating, ventilating, and air-conditioning ducts, drawn to scale; coordinate location of duct smoke detectors and access to them.
 - a. Show critical dimensions that relate to placement and support of sampling tubes, detector housing, and remote status and alarm indicators.
 - b. Show field wiring required for HVAC unit shutdown on alarm.
 - c. Locate detectors according to manufacturer's written recommendations.
12. Include floor plans to indicate final outlet locations showing address of each addressable device. Show size and route of cable and conduits and point-to-point wiring diagrams.

C. General Submittal Requirements:

1. Shop Drawings shall be prepared by persons with the following qualifications:
 - a. Trained and certified by manufacturer in fire-alarm system design.
 - b. NICET-certified, fire-alarm technician; Level IV minimum.
 - c. Licensed or certified by authorities having jurisdiction.

D. Delegated-Design Submittal: For notification appliances and smoke and heat detectors, in addition to submittals listed above, indicate compliance with performance requirements and design criteria, including analysis data signed and sealed by the qualified professional engineer responsible for their preparation.

1. Drawings showing the location of each notification appliance and smoke and heat detector, ratings of each, and installation details as needed to comply with listing conditions of the device.
2. Design Calculations: Calculate requirements for selecting the spacing and sensitivity of detection, complying with NFPA 72. Calculate spacing and intensities for strobe signals and sound-pressure levels for audible appliances.
3. Indicate audible appliances required to produce square wave signal per NFPA 72.

1.3 INFORMATIONAL SUBMITTALS

- A. Qualification Data: For Installer.
- B. Field quality-control reports.
- C. Sample warranty.

1.4 CLOSEOUT SUBMITTALS

- A. Operation and Maintenance Data: For fire-alarm systems and components to include in emergency, operation, and maintenance manuals.

1. In addition to items specified in Section 01 78 23 "Operation and Maintenance Data," include the following:
 - a. Comply with the "Records" section of the "Inspection, Testing and Maintenance" chapter in NFPA 72.
 - b. Provide "Fire Alarm and Emergency Communications System Record of Completion Documents" according to the "Completion Documents" Article in the "Documentation" section of the "Fundamentals" chapter in NFPA 72.
 - c. Complete wiring diagrams showing connections between all devices and equipment.
 - d. Riser diagram.
 - e. Record copy of site-specific software.
 - f. Provide "Inspection and Testing Form" according to the "Inspection, Testing and Maintenance" chapter in NFPA 72, and include the following:
 - 1) Equipment tested.
 - 2) Frequency of testing of installed components.
 - 3) Frequency of inspection of installed components.
 - 4) Requirements and recommendations related to results of maintenance.
 - 5) Manufacturer's user training manuals.
 - g. Manufacturer's required maintenance related to system warranty requirements.
 - h. Abbreviated operating instructions for mounting at fire-alarm control unit and each annunciator unit.

B. Software and Firmware Operational Documentation:

1. Software operating and upgrade manuals.
2. Program Software Backup: On magnetic media or compact disk, complete with data files.
3. Device address list.
4. Printout of software application and graphic screens.

1.5 QUALITY ASSURANCE

- A. Installer Qualifications: Installation shall be by personnel certified by NICET as fire-alarm Level IV technician.
- B. NFPA Certification: Obtain certification according to NFPA 72 by a UL-listed alarm company.

1.6 WARRANTY

- A. Special Warranty: Manufacturer agrees to repair or replace fire-alarm system equipment and components that fail in materials or workmanship within specified warranty period.

1. Warranty Extent: All equipment and components not covered in the Maintenance Service Agreement.
2. Warranty Period: Five years from date of Substantial Completion.

PART 2 - PRODUCTS

2.1 SYSTEM DESCRIPTION

- A. Noncoded, UL-certified addressable system, with multiplexed signal transmission and horn/strobe evacuation.
- B. Automatic sensitivity control of certain smoke detectors.
- C. All components provided shall be listed for use with the selected system.
- D. Electrical Components, Devices, and Accessories: Listed and labeled as defined in NFPA 70, by a qualified testing agency, and marked for intended location and application.

2.2 SYSTEMS OPERATIONAL DESCRIPTION

- A. Fire-alarm signal initiation shall be by one or more of the following devices:
 1. Manual stations.
 2. Heat detectors.
 3. Smoke detectors.
 4. Duct smoke detectors.
 5. Automatic sprinkler system water flow.
 6. Fire-extinguishing system operation.
- B. Fire-alarm signal shall initiate the following actions:
 1. Continuously operate alarm notification appliances.
 2. Identify alarm and specific initiating device at fire-alarm control unit and remote annunciators.
 3. Transmit an alarm signal to the remote alarm receiving station.
 4. Unlock electric door locks in designated egress paths.
 5. Switch heating, ventilating, and air-conditioning equipment controls to fire-alarm mode.
 6. Activate preaction system.
 7. Recall elevator to primary or alternate recall floors.
 8. Activate elevator power shunt trip.
 9. Activate emergency lighting control.
 10. Activate emergency shutoffs for gas and fuel supplies.
 11. Transmit an alarm signal to the Traction Power Sub-Station (TPSS).
 12. Record events in the system memory.

- C. Supervisory signal initiation shall be by one or more of the following devices and actions:
1. Valve supervisory switch.
 2. Elevator shunt-trip supervision.
 3. Loss of communication with any panel on the network.
- D. System trouble signal initiation shall be by one or more of the following devices and actions:
1. Open circuits, shorts, and grounds in designated circuits.
 2. Opening, tampering with, or removing alarm-initiating and supervisory signal-initiating devices.
 3. Loss of communication with any addressable sensor, input module, relay, control module, or remote annunciator.
 4. Loss of primary power at fire-alarm control unit.
 5. Ground or a single break in internal circuits of fire-alarm control unit.
 6. Abnormal ac voltage at fire-alarm control unit.
 7. Break in standby battery circuitry.
 8. Failure of battery charging.
 9. Abnormal position of any switch at fire-alarm control unit or annunciator.
- E. System Supervisory Signal Actions:
1. Initiate notification appliances.
 2. Identify specific device initiating the event at fire-alarm control unit and remote annunciators.
 3. After a time delay of 200 seconds, transmit a trouble or supervisory signal to the remote alarm receiving station.

2.3 FIRE-ALARM CONTROL UNIT

- A. Manufacturers: Subject to compliance with requirements, available manufacturers offering products that may be incorporated into the Work include, but are not limited to, the following:
1. Bosch Security Systems.
 2. Faraday.
 3. Fike Corporation.
 4. Fire-Lite Alarms.
 5. GAMEWELL.
 6. GE UTC Fire & Security; A United Technologies Company.
 7. Keltron Corporation.
 8. Mircom Technologies, Ltd.
 9. Notifier.
 10. Siemens Industry, Inc.; Fire Safety Division.
 11. Silent Knight.
 12. SimplexGrinnell LP.
- B. General Requirements for Fire-Alarm Control Unit:

1. Field-programmable, microprocessor-based, modular, power-limited design with electronic modules, complying with UL 864.
 2. Addressable Initiation Device Circuits: The FACP shall indicate which communication zones have been silenced and shall provide selective silencing of alarm notification appliance by building communication zone.
 3. Addressable Control Circuits for Operation of Notification Appliances and Mechanical Equipment: The FACP shall be listed for releasing service.
- C. Alphanumeric Display and System Controls: Arranged for interface between human operator at fire-alarm control unit and addressable system components including annunciation and supervision. Display alarm, supervisory, and component status messages and the programming and control menu.
1. Annunciator and Display: Liquid-crystal type, 80 characters, minimum.
 2. Keypad: Arranged to permit entry and execution of programming, display, and control commands.
- D. Initiating-Device, Notification-Appliance, and Signaling-Line Circuits:
1. Pathway Class Designations: NFPA 72: As determined by delegated designer.
 2. Pathway Survivability: As determined by delegated designer.
- E. Notification-Appliance Circuit:
1. Audible appliances shall sound in a three-pulse temporal pattern, as defined in NFPA 72.
 2. Where notification appliances provide signals to sleeping areas, the alarm signal shall be a 520-Hz square wave with an intensity 15 dB above the average ambient sound level or 5 dB above the maximum sound level, or at least 75 dBA, whichever is greater, measured at the pillow.
 3. Visual alarm appliances shall flash in synchronization where multiple appliances are in the same field of view, as defined in NFPA 72.
- F. Elevator Recall:
1. Elevator recall shall be initiated only by one of the following alarm-initiating devices:
 - a. Elevator lobby detectors except the lobby detector on the designated floor.
 - b. Smoke detector in elevator machine room.
 - c. Smoke detectors in elevator hoistway.
 2. Elevator controller shall be programmed to move the cars to the alternate recall floor if lobby detectors located on the designated recall floors are activated.
 3. Water-flow alarm connected to sprinkler in an elevator shaft and elevator machine room shall shut down elevators associated with the location without time delay.
 - a. Water-flow switch associated with the sprinkler in the elevator pit may have a delay to allow elevators to move to the designated floor.

- G. Door Controls: Door hold-open devices that are controlled by smoke detectors at doors in smoke-barrier walls shall be connected to fire-alarm system.
- H. Remote Smoke-Detector Sensitivity Adjustment: Controls shall select specific addressable smoke detectors for adjustment, display their current status and sensitivity settings, and change those settings. Allow controls to be used to program repetitive, time-scheduled, and automated changes in sensitivity of specific detector groups. Record sensitivity adjustments and sensitivity-adjustment schedule changes in system memory.
- I. Transmission to Remote Alarm Receiving Station: Automatically transmit alarm, supervisory, and trouble signals to a remote alarm station.
- J. Primary Power: 24-V dc obtained from 120-V ac service and a power-supply module. Initiating devices, notification appliances, signaling lines, trouble signals, supervisory and digital alarm communicator transmitters shall be powered by 24-V dc source.
 - 1. Alarm current draw of entire fire-alarm system shall not exceed 80 percent of the power-supply module rating.
- K. Secondary Power: 24-V dc supply system with batteries, automatic battery charger, and automatic transfer switch.

2.4 MANUAL FIRE-ALARM BOXES

- A. Manufacturers: Subject to compliance with requirements, available manufacturers offering products that may be incorporated into the Work include, but are not limited to, the following:
 - 1. AMSECO - A Potter Brand.
 - 2. Bosch Security Systems.
 - 3. Cooper Wheelock.
 - 4. Faraday.
 - 5. Federal Signal Corporation.
 - 6. Fike Corporation.
 - 7. Fire-Lite Alarms.
 - 8. GAMEWELL.
 - 9. GE UTC Fire & Security; A United Technologies Company.
 - 10. Keltron Corporation.
 - 11. Mircom Technologies, Ltd.
 - 12. Notifier.
 - 13. Siemens Industry, Inc.; Fire Safety Division.
 - 14. Silent Knight.
 - 15. SimplexGrinnell LP.
 - 16. System Sensor.
- B. General Requirements for Manual Fire-Alarm Boxes: Comply with UL 38.

1. Single-action mechanism, pull-lever type; with integral addressable module arranged to communicate manual-station status (normal, alarm, or trouble) to fire-alarm control unit.
2. Station Reset: Key- or wrench-operated switch.

2.5 SYSTEM SMOKE DETECTORS

- A. Manufacturers: Subject to compliance with requirements, available manufacturers offering products that may be incorporated into the Work include, but are not limited to, the following:

1. Bosch Security Systems.
2. Faraday.
3. Fenwal Protection Systems; A UTC Fire & Security Company.
4. Fire-Lite Alarms.
5. GAMEWELL.
6. GE UTC Fire & Security; A United Technologies Company.
7. Gentex Corporation.
8. Harrington Signal, Inc.
9. Keltron Corporation.
10. Mircom Technologies, Ltd.
11. Notifier.
12. Siemens Industry, Inc.; Fire Safety Division.
13. Silent Knight.
14. SimplexGrinnell LP.
15. System Sensor.

- B. General Requirements for System Smoke Detectors:

1. Comply with UL 268; operating at 24-V dc, nominal.
2. Detectors shall be two-wire type.
3. Integral Addressable Module: Arranged to communicate detector status (normal, alarm, or trouble) to fire-alarm control unit.
4. Base Mounting: Detector and associated electronic components shall be mounted in a twist-lock module that connects to a fixed base. Provide terminals in the fixed base for connection to building wiring.
5. Self-Restoring: Detectors do not require resetting or readjustment after actuation to restore them to normal operation.
6. Integral Visual-Indicating Light: LED type, indicating detector has operated and power-on status.
7. Remote Control: Unless otherwise indicated, detectors shall be digital-addressable type, individually monitored at fire-alarm control unit for calibration, sensitivity, and alarm condition and individually adjustable for sensitivity by fire-alarm control unit.
 - a. Rate-of-rise temperature characteristic of combination smoke- and heat-detection units shall be selectable at fire-alarm control unit for 15 or 20 deg F (8 or 11 deg C) per minute.

- C. Photoelectric Smoke Detectors:

1. Detector address shall be accessible from fire-alarm control unit and shall be able to identify the detector's location within the system and its sensitivity setting.
2. An operator at fire-alarm control unit, having the designated access level, shall be able to manually access the following for each detector:
 - a. Primary status.
 - b. Device type.
 - c. Present average value.
 - d. Present sensitivity selected.
 - e. Sensor range (normal, dirty, etc.).

D. Duct Smoke Detectors: Photoelectric type complying with UL 268A.

1. Detector address shall be accessible from fire-alarm control unit and shall be able to identify the detector's location within the system and its sensitivity setting.
2. An operator at fire-alarm control unit, having the designated access level, shall be able to manually access the following for each detector:
 - a. Primary status.
 - b. Device type.
 - c. Present average value.
 - d. Present sensitivity selected.
 - e. Sensor range (normal, dirty, etc.).
3. Weatherproof Duct Housing Enclosure: NEMA 250, Type 4X; NRTL listed for use with the supplied detector for smoke detection in HVAC system ducts.
4. Each sensor shall have multiple levels of detection sensitivity.
5. Sampling Tubes: Design and dimensions as recommended by manufacturer for specific duct size, air velocity, and installation conditions where applied.
6. Relay Fan Shutdown: Fully programmable relay rated to interrupt fan motor-control circuit.

2.6 HEAT DETECTORS

- A. Manufacturers: Subject to compliance with requirements, available manufacturers offering products that may be incorporated into the Work include, but are not limited to, the following:

1. Bosch Security Systems.
2. Faraday.
3. Fire-Lite Alarms.
4. GAMEWELL.
5. GE UTC Fire & Security; A United Technologies Company.
6. Gentex Corporation.
7. Harrington Signal, Inc.
8. Keltron Corporation.
9. Mircom Technologies, Ltd.
10. Notifier.
11. Siemens Industry, Inc.; Fire Safety Division.
12. Silent Knight.

13. SimplexGrinnell LP.
14. System Sensor.

B. General Requirements for Heat Detectors: Comply with UL 521.

1. Temperature sensors shall test for and communicate the sensitivity range of the device.

C. Heat Detector, Combination Type: Actuated by either a fixed temperature or a rate of rise.

1. Mounting: Twist-lock base interchangeable with smoke-detector bases.
2. Integral Addressable Module: Arranged to communicate detector status (normal, alarm, or trouble) to fire-alarm control unit.

2.7 NOTIFICATION APPLIANCES

A. Manufacturers: Subject to compliance with requirements, available manufacturers offering products that may be incorporated into the Work include, but are not limited to, the following:

1. Cooper Wheelock.
2. Federal Signal Corporation.
3. GE UTC Fire & Security; A United Technologies Company.
4. Gentex Corporation.
5. Harrington Signal, Inc.
6. Keltron Corporation.
7. Mircom Technologies, Ltd.
8. Siemens Industry, Inc.; Fire Safety Division.
9. SimplexGrinnell LP.
10. System Sensor.

B. General Requirements for Notification Appliances: Connected to notification-appliance signal circuits, zoned as indicated, equipped for mounting as indicated, and with screw terminals for system connections.

1. Combination Devices: Factory-integrated audible and visible devices in a single-mounting assembly, equipped for mounting as indicated, and with screw terminals for system connections.

C. Chimes: Vibrating type.

D. Horns: Electric-vibrating-polarized type, 24-V dc; with provision for housing the operating mechanism behind a grille. Comply with UL 464.

E. Visible Notification Appliances: Xenon strobe lights complying with UL 1971, with clear or nominal white polycarbonate lens mounted on an aluminum faceplate. The word "FIRE" is engraved in minimum 1-inch- (25-mm-) high letters on the lens.

1. Mounting: Wall mounted unless otherwise indicated.

2. Flashing shall be in a temporal pattern, synchronized with other units.
3. Strobe Leads: Factory connected to screw terminals.
4. Mounting Faceplate: Factory finished, red.

2.8 REMOTE ANNUNCIATOR

- A. Description: Annunciator functions shall match those of fire-alarm control unit for alarm, supervisory, and trouble indications. Manual switching functions shall match those of fire-alarm control unit, including acknowledging, silencing, resetting, and testing.
 1. Mounting: Semi-flush cabinet, NEMA 250, Type 1.
- B. Display Type and Functional Performance: Alphanumeric display and LED indicating lights shall match those of fire-alarm control unit. Provide controls to acknowledge, silence, reset, and test functions for alarm, supervisory, and trouble signals.

2.9 ADDRESSABLE INTERFACE DEVICE

- A. General:
 1. Include address-setting means on the module.
 2. Store an internal identifying code for control panel use to identify the module type.
 3. Listed for controlling HVAC fan motor controllers.
- B. Monitor Module: Microelectronic module providing a system address for alarm-initiating devices for wired applications with normally open contacts.
- C. Integral Relay: Capable of providing a direct signal to elevator controller to initiate elevator recall to circuit-breaker shunt trip for power shutdown.
 1. Allow the control panel to switch the relay contacts on command.
 2. Have a minimum of two normally open and two normally closed contacts available for field wiring.
- D. Control Module:
 1. Operate notification devices.
 2. Operate solenoids for use in sprinkler service.

2.10 DIGITAL ALARM COMMUNICATOR TRANSMITTER

- A. Digital alarm communicator transmitter shall be acceptable to the remote central station and shall comply with UL 632.
- B. Functional Performance: Unit shall receive an alarm, supervisory, or trouble signal from fire-alarm control unit and automatically capture one telephone line(s) and dial a preset number for a remote central station. When contact is made with central station(s), signals shall be transmitted. If service on either line is interrupted for longer than 45

seconds, transmitter shall initiate a local trouble signal and transmit the signal indicating loss of telephone line to the remote alarm receiving station over the remaining line. Transmitter shall automatically report telephone service restoration to the central station. If service is lost on both telephone lines, transmitter shall initiate the local trouble signal.

- C. Local functions and display at the digital alarm communicator transmitter shall include the following:
1. Verification that both telephone lines are available.
 2. Programming device.
 3. LED display.
 4. Manual test report function and manual transmission clear indication.
 5. Communications failure with the central station or fire-alarm control unit.
- D. Digital data transmission shall include the following:
1. Address of the alarm-initiating device.
 2. Address of the supervisory signal.
 3. Address of the trouble-initiating device.
 4. Loss of ac supply.
 5. Loss of power.
 6. Low battery.
 7. Abnormal test signal.
 8. Communication bus failure.
- E. Secondary Power: Integral rechargeable battery and automatic charger.
- F. Self-Test: Conducted automatically every 24 hours with report transmitted to central station.

PART 3 - EXECUTION

3.1 EQUIPMENT INSTALLATION

- A. Comply with NFPA 72, NFPA 101, and requirements of authorities having jurisdiction for installation and testing of fire-alarm equipment. Install all electrical wiring to comply with requirements in NFPA 70 including, but not limited to, Article 760, "Fire Alarm Systems."
- B. Install wall-mounted equipment, with tops of cabinets not more than 78 inches (1980 mm) above the finished floor.
- C. Manual Fire-Alarm Boxes:
1. Install manual fire-alarm box in the normal path of egress within 60 inches (1520 mm) of the exit doorway.
 2. Mount manual fire-alarm box on a background of a contrasting color.

3. The operable part of manual fire-alarm box shall be between 42 inches (1060 mm) and 48 inches (1220 mm) above floor level. All devices shall be mounted at the same height unless otherwise indicated.
- D. Smoke- or Heat-Detector Spacing: Comply with NFPA 72.
 - E. Duct Smoke Detectors: Comply with NFPA 72 and NFPA 90A. Install sampling tubes so they extend the full width of duct. Tubes more than 36 inches (9100 mm) long shall be supported at both ends.
 - F. Elevator Shafts: Coordinate temperature rating and location with sprinkler rating and location. Do not install smoke detectors in sprinklered elevator shafts.
 - G. Remote Status and Alarm Indicators: Install in a visible location near each smoke detector, sprinkler water-flow switch, and valve-tamper switch that is not readily visible from normal viewing position.
 - H. Audible Alarm-Indicating Devices: Install not less than 6 inches (150 mm) below the ceiling. Install bells and horns on flush-mounted back boxes with the device-operating mechanism concealed behind a grille. Install all devices at the same height unless otherwise indicated.
 - I. Visible Alarm-Indicating Devices: Install adjacent to each alarm bell or alarm horn and at least 6 inches (150 mm) below the ceiling. Install all devices at the same height unless otherwise indicated.
 - J. Device Location-Indicating Lights: Locate in public space near the device they monitor.

3.2 PATHWAYS

- A. Pathways above recessed ceilings and in non-accessible locations may be routed exposed.
 1. Exposed pathways shall be installed in EMT.
- B. Exposed EMT shall be painted red enamel.

3.3 CONNECTIONS

- A. For fire-protection systems related to doors in fire-rated walls and partitions and to doors in smoke partitions, comply with requirements in Section 08 71 00 "Door Hardware." Connect hardware and devices to fire-alarm system.
 1. Verify that hardware and devices are listed for use with installed fire-alarm system before making connections.
- B. Make addressable connections with a supervised interface device to the following devices and systems. Install the interface device less than 36 inches (910 mm) from the device controlled. Make an addressable confirmation connection when such feedback is available at the device or system being controlled.

1. Electronically locked doors and access gates.
2. Alarm-initiating connection to elevator recall system and components.
3. Alarm-initiating connection to activate emergency lighting control.
4. Alarm-initiating connection to activate emergency shutoffs for gas and fuel supplies.
5. Supervisory connections at valve supervisory switches.
6. Supervisory connections at elevator shunt-trip breaker.
7. Supervisory connections at fire-extinguisher locations.

3.4 IDENTIFICATION

- A. Identify system components, wiring, cabling, and terminals. Comply with requirements for identification specified in Section 26 05 53 "Identification for Electrical Systems."
- B. Install framed instructions in a location visible from fire-alarm control unit.

3.5 GROUNDING

- A. Ground fire-alarm control unit and associated circuits; comply with IEEE 1100. Install a ground wire from main service ground to fire-alarm control unit.
- B. Ground shielded cables at the control panel location only. Insulate shield at device location.

3.6 FIELD QUALITY CONTROL

- A. Field tests shall be witnessed by authorities having jurisdiction.
- B. Perform the following tests and inspections with the assistance of a factory-authorized service representative:
 1. Visual Inspection: Conduct visual inspection prior to testing.
 - a. Inspection shall be based on completed record Drawings and system documentation that is required by NFPA 72 in its "Completion Documents, Preparation" table in the "Documentation" section of the "Fundamentals" chapter.
 - b. Comply with the "Visual Inspection Frequencies" table in the "Inspection" section of the "Inspection, Testing and Maintenance" chapter in NFPA 72; retain the "Initial/Reacceptance" column and list only the installed components.
 2. System Testing: Comply with the "Test Methods" table in the "Testing" section of the "Inspection, Testing and Maintenance" chapter in NFPA 72.
 3. Test audible appliances for the public operating mode according to manufacturer's written instructions. Perform the test using a portable sound-level meter complying with Type 2 requirements in ANSI S1.4.

4. Test visible appliances for the public operating mode according to manufacturer's written instructions.
 5. Factory-authorized service representative shall prepare the "Fire Alarm System Record of Completion" in the "Documentation" section of the "Fundamentals" chapter in NFPA 72 and the "Inspection and Testing Form" in the "Records" section of the "Inspection, Testing and Maintenance" chapter in NFPA 72.
- C. Reacceptance Testing: Perform reacceptance testing to verify the proper operation of added or replaced devices and appliances.
 - D. Fire-alarm system will be considered defective if it does not pass tests and inspections.
 - E. Prepare test and inspection reports.
 - F. Maintenance Test and Inspection: Perform tests and inspections listed for weekly, monthly, quarterly, and semiannual periods. Use forms developed for initial tests and inspections.
 - G. Annual Test and Inspection: One year after date of Substantial Completion, test fire-alarm system complying with visual and testing inspection requirements in NFPA 72. Use forms developed for initial tests and inspections.

3.7 SOFTWARE SERVICE AGREEMENT

- A. Comply with UL 864.
- B. Technical Support: Beginning at Substantial Completion, service agreement shall include software support for two years.
- C. Upgrade Service: At Substantial Completion, update software to latest version. Install and program software upgrades that become available within two years from date of Substantial Completion. Upgrading software shall include operating system and new or revised licenses for using software.
 1. Upgrade Notice: At least 30 days to allow Owner to schedule access to system and to upgrade computer equipment if necessary.

3.8 DEMONSTRATION

- A. Train Owner's maintenance personnel to adjust, operate, and maintain fire-alarm system.

END OF SECTION 28 31 11

SECTION 31 05 19.13**GEOTEXTILE FABRIC, GEOCOMPOSITES AND BALLAST MATS****PART I - GENERAL****1.1 SUMMARY****A. Description**

This Section covers the furnishing and placing of filter fabric, subgrade geotextile, drainage geotextile fabric, silt fence and composite drainage material at locations shown on the Contract Drawings and as specified herein.

B. Related Sections

1. 31 22 00 – Site Preparation and Grading
2. 31 37 00 - Riprap
3. 31 25 00 – Erosion and Sedimentation Controls
4. 34 11 29 – General Track Construction
5. 34 11 23 - Special Trackwork
6. 33 46 00 - Subdrainage
7. KCMO Standards - Storm Drainage Systems

EPA	9090	Test to Evaluate the Effects of Chemicals on the Physical Properties of a Product

1.3 SUBMITTALS

- A. Submittals shall be made in accordance with the requirements of the General Provisions, except as modified herein.
- B. A certificate or affidavit attesting that the fabric meets all the requirements stated in these Specifications.
- C. The manufacturer's reported property values shall be based on the following sampling and testing requirements:
 - 1. Sample all geotextiles according to ASTM D 4354. The production unit used for sampling shall be a roll.
 - 2. Perform specified tests to determine geotextile properties for the intended applications. Test the tensile strength requirements in both machine and cross-machine directions.
- D. Where factory seams are made, the sheets of geotextile shall:
 - 1. Be sewn together using a lock-type stitch Type 301 or 401 as shown on the plans;
 - 2. Be sewn with polymeric thread that is at least 85 percent by weight polyolephins, polyester, or polyamides, and be as resistant to deterioration as the geotextile being sewn, nylon thread shall not be used; and
 - 3. Have test results showing that the seams meet or exceed 90 percent of the specified tensile strength minimum values for the intended applications.
- E. Samples:

1. Geotextiles and Geocomposites: One-piece, minimum 18 inches long, taken across full width of roll of each type and weight of geotextile or geocomposite furnished.
- F. Quality Control Submittals:
1. Certifications from each geotextile and geocomposite manufacturer furnished products have specified property values. Certified property values shall be either minimum or maximum average roll values, as appropriate, for materials furnished.
- G. Shop Drawings:
1. The Manufacturer shall submit detailed shop and installation drawings showing the location of all joints in the ballast mat and alignment of mats around all penetrations.

1.4 DELIVERY, STORAGE, AND HANDLING

- A. Label, handle and store product per ASTM D 4873.
- B. Delivery each roll with sufficient information attached to uniquely identify it for inventory and quality control.
- C. Handle products during shipment and on-site in a manner that maintains undamaged condition.
- D. Do not store products directly on ground. Ship and store geotextile and geocomposite materials with suitable wrapping for protection against moisture, ultraviolet exposure, and other weather elements. If stored outdoors, elevate and protect materials with waterproof cover.

1.5 SCHEDULING AND SEQUENCING

- A. Where geotextile and geocomposite is to be laid directly upon the ground surface, first prepare subgrade as specified in the appropriate Related Sections specified herein.

PART II - PRODUCTS

2.1 GEOTEXTILE FABRIC MATERIALS

- A. Pervious fabric sheet composed of strong rot proof polymeric fibers oriented into a stable network such that the fibers retain their relative positions with respect to each other. The fabric shall be free of any chemical treatment or coating which could significantly reduce permeability, and shall have no flaws or defects which could significantly alter its properties.
- B. Nonwoven geotextile shall be composed of continuous or discontinuous (staple) fibers held together through needle-punching or spun-bonding. Fabric edges shall be selvaged or otherwise finished to prevent outer material from pulling away from fabric. Unseamed roll width shall be a minimum of 14 feet. Conform to physical property requirements for the specific application herein.
- C. Woven Geotextile Fabric shall be a pervious sheet of polymeric yarn woven into a uniform pattern with distinct and measurable openings. Polymeric yarn shall consist of long-chain synthetic polymers with stabilizers to make filaments resistant to deterioration

due to heat and ultraviolet light exposure. Fabric edges shall be selvaged or otherwise finished to prevent outer material from pulling away from the fabric. Unseamed roll width shall be a minimum of 3 feet. Conform to physical requirements for the specific application herein.

D. Material Properties:

1. Subgrade Geotextile for use in track subgrade stabilization and Drainage Geotextile Fabric for use in underdrain: Non-woven Polypropylene, Polyester or Polyethylene

Unit Weight (ASTM-5261)	8 oz/yd ² , min
Water Permeability (k) (ASTM D 4491)	70 gal/min/sf, min.
Apparent Opening Size (U.S. Standard sieve) (ASTM D 4751)	70, or smaller.
Grab Tensile Strength (ASTM D 4632)	200 lb., min. @ 50%
Mullen Burst Strength (ASTM D 3786)	375 psi
Puncture Strength (ASTM D 4833)	80 lb., min
Trapezoidal Tear Strength (ASTM D 4533)	90 lb., min.
Abrasion Resistance	20% loss
Ultraviolet Radiation Resistance	70% strength retention/500 hrs

2. Geotextile for use in riprap bedding shall conform to the requirements in Section 31 37 00 – Riprap, Section 2.1.

3. Filter Fabric for use with walls: Nonwoven Polypropylene, Polyester or Polyethylene

Water Permittivity (ASTM D 4491)	100 gal/min/ft ⁵ , min.
Apparent Opening Size (U.S. Standard sieve) (ASTM D 4751)	70, max.
Puncture Strength (ASTM D 4833)	70 lbs., min.
Grab Strength (ASTM D 4632)	160 lbs., min.
Mullen Burst Strength (ASTM D 3786)	260 psi., min.
Trapezoidal Tear Strength (ASTM D 4533)	50 lbs., min.

4. Composite Drainage Material for use with walls: Composite Drainage Material shall be a first-quality, commercially available, Sheet Drain product. Sheet drain shall have a core consisting of double cusped material, single dimpled material,

or double dimpled material. Sheet drain core shall be made of polyethylene, high density polyethylene, or high impact polystyrene. Core shall be transversely surrounded by nonwoven geotextile manufactured integrally with the core material to form a composite product. Unsupported geotextile or geogrid without core is not acceptable.

Width/Length 1.5 feet/30 feet, min.

Compressive Strength 30 psi, min.

In Plane Flow Rate
grad = 0.1, press. = 5 psi 3 gal/min/ft, min.
grad = 0.1, press. = 14.5 psi 10 gal/min/ft, min

5. Silt Fence Fabrics: Woven Polypropylene, Polyester or Polyethylene Fabric

Grab Strength (ASTM D 4632) 125 lbs min.

Grab Elongation (ASTM D 4632) 25 %

Burst Strength (ASTM D 3786) 300 psi, min.

Puncture (ASTM D 4833) 80 lbs, min.

Tear(ASTM D 4533) 50 lbs, min.

Apparent Opening Size, 30 to 50
U.S. Sieve Number (ASTM D 4751)

Permitivity (ASTM D 4491) 30 gal/min/ft⁵, min.

2.2 ROADBED AGGREGATE GEOGRID

- A. Geogrids shall be a regular network of integrally connected polymer tensile elements constructed in a single layer with aperture geometry sufficient to permit significant mechanical interlock with the surrounding soil or rock. Geogrids must also be dimensionally stable and able to retain their geometry under manufacture, transport and installation.
- B. Use BX 1200 Biaxial Geogrid by Tensar or approved equal. Geogrids shall have the following properties:

GEOGRID PROPERTY VALUES

Geogrid Properties	Test Method	Machine Direction MD	Perpendicular to Machine Direction CMD
Type of Geogrid		Punched and Drawn	Punched and Drawn
Aperture Size	Nominal Dimensions	Minimum – 0.8 in Maximum – 1.3 in	Minimum – 0.8 in Maximum – 1.3 in
Rib Thickness	Nominal Dimensions	Minimum - 0.05 in	Minimum – 0.05 in
Tensile Strength at 2% Strain	ASTM D66371	Minimum – 410 lb/ft	Minimum – 590 lb/ft

Flexural Stiffness	ASTM D-5732-952	Min. 750,000 mg-cm	NA
True Initial Modulus in Use	ASTM 66371	Minimum – 27420 lb/ft	Minimum – 44550 lb/ft
Junction Efficiency	GRI-GG2-87	93%	93%
Aperture Stability	U.S. Army Corps of Engineers Methodology	6.5 kg-cm/deg	NA
Resistance to Long Term Degradation	EPA 9090 Immersion Testing	100%	100%

1. Resistance to elongation when initially subjected to load measured via ASTM 6637 without deforming test materials under load before measuring such resistance or employing “secant” or “offset” tangent methods of measurement.
 2. Resistance to bending force measured via ASTM D-5732-95, using specimens of width two ribs wide, with transverse ribs cut flush with exterior edges of longitudinal ribs (as a “ladder”), and of length sufficiently long to enable measurement of the overhang dimension. The overall Flexural Stiffness is calculated as the square root of the product of machine-and cross-machine-direction Flexural Stiffness values.
 3. Unless indicated otherwise, values shown are minimum average roll values determined in accordance with ASTM D-4759.
- C. Multiple layers of geogrid used to meet the requirements set forth in the preceding table shall not be accepted.
- D. Alternate geogrid materials will be considered. Such materials must be pre-approved in writing by the Engineer, prior to bid.

2.3 BALLAST MATS

- A. A ballast mat shall consist of natural rubber with fabric reinforcement designed to provide reduction in the impact on structures of ground or structure-borne vibrations. The upper surface of the mat shall be textured to permit ballast to nest for trackbed stability and contain synthetic elastomers for protection against attack by contaminants that may filter through ballast over time. The subsurface shall contain fabric reinforcement for strength and load distribution. Its underside shall provide a regular pattern of projections in the form of truncated cones.
- B. Ballast Mat material shall satisfy the following requirements:
1. Capacity – Axle Load (Approx.): 33 Tons
 2. Dimensions:
 - a. Width - No less than 54” not including joint overlaps
 - b. Thickness – 7/8”
 - c. Length – 30’ maximum
 3. Fabric (Fiberglass-coated PVC)’
 - a. Tensile Strength – 60 pounds/inch
 - b. Elongation at Break – 10%

4. Elastomer Properties: Natural rubber unless otherwise specified
5. Top Layer (synthetic):
 - a. 3/16", 1-ply fabric
6. Isolating Layer:
 - a. 5/8"
7. Ballast Mat:
 - a. Tensile Strength – 200 psi
 - b. Elongation at Break – 100%
 - c. Tear Resistance – 50 pounds/inch
 - d. Hardness (Shore A) = 53 (\pm 7)
8. Dynamics – Dynamic to static stiffness ration K_d related to a preload of 8.5 psi = 1.86
9. Temperature Range – Standard quality is suitable for service where ballast mat temperatures range between -4°F and +158°F.
10. The material used for sealing of the ballast mat joints shall be an integral extension of the top surface of the mat or a separate material having strength characteristics equal to those of the top layer of the ballast mat.

PART III - EXECUTION

3.1 PLACEMENT METHOD FOR GEOTEXTILE FABRIC AND GEOGRID

- A. Geotextile fabric shall be placed at locations shown on the Contract Drawings, or as specified. Fabric shall be unrolled directly on the soil surface to the line and dimensions shown on the Contract Drawings. The Contractor shall place subsequent or overlying material in such a way as to not tear, puncture or shift the fabric. Tears or rips in the filter fabric shall be patched with fabric lapped in accordance with the overlap requirements herein. Tracked equipment shall not be permitted on the filter fabric covered subgrade. Aggregates shall not be dropped onto the fabric from a height which causes damage to the fabric.
- B. Backfill or borrow material shall be placed over filter fabric and compacted according to Section 31 22 00.

3.2 DRAINAGE GEOTEXTILE PLACEMENT

- A. Fabric shall be placed in the trench according to the project plans. Overlapping along the longitudinal drain axis shall be a minimum of 18 inches. Damaged fabric shall be repaired by placing new fabric over the damaged area meeting the overlap requirements.
- B. Assure intimate contact between the filter fabric and soil by exercising care during excavation and placement of the fabric. Place the geotextile loose enough to conform to the soil surface and without wrinkles.
- C. Prevent clogging by removing or otherwise preventing contact with very soft soil and muddy water in the excavation.

- D. Exercise caution while placing overlying drain rock onto the filter fabric to prevent cutting of the fabric. Damaged fabric shall be repaired by placing new fabric over the damaged area meeting the overlap requirements.
- E. Fabrics shall be covered as soon as possible after being placed, but not later than seven (7) calendar days after placement. Fabrics left uncovered for more than seven (7) calendar days shall be removed and rejected.

3.3 SUBGRADE GEOTEXTILE PLACEMENT FOR TRACK

- A. Prior to placement of Subgrade Geotextile fabric, the Contractor shall construct a prepared subgrade in accordance with the plans and specifications. Subgrade geotextile fabric shall be aligned and placed in a manner free of wrinkles. The preceding roll shall overlap the following roll a minimum of 18 inches in the direction the material is being spread. Place fabric with long dimension of each sheet parallel to direction of track, unless otherwise directed or approved by Engineer.
- B. Equipment or vehicles operation on the fabric shall be minimized. Damaged fabric may be repaired, by placing new fabric over the damaged area meeting overlap requirements. Where possible, aggregate shall be dumped at least 15 feet from the edge of previously constructed base and pushed onto the fabric with push type equipment.
- C. Normal traffic will be allowed only after aggregate layers have been placed to a minimum thickness of 6 inches and Contractor has demonstrated to Engineers satisfaction that damage to the geotextile will not result.
- D. Place subgrade geotextile centered under the centerline of the track varying no more than 6 inches left or right of centerline, or as otherwise shown or directed by Engineer.

3.4 GRANULAR BASE REINFORCEMENT

- A. Place geogrid at the proper elevation and alignment as shown on the construction drawings. Install geogrid in accordance with the installation guidelines provided by the manufacturer. Geogrid may be temporarily secured in place with ties, staples, pins, sand bags or backfill as required by fill properties, fill placement or weather conditions.
- B. Granular fill material shall be placed, spread, and compacted in such a manner that minimizes the development of wrinkles in the geogrid and/or movement of the geogrid.
- C. A minimum loose fill thickness of 6 inches is required prior to operation of tracked vehicles over the geogrid. Turning of tracked vehicles should be kept to a minimum to prevent tracks from displacing the fill and damaging the geogrid. If subgrade conditions permit, rubber-tired equipment may pass over the geogrid reinforcement at slow speeds (less than 10 mph) when integrally-formed geogrids are used. When woven, multi-layer or welded strip geogrids are used, rubber-tired equipment shall not be allowed directly on the geogrid. Sudden braking and sharp turning movements shall be avoided.
- D. Any roll of geogrid damaged before, during and/or after installation shall be replaced by the Contractor. Proper replacement shall consist of replacing the affected area and overlapping the geogrid per the manufacture's recommendations.

3.5 GEOGRID PLACEMENT

- A. Install geogrid per manufacturer's recommendations.

- B. Place geogrid on top of geotextile fabric.
- C. Do not fold.
- D. Overlap panels in the direction of fill placement.
- E. Provide geogrid overlap as follows.

Reinforcement Geogrid Overlaps	
Soil CBR Rating	Recommended Overlap
3+	1.0 feet
2 – 3	2.0 feet
1 – 2	2.0 feet
< 1	3.0 feet

3.6 SILT FENCE FOR EROSION CONTROL

Silt fencing for erosion control shall be installed in accordance with Section 31 25 00.

3.7 FILTER FABRIC AND COMPOSITE DRAINAGE MATERIAL FOR WALLS

Filter fabric and composite drainage materials for walls shall be installed in accordance with article Placement Method, herein.

3.8 SECURING FABRIC

Secure fabric during installation as necessary with sand bags, or other means approved by the Engineer.

3.9 PLACING PRODUCTS OVER FABRIC

- A. Do not install overlying products or materials until Engineer provides authorization to proceed.
- B. If large wrinkles develop in fabric during placement of overlying product, fold wrinkles flat in direction of placement. Maintain minimum overlap and fabric continuity as overlying product is placed.
- C. If fabric is damaged during placement of overlying products, remove overlying products as necessary to expose damaged area, and repair by placing new fabric over the damaged area meeting the overlap requirements.

3.10 BALLAST MAT INSTALLATION

- A. Ballast Mats shall be placed at locations shown on the Contract Drawings, or as specified.
- B. Install the mats in accordance with the Manufacturer's recommendations and instructions. Overlap the mat sections as required by the instructions.
- C. Cut ends of the ballast mat rolls square and in a neat straight line. Seal the joint with repair tape as specified by the ballast mat Manufacturer.

- D. The Contractor shall exercise extreme care to prevent the intrusion of silt and debris into the void space between the cones of the ballast mat. Protect the joints and place the A-fastener strips over the edges of the ballast mat.

PART IV - MEASUREMENT

- 4.1 Measurement** – No Separate measurement will be made for Work described in this Section.

PART V - PAYMENT

- 5.1 Payment** – No separate payment will be made for the Work described in this Section. All costs pertaining thereto shall be included in the Contract Unit Prices for other items as listed in the Bid Form-Unit Prices.

END OF SECTION

SECTION 31 13 00**TREE REMOVAL****PART 1 - GENERAL**

1.1 RELATED DOCUMENTS

- A. Drawings and general provisions of the Contract, including General and Supplementary Conditions and other Division 01 Specification Sections, apply to this Section.

1.2 SUMMARY

- A. Section includes general removal of existing trees and plants that are affected by execution of the Work, whether temporary or permanent construction.
- B. Related Sections:
1. Section 01 56 39 "Temporary Tree and Plant Protection and Pruning" for protection of existing landscape material to remain, and pruning methods.
 2. Section 32 93 00 "Plants" for replacement plant installation.

1.3 DEFINITIONS

- A. Caliper: Diameter of a trunk measured by a diameter tape at 6 inches above the ground for trees up to, and including, 4-inch size; and 12 inches above the ground for trees larger than 4-inch size.
- B. Vegetation: Trees, shrubs, groundcovers, grass, and other plants.

1.4 GENERAL

- A. The CONTRACTOR is to use appropriate precautions when working near trees and shrubs along the grading limits to prevent unnecessary damages to them. The CONTRACTOR will be responsible for any damage caused by careless or reckless work in the vicinity of any trees or vegetation located outside of the construction easements. All damages to trees outside of the construction easements are to be reported, and immediate repair or care efforts will be coordinated with the OWNER and OWNER'S REPRESENTATIVE.
- B. The CONTRACTOR shall notify businesses of the impending construction start date so that they may have ample time to relocate any favored vegetation. Notification shall be at least one week in advance of any construction that will affect their property.

PART 2 – PRODUCTS

None Used

PART 3 - EXECUTION**1.1 TREE REMOVAL**

- A. All existing trees and vegetation to be removed, as noted on the plans, shall be removed unless otherwise directed by the owner's representative or the plan set. The CONTRACTOR shall be responsible for determining the exact quantity of trees to be removed within the project limits for bid purposes. There will be no additional payment for removal of trees within the project limits, which are not shown on the plans.
- B. All trees listed in the Removal of Improvements shall be removed unless otherwise directed by the owner's representative.
- C. The CONTRACTOR is directed to protect all existing trees not shown to be removed in the plan set.
- D. The CONTRACTOR may trim or remove other trees only if shown on the plans or determined necessary by the ENGINEER at the time of construction.
- E. Only trees marked "Replace" shall be replaced. Replacement trees shall be of like kind and of nursery stock size. See planting detail.
- F. Trees shall be completely removed with stump ground down to a minimum depth of 3'-0" of planter depth.
- G. Organic materials removed shall be legally disposed of off-site.

PART 4 - MEASUREMENT

4.1 Measurement – No Separate measurement will be made for Work described in this Section.

PART 5 - PAYMENT

5.1 Payment – No separate payment will be made for tree removals, relocations, or replacements. All costs pertaining thereto shall be included in the Contract Unit Prices for other items as listed in the Bid Form-Unit Prices.

END OF SECTION

SECTION 31 22 00**SITE PREPARATION AND GRADING****PART 1 - GENERAL****1.01 SCOPE OF WORK**

- A. Furnish all labor, materials, equipment and incidentals required and perform all excavation work and grading; place and compact backfill and fill; and dispose of unsuitable, waste and surplus materials as shown on the Drawings and as specified in American Public Works Association Standard Specifications and Design Criteria Section 2100 as revised, adopted, and provided by the Director of Kansas City, Missouri Public Works current at the time of bidding.
- B. Obtain all permits required for site preparation work prior to proceeding with the work.

1.02 REFERENCE STANDARDS

- A. In addition to complying with all pertinent codes and regulations, comply with the referenced or applicable portions of the American Public Works Association Standard Specifications and Design Criteria, as revised, adopted, and provided by the Director of Kansas City, Missouri current at the time of bidding.
- B. The following standards are referenced directly in this section. The latest version of these standards shall be used.

ASTM

D638 – Standard Test Method for Tensile Properties of Plastics

D698 – Test Method for Laboratory Compaction Characteristics of Soil Using
Standard Effort (12,400 ft-lbf/ft² (600 kN-m/m³))D4318 – Method of Test for Liquid Limit, Plastic Limit, and Plasticity Index of
Soils**PART 2 - PRODUCTS (NOT USED)****PART 3 - EXECUTION****3.01 CONSTRUCTION DETAILS****A. General**

- 1. The Contractor shall adhere to any and all statutes regarding the notification of utilities prior to beginning any work within public right-of-way. Relocation or protection of any existing utilities located in street right-of-way that lies within a utility easement and is endangered by this construction shall be the responsibility of the Contractor.

2. The Contractor shall make every reasonable effort to protect private facilities. These facilities may not be shown on the plans. When these facilities are disturbed or damaged by the work, the Contractor shall make necessary arrangements for repairs to the facilities for continuous service prior to the close of that work day.
3. It shall be the responsibility of the Contractor to protect all property lot corners and control monumentation. Should it be necessary to disturb any such monument, whether stake, pin, bar, disk, box, or other, it remains the responsibility of the Contractor to reference such markers prior to removal, reset, them, and file such relocations or monumentation documents as the law may require. Any such references, removal, replacement and certification of monuments shall be performed by a registered licensed surveyor. A copy of all such certification documents shall be provided to the Engineer prior to final payment. Any monument destroyed or improperly reset by the Contractor may be replaced by the Engineer to the standards required by law at the expense of the Contractor.
4. Grading, excavation and backfilling for all improvements shall be made to the lines, grades and cross sections indicated by the plans.
5. In addition, to any erosion control measures shown on the plans, the Contractor shall schedule and conduct his operations in such a manner and shall provide any necessary control facilities to protect downstream and adjacent properties from pollution, sedimentation or erosion caused by the grading operations. Any pollution or damage occurring shall be the responsibility of the Contractor.
6. During construction, the graded area shall be maintained by the Contractor in such condition that it will be well drained at all times. Roadway ditches, channel changes, inlet and outlet ditches and other ditches in connection with the roadway shall be cut and maintained to the required cross section. All drainage work shall be performed in proper sequence with other operations. All ditches and channels shall be kept free of debris or obstructions.

3.02 CLEARING, GRUBBING, AND DEMOLITION

A. Description

1. Clearing

- a. Clearing shall consist of removing all vegetative matter such as trees, brush, downed timber, and other objectionable materials found on or above the surface of the site. It shall include: removing buildings, fences, and lumber; waste dumps and trash; salvaging of such materials as may be specified; and disposing of the debris as per public entity requirements. Scalping shall include the removal of material such as sod, grass, residue or agricultural crops, and decayed vegetative matter from the surface of the ground without removing more earth than is necessary. Perimeter erosion and sediment controls must be in place before clearing activities occur.

2. Grubbing

- a. Grubbing shall consist of removing and disposing of all vegetative matter such as stumps, roots, buried trees, and brush encountered below the surface of the ground or subgrade, whichever is lower, that has not been included in the description of clearing.
- b. In all cases of grubbing, the vegetative matter shall be removed to a minimum depth of 12 inches below ground line or subgrade, whichever is lower, except as provided in the description of demolition and removal.
- c. When deleterious materials are encountered below the ground line which may be detrimental to the proposed improvement, they shall be removed to a depth necessary to provide adequate support for the proposed improvement.

3. Demolition and Removal

- a. This work shall consist of demolishing, removing, and disposing of all structures and improvements within the construction limits unless included in other items of work as shown on the plans or in the Special Provisions. This work shall apply to all structures and improvements whether on, above, or below the surface of the ground or subgrade.
- b. Demolition and removal shall include, but not be limited to, items such as buildings, drainage structures, pipes, pavements, fences, retaining walls, guardrails, and signs.
- c. Items such as fences and guardrails shall be salvaged and relinquished to the appropriate owner or relocated, where indicated on the plans.
- d. Relocation of signs, fences, guardrails, etc. shall be considered incidental to removal work except where such relocation is listed separately in the Itemized Proposal or the Special Provisions.
- e. All pipes that are to be abandoned shall be removed unless otherwise shown on the plans or approved by the Engineer.

B. Construction Specifications:

1. Limits of Work

- a. The limits of clearing, grubbing, and demolition shall extend to the construction limits unless otherwise shown on the plans. Clearing should only occur in those areas required for construction within a six month period. Where possible, large projects should be cleared and grubbed as construction progresses. Mass clearing and grubbing should be avoided. An undisturbed strip of not less than 25 feet in width of existing grass or other vegetation should be kept in place around the perimeter of the construction site, where possible, and protected from damage. The Contractor shall scalp

only those excavation and embankment areas necessary for construction of the project.

- b. Existing structures within or adjacent to the construction limits which are not to be removed or demolished shall be protected by the Contractor during construction. Any private facilities, such as house sewer laterals, that are disturbed or damaged by the Contractor's work shall be repaired by the Contractor prior to the close of the workday. This repair shall be made in a manner sufficient to restore utility service to that property.
- c. Perimeter Erosion and Sediment Controls: Perimeter controls will be put in place prior to the start of clearing and grubbing of the site. It is possible some clearing and grubbing will need to be done to accommodate the installation of some perimeter controls.

2. Embankment Areas

- a. Where undisturbed stumps and roots are encountered where the fill depth will exceed 3 feet, the stumps and roots may be left in place provided they do not extend more than 3 inches above the original ground line.

3. Borrow Areas

- a. All stumps, roots, and other objectionable matter shall be removed from the borrow material used for embankment or fill. The borrow area shall be left in a well drained and smooth condition.

4. Backfilling the Site

- a. All trenches, holes, pits, and basement areas resulting from clearing, grubbing, demolition, or removal on the site shall be backfilled with suitable material placed and compacted in conformance with this section.

5. Disposal of Materials

- a. All materials, with the exception of those that are designated for salvage or embankment, shall become the Contractor's property and shall be disposed of by the Contractor, outside the project limits.

6. Items to be Left in Place

- a. In removing concrete pavements, curbs, curb and gutter, sidewalks, and similar objects where portions of these objects are to be left in place, they shall be removed to an existing or new joint and sawed to a minimum depth of 2 inches or $\frac{1}{4}$ the slab thickness, whichever is greater. This joint shall be to true line and vertical face. Sufficient portions of these items shall be removed to provide the proper grade and connection to the new work.

3.03 LAND GRADING

A. Description

1. Grading

- a. Grading, as used herein, shall mean the performance of all excavation, embankment, and backfill in connection with the construction of all improvements. Mass grading should be avoided. An undisturbed strip of existing grass or other vegetation should be kept in place around the perimeter of the construction site where possible. The Contractor shall scalp only those excavation and embankment areas necessary for construction of the project.

2. Excavation

- a. Excavation is defined as the removal of materials from the construction area to the lines and grades shown on the plans.

1) Unclassified Excavation

- i. Unclassified excavation is defined as the removal of all material encountered regardless of its nature. All material excavated will be considered as Unclassified Excavation unless the Special Provisions specify Classified Materials.

b. Rock Excavation

- 1) Rock excavation is defined as the removal of all rock ledges 6 inches or more in thickness, detached rock or boulders having a volume of more than 1 ½ cubic yards, and shale occurring in its natural state, hard and unweathered.
- 2) A rock ledge is defined as a continuous body of rock that may not include thin interbedded seams of shale or other soft materials less than 12 inches thick. The vertical limit of each ledge shall be defined by interbedded seams of soft materials 12 inches or more in thickness. The beds of soft interbedded material 12 inches or more in thickness shall not be included in the measurement for Rock Excavation but shall be included in the measurement for Earth Excavation.

3. Embankment or Backfill

- a. Embankment or backfill is defined as the placing and compacting of material in the construction area to the lines and grades as shown on the plans.

1) Unsuitable Material

- i. Unsuitable material is defined as muck, frozen material, organic material, top soil, rubbish, and rock with a maximum dimension greater than 24 inches.

2) Suitable Material

- i. Suitable material is defined as entirely imperishable with that portion passing the No. 40 sieve having a liquid limit not exceeding 40 and a plastic index not exceeding 25 when tested in accordance with ASTM D-4318.

3) Rock Embankment

- i. Material for rock embankment shall be free of unsuitable material and shall contain, by volume, greater than 10 percent rock or gravel having a maximum dimension greater than 3 inches, but not greater than 24 inches.

4) Earth Embankment

- i. Material for earth embankment shall be free of unsuitable material and shall contain, by volume, less than 10 percent rock or gravel having a maximum dimension greater than 3 inches.

5) Borrow

- i. Borrow is defined as approved material excavated from an area outside of the project limits and required for construction of embankments.

6) Waste

- i. Waste is defined as excavation material that is not used in embankments and is disposed of outside of the embankment areas.

7) Structures

- i. Structures, as used herein, refer to bridges, culverts, storm sewer and sanitary appurtenances, retaining walls, and similar construction.

B. Application

1. This practice is applicable where grading to a planned elevation is necessary and practical for the proposed development of a site and for proper operation of sediment control practices.

C. Construction Specifications:

1. General

- a. Construct and maintain all erosion and sediment control practices and measures in accordance with the approved erosion and sediment control plan and construction schedule.

- b. Remove good topsoil from areas to be graded and filled and preserve it for use in the final grading of all critical areas. Earth Excavation: Earth excavation is defined as the removal of all material not defined as rock.
- c. Scarify areas to be topsoiled to a minimum depth of 2 inches before placing topsoil.
- d. Clear and grub areas to be filled to remove trees, vegetation, roots, or other objectionable material that would affect the planned stability of the fill.
- e. Ensure that fill material is free of brush, rubbish, rocks, logs, stumps, building debris, and other materials inappropriate for constructing stable fills.
- f. Place all fill in layers not to exceed 9 inches in thickness (dependent on compaction method see Geotechnical Report), and compact the layers as required to reduce erosion, slippage, settlement, or other related problems.
- g. Do not incorporate frozen or soft, mucky, or highly compressible materials into fill slopes.
- h. Do not place fill on a frozen foundation due to possible subsidence and slippage.
- i. Keep diversions and other water conveyance measures free of sediment during all phases of development.
- j. Handle seeps or springs encountered during construction in accordance with State Agency-approved methods.
- k. Permanently stabilize all graded areas immediately after final grading is completed on each area in the grading plan. Apply temporary stabilization measures within 14 days on all graded areas when work is to be interrupted or delayed for 30 calendar days or longer.
- l. Show topsoil stockpiles, borrow areas, and spoil areas on the plans, and make sure they are adequately protected from erosion. Include final stabilization of these areas in the plan.

2. Excavation

- a. All suitable material removed by excavation shall be used as far as practicable in the formation of embankment as required to complete the work. The Contractor shall sort all excavated material and stockpile when necessary, so as to provide suitable materials for embankments.
- b. After removal of the roadway excavation material to the required section, all material between lines 1 foot (30.48 cm) outside of the curbs and within the top 6 inches (15.24 cm) of the subgrade shall be compacted to

95 percent of maximum density for the material as defined in Section 31 22 00.

- c. Rock encountered within the full width of the roadway, toe of slope to toe of slope, shall be undergraded to an elevation of 6 inches (15.24 cm) below the finished subgrade elevation. Rock shall be removed in such a manner as to leave no excessive water pockets in the surface.
- d. Areas of undergrading or overbreak in rock between lines 1 foot (30.48 cm) outside of the curbs shall be backfilled with spalls, rock fragments or a granular type material. Backfill materials shall have a plasticity index not to exceed 10 and a gradation such that at least 50 percent of the material will be retained on the No. 4 (4.75 mm) Sieve.
- e. Undergrading
 - 1) Where materials are encountered which are deemed as unsuitable by the Engineer or as defined in the Geotechnical Report, for use in the work, they shall be removed to the depth and limits as ordered by the Engineer. Areas undergraded shall be backfilled with one of the following materials:
 - i. A granular type material having a plasticity index not to exceed 10 and a gradation such that at least 50 percent of the material will be retained on the No.4 (4.75 mm) Sieve and not more than 40 percent will pass the No. 10 (2.00 mm) Sieve. Dependent upon the location of undergrading the required granular material shall comply with the specified granular material.
 - ii. A material meeting the requirements of Embankment or Backfill above.

3. Starting the Embankment

- a. The existing surface upon which embankment material is to be placed shall have all unstable and unsuitable material removed before starting the embankment work.
- b. Where embankments 2 feet (60.96 cm) or less in depth are to be placed on areas covered by existing pavement, the existing pavement shall be removed and the cleared ground surface shall be compacted to the specified density. Where embankments greater than 2 feet (60.96 cm) in depth are to be placed on areas covered by existing pavement, the existing pavement shall be broken into pieces not larger than 24 inches (60.96 cm) maximum dimension, left in place and the embankment started thereon.
- c. Where embankments, regardless of height, are placed against hillsides or existing embankments, either of which have a slope steeper than 1 vertical to 4 horizontal, the existing slope shall be benched or stepped in maximum 36 inch rises and should be wide enough to accommodate

compaction equipment. The new fill shall be brought up in 9 inches or less layers or lifts in loose thickness when heavy, self-propelled compaction equipment is used; 4 to 6 inches in loose thickness when hand-guided equipment (i.e. jumping jack or plate compactor) is used. The material bladed out, the bottom of the area cut into, and the embankment material being placed, shall be compacted to the required density. Material cut out, bladed into place and compacted shall not be measured and paid for directly but will be considered as incidental work.

4. Placing Embankment

- a. **Placing Earth Embankment:** Earth shall be placed in successive horizontal layers, wetted or dried as necessary to be within the required moisture range and distributed uniformly over the full width of the embankment area. Each layer of material shall not exceed 9 inches or less layers or lifts in loose thickness when heavy, self-propelled compaction equipment is used and 4 to 6 inches in loose thickness when hand-guided equipment (i.e. jumping jack or plate compactor) is used and shall be compacted to not less than the required density before the next layer is placed thereon. Compaction equipment shall be approved by the Engineer prior to use. As the compaction of each layer progresses, continuous blading, or dozing will be required to level the surface and to insure uniform compaction. Embankment construction shall not be performed when material contains frost, is frozen or is snow covered.
- b. **Placing Earth and Rock Embankment:** When earth and stone or rock fragments are mixed in the embankment, all stones or rock fragments exceeding the thickness of the compacted lift shall be disposed of by being incorporated into the embankment outside the limits of the proposed surfaced areas. The thickness of the layer in these areas may be increased if necessary to accommodate the rocks, but shall not exceed 24 inches (60.96 cm) in thickness (loose state). The stones or rock fragments are to be placed so there will be no nesting. Compaction equipment shall be approved as required in the above paragraph.
- c. **Consolidated Rock Embankment:** When the excavated material consists predominantly of stone or rock fragments of such size that the material cannot be placed in layers of the thickness prescribed, such material shall be placed in the embankment in layers having a thickness of the approximate average size of the larger rocks but not to exceed 24 inches (60.96 cm). Rocks or boulders too large to permit placing in a 24 inch (60.96 cm) layer shall be reduced in size as necessary to permit placement. Rock shall not be dumped in place but shall be distributed by blading or dozing in a manner to insure proper placement in final position in the embankment. The spalls and smaller stone fragments shall be left on the surface of each layer as formed. Each layer shall be thoroughly consolidated before the next layer is placed. The top 12 inches (30.48 cm) of the embankment shall not contain material having a maximum dimension greater than 3 inches (7.62 cm). The rock fragments or crushed stone shall be well graded to form a dense mass when compacted

5. Compacting the Embankment

- a. Before placing any embankment, the surface of the existing ground shall be prepared as heretofore specified, moistened as required, and the top 6 inches (15.24 cm) compacted to a density of 90 percent as prescribed by the following paragraph.
- b. All embankment shall be compacted to a density of at least 95 percent of the maximum standard Proctor dry density for the material used as determined by ASTM D-698 and within a tolerance of minus 2 percent and plus 2 percent of the optimum moisture content value at maximum density as determined by the standard Proctor test at the time of placement and compaction. In addition to the above required compaction, the subgrade between lines 1 foot (30.48 cm) outside of the curbs and within the top 6 inches (15.24 cm) of the subgrade shall be compacted to a density of at least 95 percent of the maximum density for material used as determined by ASTM D-698 and with a tolerance of minus 2 percent and plus 2 percent of the optimum moisture at maximum density as determined by the Moisture Density Curve obtained.
- c. All the work involved in either adding moisture to or removing moisture from embankment materials to within these moisture limits shall be considered incidental to the completion of the grading operation.
- d. The Contractor shall reference and be responsible for following guidelines as stated in the Geotechnical Report.

D. Testing

1. Moisture - Density Determination

- a. In-place density and moisture content of the embankment will be determined by the Standard Proctor Test (ASTM D-698).
- b. All testing shall be performed by an independent testing agency and all coordination shall be the responsibility of the Contractor at no additional cost to the City or the Engineer.
- c. All test reports shall be submitted and approved by the Engineer prior to pavement construction. Should the results of the in-place density tests indicate the specified moisture or compaction limits have not been met, the area represented by the test shall be reworked and retested as required until the specified moisture and compaction requirements are achieved.

E. Inspection and Maintenance

1. Periodically check all graded areas and their associated erosion and sediment control practices, especially after rainfall events of ½-inch or greater. Promptly

remove all sediment from diversions and other control devices. If washouts or breaks occur, repair them immediately.

3.04 TOPSOILING

A. Description

1. Topsoiling is a method of preserving and reusing the surface layer of undisturbed soil, which is often enriched in organic matter, to obtain a more desirable planting and growth medium.

B. Application

1. Topsoiling provides a suitable growth medium for final site vegetative stabilization.
 - a. Where the preservation or importation of topsoil is determined to be the most effective method of providing a suitable growth medium.
 - b. Where the subsoil or existing soil presents the following problems:
 - 1) The texture, pH, or nutrient balance of the available soil cannot be modified by reasonable means to provide an adequate growth medium.
 - 2) The soil material is too shallow to provide an adequate root zone and to supply necessary moisture and nutrients for plant growth.
 - 3) The soil contains substances potentially toxic to plant growth.
 - c. Where high-quality turf is desirable to withstand intense use or meet aesthetic requirements.
 - d. Where ornamental plants will be established.
 - e. Only on slopes that are 2H:1V or flatter unless other measures are taken to prevent erosion and sloughing.

C. Construction Specifications

1. Materials

- a. Field exploration of the site shall be made to determine if there is sufficient surface soil of good quality to justify stripping. Topsoil shall be friable and loamy: loam, sandy loam, silt loam, sandy clay loam, or clay loam. It shall be free of debris, trash, stumps, rocks, root, and noxious weeds and shall give evidence of being able to support healthy vegetation. It shall contain no substance that is potentially toxic to plant growth.

2. Stripping

- a. Topsoil operations should not be performed when the soil is wet or frozen. Stripping shall be confined to the immediate construction area. Stripping depth may vary depending on the particular soil. All perimeter dikes, basins, and other sediment controls shall be in place prior to stripping.

3. Stockpiling

- a. Topsoil shall be stockpiled in such a manner that natural drainage is not obstructed and no off-site sediment damage results. Side slopes of the stockpile shall not exceed 2H:1V. Perimeter controls must be placed around the stockpile immediately.

4. Site Preparation

- a. Before topsoiling, establish needed erosion and sediment control practices such as diversions, grade stabilization structures, berms, dikes, level spreaders, waterways, sediment basins, etc. These practices must be maintained during topsoiling.
- b. Previously established grades on the areas to be topsoiled shall be maintained according to the approved plan. Where the pH of the subsoil is 6.0 or less or the soil is composed of heavy clays, agricultural limestone shall be spread in accordance with the soil test. After the areas to be topsoiled have been brought to grade, and immediately prior to dumping and spreading the topsoil, the subgrade shall be loosened by discing or scarifying to a depth of at least 2 inches to ensure bonding of the topsoil and subsoil.

5. Applying Topsoil

- a. Topsoil shall not be placed while in a frozen or muddy condition, when topsoil or subgrade is excessively wet, or in a condition that may otherwise be detrimental to proper grading or proposed sodding or seeding. The topsoil shall be uniformly distributed to a minimum compacted depth of 4 inches. It is necessary to compact the topsoil enough to ensure good contact with the underlying soil and to obtain a level seed bed for the establishment of high maintenance turf. However, undue compaction is to be avoided as it increases runoff velocity and volume and deters seed germination.

END OF SECTION 31 22 00

SECTION 31 22 19**FINISH GRADING****PART I - GENERAL****1.1 SUMMARY****A. Description**

This work consists of:

1. Within the roadway or trackbed section, trimming, shaping, and finishing ditches, slopes, and other graded surface areas to the lines, grades, typical sections or cross sections, as specified on the Contract Drawings, in these Specifications or by the Engineer.
2. Outside the roadway or trackbed section, obliterating roadways and other paved surfaces by loosening, breaking up, and spreading the existing base materials and surfaces lying outside the new roadway or trackbed cross section, and blending into the adjacent terrain.

PART II – PRODUCTS**2.1 WATER**

- A. Water used in the work shall be free of silts and other materials deleterious to the quality of the material to which it is applied or with which it is mixed.
- B. The Contractor shall make all necessary arrangements for obtaining water. The Contractor shall furnish, install and maintain equipment necessary to pump, haul and place the water. An adequate supply of water shall be maintained at all times.

PART III – EXECUTION**3.1 GENERAL**

- A. After the trackbed and roadway earthwork involved has been substantially completed, the following shall be performed:
 1. Ditches
 - a. Remove all litter, debris and obstructions.
 - b. Trim and shape to neat lines all ditches, channels, and canals provided for waterways.
 2. Slopes
 - a. Remove all exposed roots, debris, and all stones more than 3 inches in size which are loose or could become loosened.
 - b. Trim and shape all excavation and embankment side slopes. Shape tops of banks to circular curves with not more than two foot radius,

unless rock or right-of-way limitations makes such work impractical.

3. Structure Sites

- a. Clean out all sewers, culverts, drains, and their appurtenances constructed under the Contract.
- b. Remove all extraneous matter in the vicinity of culvert ends, inlets, walls, and other areas.
- c. Trim and shape the cleaned areas.

- B. Removed materials shall be disposed of as specified in Sections 02 41 00, 31 13 00, and 31 22 00.

3.2 HAUL ROAD

After the excavation removal work has been performed, remaining haul road bases and surfacings, within KCMO rights-of-way, shall be loosened by scarifying, plowing to a depth of at least 12 inches, or to solid rock, whichever is the lesser depth, and the loosened material shall be treated as follows:

- A. Break the loosened materials into fragments having no dimension greater than 3 inches, unless the aggregate in the original material exceeds that size.
- B. Remove the loosened and broken materials and deposit in a predetermined and suitable site designated to receive this kind of fill.

3.3 MAINTENANCE

The finished work shall be maintained in its finished condition until final completion of the work, or until it is covered with a subsequent course of material placed under the contract.

3.4 GRADING TOLERANCES

Roadways or trackbed finished surface of the aggregate base, and the surface of each underlying layer, shall parallel the design grade and cross-section for the finished surface within 0.07 foot. Grading tolerances for final asphalt, open graded and concrete pavement surfaces will be in accordance with Section 32 11 00, 32 12 16.10, and 32 13 13 respectively.

3.5 WATERING

Watering shall be performed at any hour of the day and on any day of the week necessary for proper performance of the work and for adequate alleviation of dust nuisance. Wastage of water or watering which is detrimental to other work shall be avoided and such operations ceased corrective measures shall be taken.

PART 4 - MEASUREMENT

- 4.1 **Measurement** – No Separate measurement will be made for Work described in this Section.

PART 5 - PAYMENT

- 5.1 **Payment** – No separate payment will be made for the Finish Grading. All costs pertaining thereto

shall be included in the Contract Unit Prices for other items as listed in the Bid Form-Unit Prices.

END OF SECTION

SECTION 31 23 00
BUILDING EXCAVATION, FILLING, AND BACKFILLING

PART 1 - GENERAL**1.1 SUMMARY**

- A. Furnish all labor, materials, tools, equipment, and services for Building Excavation, Filling, and Backfilling, as indicated, in accordance with provisions of Contract Documents.
- B. Definitions:
 - 1. Unsuitable material: Debris and/or soil material judged unsuitable by Geotech for support of slabs and foundations or for use as a fill or backfill material.
 - 2. Maximum density: As determined using ASTM-D698 (Standard Proctor).
 - 3. Geotech: Geotechnical Engineer or Representative of Foundation Consultant employed by Owner to inspect foundation work.
 - 4. Rock excavation: Excavation of rock material which is sufficiently solid and of such strength that it cannot be loosened or broken down in a single pass with following equipment:
 - a. Late model tractor mounted hydraulic ripper equipped with a single digging point sized for use with and propelled by a crawler type tractor rated at a minimum 200 net flywheel horsepower, operating in low gear.
 - b. A 0.6 cubic meter 3/4 cubic yard hydraulic backhoe with a rock tooth.
- C. Completely coordinate with work of other trades.

1.2 EXTRA WORK

- A. Removal and replacement of unsuitable material will be paid as extra work.
 - 1. Notify (Owner's agent) in time to estimate and record quantity removed.
 - 2. If Contractor is unwilling to accept estimate, notify Architect or Construction Manager prior to backfilling and a surveyor will be hired at Contractor's expense to measure and determine excavated volumes.
 - 3. Recorded quantity will be basis for payment.
 - 4. Include unit price on Bid Form.
- B. Rock excavation will be paid for as extra work.
 - 1. Notify (Owner's agent) in time to estimate and record quantity removed.
 - 2. Recorded quantity will be basis for payment.
 - 3. Include unit price on Bid Form.

1.3 QUALITY ASSURANCE

- A. Subsurface soils investigations have been made at project site.
 - 1. Soils information was obtained for use in preparing foundation design.
 - 2. Availability of soils report information is indicated in specifications.
 - 3. Examine site and soils report and independently determine character of materials to be encountered.
- B. Inspection and compaction density tests:
 - 1. Owner will hire the Geotech to inspect earthwork and to conduct in-place compaction moisture-density tests.
 - 2. Initial test at each location will be paid by Owner.
 - 3. If initial test fails, Contractor pays for retesting.
- C. Tolerances of subgrade:

1. 30 mm 0.10 FT plus/minus from required elevations.

1.4 SUBMITTALS

- A. Product Data:
 1. Maximum Density curves for fill and backfill material.
 2. Sieve analysis for granular fill.

1.5 JOB CONDITIONS

- A. Contractor is responsible for:
 1. Determining safe slopes of excavations for the earth materials encountered.
 2. Shoring and bracing excavations as required to protect personnel, utilities, existing construction and new work.
 3. Removing bracing when safe.
 4. Protecting from damage (or replacing as directed) sidewalks, pavements and other facilities resulting from settlement, lateral movement, undermining erosion or other hazards created by earthwork operations.
 5. Complying with rules and regulations governing earthwork and respective utilities.
 6. Providing adequate barricades and warning lights as required to protect persons and property and to satisfy applicable regulations.
 7. Maintaining bench marks, movements and other reference points and replacing any disturbed or destroyed.

PART 2 - PRODUCTS

2.1 MATERIALS

- A. Fill and backfill material:
 1. Clean selected materials, approved by Geotech, from site excavation or from off site borrow areas.
 2. Submit Maximum Density curves for each source of fill or backfill material.
- B. Granular fill:
 1. Clean, uncrushed, natural rounded gravel; without broken faces, sharp edges, or points.
 2. Submit sieve analysis verifying following gradation.
 - a. 100 percent passing 19 mm 3/4 IN sieve.
 - b. 100 percent retained on No.4 sieve (6 mm).

PART 3 - EXECUTION

3.1 EXCAVATION - GENERAL

- A. Do not perform blasting.
- B. Excavate to dimensions and elevations indicated regardless of materials encountered.
 1. Allow additional space as required for construction operations and inspection of foundations.
- C. Remove old foundations, building construction, and other materials concealed beneath present grade, as required to execute work, and as indicated.
- D. Remove and replace unsuitable material with compacted backfill as directed by Geotech.
- E. If rock is encountered, remove and replace with suitable material as directed by Geotech.

- F. Properly level off bottoms of excavations.
- G. Where cuts are required to bring floor slabs to proper elevations, excavate to level below slabs allowing for required granular fill.
 - 1. Remove rocks, lumps, vegetation and other foreign material.
 - 2. Scarify top 205 mm 8 IN of earth below granular fill and recompact to 95 percent of maximum density.
 - 3. Where compacted subgrade is disturbed by frost, moisture, or construction operations, re-scarify and recompact as directed by Geotech.
- H. Control grading around building.
 - 1. Pitch surface to prevent water from running into excavated areas or damaging structure.
 - 2. Maintain pits and trenches where footings will be placed free of water.
 - 3. Provide pumping required to keep excavated spaces clear of water during construction.
 - 4. When springs or running water are encountered, notify Architect. Provide free discharge of water by trenches or pumps, and drain to appropriate point of disposal as directed.

3.2 FOOTINGS AND PILE CAPS

- A. Provide undisturbed, level, dry, unfrozen surfaces free of foreign or loose material for placement of footings and pile caps.
- B. Obtain Geotech's approval of footing subgrade before placing concrete.
- C. Do not carry excavations lower than indicated, except when directed by Geotech.
- D. If excavations are made below indicated level, fill with concrete of same strength as foundation concrete at no extra cost.
- E. When excavations become soft and wet, remove soft material and replace with concrete of same strength as foundation concrete, at no extra cost.
- F. When freezing temperatures are expected, do not excavate to full depth unless footings or pile caps can be placed immediately. Protect bottoms of excavations from freezing if placement is delayed.

3.3 SUBGRADE PREPARATION, FILLING, AND BACKFILLING

- A. Remove rocks, lumps, frozen ground, soft or wet material, vegetation, and other foreign material upon which fill or backfill is to be placed.
- B. Before scarifying subgrade, obtain approval of Geotech.
- C. Scarify top 205 mm 8 IN of excavation surface or subgrade and compact to 95 percent of maximum density.
- D. Place fill material in 150 mm 8 IN lifts and compact each lift to 95 percent maximum density, 98% for wall footing support.
- E. Maintain moisture between 0 and 3 percent above optimum moisture content during compaction.
- F. Compact fill and backfill using suitable mechanical tamping equipment to obtain specified density.
 - 1. Use mechanical hand tampers for filling and backfilling next to walls.
 - 2. Compact granular fill using vibratory methods.
- G. Where existing ground surface is steeper than one vertical to four horizontal, step surface with steps not exceeding 305 mm 12 IN or slope surface not exceeding one vertical to 50 horizontal.

- H. Correct and recompact compacted material not meeting specified compaction requirements. Continue corrective measures until required compaction has been attained.
- I. Do not backfill against part of walls, piers, or columns until each part has reached design strength.
 - 1. Do not place fills against walls until floor slabs at top and bottom of walls are in place.
 - 2. Bring backfill up uniformly around building and individual wall units.
- J. Do not backfill against foundations, walls, curbs, footings, and areaways until concrete forms have been removed, masonry work has been pointed, and concrete finishing, dampproofing, and waterproofing have been completed.

3.4 GRADING NEXT TO BUILDING

- A. To provide drainage evenly slope finished grade away from building walls at slopes not less than one (1) vertical to fifty (50) horizontal.

3.5 GRANULAR FILL UNDER SLABS ON GRADE

- A. Place minimum 150 mm 6 IN granular fill below vapor retarder under slabs on grade.
 - 1. Vapor retarder: See Section 03 31 10.

3.6 ACCEPTANCE OF WORK

- A. Obtain Architect's and Geotech's approval of each earthwork operation before next operation.
- B. Notify Architect and Geotech in sufficient time for inspection.

3.7 DISPOSAL OF EXCESS AND WASTE MATERIAL

- A. Remove waste and excess materials including excess earth, unsuitable materials, trash and debris and legally dispose of it off Owner's property.

END OF SECTION

SECTION 31 23 13**SUBGRADE PREPARATION****PART 1 - GENERAL****1.01 SCOPE OF WORK**

- A. Furnish the necessary equipment, labor and materials required and perform all work in connection with the subgrade and roadbed construction as shown on the Drawings and as specified in American Public Works Association Standard Specifications and Design Criteria Section 2200 as revised, adopted, and provided by the Director of Kansas City, Missouri Public Works current at the time of bidding.

1.02 REFERENCE STANDARDS

- A. In addition to complying with all pertinent codes and regulations, comply with the referenced or applicable portions of the American Public Works Association Standard Specifications and Design Criteria as revised, adopted, and provided by the director of Kansas City, Missouri Public Works current at the time of bidding.
- B. The following standards are referenced directly in this section. The latest version of these standards shall be used.

ASTM D 698 -Test Method for Laboratory Compaction Characteristics of Soil Using Standard Effort (12,400 ft-lbf/ft³ (600 kN-m/m³))

ASTM D 2922 –Standard Test Methods for Density of Soil and Soil-Aggregate in Place by Nuclear Methods (Shallow Depth).

PART 2 - PRODUCTS (NOT USED)**PART 3 - EXECUTION****3.01 SUMMARY**

- A. This section includes subgrade preparation at locations which have been previously graded in accordance with the requirements of Section 31 22 00 entitled "Site Preparation and Grading."

3.02 DEFINITIONS**A. Subgrade**

1. Subgrade is defined as a well graded and compacted layer on which base and subsequent courses are placed.

B. Subgrade Preparation

1. Subgrade preparation is the repeated operation of fine-grading and compacting the subgrade until the specified lines, grades, and cross-section, as indicated on the plans are obtained and the materials are compacted to the specified depth and density.

3.03 CONSTRUCTION

A. General

1. The subgrade surface shall be brought to the specified lines, grades and cross-section by adding or removing material and compacting to the specified density. Tolerance allowed on all lines, grades and cross-sections shall be no more than 1/4 inch (6 mm).

B. Compacting the Subgrade

1. The top 6 inches (15.24 cm) of subgrade for pavements shall be compacted to 95% of the standard proctor maximum density for the material used as determined by ASTM D 698 and within a tolerance of plus 2% and minus 2% of the optimum moisture content.

C. Protection and Maintenance of Subgrade

1. The subgrade shall be protected from action of the elements or others. Any action (eg. settlement or erosion) that damages the subgrade or any subgrade that has become unacceptable prior to placing the pavement thereon, shall be repaired and the specific lines, grades, cross-section, tolerance, density, and moisture content range reestablished.
2. The Contractor shall protect all existing improvements from damage resulting from his subgrade operation. Any improvement damaged shall be repaired or replaced by the Contractor at his own expense.

D. Cleanup

1. Subgrade cleanup shall follow the work progressively. The Contractor shall remove from the project site all rubbish, surplus or discarded material, unsuitable material, and any equipment, tools and temporary construction items used for the preparation of the subgrade.

E. Roll Testing

1. Once the subgrade has been brought to the final plan elevation, but prior to approval of the subgrade for paving, all lanes shall be roll tested in their entire length. The subgrade will not be acceptable if rutting, pumping, or deformation of the subgrade results from the roll test. This testing will be done by the Contractor, and will be in addition to the applicable moisture and density testing, at no additional cost to the City or Engineer.
 - a. Equipment for roll testing shall be a tandem dump truck (one front and two rear axles) carrying a twenty ton load.

- b. The truck shall proceed slowly along each traffic lane, allowing the Inspector or Engineer to walk alongside and observe the results. Areas failing the roll test will be reworked and retested prior to approval of the subgrade for paving.

END OF SECTION 31 23 13

SECTION 31 23 16.16**STRUCTURAL EXCAVATION AND BACKFILL****PART I - GENERAL****1.1 SUMMARY**

- A. Description: This work includes performing excavation and furnishing and placing backfill, and shall be constructed in accordance with the specifications and in conformity with the lines, grades, dimensions and notes shown in the Contract Drawings and as specified herein.
1. Removal and disposal of materials for the construction of foundations for retaining walls, bridges piers, wayside buildings, box culverts, OCS poles and other structures as specified.
 2. Furnishing, placing, and compacting backfill materials for structures to the lines delineated and in areas that below the designed slope or subgrade line provided in the Contract Drawings.
 3. Unless otherwise specified, the work includes all equipment, machinery, tools, and incidentals required, including temporary dewatering and excavation support, for proper execution of the work.

1.2 REFERENCED STANDARDS

<u>Sponsor</u>	<u>Number</u>	<u>Subject</u>
AASHTO	M 145	Recommended Practices for Classification of Soils and Soil Aggregate Mixtures for Highway Construction Purposes
ASTM	C117	Materials Finer Than 75 μ m (No. 200) Sieve in Mineral Aggregates by Washing
ASTM	C 136	Sieve Analysis of Fine and Coarse Aggregates
ASTM	D 4318	Determining the Plastic Limit and Plasticity Index of Soils
AREMA		Manual of Railway Engineering
ASTM	D 1557	Soils and Soil-Aggregate Mixtures Using 10-lb Rammer and 18-in Drop

1.3 SUBMITTALS

- A. Submittals shall be made in accordance with the requirements of the Project Quality Plan, except as modified herein.
1. Submit method statement describing work sequence, steps, protection and remedial measures together with submittals of construction dewatering and sheeting, shoring and bracing.

1.4 QUALITY CONTROL

- A. Quality control shall be made in accordance with the requirements of the Project Quality Plan, except as modified herein.

PART II - PRODUCTS**2.1 MATERIALS****2.2 GRANULAR BACKFILL BORROW (STRUCTURAL FILL)**

- A. Classification A-1-a (AASHTO M 145) (GW, GP, SW, SP – ASTM)
- B. Non-plastic, uniformly graded with a particle size of 2" maximum.

PART III - EXECUTION**3.1 EXCAVATION**

- A. Perform clearing, grubbing, and removal within 6 ft outside of the structure exterior faces, unless otherwise shown on the Contract Drawings.
- B. Structural excavation shall be performed to the lines and grades as established within a tolerance of plus 0 inch or minus 2 inch.
- C. When piles are to be driven, complete the excavation for structures to the bottom of the footings before driving any piles within the excavation.
 - 1. Remove excess material remaining in the excavation after pile driving to the elevation of the bottom of the footings.
 - 2. When ground displacement results from pile driving operations, excavated or backfill the footing area to the grade of the bottom of the footing as shown on the Contract Drawings with structure backfill materials.
- D. Excavations shall be protected with shoring support or other means unless open excavation would not be contrary to applicable safety requirements or detrimental to adjacent structures, roadways, and railway tracks. Perform excavation support work in accordance with Section 31 41 00.
- E. When footing concrete is to rest upon rock, fully uncover the rock and remove the rock surface to a depth sufficient to expose sound rock using pavement breakers, rippers, backhoes, other excavation equipment, or non-explosive means that preclude breakage of rock materials below and outside of the structure excavation limits.
- F. Maintain excavated bottom dry and protect the bottom from water intrusion. Perform dewatering as required.
- G. Any unstable or unsuitable material below footing or base of structure, including bedding, shall be excavated until satisfactory foundation conditions are achieved. Replace the unstable or unsuitable material with competent material, such as concrete or structural fill to the foundation elevations as shown on the Contract Drawings.
- H. Foundations that will support structures shall be constructed as follows:

1. The top surface of backfilled foundations shall be constructed 3 ft beyond the boundary of the foundation, unless otherwise shown on the Contract Drawings. Granular Backfill Borrow shall be used and placed in 6 inch layers and compacted to not less than 90 percent of maximum density as determined by ASTM D 1557. Heavy compaction equipment shall not be allowed closer than 5 ft to embedded walls.
 2. The sides and bottom of the excavation shall not be disturbed. Concrete shall be placed against undisturbed soil where shown. Concrete may be used as backfill as permitted by the Engineer. If disturbed, all disturbed material shall be compacted to 95 percent of maximum density as determined by ASTM D 1557.
 3. Before placing concrete on rock foundations, all rock surfaces shall be cleaned and loose material removed; seams and fractures shall be cleaned and sealed with grout. Rock surface shall be leveled, stepped, or roughened as shown in the Contract Drawings.
- I. Notify the Engineer for inspection of the excavation when any structure excavation is completed. Place concrete into the excavation only after the excavation has been approved by the Engineer.

3.2 STRUCTURAL BACKFILL

- A. Backfilling and compaction shall be made in conformance with Section 31 22 00 for foundations of embankment or trench, or is to support a structure not covered in this Section.
- B. Do not place structural backfill until the structure footings or other portions of the structure to be backfilled have been inspected and approved for backfilling by the Engineer.
- C. Backfill shall not be placed so as to cause unbalanced loading on the concrete until the concrete has been in place 28 calendar days or until test cylinders show the concrete has attained 80% of design strength, whichever occurs first. Exceptions may be granted with Engineer's approval.
- D. Backfill shall be placed so as not to damage the concrete footings, drain pipes, and other permanent work. Backfill shall not be jetted or puddled. Perform compaction per Section 31 22 00.
- E. Flowable Fill may be used in place of structural backfill. See Section 03 90 00 for Flowable Fill specifications.

PART IV - MEASUREMENT

- 4.1 **Measurement** – No Separate measurement will be made for Work described in this Section.

PART V - PAYMENT

- 5.1 **Payment** – No separate payment will be made for structural excavation and backfill. All costs pertaining thereto shall be included in the Contract Unit Prices for other items as listed in the Bid Form-Unit Prices.

END OF SECTION

SECTION 31 23 33**TRENCHING, BACKFILLING, AND COMPACTING FOR UTILITIES****PART 1 - GENERAL****1.1 SUMMARY**

- A. Furnish all labor, materials, tools, equipment, and services for Trenching, Backfilling and Compacting for Utilities, as indicated, in accordance with provisions of Contract Documents.
- B. Definitions:
 - 1. Unsuitable material: Debris and/or soil material judged unsuitable by Engineer for support of slabs or other site improvements.
 - 2. Engineer: Soils Engineer employed by Owner and empowered to undertake necessary inspections and approvals.
 - 3. Rock excavation: Excavation of rock material which is sufficiently solid and of such strength that it cannot be loosened or broken down in a single pass with following equipment.
 - a. Late model tractor mounted hydraulic ripper equipped with single digging point sized to use with and propelled by crawler type tractor rated at a minimum 200 net flywheel horsepower, operating in low gear.
 - b. A 0.6 cubic meter 3/4 cubic yard hydraulic backhoe with a rock tooth.
- C. Completely coordinate with work of other trades.

1.2 EXTRA WORK

- A. Removal and replacement of unsuitable material will be paid for as extra work.
 - 1. Notify Owner's agent in time to have Engineer measure and record quantity removed.
 - 2. Recorded quantity will be basis for payment.
 - 3. Include unit price per cubic meter yard on Bid Form.
- B. Rock excavation will be paid for as extra work.
 - 1. Notify Owner's agent in time to have Engineer measure and record quantity removed.
 - 2. Recorded quantity will be basis for payment.
 - 3. Include unit price on Bid Form.

1.3 QUALITY ASSURANCE

- A. Compaction density test:
 - 1. Standard Proctor, ASTM-D698.
- B. Owner will hire an independent soils laboratory to conduct in place moisture and density tests.
 - 1. Contractor to pay for retests of material not passing initial tests.
 - 2. Notify Owner at least 2 weeks prior to anticipated date of testing.
 - 3. Contractor to pay additional costs if work is delayed due to Contractor's failure to notify party as specified above.
- C. Comply with aspects of "Safety Rules and Regulations for Excavation" as promulgated by State law for state in which excavation will occur.

2013/12/1331_23_33_hdr_TRENCHING, BACKFILLING AND COMPACTING FOR UTILITIES
(1).doc

1.4 JOB CONDITIONS

- A. Verify location and existence of underground utilities.
 - 1. Omission or inclusion of located utility items on drawings does not constitute non-existence or definite location.
 - 2. Secure and examine local utility surveyor records for available location data.
- B. Protect existing utilities from damage.
 - 1. Repair damages to utility items.
- C. Avoid overloading.
- D. Keep surcharge sufficient distance back from edge of excavation to prevent slides or caving.
- E. Maintain and trim excavated materials in such a manner to be as little inconvenience as possible to public and adjoining property owners.
- F. Provide full access to public and private premises, to fire hydrants, at street crossings, sidewalks and other points as designated by Engineer to prevent serious interruption of travel.

PART 2 - PRODUCTS

2.1 MATERIALS

- A. Backfill material:
 - 1. As approved by Engineer.
 - 2. Free of rock cobbles, roots, sod or other organic matter, and frozen material.
 - 3. Moisture content at time of placement:
 - a. Within 3 percent of optimum moisture content.
 - b. Wet dry material, as required.
 - c. Dry wet material, as required or:
 - d. Furnish off site material at no additional cost to Owner.

PART 3 - EXECUTION

3.1 GENERAL

- A. Remove and dispose materials Engineer finds unsuitable.
- B. Trench, backfill and compact for underground utilities.

3.2 TRENCH EXCAVATION

- A. Excavate trenches by open cut method to depth indicated and necessary to accommodate work.
 - 1. Permission may be granted for tunnel work for crossing under crosswalks, driveways or existing utility lines.
 - 2. Such tunnels are limited to 3050 mm 10 FT in length.
- B. Open no more than 90 m 300 LF of trench at one time, or less, as required by Engineer.
- C. Failure to comply may necessitate shutdown of entire project until backfilling is performed.
- D. Carry rock excavations minimum of 305 mm 12 IN below indicated invert elevations.
- E. Do not excavate below indicated grades unless required to remove unsuitable material.

(1).doc

F. Backfill overexcavations in maximum 205 mm 8 IN lifts compacted to specified density.

G. Trench size:

1. Excavate only sufficient width to accommodate free working space.
2. Cut trench walls vertically from bottom of trench to top of pipe, conduit, or utility service.
3. Trench width at top of pipe or conduit may not exceed outside diameter of utility service by more than following dimensions:

Overall Diameter of Utility Service	Excess Dimension
--	------------------

840 mm and less	400 mm
more than 840 mm	600 mm

Overall Diameter of Utility Service	Excess Dimension
--	------------------

33 IN and less	16 IN
more than 33 IN	24 IN

H. Keep trenches free of water.

I. Brace and sheet trenches as soil conditions dictate.

J. Do not remove until backfilling has progressed to a stage that no damage to piping, utility service, or conduit will result due to removal.

3.3 PREPARATION FOR PIPE LAYING

A. See drawings and specific pipe material sections for embedment requirements.

B. When discrepancy exists between those requirements and these specifications, provide type of embedment which provides greatest load factor.

C. Types of embedment:

1. Class A: Concrete cradle.
 - a. Load factors:
 - 1) 2.2 - Lightly Tamped.
 - 2) 2.8 - Carefully tamped.
 - 3) 3.4 - Reinforced Concrete with p=0.4 percent.
2. Class 4: Concrete arch type bedding.
 - a. Load factors:
 - 1) 2.8 - Plain Concrete.
 - 2) 3.4 - Reinforced Concrete with p=0.4 percent.
 - 3) 4.8 - Reinforced Concrete with p=1.0 percent.
3. Class B: First-class bedding.
 - a. Shaped bottom with tamped backfill, or:
 - b. Compacted granular bedding with tamped backfill.
 - c. Load factor:
 - 1) 1.9 - Carefully compacted backfill.
4. Class C: Ordinary bedding.
 - a. Granular bedding with tamped backfill.
 - b. Load factor:
 - 1) 1.5 - Lightly compacted backfill.

D. Form bell holes in trenches such that only barrel of pipe is firmly supported by bedding material.

2013/12/1331_23_33_hdr_TRENCHING, BACKFILLING AND COMPACTING FOR UTILITIES
(1).doc

3.4 BACKFILLING

- A. Do not backfill until tests are performed on system, and system complies with specified requirements.
- B. Hand or pneumatic tamp backfill around and over pipe in lifts not exceeding 205 mm 8 IN loose thickness.
- C. Compact to specified density.
- D. Exercise care in backfilling operations to avoid displacing pipe joints either horizontally or vertically and to avoid breaking pipe.
- E. Do not water flush or puddle to consolidate backfill.

3.5 COMPACTION

- A. Compact trench backfill in areas under paved roads, parking areas, sidewalks and other structures as directed by Engineer to at least 95 percent of maximum dry density.
- B. In locations where trench will not be under paved areas, compact backfill to minimum 90 percent of maximum dry density.

3.6 CLEANUP

- A. Cleanup debris resulting from work.

END OF SECTION

SECTION 31 25 00**EROSION AND SEDIMENTATION CONTROLS****PART I - GENERAL****1.1 SUMMARY****A. Description**

1. The Contractor shall prepare and submit an Erosion Control Plan (ECP) which satisfies the requirements of this section as described below.
2. This work consists of temporary control measures as shown on the Erosion Control Plans [SWPPP] or ordered by the Engineer during the life of the contract to control water pollution and soil erosion through the use of berms, dikes, swales, dams, fiber mats, netting, gravel, mulches, grasses, slope drains, sediment fences, and other sediment barriers, gravel construction entrances, and other erosion control devices or methods.
3. This work also consists of temporary and permanent in-stream erosion control measures as shown on the Erosion Control Plans or ordered by the Engineer during the life of the contract to control turbidity in waterways through the use of berms, sandbag dikes, riprapped ditch outfalls, swales, cofferdams, filter fabric, fiber mats, riprap, temporary stream diversion and other erosion control devices or methods.
4. Temporary pollution control provisions contained herein shall be coordinated with any and all permanent erosion control features specified elsewhere in the Contract to the extent practicable to assure economical, effective, and continuous erosion control throughout the construction and post-construction period.
5. Failure to control erosion or pollution shall be cause for the Engineer to stop construction work in the vicinity of the erosion breach, until measures have been taken to bring construction into compliance with this Section.

B. Related Sections

1. 31 22 00 – Site Preparation and Grading
2. 31 22 19 - Finish Grading
3. 32 11 00 - Aggregate Base Course
4. 31 05 19.13 - Geotextile Fabric, Geocomposites and Ballast Mats

1.2 REFERENCES

<u>Sponsor</u>	<u>Number</u>	<u>Subject</u>
USA	(latest edition)	Erosion Control Plans Technical Guidance Handbook

1.3 SUBMITTALS

- A. Submittals shall be made in accordance with the requirements of the Project Quality Plan, except as modified herein.
- B. The Contractor shall submit an Erosion Control Plan. The Erosion Control Plan shall include the methods of operation and the schedules for accomplishing temporary and permanent erosion control work and work required, as are applicable for clearing and grubbing, grading, trenching, bridges, and other structures at water-courses, paving, and other construction. The Erosion Control Plan shall also include a proposed method of erosion control on haul roads and borrow pits and a plan for disposal of waste materials. No work shall be started until the Erosion Control Plan has been reviewed by the Engineer and found to comply with the requirements of the Plans and Specifications. The approved Erosion Control Plan and schedule shall be subject to Engineer-approved modifications during construction.
- C. Working drawings and data shall be submitted on proposed silt fences and other geotextiles, including physical properties of geotextile fabric.
- D. The Contractor shall submit methods of in-stream erosion control to the Engineer for review and approval before work in a waterway site is initiated.
- E. Proof of seeding specification, see Storm Water Pollution Prevention Plan, section 2.3.1.
 - 1. Seeding material shall be purchased just prior to seeding season.
 - 2. Proof of purchase shall be available for review by Engineer during construction. Proof shall constitute copies of purchase orders and written confirmation of receipt and acceptance of order by Supplier.
- F. The following shall be submitted 14 days prior to acceptance:
 - 1. Schedule for maintenance work as specified herein.
 - 2. "As-Built" drawings for landscape work.
- G. The following shall be submitted as requested:
 - 1. Delivery tickets, receipts, materials, packages, and other items as requested by Engineer to verify amount and type of materials supplied.
 - 2. Other items as requested by Engineer to verify compliance with Contract requirements.

1.4 QUALITY ASSURANCE

- A. In the event of conflict between these requirements and pollution control laws, rules, or regulations of other federal, state or local agencies, the more restrictive laws, rules, or regulations shall apply.
- B. Fertilizers shall conform to all state and federal regulations and shall be subject to testing by the Engineer.
- C. Seed shall be tested within 9 months of the delivery date and shall not be sprouted, moldy, or show evidence of having been wet or otherwise damaged. Each lot of seed

shall be subject to inspection, sampling, and testing upon delivery to the Project. Seed that is not labeled or that does not conform to Specifications will be rejected.

- D. Contractor shall comply with the Storm Water Pollution Prevention Plan that contains seeding specifications.
- E. Contractor shall notify Engineer 24 hours in advance of intent to hydro-seed.
- F. Engineer or his representative shall be present at the time when the materials are being assembled for the hydro-seeding process to insure that the proper materials and quantities are present at the specified rates as herein specified.

1.5 DELIVERY, STORAGE, AND HANDLING

- A. Packing and Shipping: Packed materials shall be delivered in original unopened containers showing weight, analysis and make of manufacturer. Materials shall be protected from damage and deterioration during delivery and while stored at site.
- B. Any required geotextile shall be delivered, handled and stored in accordance with the recommendations of the manufacturer and as specified in Section 31 05 19.13.

1.6 PROJECT CONDITIONS

A. General

- 1. The Engineer has the authority to limit the surface area of erodible earth material exposed by clearing, grubbing, excavation, borrow, embankment, and fill operations, and to direct the Contractor to provide immediate, permanent, or temporary pollution control measures to prevent contamination of adjacent streams or other watercourses, lakes, ponds, or other areas of water impoundment. Such work may involve the construction of temporary berms, dikes, dams, sediment basins, slope drains, and use of temporary mulches, mats, seeding, or other control devices or methods as necessary to control erosion. Cut slopes shall be seeded and mulched as the excavation proceeds to the extent considered desirable and practicable by the Engineer.
- 2. The ECP facilities shall be constructed in conjunction with all clearing, grading, and other land alteration activities, and in such a manner as to ensure that sediment laden water does not enter the drainage systems, or violate applicable water quality standards.
- 3. The ECP facilities in the approved Erosion Control Plan shall be upgraded as needed during the construction period for unexpected storm events or for other reasons to ensure that sediment laden water does not leave the construction site.

B. Permanent Features

- 1. All permanent erosion control features shall be incorporated into the Project at the earliest practicable time as outlined in the Contractor's accepted schedule. Temporary pollution control measures shall be used to correct conditions that develop during construction that were not foreseen during the design stage, that are needed prior to installation of permanent pollution control features, or to temporarily control erosion that develops during normal construction.
- 2. Where erosion is likely to be a problem during clearing and grubbing operations, work shall be scheduled and performed so that grading operations and

permanent erosion control features can follow immediately thereafter if the Project conditions permit; otherwise temporary erosion control measures shall be required between successive construction stages.

C. Areas of Work

1. The Engineer will limit the area of clearing, grubbing, excavation, borrow, and embankment operations in progress commensurate with the Contractor's capability and progress in accordance with the Contractor's submitted schedule and based upon construction conditions. Should seasonal limitations make such coordination of operations unrealistic, temporary erosion control measures shall be taken immediately.
2. The boundaries of the clearing limits will be clearly flagged by the Engineer upon request prior to construction. Disturbance of the ground will not be permitted beyond the flagged boundary. The flagging shall be maintained for the duration of the construction.
3. Temporary soil erosion and sediment control may include construction work outside the right-of-way where such work is necessary as a result of project construction such as borrow pit operations, haul roads, and equipment storage sites.

D. Maintenance and Removal

1. The erosion control features installed shall be acceptably maintained, including replacement and upgrading of the facilities when needed, until the project is completed and notice of final acceptance issued.
2. The ECP facilities on active construction sites shall be inspected daily and repaired as necessary to ensure their continued functioning. Inactive sites shall be inspected at least monthly, but inactive and active sites shall be inspected at least daily during rainy periods. Deficiencies shall be corrected immediately.
3. Catch basins (inlets with sumps or inverted siphons) shall be maintained so that not more than one-foot sediment shall be allowed to accumulate within a trap (or sump). All catch basins and storm drains shall be cleaned prior to paving and prior to project acceptance. The sediment shall be removed and sediment laden water shall not be flushed into the downstream system.
4. All paved areas shall be kept clean for the duration of the Project. Additional measures to those shown on the Plans may be required.
5. At no time shall more than a one-foot depth of sediment be allowed to accumulate behind a silt fence. Sediment shall be removed or regraded into slopes, and the silt fences repaired and reestablished as needed.
6. Silt fences shall be removed in their entirety when no longer required. They shall be required until the uphill area has been permanently stabilized.
7. All pipes, end sections, drainage curbs, silt fences, and other materials which are removed from temporary erosion control devices and not incorporated into the permanent work and shall be removed from the area. Materials shall be disposed of in accordance with federal, state and local laws and in a suitable location.

1.7 WARRANTY:

- A. The contractor shall be responsible for the protection, watering and replacement of any seeded areas until acceptance by the Engineer.
- B. This guarantee shall include re-seeding of any areas, repairing of any eroded places and maintaining the seeded areas by watering and controlling of insects as well as advising the owner of any maintenance or watering procedures necessary to care for and promote seed germination and growth.
- C. All seeded areas must be in satisfactory condition at the time of the final inspection.

PART II- PRODUCTS

2.1 SEED MIXTURE – Refer to Storm Water Pollution Prevention Plan.

2.2 MATTING

- A. Jute Matting
 - 1. Jute matting shall consist of a uniform, open, plain weave of single jute yarn. The yarn shall be of loosely-twisted construction and shall not vary in thickness by more than one-half of its normal diameter. The weave shall provide openings of about one square inch.
 - 2. The matting shall be furnished in widths of 45 inches or more, continuous lengths of not less than 150 feet, and weight not less than 0.9 pounds per square yard.
 - 3. Staples shall be made of 12 gauge or heavier steel wire which is bent to a U-shape 2 inches wide. Staples shall not be less than 10 inches long unless the Engineer allows a shorter length for hardpan soil conditions.
 - 4. Installation will be done in accordance with manufacturer's recommendations.
- B. Excelsior Matting
 - 1. Excelsior matting shall consist of a machine-produced blanket of curled-wood fibers, of which 80 percent are 6 inches or longer. Blanket shall be uniform thickness, with the fiber evenly distributed over the entire area of the mat.
 - 2. The top side of the matting shall have a maximum 3 inch x 3 inch size mesh of high wet-strength, twisted kraft paper, or a maximum 2 inch x 2 inch biodegradable, extended plastic mesh. The matting shall be smolder-resistant without the use of chemical additives.
 - 3. Excelsior matting shall have a minimum dry weight of 0.8 pound per square yard, and furnished in minimum 36-inch wide rolls.
- C. Coconut Matting
 - 1. Coconut matting shall consist of a machine-produced mat containing a matrix of coconut fibers. Blanket shall be uniform thickness, with the coconut fiber evenly distributed over the entire area of the mat.
 - 2. The matting shall be contained by a polypropylene netting having ultraviolet additives to resist breakdown. It should biodegrade after 24 - 36 months. The matting shall be smolder-resistant without the use of chemical additives.

3. Coconut matting shall have a minimum dry weight of 0.5 pound per square yard.

2.3 GEOTEXTILES

Geotextiles shall conform to the requirements of Section 31 05 19.13.

2.4 MISCELLANEOUS MATERIALS

- A. Plastic Sheeting: Plastic sheeting shall be clear polyethylene plastic at least 10 mils thick.
- B. Temporary Drainage Curbs: Temporary drainage curbs shall be machine extruded asphalt concrete or Portland cement concrete.
- C. Silt Fences: Silt fences shall be constructed of geotextile drainage fabric supported on wood or metal posts. Geotextile materials shall be as specified in Section 31 05 19.13.
- D. Aggregate: Aggregate for soil erosion and sediment control facilities shall conform to Section 32 11 00, Paragraph 2.1.B, Grading Requirements for 1-¹/₂-inch grading.
- E. Riprap: Material shall be as specified in section 31 37 00.
- F. Compost: Compost shall be of clean mixed yard debris, ³/₄ inch minus particle size. It shall be stabilized and mature with less than 25 percent moisture content and less than 5 percent foreign materials (rock, glass, etc.), including less than 2 percent plastics, by weigh

PART III - EXECUTION

3.1 EROSION CONTROL SEEDING

- A. General
 1. The work shall be performed only when local weather and other conditions are favorable to seeding. The work shall not be performed when wind velocities would prevent uniform application of materials or would drift materials.
 2. Seeding shall be performed in stages along the project as soon as practical after completing earthwork.
- B. Preparation of Areas
 1. All earthwork shall be completed before seeding. Areas which are misshapen or eroded shall be restored before seeding.
 2. Rocks, weeds, debris and other matter detrimental or toxic to the growth of grass shall be removed from areas to be seeded. If topsoil is to be added to these areas, existing ground surface shall be cultivated to a depth of 4 to 6 inches before placing topsoil. All loose stones larger than 2 inches, on 3:1 or flatter slopes shall be removed.
 3. Existing vegetation that is to be left in place shall not be damaged.

4. On areas to be seeded surface soil shall be prepared to a condition favorable for germination of seed and growth of grass. At least 2 inch of surface shall be maintained in a loose condition.
5. Surface preparation operations shall be performed along the contours of areas involved. On cut and fill slopes, minor ridges and irregularities shall be formed to retard erosion and improve germination.

C. Seeding

1. General

- a. The Engineer shall be given at least 2 days notice in advance of seeding and shall be kept advised of continuing operations.
- b. Seed shall be prevented from falling or drifting onto areas occupied by rock base, rock shoulders, plant beds or other areas where grass is detrimental.

2. Seeding Method

- a. The area to be seeded shall be staked in 2000 square foot segments to control application rates and verify coverage.
- b. Combine the specified seed mixture at the rates herein specified; fertilizer at the rate of 6 pounds per 1000 s.f.; "silva-fibre" at the rate of 2000 pounds per acre; seeds at the specified seeding rates for the variety of seed being applied and water in tanks. Agitate these components into a well mixed slurry suspension. Spray the mixture under pressure onto the prepared areas to be seeded.
- c. This seeding shall be accomplished in the early spring prior to April 15 or in the fall after September 1 and no later than October 15. The preferred time for seeding is in the fall.
- d. Regardless of equipment and methods used, drift and displacement of seed and fertilizer shall be prevented. If equipment and methods of application results in wasting material, corrections shall be made as directed. Areas previously completed shall not be disturbed. If areas are disturbed they shall be redone as directed.

D. Watering

1. Watering of the seeded areas shall be the complete responsibility of the Contractor by whatever means necessary to establish the seed in an acceptable manner prior to acceptance by the Engineer. If an irrigation system is in place on the site, but if for whatever reason, water is not available in the system, it is the full responsibility of the Contractor to water the seeded areas by whatever means, until the area is accepted by the Engineer.
2. Erosion caused by over watering shall be repaired immediately and re-seeded according to these specifications.
3. Areas that continually experience erosion shall be sodded.

3.2 MATTING

- A. Jute, Excelsior or coconut matting shall be placed flat in single thickness strips paralleling the direction of probable water flow.
- B. Multiple strips of jute or coconut matting shall be lapped in shingle fashion in accordance with manufacturer's recommendations.
- C. Overlapping of adjacent strips of Excelsior matting will not be required. Matting shall be in contact with the soil at all points and secured with staples.

3.3 PLASTIC SHEET

- A. Plastic sheet covering shall provide immediate erosion protection to slopes and disturbed areas when vegetative cover cannot be achieved due to soils, slopes, or time of year.
- B. Plastic sheet covering shall be used:
 - 1. On disturbed areas which require immediate erosion protection.
 - 2. On areas of steep slopes (greater than 50 percent) and areas of moderate slopes that are prone to erosion, particularly during wet weather season (October 1 through May 31).
 - 3. As a temporary measure to provide erosion protection and assist in germination on areas seeded between November 1 and March 31.
 - 4. With sandbag dikes to make temporary cofferdams at structures.
- C. Covering shall be installed and maintained tightly in place by using sandbags or tires on ropes with a maximum 10 foot grid spacing in all directions. All seams shall be taped or weighted down full length and there shall be at least a 12 inch overlap of all seams. For seams parallel to the slope contour, the uphill sheet shall overlap the downhill sheet.
- D. Drainage from areas covered by plastic sheeting shall be controlled such that no discharge occurs directly onto uncontrolled, disturbed areas of the construction site.
- E. Plastic sheeting shall be installed immediately on areas seeded between November 1 and March 31, and remain until vegetation is firmly established.
- F. When the plastic sheeting is used on unseeded slopes, it shall be left in place until the next seeding period.

3.4 STORM DRAIN INLET PROTECTION

- A. Storm drain inlet protection shall prevent sediment from entering storm drain systems prior to permanent stabilization of disturbed areas.
- B. Storm drain inlet protection shall be used:
 - 1. Where storm drain inlets are operational before permanent stabilization of the disturbed drainage area.
 - 2. Adjacent to and immediately downhill of utility type construction in existing paved areas with catch basin drainage.
 - 3. When cleaning streets.

- C. Berms may be required to direct drainage to flow through the filters and prevent bypassing of the inlets.
- D. At no time shall more than a one-foot depth of sediment be allowed to accumulate against storm drain inlet protection. Sediment shall be removed and inlet protection restored as needed to maintain the sediment trapping and filtering capability.

3.5 TEMPORARY EROSION BLANKETS

- A. Temporary erosion blankets shall provide immediate protection and physical stabilization of disturbed soils. Typically they are used when vegetative cover cannot be achieved due to soils, slopes, or time of year. Temporary erosion blankets may be used to enhance success of seeding, planting, or sodding.
- B. Temporary erosion blankets shall be used on areas of steep slopes (greater than 50 percent) and areas of moderate slopes that are prone to erosion, particularly during wet weather season (October 1 through May 31).
- C. Erosion blankets may be used on level areas and on slopes up to 1:1. Where soil is highly erodible, netting shall only be used in conjunction with an organic mulch such as straw and wood fiber. The blanket shall be applied so that it is in complete contact with the soil; if it is not, erosion will occur beneath it. Erosion blankets shall be securely anchored to the slope in accordance with manufacturer's recommendations.
- D. Excelsior blankets are considered protective mulches and may be used alone on erodible soils and during any time of year.

3.6 TEMPORARY SILT FENCES

- A. Temporary silt fence shall reduce the transport of sediment from a construction site by providing a temporary physical barrier to sediment and reducing runoff velocities. The terms "filter fabric" and "geotextile" are used interchangeably herein. Silt fences shall not be installed across streams.
- B. Temporary silt fences shall be constructed:
 - 1. Down the slope below disturbed areas where runoff may occur as sheet runoff.
 - 2. At the toe of soil stockpiles.
 - 3. At grade breaks exceeding 20 percent.
 - 4. Following discharge from a sediment trap or pond.
- C. Silt fences shall be constructed along the contours where feasible.
- D. In the event that the Contractor elects to construct fence of geotextile and wire fabric, the geotextile shall be a continuous roll cut to the length of the barrier to avoid use of joints. When joints are necessary, geotextile shall be spliced together only at support posts, with a minimum 6 inch overlap, and both ends securely fastened to the post.
- E. The geotextile shall be fastened securely to the uphill side of the wire mesh (if used) and posts. The geotextile shall extend into a trench, excavated on the uphill side of the posts, 6 inches vertically and 6 inches horizontally.

- F. The geotextile shall not extend more than 30 inches above the original ground surface.
- G. Geotextile shall not be stapled to trees.
- H. When extra-strength geotextile and closer post spacing are used, the wire mesh support fence may be eliminated.
- I. Manufactured sediment control fences shall be installed in accordance with manufacturer's recommendations.

3.7 TEMPORARY SLOPE DRAINS

- A. Temporary slope drains shall consist of a waterproof drainage structure to carry surface water down embankment slopes with a minimum of erosion. The drains may be of plastic or metal materials as the Contractor elects except the end section, pipe stub, and elbow sections at the top of each slope drain shall be 12-inch minimum diameter metal.
- B. Temporary slope drains shall be extended along the embankment as the height of the embankment increases. Water shall be directed into the drains by means of temporary earth berms at the top of the embankment slopes. Temporary drainage curbs shall be installed on the stage construction surface to direct water to the temporary drains until construction of the permanent drainage structures are completed at which time the temporary drainage curb and the temporary slope drains shall be removed.

3.8 GRAVEL CONSTRUCTION ENTRANCES

- A. Reduce the amount of mud, dirt, rocks, and other matter transported onto roads by motor vehicles or storm water runoff by constructing a stabilized pad of gravel at entrances and exits to construction sites.
- B. Gravel construction entrances shall be constructed at all construction sites at the point where traffic will be leaving the site and moving directly onto public roads, other paved areas, or other approved access points. A geotextile shall be placed under all gravel.
- C. Aggregate shall be clean pit run gravel approved by the Engineer or aggregate as set forth in Section 32 11 00. Subgrade geotextile shall meet the requirements of Section 31 05 19.13.
- D. Gravel pad shall be at least 8 inches thick and 50 feet in length. Width shall be the full width of the vehicle ingress and egress area. Gravel shall be added periodically as needed to maintain proper function of the pad.
- E. If the gravel pad does not adequately remove dirt and mud from vehicle wheels such that mud and dirt tracking is evident off site, additional measures shall be taken. Such measures may include hosing off wheels before vehicles leave the site or other construction techniques or work operation modifications. Wheel washing shall be done on the gravel pad and wash water shall drain through a silt-trapping structure prior to leaving the construction site.

3.9 IN-STREAM EROSION CONTROL

- A. Contractor shall implement in-stream erosion control measures to prevent stream bank erosion, scour and turbidity in the waterways to minimize unwanted sedimentation and disruption of wildlife habitat. Contractor's operations shall be executed to comply with all

current requirements for in-stream erosion control as dictated by the Federal, State and local agencies having jurisdiction over the waterway.

- B. Work in waterways is restricted by the Corps of Engineers Nationwide 404 Permit to the annual period between July 1 and September 30. This period may be shortened by the above agencies if weather conditions dictate. The Contractor shall be prepared to cease in-stream operations upon notice from the Engineer.
- C. The Contractor shall submit methods of in-stream erosion control to the Engineer for review and approval before work in a waterway site is initiated. The in-stream erosion control method offered by the Contractor must be approved by the respective Federal, State and local jurisdictions before submittal to the Engineer for approval. The in-stream erosion control method shall conform to the following:
 - 1. All grading, excavating, clearing and grubbing, stripping, backfilling, pile driving, forming, and placing concrete shall only be permitted in areas that are isolated from the waterway. Acceptable methods for isolating the waterway are sandbag dikes or a temporary cofferdam to an elevation 1'-6" above the expected water elevation during the time of construction. Use of berms to divert the stream shall be designed, and reviewed by the respective federal, state and local jurisdiction, on a site specific basis to insure turbidity control during construction and removal. A flowing stream such as a creek or drainage ditch may be contained in pipe sized for expected flows or trapped and pumped around the worksite by equipment sized for expected flows.
 - 2. Any water seeping into an excavated area which interferes with the work shall be removed by pumping into a facility designed to remove turbidity from the water before it is returned to the stream. An established grassy swale with bio-bags filtering the concentrated flow is an acceptable method of removing fine suspended particulate matter from the excess seepage water. An adequately sized settlement pond is also acceptable.
 - 3. All in-stream areas regraded by cutting shall be treated to prevent erosion of the freshly cut bank. Below Mean Low Water level, the slope shall be over excavated, covered with riprap geotextile fabric, and covered with Class 50 Riprap. Above Mean Low Water level, to the top of the stream bank, the slope shall be covered by a biodegradable erosion control mat, held in place as per manufacturer's recommendations. The mat shall resist biodegrading for 2 years.
 - 4. All in-stream areas to be backfilled shall be protected with Class 100 Riprap placed a minimum 2'-0" thick over riprap geotextile fabric. The finish grade shall be at top of riprap.

3.10 CLEAN-UP

- A. The contractor shall keep the site free from accumulation of waste material.
- B. At the time of completion, all areas must be swept or washed clean and all rubbish removed.

PART 4 - MEASUREMENT

- 4.1 **Measurement** – No Separate measurement will be made for Work described in this Section.

PART 5 - PAYMENT

5.1 Payment – No separate payment will be made for erosion and sedimentation controls. All costs pertaining thereto shall be included in the Contract Unit Prices for other items as listed in the Bid Form-Unit Prices.

END OF SECTION

SECTION 31 34 19**GEOSYNTHETIC REINFORCED SOIL SLOPE SYSTEM****PART 1 - GENERAL****1.1 DESCRIPTION**

Work shall consist of design, furnishing materials, and construction of geosynthetic reinforced soil slope (GRSS) structure meeting approval of the Engineer. Design and supply of geosynthetic reinforcement, drainage composite, and erosion control materials, and site assistance are all to be furnished by the slope system supplier.

1.2 PREQUALIFICATION OF REINFORCED SLOPE SYSTEM AND MATERIALS.

All systems and materials shall be pre-qualified and approved before the contract is awarded. To apply for prequalification or prequalification requirements, the supplier or manufacturer shall submit a request to Construction and Materials. The following systems are pre-qualified and may be used:

Tensor Sierra Slope Retention System:

Tensor Earth Technologies, Inc.	Phone 404-250-1290
5883 Glenridge Drive	sales 800-202-4459
Suite 200	fax 404-250-0461
Atlanta, GA 30328-5363	

Mirafi Geogrid Reinforced Slope:

Ten Cate Nicolon USA	Phone 706-693-2226
365 South Holland Drive	fax 706-693-4400
Pendergrass, GA 30567	email: tc mirafi@rtcusa.net

StrataSlope System:

Strata Systems Inc.	Phone 770-888-6688
380 Dahlonega Rd, Suite 200	fax 770-888-6680
Cumming, GA 30040	email: strata@geogrid.com

1.3 PRELIMINARY DESIGN AND PLANS.

- A. Prior to any work being done, GRSS design plans and computations shall be submitted to the engineer complete with all details as a separate submittal for each individual reinforced slope structure.
- B. All drawings shall be clear and complete. Six sets of drawings of the completed wall design plans shall be submitted for distribution. The drawings submitted shall be legible and have distinct details of sufficient contrast to be suitable for microfilming. Drawings which do not have the desired clarity and contrast will be returned for corrective action. The GRSS system manufacturer shall be solely responsible for the content of the design plans.
- C. All GRSS design plans submitted for distribution shall be signed, sealed and stamped in accordance with the laws relating to architects and professional engineers (Chapter 327, RSMo.).
- D. The minimum factors of safety for slope stability shall be as follows or as required by the

contract.

1. 1.5 against horizontal sliding of the reinforced mass along its base
 2. 1.3 against external, deep seated failures
 3. 1.3 against compound failure surfaces
 4. 1.3 against internal failure
 5. 1.1 seismic loading for the above failure modes
- E. Reinforced slopes shall be designed for the appropriate SEISMIC PERFORMANCE CATEGORY A, B, C, or D and additional requirements as may be shown in the plans or this specification.
- F. Completed GRSS design plans shall also contain all material specifications, fabrication requirements, and all construction requirements for erecting the reinforced slope complete in place. Any requirements on the design plans conflicting with this special provision shall not be used.
- G. The effect of construction damage test shall be incorporated into the construction damage factor F_c that is applied to the limit and serviceability state reinforcement tensions. Where construction tests have been made, but with fills or construction procedures other than those representative or site specific on the project, the minimum value of F_c shall be taken as 1.25. Lower values of F_c may be only used if substantiated with damage test using fills and construction procedures specific to the project. A default F_c value of 3.0 shall be used in the absence of any construction tests.

1.4 BACKFILL MATERIAL.

- A. Backfill material for GRSS shall conform to the following requirements.
- B. Backfill shall be gravel, stone, sand or any combination, conforming to the following gradation limits:

Sieve Size	Percent Passing
3/4 inch (19 mm)	100-75
No. 4 (4.75 mm)	100-20
No. 40 (425 μ m)	0-60
No. 200 (75 μ m)	0-50

- C. The plasticity Index, as determined by AASHTO T-90, shall not exceed 20.
- D. The material shall substantially be free of shale or other soft, poor durability particles and shall have a magnesium sulfate soundness loss of less than 30 percent after four cycles as determined by AASHTO T-104.
- E. Backfill materials shall meet the following electrochemical requirements:

Requirements	Test Methods
pH 4.5-9.5	California DOT 643
Organic Content < 1%	California DOT 643
Chlorides < 100 ppm	California DOT 422
Sulfates < 200 ppm	California DOT 417

- F. The contractor shall furnish to the engineer a Certificate of Compliance certifying the selected granular backfill material complies with this section of the specifications. A copy of test results from an approved laboratory testing the material for all of the above requirements shall also be furnished to the Engineer. Tests shall apply specifically to the material being used and shall not be more than twelve months old, if previously tested for another job and still applicable.
- G. Acceptance will be based on the Certificate of Compliance, accompanying test reports, and any applicable tests performed by the Engineer.

1.5 DESIGN AND PLAN REQUIREMENTS.

- A. The final design to be submitted after contract award shall include detailed design computations and all details, dimensions, quantities and cross sections necessary to construct the slope(s). The fully detailed plans shall be prepared to KCMO standards and shall include, but not be limited to, the following items:
1. An elevation view indicating elevations at top and bottom of slope, beginning and end stations, all horizontal and vertical break points, whole station points, and each level of reinforcement. Location of proposed final ground lines shall be indicated.
 2. Length, size, and type of grade of reinforcement shall be shown.
 3. Internal drainage alignment, elevations, and slope face exit points shall be shown on the elevation, plan, and cross section views.
 4. Plan view shall reflect the horizontal alignment and shall indicate the offset from the horizontal control line to the front face of the slope. All utilities, signs, lights, etc. that affect the reinforced slope shall be shown.
 5. Any general notes required for construction of the reinforced slope.
 6. Cross sections showing limits of construction fill requirements, and excavations limits.
 7. Limits and extent of reinforced soil fill volume.
- B. Typical Details of Primary and Secondary Reinforcement.
1. Facing details for erosion control.
 2. Temporary slope face support (if required).
 3. All details for construction of slope around drainage facilities, overhead sign footings and abutments shall be clearly shown.
- C. Detailed Design Computations.

1. Slope stability computations, computer output, and an explanation of analysis details within the program. If an in-house computer program was used, submit a copy of the computer program with user documentation .
 2. Cross section plots showing critical failure planes for internal, compound, and global failure modes; and a summary of the critical failure surface(s) search.
 3. Sliding stability computations.
 4. Seismic stability computations, where applicable.
 5. Tractive shear stress of all erodible surfaces and appropriate anchorage mechanism(s). (Erosion protection requirements per KCMO specification)
 6. Drainage system design computations including volume of water to be removed by the subsurface drainage system; geotextile retention, permeability, and survivability requirements based upon fill and subgrade characteristics; and maximum long-term flow of the drainage composite. (Maximum drain spacing and flow requirements per KCMO specification)
- D. The plans and design computations shall be prepared and sealed by a professional engineer, licensed according to Chapter 327. RSMo. Six sets of design drawings and detail design computations shall be submitted to the Engineer. The computations shall include a detailed explanation of any symbols and computer programs used in the design. All design and construction details will be checked by the Engineer against the preapproved design values and procedures for materials approved for use in that particular system.

1.6 CONSTRUCTION REQUIREMENTS.

- A. Delivery, storage, and handling of geosynthetic reinforcement, drainage composite, and geosynthetic erosion mat shall comply with requirements set forth in the Missouri Standards Specifications for Highway Construction.
- B. Geosynthetic reinforcement material suppliers shall provide a qualified and experienced representative on site, for a minimum of three days, to assist the contractor and KCMO inspectors at the start of construction. If there is more than one slope on a project, then criteria will apply to construction of the initial slope only. The representative shall also be available on an as needed basis, as requested by the Engineer, during construction of the remaining slope(s).
- C. All areas immediately beneath the installation area for the geosynthetic reinforcement shall be properly prepared as detailed on the plans, specified elsewhere within the specifications, or directed by the Engineer. Subgrade surface shall be level, free from deleterious materials, loose or otherwise unsuitable soils. Prior to placement of geosynthetic reinforcement, subgrade shall be proof-rolled to provide a uniform and firm surface. Any soft areas, as determined by the Engineer, shall be excavated and replaced with suitable compacted materials. Foundation surface shall be inspected and approved by the Engineer prior to fill placement. Benching the back cut into competent soil is recommended to improve stability.
- D. Geosynthetic reinforcement shall be installed within the layers of the compacted soil in accordance with the manufacturer's recommendations and as shown on the plans. Geosynthetic reinforcements are to be placed within 3 inches (75 mm) of the design elevations and extend the length as shown on the elevation view unless otherwise directed by the Engineer. Correct orientation of the geosynthetic reinforcement shall be

- verified by the contractor.
- E. Backfill shall be placed, spread, and compacted in such a manner to minimize the development of wrinkles and/or displacement of the geosynthetic reinforcement. Cohesive soils shall be compacted in a maximum loose lift thickness of 8 inches (200 mm) and granular soils in a maximum loose lift thickness of 10 inches (250 mm). Backfill shall be compacted as specified by project specifications or to at least 95 percent of the maximum density determined in accordance with AASHTO T-99, whichever is greater. Backfill shall be graded away from the slope crest and rolled at the end of each work day to prevent ponding of water on surface of the reinforced soil mass. Tracked construction equipment shall not be operated directly upon the geosynthetic reinforcement. A minimum fill thickness of 6 inches (150 mm) is required prior to operation of tracked vehicles over the geosynthetic reinforcement. Turning of tracked vehicles shall be kept to a minimum to prevent tracks from displacing the fill and the geosynthetic reinforcement. If approved by the Engineer and subject to satisfactory performance, rubber-tired equipment may pass over the geosynthetic reinforcement at speeds no greater than 10 mph (16 km/h). Sudden braking and sharp turning shall be avoided.
- F. Erosion Control Material Installation.
1. Delivery, Storage, and Handling. Contractor shall check the erosion control material to ensure that the proper material has been received. During all periods of shipment and storage, the erosion mat shall be protected from temperatures greater than 140 F (60 C), mud, dirt, and debris. Follow manufacturer's recommendations in regards to protection from direct sunlight. At the time of installation, the erosion mat/blanket shall be rejected if it has defects, tears, punctures, flaws, deterioration, or damage incurred during manufacture, transportation, or storage. If approved by the engineer, torn or punctured sections may be removed by cutting a cross section of the mat out. The remaining ends should be overlapped and secured with ground anchors. Any erosion mat/blanket damaged during storage or installation shall be replaced by the contractor at no additional cost to KCMO.
 2. On Site Representative. Erosion control material suppliers shall provide a qualified and experienced representative on site, for a minimum of one day, to assist the contractor and KCMO inspectors at the start of construction. If there is more than one slope on a project then this criteria will apply to construction of the initial slope only. The representative shall also be available on an as needed basis, as requested by the engineer, during construction of the remaining slope(s).
 3. Placement. The erosion control material shall be placed and anchored on a smooth graded, firm surface approved by the engineer. Anchoring terminal ends of the erosion control material shall be accomplished through use of key trenches. The material in the trenches shall be anchored to the soil on maximum 18 inch (450 mm) centers. (Topsoil, if required by construction drawings, placed over final grade prior to installation of the erosion control material shall be limited to a depth not exceeding 3 inches (75 mm)).
 - a. Erosion control material shall be anchored, overlapped, and otherwise constructed to ensure performance until vegetation is well established. Anchors shall be as designated on the construction drawings, with a minimum length of 12 inches (300 mm) recommended, and shall be spaced as designated on the construction drawings, with a maximum spacing of 4 feet (1.2 m) recommended.
 4. Soil Filling. If noted on the construction drawings, the erosion control mat shall be

filled with fine grained topsoil, as recommended by the manufacturer. Soil shall be lightly raked or brushed on/into the mat to fill mat thickness or to a maximum depth of 1 inch (25 mm).

G. Geosynthetic Drainage Composite.

1. Delivery, Storage, and Handling. Contractor shall check the erosion control material to ensure that the proper material has been received. During all periods of shipment and storage, the erosion mat shall be protected from temperatures greater than 140 F (60 C), mud, dirt, and debris. Follow manufacturer's recommendations in regards to protection from direct sunlight. At the time of installation, the erosion mat/blanket shall be rejected if it has defects, tears, punctures, flaws, deterioration, or damage incurred during manufacture, transportation, or storage. If approved by the engineer, torn or punctured sections may be removed by cutting a cross section of the mat out. The remaining ends should be overlapped and secured with ground anchors. Any erosion mat/blanket damaged during storage or installation shall be replaced by the contractor at no additional cost to KCMO.
2. On Site Representative. Geosynthetic drainage composite material suppliers shall provide a qualified and experienced representative on site, for a minimum of one half day, to assist the contractor and KCMO inspectors at the start of construction with directions on the use of drainage composite in conjunction with the geosynthetic reinforced soil system. If there is more than one slope on a project then this criteria will apply to construction of the initial slope only. The representative shall also be available on an as needed basis, as requested by the engineer, during construction of the remaining slope(s).
3. A geotextile flap shall be provided along all drainage core edges. This flap shall be of sufficient width for sealing the geotextile to the adjacent drainage structure edge to prevent soil intrusion into the structure during and after installation. The geotextile shall cover the full length of the core.
4. The geocomposite core shall be furnished with an approved method of constructing and connecting with outlet pipes or weep holes as shown on the plans. Any fittings shall allow entry of water from the core but prevent intrusion of backfill material into the core material.
5. Placement. The soil surface against which the geosynthetic drainage composite is to be placed shall be free of debris and inordinate irregularities that will prevent contact between the soil surface and the drain.
6. Seams. Edge seams shall be formed by utilizing the flap of geotextile extending from the geocomposite's edge and lapping over the top of the fabric of the adjacent course. The fabric flap shall be securely fastened to the adjacent fabric by means of plastic tape or non-water soluble construction adhesive, as recommended by the supplier. Where vertical splices are necessary at the end of a geocomposite roll or panel, an 8 inch (200 mm) wide continuous strip of geotextile may be placed, centering over the seam and continuously fastened on both sides with plastic tape or non-water soluble construction adhesive. As an alternative, rolls of geocomposite drain material may be joined together by turning back the fabric at the roll edges and interlocking the cuspidations approximately 2 inches (50 mm). For overlapping in this manner, the fabric shall be lapped over and tightly taped beyond the seam with tape or adhesive. Interlocking of the core shall always be made with the upstream edge on top in the direction of water flow. To prevent soil intrusion, all exposed edges of the geocomposite drainage core

shall be covered by tucking the fabric flap over and behind the core edge. Alternatively, a 12 inch (300 mm) wide strip of fabric may be utilized in the same manner, fastening it to the exposed fabric 8 inches (200 mm) in from the edge and folding the remaining flap over the core edge.

7. Repairs. Should the fabric be damaged during installation by tearing or puncturing, the damaged section shall be cut out and replaced completely or repaired by placing a piece of fabric that is large enough to cover the damaged area and provide a sufficient overlap on all sides to fasten.
8. Soil Fill Placement. Structural backfill shall be placed immediately over the geocomposite drain. Care shall be taken during the backfill operation not to damage the geotextile surface of the drain. Care shall also be taken to avoid excessive settlement of the backfill material. The geocomposite drain, once installed, shall not be exposed for more than seven days prior to backfilling.

1.7 METHOD OF MEASUREMENT.

- A. Measurement of Geosynthetic Reinforced Soil Slope Systems is on a vertical square foot (meter) basis.
- B. Payment shall cover GRSS design, materials, and installation of geosynthetic reinforcement, backfill, drainage composites, and geosynthetic erosion mat. Excavation of any unsuitable materials and requirement with select fill, as directed by the Engineer shall be paid under a separate pay item.
- C. Quantities of reinforced soil slope system as shown on the plans may be increased or decreased at the direction of the Engineer based on construction procedures and actual site conditions.

1.8 BASIS OF PAYMENT.

The accepted quantities of geosynthetic reinforced soil slope system will be paid for per vertical square foot (meter) of GRSS in place, (Geosynthetic Reinforced Slope System, square feet).

END OF SECTION

SECTION 31 37 00**RIP RAP****PART 1 - GENERAL****1.01 SCOPE OF WORK**

- A. This section governs the performance of all work necessary for construction of slope or bank protection of the type specified in the plans, constructed at locations shown on the plans or as directed by the engineer.

1.02 DESCRIPTION

- A. Rip Rap construction shall consist of furnishing all labor, materials and equipment for the complete installation of rip rap and incidentals in accordance with Contract Drawings and these specifications and as specified in American Public Works Association Standard Specifications and Design Criteria Section 2600 as revised, adopted, and provided by the Director of Kansas City, Missouri Public Works current at the time of bidding and American Public Works Association Standard Specifications.

1.03 REVISIONS OF STANDARDS

- A. In addition to complying with all pertinent codes and regulations, comply with the referenced or applicable portions of the American Public Works Association Standard Specifications and Design Criteria as revised, adopted, and provided by the director of Kansas City, Missouri Public Works current at the time of bidding.
- B. When reference is made to a Standard Specification, i.e., ASTM, ANSI, AWWA, the Specification referred to shall be understood to mean the latest revision of said specifications as amended at the time of the Notice to Bidders, except as noted on the Drawings or in the Specific Project Requirements section of these specifications.

PART 2 - PRODUCTS**2.01 MATERIALS****A. Rip Rap**

1. Rip Rap shall be sound, durable and free from cracks and other structural defects that would cause the revetment to deteriorate. The stone shall not contain any soapstone, shale or other material easily disintegrated. The stone shall be in blocks at least 12 inches thick perpendicular to the slope and shall have approximately rectangular

faces 12 inches wide or more. All stone shall weigh no less than 50 pounds, and at least 60 percent shall weigh no less than 100 pounds.

2. Stone shall consist of quarried rock and be sound, durable, and angular in shape. No more than 10 percent shall have an elongation greater than 3:1, and no stone shall have an elongation greater than 4:1. Material shall be free from cracks, seams, or other defects. Shale and stone with shale seams are not acceptable.
 - a. The minimum unit weight of the stone shall be 165 pounds per cubic foot as computed by multiplying the specific gravity (bulk-saturated-surface-dry basis, AASHTO Test T85) times 62.4 pounds per cubic foot.
 - b. Not more than 10 percent of the stone shall exhibit splitting, crumbling, or spalling when subject to 5 cycles of the sodium sulfate soundness test in accordance with ASTM C 88.
- B. Filter Blanket: Filter blanket shall be installed as shown on the contract drawings.
1. Filter Fabric: Filter fabric shall consist of woven or nonwoven fabric. The synthetic fiber of either the woven or nonwoven fabric shall consist of polypropylene, nylon, or polyester filaments. The percent open area shall be not less than 4 percent nor more than 10 percent. The cloth shall provide an Equivalent Opening Size (EOS) no finer than the U.S. Standard Sieve No. 100. In addition, filter fabric shall meet the following physical requirements:
 - a. Tensile Strength: Minimum grab tensile strength, both warpwise and fillingwise, shall be 200 pounds when tested in accordance with ASTM D 5034, using a 4-inch by 6-inch specimen and a jaw speed of 12 inches per minute.
 - b. Tear Strength: Minimum trapezoid tear strength shall be 100 pounds, both warpwise and fillingwise. Method of test for woven fabrics shall be in accordance with ASTM D 4533.
 - c. Bursting Strength: Minimum bursting strength shall be 400 psi when tested in accordance with ASTM D 3887.
 - d. Seam Strength: Woven fabric shall have a minimum seam-breaking strength of 180 pounds when tested in accordance with ASTM D 1683, using a jaw speed of 12 inches per minute.
 - e. Width: Filter fabric shall be furnished in widths of not less than 6 feet.

PART 3 - EXECUTION**3.01 CONSTRUCTION**

- A. Foundation Preparation: After completion of grading in accordance with Section 31 22 00, the area to receive rip rap shall be trimmed and dressed to conform to the cross sections indicated on the drawings within a tolerance of plus or minus 1 inch from the theoretical slope lines and grades. All deleterious materials shall be removed from the foundation area.
- B. Filter Fabric
1. Place filter fabric with its long dimension horizontal and lay free of tension, stress, folds, wrinkles, or creases.
 - a. Place to provide 18 inches minimum overlap at each joint and anchor to prevent dislocation during construction of overlaying material.
 - b. Fabric shall not be left exposed more than two weeks prior to placement of overlaying material. Tracked or wheeled equipment or vehicles shall not be operated on the fabric.
- C. Riprap Placement: Riprap shall be placed on the prepared foundation in a manner which will provide a reasonably well-graded mass of stone with the minimum practicable percentage of voids.
1. The entire mass of stone shall be placed so as to be in conformance with the lines, grades, and thickness indicated. A filter blanket of filter fabric conforming to Section 2.01 D. entitled "Filter Fabric," shall be constructed under all riprap. Riprap shall be placed to full-course thickness in one operation and in such a manner as to avoid displacing the fabric. The Contractor shall place the riprap in such a way as to not tear, puncture, or shift the fabric. Riprap shall not be dropped more than 3 feet when being placed directly on the fabric. Tears or rips in the fabric shall be repaired with fabric lapped a minimum of 12 inches in all directions.
 - a. Placing: Placing of riprap in layers, or by dumping into chutes, or by similar methods likely to cause segregation will not be permitted.
 - b. Distributing: The larger stones shall be well distributed and the entire mass of stone shall conform to the specified gradation. All materials shall be so placed and distributed that there will be no objectionable accumulations of either the larger or smaller sizes of stone.
 - c. Hand Placing: It is the intent of these specifications to produce a fairly compact riprap protection in which all sizes of material are placed in their proper proportions. Hand placing or rearranging of individual stones by mechanical equipment may be required to the extent necessary to secure the specified results.

2. The slopes shall be compacted to a uniform density as required for adjacent material. The revetment shall be started in a trench below the toe of the slope or at the back face of wall and shall progress upward. Each stone shall be laid perpendicular to the slope, shall be firmly bedded against the slope and against adjoining stones, and shall be laid with well-broken joints. Only one layer of stone perpendicular to the slope will be permitted. After revetment has been placed, the voids shall be filled with spalls or small stones in such a manner that all revetment stones are tightly wedged. The finished surface shall present a uniform appearance true to line, grade and section.

END OF SECTION 31 37 00

SECTION 31 41 00**SHORING****PART I - GENERAL****1.1 SUMMARY**

- A. Description: This Section specifies requirements and performance procedures for the design, furnishing, installing, and maintaining temporary sheeting, shoring, bracing, or other excavation supports required for excavation below the existing grade and the protection of existing structures, pavements, and railroad tracks adjacent to the Work, and their removal during and after construction of the Work.

1.2 REFERENCED STANDARDS AND DOCUMENTS

<u>Sponsor</u>	<u>Number</u>	<u>Subject</u>
ASTM	A 36	Standard Specification of Carbon Structural Steel
ASTM	A 328	Standard Specification for Steel Sheet Piling
ASTM	A 572	Standard Specification for High-Strength Low-Alloy Columbium-Vanadium Structural Steel
AWPA	T 1	Processing and Treatment Standard
AREMA		Manual of Railway Engineering
OSHA	Title 29	Safety and Health Regulations for Construction, Part 1926

1.3 REGULATORY REQUIREMENTS

- A. Protection and safety: Pursuant to the requirements of the United States Department of Labor Occupational Safety and Health Administration (OSHA), and the Missouri Labor and Industrial Relations Commission, all open excavations greater than 5 feet in depth shall be constructed with bracing, sheeting, shoring or other equivalent method designed for the protection of life and limb. The trench excavation and support system shall comply in all respects with the requirements of OSHA and the Missouri Labor and Industrial Relations Commission Regulations.
- B. Certification: The minimum required protection shall be that described in the Construction Standards of the Missouri Labor and Industrial Relations Commission. If the Contractor uses excavation plans that vary from the shoring system standards established by the Construction Standards, the plans shall be prepared and signed by a licensed civil engineer registered in the State of Missouri.

1.4 SUBMITTALS

- A. Submittals shall be made in accordance with the requirements of the Project Quality Plan, except as modified herein:
- B. Detailed shop drawings, design calculations and installation procedures of an excavation

support system meeting the requirements of all applicable standards and regulations of local, state, and federal agencies having jurisdiction.

1. No plan shall allow the use of shoring, sloping or a protective system less effective than that required by the Construction Safety Orders of the Division of Occupational Safety and Health. If the plan complies with the shoring system standards established by the Construction Safety Orders, the plan shall be submitted at least 5 days before the Contractor intends to begin excavation for the trench. If the plan varies from shoring system standards established by the Construction Safety Orders, the plan shall be prepared and signed by an engineer who is registered as a Civil Engineer in the State of Missouri and the plan and design calculations shall be submitted at least 3 weeks before the Contractor intends to begin excavation for the trench.
 2. Plans of the shoring details for excavations on or affecting railroad property will be reviewed for adequacy of protection provided for railroad facilities, property and traffic. Those plans shall be submitted at least 12 weeks before the Contractor intends to begin excavation requiring the shoring. Approval by the Engineer of the plans for the shoring details will be contingent upon the plans being satisfactory to the railroad company involved.
- C. Dewatering system in conformance with the requirements stipulated in Section 31 23 19 Construction Dewatering.
- D. Instrumentation program to monitor the excavation support system and adjacent structures for movement, stability, effectiveness, and settlement. List the type, brand, quantity, and model number of the instrument to be deployed, proposed locations, and manner of installation. Include record forms and record frequency and remedial measures in case of emergency in the program. The recorded data shall be transmitted to the Engineer within 7 calendar days of the recorded activities.
- E. As part of the design, the Contractor shall prepare an action plan for each measured parameter indicating what is considered to be "normal" behavior so abnormalities may be recognized. The action plan shall indicate the limiting magnitudes and modes of acceptable ground behavior, or hazard warning level, that will require remedial action if these limits are exceeded. The action plan shall include appropriate remedial or contingency activities required when the hazard warning level for any measurement is exceeded.
- F. When the construction sequence of structures requires the transfer of bracing to the completed portions of any structure, the Contractor shall submit request to secure written acceptance from the Engineer prior to the installation of such bracing.
- G. Submittals shall be signed by a professional civil engineer currently licensed and registered in the State of Missouri.

1.5 QUALITY CONTROL

- A. Quality control shall be made in accordance with the General Provisions, except as modified herein.
- B. Protect all utilities, structures and facilities from damage caused by settlement, lateral movement, undermining, washout, and other hazards created by excavation and backfill operations.
- C. Excavation support systems shall be designed for surcharge loads from construction

equipment, excavation spoil, storage, tracks, structures and appropriate seismic loads. The excavation supports shall provide adequate protection against lateral movement or settlement of the existing structures, above and below grade, and tracks adjacent to the Work.

- D. Qualifications:
1. The Contractor shall have a minimum of 3 years proven experience in providing the types of excavation support system proposed for the project.
 2. The design engineer shall have a minimum of 3 years proven experience in the design of the type of excavation support system proposed for the project in similar magnitude and soil conditions.
- E. The Contractor shall be solely responsible for any and all liabilities that may arise from his failure to provide adequate excavation supports as necessary to support the excavation under any or all of the conditions of loading that may exist or arise during the construction.

1.6 SUBSURFACE CONDITIONS

- A. The reports on the soil and subsurface conditions are available for examination in the Engineer's office. Soil conditions between borings and soundings may vary in an irregular manner. The Engineer assumes no responsibility for any such variations that may exist, nor for any deductions or conclusions the Contractor may make from information made available by the Engineer.
- B. The Contractor shall be responsible for performing any additional investigations, testing, or analyses required for the design of the excavation support system.

1.7 SITE CONDITIONS

- A. The Contractor's design engineer shall visit the site to evaluate existing conditions, including access, nature and extent of existing improvements, and other factors that may affect the work under this section.

PART II - PRODUCTS

2.1 SHORING SYSTEMS

- A. General: any proven systems of internal shoring or bracing that are compatible with site conditions.
- B. Materials: Materials for excavation support systems shall be new, or in good condition as determined by the Contractor's design engineer.
- C. In areas where groundwater table is at least 2 ft below the excavation bottom, timber lagging with rail piles may be used, while in areas with higher groundwater table, a watertight support system should be selected.

2.2 MATERIALS

- A. Steel H Piles: ASTM A36.
- B. Timber Lagging: Treated Douglas Fir (1250 psi) conforming to AWPA T1.

- C. Steel Sheet Piling: ASTM A328 or ASTM A572, Grade 50.

2.3 INSPECTIONS

- A. The Engineer may perform periodic inspections of the excavation support system, but such inspections shall in no way relieve the Contractor of responsibility under the terms of the Contract.
- B. The Contractor's design engineer shall perform inspections of the installation and operation of the excavation support system to assure that site conditions are consistent with those assumed in the design and that the system is functioning accordingly.

PART III - EXECUTION

3.1 CONTRACTOR'S RESPONSIBILITY

- A. Assess the extent and nature of excavation support required in the Work. There may be situations where shoring components may have to be left in place after the construction.
- B. Perform site reconnaissance survey and collect available record drawings of existing structures, rail tracks, and utilities for conditions and limitations which may influence the Work required by this Section.

3.2 SHEETING, SHORING AND BRACING

- A. Excavations shall be properly and adequately shored or braced to provide safe and acceptable working conditions, protect existing and new structures, protect existing roads and tracks, and maintain existing slopes and fills. The temporary sheeting, shoring, or bracing shall not place any stress on portions of the completed work until the construction thereof has proceeded far enough to provide adequate strength.
- B. Where required for safety and governing laws, or as directed by the Engineer, temporary sheeting shall be left in place. In such instances, remove original braces and re-brace sheeting against structure as approved by the Engineer. Sheeting shall be cut off a minimum of 2 feet below existing grade unless otherwise directed by the Engineer.
 - C. Where Contractor elects to slope sides of excavations, backfill of over-excavated areas shall be made in same manner specified for adjacent excavated area. All additional backfills shall be at Contractor's own expense.

3.3 COFFERDAMS

- A. Cofferdams for foundation construction shall be carried well below the bottom of the footings and shall be well braced and as watertight as practical. The interior dimensions of cofferdams shall provide sufficient clearance inside the wales for constructing forms and driving piles and to permit pumping outside the forms.
- B. If in the judgment of the Contractor, the clearance provided on the plans between the outside line of the footing and any pile or interior wall or surface is not sufficient to permit the driving of piles or building of forms, the Contractor may provide the necessary clearance by constructing the cofferdam sufficiently large to provide such clearance as the Contractor may deem necessary. Any enlargement in excess of 2 foot outside the dimensions of the footing as shown on the plans shall be considered as being for the sole purpose of expediting the work of the Contractor, and the quantities of any additional

excavation and backfill will not be included in the quantities to be paid for.

- C. Cofferdams which are tilted or moved out of position by any cause during the process of sinking shall be righted or enlarged so as to provide the necessary clearance and proper pier location, and that work shall be done by the Contractor at the Contractor's expense.
- D. No shoring will be permitted in cofferdams which will induce stress, shock or vibration in the permanent structure.
- E. When permitted by the Engineer, cross struts or bracing may extend through foundation concrete. Struts or bracing below low water will be permitted to remain in place, except in navigable streams or when shown on the plans, to be removed. Struts or bracing above low water shall be removed and the resulting space filled with concrete of the same mix as that specified for the surrounding concrete.

3.4 STABILITY OF EXCAVATIONS

- A. Provide safe and stable excavations for protection of workers and for protection of structures in the vicinity of excavations from any damage due to movement and settlement of soils and alterations in the ground water level.

The above provision is to complement, and not to substitute or diminish, the obligations of the Contractor for the furnishing of a safe place of work pursuant to the current provisions of Missouri/OSHA specified herein.

- B. Shoring shall be provided at all locations as defined below:
 - 1. Excavation is 5 ft or deeper.
 - 2. Excavated face or surrounding soil mass may be subject to slides, caving, flow or boiling.
 - 3. Stability or integrity of new and existing structures and other improvements may be compromised by ground settlement or movement.
 - 4. In areas shoring methods are not deployable, use alternative soil stabilization measures subject to Engineer's review and approval.
- C. Design Calculations:
 - 1. Design calculations shall describe clearly the assumptions made, the criteria followed, and the stress values used for the various materials and methods.
 - 2. Design calculations shall include acceptable references substantiating the appropriateness of the design assumptions, criteria, and stress values.
- D. Design Criteria:
 - 1. Excavation supports shall be designed in accordance with accepted engineering design practice. Design shoring of excavations for Cooper E80 live load surcharge, in areas as applicable.
 - 2. Construction equipment load and storage load shall be considered as appropriate.
 - 3. Design involving materials other than steel shall be in accordance with the IBC

- (International Building Code) and other referenced standards. The most restrictive standards shall apply.
4. Design shall be made in accordance with soil characteristics and engineering parameters derived from Contractor's own geotechnical exploration with referenced information contained in other soil reports prepared for the project.
 5. Limit movement at and behind the shoring to less than 2-inch vertically and horizontally.
 6. Limit vertical settlement and horizontal movement of existing structures, buildings, and utilities to less than 1-inch.
 7. Limit vertical settlement and horizontal movement of tracks in the vicinity of excavation to one inch or a level acceptable to the rail operation company. Coordinate with the operation company to establish the acceptable criteria prior to commencement of any excavation work.
 8. Design shall take into account dewatering activities inside and outside of the excavations.
- E. Strictly follow shoring installation sequence stipulated in the approved shop drawings and design calculations. Alteration to the sequence is permitted only with written consent from the Engineer.
1. Preventing soil loss through or under the shoring. The shoring shall be tight enough to prevent loss of soil and shall be extended deep enough to prevent heave or flow of soil from the supported soil mass into the excavation.
 2. Providing surface runoff path and discharge away from the excavations.
 3. Stabilizing the groundwater level as necessary. Performing dewatering, when necessary, in such a manner as to prevent settlement in the excavation and in the surrounding area in compliance with the requirements specified in Section 31 23 19 Dewatering, and as specified herein.
 4. Prior to shoring installation, establishing control points in accordance with accepted submittal, and monitoring the shoring systems thru installation and entire construction, until their removal.
 5. Not applying shoring loads to structures and other improvements.
 6. Not changing existing soil loading on structures and other improvements without the prior approval of the Engineer.
- F. Maintenance:
1. Where loss of soil occurs, the Contractor shall plug the gap in the shoring and shall replace the lost soil with suitable fill material.
 2. Where measurements and observations indicate the possibility of failure of the excavation, Contractor shall take appropriate action immediately, and shall report to the Engineer in writing.

3.5 TESTS AND INSPECTIONS

- A. Record and evaluate the observation data, both horizontal and vertical movements of shoring control points. Monitoring the shoring systems in accordance with the accepted submittals. Provide round-the-clock monitoring of shoring systems if severe weather conditions so require.
- B. Submit to the Engineer weekly reports on accepted forms, plus a final report on the status of the complete shoring system.

3.6 REMOVAL

- A. Maintain the shoring and dewatering systems until they are no longer needed. Obtain Engineer's concurrence first.
- B. Upon removal of the support systems, backfill per Section 31 22 00, patch any gaps in permanent structures where shoring members were located, and fill holes left by geotechnical exploration and instrumentations. Dispose rubbish materials off the site.
- C. Sheet piling and timbers, if used in the excavation supports, shall be withdrawn in a manner so as to prevent subsequent settlement of the ground. Sheeting left in place shall be at least 2 ft below the ground.

PART 4 - MEASUREMENT

- 4.1 Measurement** – No Separate measurement will be made for Work described in this Section.

PART 5 - PAYMENT

- 5.1 Payment** – No separate payment will be made for shoring. All costs pertaining thereto shall be included in the Contract Unit Prices for other items as listed in the Bid Form-Unit Prices.

END OF SECTION

SECTION 31 63 29
DRILLED PIERS**PART 1 - GENERAL****1.1 SUMMARY**

- A. Furnish all labor, materials, tools, equipment, and services for Drilled Piers, as indicated, in accordance with provisions of Contract Documents.
- B. Definitions:
 - 1. Geotech: Representative of soils and foundation consultant hired by Owner to inspect pier installation.
 - 2. Obstruction: Unanticipated, unnatural, man made object projecting within pier shaft, greater than 0.03 m³ 1 CU FT in size, which cannot be drilled by use of normal earth drilling techniques and tools; an obstruction does not include cobbles, boulders, bedrock seams or naturally deposited material which may require a rock auger for removal.
 - 3. Rock excavation: Removal of natural material which has a production rate less than 610 mm 2 FT per HR with an earth auger or underreaming tool in good condition using a drill rig with a rated for the geotechnical conditions expected at the site.
 - 4. Caisson: Terms caisson and drilled pier are intended to mean one and the same and may be used interchangeably herein.
 - 5. Bearing strata:
 - a. Bearing layer, material or zone identified in soils report as capable of providing stated bearing capacities.
 - b. Geotech is sole judge as to when bearing strata is reached.
- C. Completely coordinate with work of other trades.

1.2 QUALITY ASSURANCE

- A. Subsurface soils investigations have been made at project site:
 - 1. Soils information was obtained for use in preparing foundation design.
 - 2. Availability of soils information is indicated in specifications.
 - 3. Examine site and soils report and determine character of materials to be encountered.
 - 4. Additional test borings and other exploratory operations may be made, provided such operations are acceptable to Architect.
- B. Installer qualifications: Minimum of 3 years' experience in drilled pier work, including experience with similar work and similar sub-surface conditions.
- C. Layout and measurement of piers, required for work and for specified reports, performed by a licensed surveyor employed by Contractor.
- D. Facilitate inspection by Geotech of pier excavation prior to concrete placement.
- E. Minimum bearing value of material at bottom of piers and bearing stratum as defined on the drawings.
- F. Testing:
 - 1. Routine testing of concrete for compliance with Contract Documents will be paid for by the Contractor.
 - 2. Pay for testing by independent testing agency necessary to secure initial materials and mix design approval.
 - 3. Provide sufficient notification of concrete placement, access for testing agency, concrete for testing and adequate storage facilities for test cylinders.

4. Pay for additional testing required by Architect in order to evaluate piers failing to meet requirements of Contract Documents.

G. Tolerances:

1. Plumbness: Measured from center of hole: Not more than 1 percent of shaft length, or 12-1/2 percent of shaft diameter, whichever is less.
2. Location of shaft at cut-off elevation: Not more than 50 mm 2 IN.
3. Diameter: Not less than specified.

1.3 SUBMITTALS

A. Shop Drawings:

1. Reinforcing drawings per section 03 20 00 Concrete Reinforcement

B. Product Data:

1. Concrete Mix Designs per section 03 31 00 Concrete Materials and Proportioning
2. Material certificates for permanent casing materials

C. Project Information:

1. Names of three past successful installations under similar conditions.
2. Concrete: Comply with Section 03 31 00.
3. Report for each pier:
 - a. Pier location by column grid lines.
 - b. Date and time of starting and completing excavation noting periods of delay for obstructions.
 - c. Bottom elevation of pier.
 - d. Cut-off elevation of pier.
 - e. Total length of pier from bottom to cut-off elevation.
 - f. Depth drilled into bearing stratum.
 - g. Diameter of pier shaft including variations from design.
 - h. Pier location at top and bottom of shaft, and verification of plumbness and location tolerances.
 - i. Description of soil materials and bearing capacity
 - j. Signature of Geotech that excavation was inspected and approved for concrete placement.
 - k. Corresponding concrete test cylinder numbers (obtain from testing agency).
 - l. Unusual conditions encountered including but not limited to;
 - 1) Groundwater conditions and infiltration rate depth and pumping.
 - 2) Descriptions, locations and dimensions of obstructions and removal thereof.
 - 3) Properties of slurry and slurry tests at time of slurry placement per ACI 336.1 should slurry be required.

1.4 BASE BID PRICE ADJUSTMENT

- A. Base bid shall be for lengths, size and volume derived from the structural drawings.
- B. Adjustment of contract price will be made on basis of unit prices included on proposal form times variation between total accumulated installed length and base bid length of piers as scheduled for each diameter and material.
- C. No adjustments will be made for variation in lengths of individual piers.
- D. Base bid shall anticipate and include drilling required above top of caisson elevation.
- E. No adjustment of contract price will be made for variations in type or length of material encountered above top of caisson.
- F. No adjustment of contract price will be made for frequency of auger and bit changes required for changes in material.
- G. Measurement of length:

1. Measure lengths between bottom and top of caisson as detailed and defined on plans.
2. Measure length of rock drilling and earth drilling as identified herein and established by Engineer in field.
3. Do not include volume resulting from over drilling.
4. Do not include rejected piers.
5. Include obstructed piers and replacement piers for obstructed piers.

PART 2 - PRODUCTS

2.1 MATERIALS

- A. Concrete:
 1. Conform to Section 03 31 00.
 2. Do not use concrete which has had water added more than one hour before placement.
- B. Reinforcing steel:
 1. Conform to Section 03 20 00.
 2. Dimensions as indicated.
- C. Concrete admixtures: As permitted in Section 03 31 00.
- D. Casings (when required):
 1. Steel cylinders.
 2. Wall thickness as required for loads.
 3. Weld sections together, watertight.
 4. Loose section for cleaning and inspection of pier bottom.
 5. Extend to bottom of straight pier or to top of bell, unless otherwise approved.

PART 3 - EXECUTION

3.1 LAYOUT

- A. Locate piers as indicated.

3.2 INSTALLATION

- A. Perform both excavation and concrete placement for a pier on same day.
- B. Perform work with Hughes LDH or equivalent heavy duty pier drilling rig, maintained in satisfactory working condition, operated by competent and experienced person.
 1. Provide qualified, experienced, and direct supervision in field for pier drilling, and concrete filling of piers.
 2. Use loose safety casing whenever man is in hole.
 3. Provide other required safety procedures.
- C. Provide piers with straight shaft with or without belled bottoms as indicated.
 1. Size and cut to accurate dimensions according to sizes and elevations indicated.
 2. Hand clean bell or shaft to satisfaction of soils consultant.
 3. Cover excavation between operations.
 4. Remove foreign and loose material from approved excavation.
- D. Install a 50 mm 2 IN diameter pneumatically drilled probe hole for inspection of rock continuity in each caisson after potential bearing strata is reached.
- E. Depth of probe hole smaller than 1.5 times caisson diameter or 3050 mm 10 FT.
- F. Approximate pier bottom elevations may be indicated as a guide for Contractor.

- G. Actual depth of pier determined at time of drilling by Geotech.
- H. Report underground obstructions to Geotech.
 - 1. When directed by Geotech, remove obstruction as extra work.
 - 2. Fill shaft with concrete when Geotech determines obstruction cannot be removed.
 - 3. Provide replacement pier or piers as directed by Geotech.
- I. At no additional cost, case pier shafts as necessary, to prevent caving and to shut off flow of ground water.
- J. Belling in a dry shaft below casing.
- K. Maintain excavations in essentially dry condition, using pumps where necessary.
- L. Have pier inspected by Geotech prior to placing concrete.
- M. Provide safety casing for cleaning and inspection.

3.3 REINFORCEMENT

- A. Place steel reinforcing cage in pier hole after inspection and approval of excavation and subgrade.
- B. Adequately support reinforcement to assure concentric alignment and adequate concrete cover over reinforcing.
- C. Place dowels and/or anchor bolts extending from top of pier prior to final concrete placement.

3.4 CONCRETE PLACEMENT

- A. After approval and placement of reinforcing steel, place concrete as soon as possible.
- B. Place in manner to preclude segregation, infiltration of water, or other occurrence which would tend to decrease strength of concrete or supporting capacity of finished pier.
- C. Place concrete in such a manner so as to limit free fall to 1220 mm 4 FT, unless it can be satisfactorily demonstrated that concrete may free fall without segregation and/or striking sides of excavation or reinforcing.
 - 1. If excavation contains more than 150 mm 6 IN of water, use tremie method to place concrete.
 - 2. Use tremie between 205 and 305 mm 8 and 12 IN diameter.
 - 3. Provide positive control to insure that bottom of tremie pipe is at all times at or below concrete surface.

3.5 WITHDRAWAL OF CASING

- A. When pulling casing, maintain level of concrete above bottom of casing greater or equal to level of ground water.
 - 1. Keep bottom of liner at least 3050 mm 10 FT below top of concrete.
 - 2. Prevent insitu materials from falling into and mixing with concrete.
- B. Pull casing in short slow vertical lifts (essentially continuous), maintaining plumb, and sufficient head of concrete.
- C. Allow continuous observation of interior level of concrete.
- D. If reinforcing is not required, vibrate only top 4570 mm 15 FT of concrete.
- E. If reinforcing steel is used, vibrate full height of reinforcing or 4570 mm 15 FT, whichever is greater.

3.6 REJECTED PIERS

- A. Replace rejected piers.

- B. Piers may be rejected for following reasons:
 - 1. Concrete not reaching minimum 28 day design strength.
 - 2. Piers out of horizontal and vertical alignment, in excess of tolerances indicated.
 - 3. Piers of improper size and depth.
 - 4. Installation not complying with specifications.
- C. Pay for additional engineering work required for redesign due to rejected piers.

END OF SECTION

SECTION 31 66 13.15**RAMMED PIER GROUND IMPROVEMENT****PART 1 - GENERAL****1.1 SUMMARY**

- A. Rammed pier ground improvement is required below retaining walls for this project to improve bearing capacity and reduce settlement. Work under this section shall consist of designing, furnishing and installing rammed pier ground improvement for the structures indicated and as specified herein. The rammed piers shall be high modulus columns of compacted aggregate for support of foundation loads.
- B. Related Work Specified Elsewhere
 - 1. Site Preparation and Earthwork: SECTION 31 22 00

1.2 WORK INCLUDED

- A. Provide all equipment, material, labor, and supervision to design and install rammed piers.
- B. The rammed pier design and installation shall adhere to all methods and standards described in this Specification.
- C. Layout of rammed piers, spoil removal, dewatering, footing excavations, subgrade preparation following rammed pier installation, and all other associated work is included.

1.3 QUALIFICATIONS

- A. Contractor shall have a minimum of 5 years of experience with the installation of rammed pier systems and shall have completed at least 10 projects of a similar scope and nature.
- B. At the time of bid, submit a qualification statement demonstrating the required experience.

1.4 REFERENCES

- A. Modulus Testing
 - 1. ASTM D 1143 – Standard Test Method for Deep Foundations Under Static Axial Compressive Load
 - 2. ASTM D 1194 – Standard Test Method for Bearing Capacity of Soil for Static Load and Spread Footings
- B. Materials
 - 1. ASTM D 1241 – Standard Specification for Materials for Soil-Aggregate Subbase, Base, and Surface Courses
 - 2. ASTM D 422 – Standard Test Method for Particle-Size Analysis of Soils

1.5 SUBMITTALS AND CONSTRUCTION RECORDS

- A. Building Code Acceptance – Contractor shall demonstrate that their proposed rammed pier system has been evaluated by the International Code Council (formerly ICBO).
- B. Modulus Test Reports – Perform a minimum of one (1) modulus test on a non-production rammed pier element and additionally as required by Contractor to verify the design assumptions. Contractor shall furnish Engineer a description of the installation equipment, installation records, complete test data, analysis of the test data and verification of the design parameter values based on the modulus test results. The report shall be prepared under direction of a Registered Professional Engineer in the State of Missouri. Report shall be submitted to Owner within 2 days of test completion and a minimum of 3 days prior to start of production work.
- C. Daily Rammed Pier Progress Reports – Furnish daily a complete and accurate record of rammed pier installation to Owner. The record shall indicate the pier location, length, volume of aggregate used, number of lifts, densification forces during installation, and final elevations or depths of the base and top of piers. The record shall also indicate the type and size of the installation equipment used, and the type of aggregate used. Immediately report any unusual conditions encountered during installation to Owner.
- D. Design Submittal - Contractor shall submit detailed design calculations, construction drawings, and shop drawings, (the Design Submittal), for review by Owner and Engineer at least 3 week(s) prior to the beginning of construction. A detailed explanation of the design parameters and calculations that demonstrate that the required allowable bearing capacity and settlement tolerances are met for settlement calculations shall be included in the Design Submittal . Provide a detailed installation sequence, procedure and proposed schedule. Additionally, the quality control test program for rammed pier system, meeting these design requirements, shall be submitted. All calculations and drawings shall be prepared and sealed by a Professional Engineer, licensed in the State of Missouri.

1.6 RAMMED PIER DESIGN

- A. The design of the rammed pier system shall be based on the service load bearing pressure and the allowable total and differential settlement criteria indicated.
- B. The rammed pier system shall be designed in accordance with generally-accepted engineering practice.
- C. The design life of the structure shall be 50 years.
- D. The rammed pier system shall be designed to preclude plastic bulging deformations at the top of pier at the design stress and to preclude significant tip stresses as determined from the shape of the telltale test curve from telltales installed in modulus test piers.
- E. The rammed pier elements shall be designed using a rammed pier stiffness modulus to be verified by the results of the modulus test described in PART 3 of these specifications.

PART 2 - PRODUCTS

2.1 AGGREGATE

- A. Aggregate for pier construction shall demonstrate suitable performance during modulus testing. Aggregate shall consist of Type 1, Gradation B in accordance with ASTM D-1241 and ASTM D-422, or No. 57 stone.

- B. Aggregate used for piers constructed below the water table shall be Type 1 Gradation B, except that particles passing the No. 40 sieve shall be eliminated. Alternatively, No. 57 stone may be used.
- C. Potable water or other suitable source may be used to increase aggregate moisture content where required.

PART 3 – EXECUTION

3.1 SITE PREPARATION AND PROTECTION

- A. Locate and protect underground and aboveground utilities and other structures from damage during installation of the rammed piers.
- B. Site grades for rammed pier installation shall be within one foot of the top of footing elevation or finished grade elevation to minimize rammed pier installation depths.
- C. Establish and maintain a working surface to provide wet weather protection of the subgrade and to provide access for efficient operation of the rammed pier installation.
- D. Prior to, during and following rammed pier installation, provide positive drainage to protect the site from wet weather and surface ponding of water.
- E. Spoil removal from the rammed pier work area shall be performed in a timely manner to prevent interruption of rammed pier installation. Stockpile spoil materials on site at a location designated by Owner.

3.2 INSTALLATION PROCEDURES

- A. The installation method used for rammed pier construction shall be that used in the construction of the successful modulus test.
- B. The location of rammed pier-supported foundations for this project, including layout of individual rammed pier elements, shall be marked in the field using survey stakes or similar means. Rammed piers shall be installed to within 6 inches of required locations.
- C. Rammed piers shall be installed to an undisturbed, competent, and native soil layer or bedrock.
- D. Rammed piers shall be pre-augered using mechanical drilling or excavation equipment.
- E. If cave-ins occur during excavation such that the sidewalls of the hole are deemed to be unstable, temporary steel casing shall be used to stabilize the cavity.
- F. Aggregate shall be placed in the augered cavity in loose lift thicknesses as determined by Contractor, but in no case greater than 24 inches in thickness.
- G. Should cave-ins occur on top of a lift of aggregate such that the volume of the caved soil is greater than 10 percent of the volume of the aggregate in the lift, then the aggregate shall be considered contaminated and shall be removed and replaced with uncontaminated aggregate.
- H. Special high-energy impact densification apparatus shall be employed to densify the rammed pier elements during installation. The apparatus shall apply direct downward impact energy to each lift of aggregate.

- I. A minimum tamper energy level of 250,000 foot-pounds of force per minute shall be applied by the energy source.
- J. Downward pressure shall be applied to the tamper shaft during tamping.
- K. Each lift of aggregate shall be tamped for a minimum of 15 seconds.
- L. Excavations for Obstructions
 - 1. Should any obstruction be encountered during rammed pier installation, promptly remove such obstruction and continue with installation of the pier, or the pier shall be abandoned and relocated as directed. Obstructions include, but are not limited to, boulders, timbers, concrete, bricks, utility lines, etc., which shall prevent placing the piers to the required depth, or shall cause the pier to drift from the required location.
 - 2. Dense natural rock or weathered rock layers shall not be deemed obstructions, and piers shall be terminated on such materials.
- M. Contractor shall provide a full-time Quality Control technician on-site during the installation process

3.3 REJECTED RAMMED PIERS

- A. Rammed pier elements installed beyond the maximum allowable tolerances or otherwise not in accordance with this specification shall be abandoned and replaced with new piers. All material and labor required to replace rejected piers shall be provided at no additional cost to the Owner, unless the cause of rejection is due to an obstruction.

3.4 RAMMED PIER MODULUS TEST

- A. A minimum of one (1) Modulus Test shall be completed at a mutually agreed upon location. If additional tests are needed to verify the design, submit proposed locations for those additional tests. Test procedures shall utilize appropriate portions of ASTM D 1143 and ASTM D 1194. Rammed piers shall be tested to 150 percent of the maximum design stress as shown in the rammed pier design submittal. The rammed piers for modulus tests shall be of the type and installed in a manner specified herein. Contractor shall notify the Owner of the date of testing at least 1 week before testing is to occur.
- B. A telltale shall be installed at the bottom of the test pier so that bottom-of-pier deflections may be determined. Acceptable performance is indicated when the bottom of the pier deflection is no more than 30% of the top of pier deflection at the design stress level.
- C. ASTM D-1143 general test procedures shall be used as a guide to establishing load increments, load increment duration, and load decrements. As a minimum, the following loading increments, decrements and duration shall be used.

<u>Increment</u>	<u>Approximate Load (percent design)</u>	<u>Minimum Duration (min)</u>	<u>Maximum Duration (min)</u>
Seat	5	0	N/A
1	15	15	60
2	30	15	60
3	45	15	60
4	60	15	60
5	75	15	60
6	90	15	60
7	105	15	60
8	120	15	60
9	135	15	60
10	150	60	120
11	112.5	5	N/A
12	75	5	N/A
13	37.5	5	N/A
14	0	5	N/A

- D. With the exception of the load increment representing approximately 150% of the design maximum top of rammed pier stress, all load increments shall be held for a minimum of 15 minutes. Loads shall be maintained until the rate of deflection reduces to 0.01 inch per hour or for a maximum of 1 hour, whichever is occurs first.
- E. The load increment that represents approximately 150% of the design maximum stress on the rammed pier shall be held for a minimum of 60 minutes. Loads are then maintained until the rate of deflection reduces to 0.01 inch per hour or for a maximum of 2 hours, whichever occurs first.
- F. A seating load equal to 5 percent of the total load shall be applied to the loaded steel plate prior to application of load increments and prior to measurement of deflections to compensate for surficial disturbance.
- G. Contractor shall monitor the modulus test pier installation and testing and shall provide and install for testing all dial indicators and other measuring devices required.

3.5 BOTTOM STABILIZATION TESTING (BSTs) / CROWD STABILIZATION TESTING (CSTs)

- A. Bottom stabilization testing (BSTs) or Crowd stabilization testing (CSTs) shall be performed by the Quality Control Technician during the installation of the modulus test pier. The tests are performed by applying downward vertical energy to the tamper, mandrel or probe following lift construction and monitoring the amount of additional deflection from the applied energy. Additional testing as required by the Rammed Pier Designer (typically 10% of the production rammed piers) shall be performed on selected production rammed pier elements to compare results with the modulus test pier.

3.6 QUALITY CONTROL MONITORING

- A. Contractor shall have a full-time, on-site Quality Control Technician to verify and report all installation procedures to verify that the production practices meet the design assumptions and are similar to those used during installation of the modulus test elements.

- B. Contractor shall immediately report any unusual conditions encountered during installation to the Owner. The quality control procedures shall include the preparation of Rammed Pier Progress Reports completed during each day of installation containing the following information:
1. Structure and rammed pier location/number.
 2. Pre-auger diameter and soil conditions encountered during drilling.
 3. Type of aggregate used.
 4. Rammed pier length.
 5. Planned and actual rammed pier elevations at the top and bottom of the rammed pier.
 6. Average lift thickness of each rammed pier.
 7. Tamping time for each lift.
 8. Volume of aggregate used in each rammed pier.
 9. Documentation of any unusual conditions encountered.
 10. Type and size of densification equipment used including densification forces during installation.
- C. Perform Dynamic Cone Penetration testing to evaluate the footing bottom condition, as required.

3.7 OWNER'S INDEPENDENT TESTING AGENCY (OWNER'S QUALITY ASSURANCE)

- A. Owner may acquire an Independent Testing Agency (Quality Assurance) as required.
- B. Contractor shall cooperate with Owner's Quality Assurance Personnel.

3.8 EXCAVATIONS

- A. Coordinate all excavations made subsequent to rammed pier installations so that excavations do not encroach on the piers as shown in the rammed pier construction drawings. Protection of completed rammed piers is the responsibility of the Contractor. In the event that excavations are required in close proximity to the installed rammed piers, Contractor shall contact the Rammed Pier Designer immediately to develop construction solutions to minimize impacts on the installed rammed pier elements.

3.9 FOOTING BOTTOMS

- A. Foundation excavations to expose the tops of rammed piers shall be made in a workman-like manner, and piers shall be protected until concrete placement, with procedures and equipment best suited to:
1. Avoid exposure to water,
 2. Prevent softening of the matrix soil between and around the rammed piers before pouring structural concrete, and

3. Achieve direct and firm contact between the dense, undisturbed rammed piers and the concrete footing.
- B. All excavations for footing bottoms supported by rammed pier foundations shall be prepared in the following manner:
1. Limit over-excavation below the bottom of the footing to 3-inches (including disturbance from the teeth of the excavation equipment).
 2. Compaction of surface soil and top of rammed piers shall be prepared using a motorized impact compactor ("Wacker Packer," "Jumping Jack," or similar). Sled-type tamping devices shall only be used in granular soils and when approved by the designer. Loose or soft surficial soil over the entire footing bottom shall be recompacted or removed. The surface of the rammed pier shall be recompacted prior to completing footing bottom preparation.
 3. Place footing concrete immediately after footing excavation is made and approved by Owner, preferably the same day as the excavation. Footing concrete must be placed on the same day if the footing is bearing on moisture-sensitive soils as determined by Owner. If same day placement of footing concrete is not possible, open excavations shall be protected from surface water accumulation. A lean concrete mud-mat may be used to accomplish this.
- C. The following criteria shall apply, and a written inspection report shall be furnished to Owner to confirm:
1. That water has not been allowed to pond in the footing excavation at any time.
 2. That all rammed piers designed for each footing have been exposed in the footing excavation.
 3. That immediately before footing construction, the tops of rammed piers exposed in each footing excavation have been inspected and recompacted as necessary with mechanical compaction equipment.
 4. That no excavations have been made after installation of rammed pier elements within the excavation limits described in the rammed pier construction drawings, without the written approval of the Rammed Pier Designer.

3.10 MEASUREMENT AND PAYMENT

- A. Measurement
1. Measurement of the rammed piers is on a lump sum basis.
- B. Payment
1. Payment shall cover design, mobilization, supply of materials, site preparation, installation of rammed pier foundation system, layout, modulus testing, quality control, and all related activities associated with the work.

END OF SECTION

SECTION 32 01 16.71**COLD MILLING ASPHALT PAVING****PART I - GENERAL****1.1 SUMMARY**

- A. Description
 - 1. This Section covers the rotomilling of existing asphalt pavement surfaces as shown on the Contract Drawings, and as specified herein.

1.2 SUBMITTALS

- A. Submittals shall be made in accordance with the requirements of the Project Quality Plan, except as modified herein.
- B. Prior to start of work submit:
 - 1. Details of protection to existing covers frames and monuments.
 - 2. List of equipment to be used for operation.
 - 3. Work plan which shall include dates and times of operation; traffic control measures, before, during, and after rotomilling operation; anticipated dates of overlay placement.

1.3 QUALITY ASSURANCE/QUALITY CONTROL

- A. Quality assurance/quality control shall be made in accordance with the requirements of the Project Quality Plan.

PART II - PRODUCTS - NOT USED**PART III - EXECUTION****3.1 EQUIPMENT**

- A. Power-operated track propelled planning machine or grinder shall be used which is:
 - 1. Capable of milling to plan cross slope.
 - 2. Self-propelled with sufficient power, traction, and stability to maintain accurate depth of cut.
 - 3. Maximum of 5/8-inch between the cutting teeth on the mandrel.
- B. Appropriate cleaning equipment capable of sweeping and picking up millings to clean up after milling operation shall be used.

3.2 PROCEDURE

- A. Existing bituminous pavement surface shall be rotomilled to the width and depth shown on the plans to an accuracy of $\pm 3/8$ -inch of plan depth, measured from original surface to the top of the ridge.
 - 1. Depth tolerance shall be maintained. Skis or other profile grade control devices shall not be used if the specified depth tolerance cannot be met with their use.
- B. The area directly surrounding manholes, catch basins, water meters, water valves or any other permanent fixtures shall be rotomilled to the specified depth.
- C. The Engineer:
 - 1. Will measure and record rotomilling depths, taking two random measurements every 1,000 ft of each pass of the milling machine.
 - 2. May adjust the depth of the milling operation, within tolerances, to remove unacceptable material or to improve ride.
- D. The reclaimed material from milling operation shall be loaded into a truck in one operation. Milled material is the property of the Contractor, unless specified otherwise.

3.2 CLEANING AND REPAIR

- A. All millings shall be removed and cleaned from the surface daily. Dust created by the cutting action shall be controlled. Rotomilled surface shall be cleaned after milling operation and prior to opening to traffic, meeting environmental regulations for cleaning process.
- B. Contractor shall remove and replace, or repair damage caused by the operation outside of the widths and depths shown in the plans. Damage to traffic due to loose material on milled surface shall be repaired.
- C. Milled material shall be disposed of in a manner approved by the Engineer and in accordance with the specifications.

PART IV - MEASUREMENT**4.1 Measurement**

- A. The quantities of accepted work will be measured in the following units. All measurements will be plan measure except for authorized changes.
 - 1. Mill Existing Asphalt Pavement SY (Square Yard)

PART V - PAYMENT**5.1 Payment**

Payment will be made at the respective unit or lump-sum price listed in the proposal and shall be full compensation for all labor, materials, and equipment necessary to complete the respective unit in place. There will be no separate measurement or payment for any item of work not specifically identified and listed in the proposal, and all such work shall be considered a subsidiary item with all costs pertaining thereto included in the prices for other

items listed in the proposal. At the Engineer's option, partial payment may be made for any lump sum item listed in the proposal, providing that the Contractor is diligently and satisfactorily pursuing full completion of such partially complete item in accordance with the approved job progress schedule.

END OF SECTION

SECTION 32 01 29.13**DAMAGED CONCRETE REMOVAL AND PATCHING****PART I - GENERAL****1.1 DESCRIPTION**

- A. The work specified in this section consists of the removal and repair of damaged concrete on the existing bridges as well as minor repairs on other existing structures. This includes repair of spalling, injection of cracks, etc.

1.3 SUBMITTALS

- A. Product data of all proposed materials including material specifications, evidence of successful utilization for similar applications, confirmation of compatibility with other materials, and application procedures.
- B. Applicator qualifications showing successful completion of similar type jobs. Also submit certification from product manufacturers that applicator is sufficiently qualified to perform job.
- C. Applicators schedule of construction.
- D. Staging and screening plans detailing how the applicator will provide adequate access to workers while sufficiently protecting passing rail, automotive and pedestrian traffic from any and all hazards associated with the work. Substantiating design drawings, calculations, and engineering certification shall be provided by the Contractor at KCMO's request.
- E. The Contractor shall submit copies of all required permits and clearances (i.e., authorization from MoDOT, railroad authorization, etc.).

PART II - PRODUCTS

2.1 GENERAL

All products used for repair of existing concrete shall meet the requirements of ACI 546.1R, ACI 318, 2006 International Building Code, and Sections 03 15 16 and 03 31 05 of these specifications. They shall be approved by the manufacturer for the proposed application and have approval of the Engineer prior to ordering for the job.

PART III - EXECUTION

3.1 GENERAL

- A. Prior to ordering any materials or commencing any patching and repair of existing concrete, the Contractor shall obtain written approval of all relevant submittals.
- B. Prior to the commencement of work, staging and screening shall be installed to protect adjacent railroad, motorists and pedestrians from falling debris, dust, etc.
- C. Contractor shall inspect staging and screening on a frequent basis to insure adequacy and shall remedy any inadequacies as required.
- D. Contractor shall clean up and remove from site all demolition debris each day. This cleaning

shall include vacuuming all dust.

- E. The Contract Drawings identify areas to be repaired. This information is provided for informational purposes only. The nature of this work requires that the exact extents of work required needs to be field determined as work progresses as directed and approved by the Engineer.
- F. All work shall comply with ACI 546.1R, ACI 318, 2006 International Building Code, and Sections 03 15 16 and 03 31 05 of these specifications.
- G. The Contractor shall be responsible for providing uniform appearance of all exposed concrete surfaces without blemishes upon completion of job.

3.2 PREPARATION

- A. Clean concrete surfaces of dirt, latence, corrosion, or other contamination; wire brush using water; rinse surface and allow to dry.
- B. Where required patch is less than ½" in depth, remove damaged concrete, thoroughly clean surface and patch using epoxy/sand mix.
- C. Where rebar is exposed, remove all concrete surrounding rebar, thoroughly clean concrete and rebar surfaces, and patch as required.
- D. The Contractor shall take all steps necessary to prevent cutting or otherwise damaging existing reinforcing steel. Any such bars damaged by the Contractor's operations shall be repaired or replaced.
- E. No removal of concrete by hammer methods shall proceed within 40 feet of freshly placed concrete until 48 hours of curing has elapsed, unless otherwise separated by expansion joints or approved by the Engineer.
- F. Sandblast clean the exposed reinforcement steel surfaces and concrete located within the repair cavities.
- G. Following concrete removal operations, the condition of all exposed reinforcing bars shall be inspected by the Engineer. If, in the opinion of the Engineer, the bars are deteriorated by 10% or more of their original cross section area at any point, the Contractor shall remove and replace or supplement these bars as directed by the Engineer.
- H. Flush out cracks and voids with water to remove latence and dirt.
- I. For epoxy injection provide temporary entry ports spaced to accomplish movement of fluids between ports; no deeper than the depth of the crack to be filled or port size diameter no greater than the thickness of the crack. Provide temporary seal at concrete surface to prevent leakage of adhesive.
- J. Any areas of the prepared surface contaminated by oil or other materials detrimental to good bond shall be removed by the Contractor to such depth as may be required. Remove by sandblasting, clean by hydro washing.
- K. Chipping hammers shall be limited to fifteen pound class (nominal).
- L. Concrete saws shall be hand-held electric or gasoline powered.

3.3 REPAIRS

- A. Upon completion of concrete demolition, removal and surface preparation; prior to patching and injection, the Contractor will obtain written approval of the Engineer to proceed with repairs.
- B. Use approved products and procedures for all repair work.

PART IV - MEASUREMENT

- 4.1 Measurement** – No Separate measurement will be made for Work described in this Section.

PART V - PAYMENT

- 5.1 Payment** – No separate payment will be made for damaged concrete removal and patching. All costs pertaining thereto shall be included in the Contract Unit Prices for other items as listed in the Bid Form-Unit Prices.

END OF SECTION

SECTION 32 01 29.16**DELAMINATION REPAIR****PART I - GENERAL****1.1 SUMMARY****A. Description**

This work includes repair of delaminated concrete areas as identified by inspections reports, QA/QC and as specified herein. This work shall be constructed in accordance with these specifications and in conformity with the lines, grades, dimensions and notes shown on the Contract Drawings or presented by the Engineer. The work includes material, equipment, and labor necessary to procure, fabricate, prepare, and install in field the concrete repair.

1.2 REFERENCES

<u>Sponsor</u>	<u>Number</u>	<u>Subject</u>
AASHTO	M 235	Epoxy Resin Adhesives
MoDOT		Performance Data Products Listing
MoDOT		Accepted Product Listing

1.3 SUBMITTALS

- A. Submittals shall be made in accordance with the requirements of the Project Quality Plan, except as modified herein.
- B. Prior to repairing the concrete the product review, data sheets, and repair procedure shall be submitted to the Engineer for review and approval for each repair. Include as needed special mixing procedures and site preparation procedures as applicable. Indicate additional mix ingredients and proportions not provided by the manufacturer such as but not limited to; curing compounds, rebar, coarse aggregate, fine aggregate, and/or any add mixtures.
1. With each mix design, submitting manufacture certifications or laboratory test results including compressive strength at 28 days and mill or manufacturer's certificates attesting to conformance of ingredients with Specifications.
 2. Include the source, brand or characteristic properties of the ingredients need to be verified during the term of the Contract.
- C. Inspection reports for each repair indicating structure and location.

1.4 QUALITY CONTROL

Quality control shall be made in accordance with the approved Project Quality Plan.

1.5 ACCEPTANCE

- A. Rebuild the areas to original shape, \pm 1/8 inch.

- B. Remove and repair if the patching fails to bond.

PART II - PRODUCTS

2.1 MATERIALS

- A. Repair Concrete:
 - 1. Portland Cement Concrete: Class AA (AE). Refer to Section 03 15 16.
 - 2. Cement: Type II. Refer to Section 03 15 16.
 - 3. Aggregate: 3/4 inch maximum.
- B. Patching Concrete:
 - 1. Select from the Performance Data Products Listing (PDPL) maintained by the MODOT Research Division.
 - 2. Only use products for which the manufacturer recommends vertical application.
- C. Substrate Coating: Use a bonding agent or primer recommended by the particular patching concrete manufacturer.
- D. Epoxy Resin Adhesive: Type II. AASHTO M 235.
 - 1. Use a class rating consistent with the application temperature.
 - 2. Select from the Performance Data Products Listing (PDPL) maintained by the MODOT Research Division.
- E. Surface Sealing Material (Penetrating Type): Select from the Accepted Products Listing (APL) maintained by MODOT.
- F. Cement, fly ash, aggregates, and embedments shall be free of calcium chloride.

2.2 MIXER

- A. Use an approved type of small mixer to batch out the repair concrete when specifically approved by the Engineer.

PART III - EXECUTION

3.1 PREPARATION

- A. Locate the repair areas: Sound the items requiring this work and mark the limits of delaminated areas for repair work in the presence of the Engineer.
- B. Remove concrete:
 - 1. Remove all loose materials by dry sweeping.
 - 2. Clean by blowing with compressed air at 90 psi.
 - 3. Make ½ inch deep saw cuts in the sound concrete surrounding the damaged areas.

4. Remove all damaged and shattered concrete.
- C. Cleaning:
1. Remove all loose materials by dry sweeping.
 2. Clean by blowing with compressed air at 90 psi.
 3. Sandblast clean all exposed reinforcing steel and concrete surfaces before placing new concrete.

3.2 INSTALLATION

- A. Form Work
1. Use forms and braces to place new concrete to the original dimensions.
 2. Vibration is required in the forms when the area between forms and existing concrete surface will allow use of vibrators.
- B. Use one type of repair concrete.
- C. Placing concrete when thickness to be placed is less than or equal to 3 inches:
1. Use patching concrete.
 2. Coat the cleaned concrete using the manufacturer's recommended primer.
 3. Place patching concrete in layers not exceeding the manufacturer's recommended application thickness per layer.
 4. Apply the surface sealer recommended by the manufacturer.
 5. Consult the manufacturer's recommendations for finishing.
- D. Placing concrete when thickness to be placed is greater than 3 inches:
1. Apply an epoxy-resin adhesive to the cleaned concrete surface of the repair area before placing the new concrete.
 2. Place the concrete and allow it to cure following the requirements of Section 03 39 00.
 3. After the concrete has properly cured, sandblast the finished concrete surfaces and coat with a non-penetrating type epoxy sealer. Follow the manufacturer's procedure.
- E. Finished surfaces: Provide the look of one color.

PART IV - MEASUREMENT

- 4.1 **Measurement** – No Separate measurement will be made for Work described in this Section.

PART V - PAYMENT

5.1 Payment – No separate payment will be made for delamination repair. All costs pertaining thereto shall be included in the Contract Unit Prices for other items as listed in the Bid Form-Unit Prices.

END OF SECTION

SECTION 32 01 90**OPERATION AND MAINTENANCE OF PLANTING****PART 1 - GENERAL****1.1 RELATED DOCUMENTS**

- A. Drawings and general provisions of the Contract, including General and Supplementary Conditions and Division 01 Specification Sections, apply to this Section.

1.2 SUMMARY

- A. Section Includes plant and grass area maintenance including the following:
1. Maintenance service.
 2. Fertilizers.
 3. Pesticides/Herbicides.
- B. Related Sections:
1. Section 32 80 00 "Irrigation" for irrigation.
 2. Section 32 92 00 "Prairie Grasses and Wildflowers" prairie planting, hydroseeding, and erosion-control materials.
 3. Section 32 93 00 "Plants" for trees, shrubs, perennials, ornamental grasses and other plants.

1.3 DEFINITIONS

- A. Pesticide: A substance or mixture intended for preventing, destroying, repelling, or mitigating a pest. This includes insecticides, miticides, herbicides, fungicides, rodenticides, and molluscicides. It also includes substances or mixtures intended for use as a plant regulator, defoliant, or desiccant.
- B. Pests: Living organisms that occur where they are not desired, or that cause damage to plants, animals, or people. These include insects, mites, grubs, mollusks (snails and slugs), rodents (gophers, moles, and mice), unwanted plants (weeds), fungi, bacteria, and viruses.
- C. Plant; Plants; Plant Material: These terms refer to vegetation in general, including trees, shrubs, ground covers, ornamental grasses, bulbs, corms, tubers, or herbaceous vegetation.

1.4 SUBMITTALS

- A. Product Data: For each type of product indicated.
1. Pesticides and Herbicides: Include product label and manufacturer's application instructions specific to this Project.
- B. LEED Submittals:
1. Product Data for Credits MR 5.1 and 5.2 - Local/Regional Materials:
 - a. Indicate location of manufacturing facility, including name, address, and distance between manufacturing facility and the project site. Provide manufacturer's documentation indicating location where the base materials were extracted, mined, quarried, harvested, etc. and the

distance between this location and the project site. Also include material costs, excluding cost of installation.

- C. Qualification Data: For qualified landscape Maintenance Service Provider. Include list of similar projects completed by Maintenance Service Provider demonstrating Maintenance Service Provider's capabilities and experience. Include project names, addresses, and year completed, and include names and addresses of owners' contact persons.
- D. Product Certificates: For each type of manufactured product, including fertilizers, from manufacturer, and complying with the following:
 - 1. Manufacturer's certified analysis of standard products.
 - 2. Analysis of other materials by a recognized laboratory made according to methods established by the Association of Official Analytical Chemists, where applicable.
- E. Maintenance Instructions: Recommended procedures to be established by Owner for maintenance of plants and prairies during a calendar year. Submit before start of required initial maintenance periods.

1.5 QUALITY ASSURANCE

- A. Maintenance Service Provider Qualifications: A qualified landscape Maintenance Service Provider whose work has resulted in successful plant and prairie establishment of plants.
 - 1. Professional Membership: Maintenance Service Provider shall be a member in good standing of either the Professional Landcare Network or the American Nursery and Landscape Association.
 - 2. Experience: Five years' experience in landscape maintenance in addition to requirements in Division 01 Section "Quality Requirements."
 - 3. Maintenance Service Provider's Field Supervision: Require Maintenance Service Provider to maintain an experienced full-time supervisor on Project site when work is in progress.
 - 4. Personnel Certifications: Maintenance Service Provider's field supervisor shall have certification in the following categories from the Professional Landcare Network:
 - a. Certified Landscape Technician - Exterior, with maintenance and irrigation specialty area(s), designated CLT-Exterior.
 - 5. Maintenance Proximity: Not more than two hours' normal travel time from Maintenance Service Provider's place of business to Project site.
 - 6. Pesticide Applicator: State licensed, commercial.
- B. Pre-Maintenance Conference: Conduct conference at Project site.

1.6 DELIVERY, STORAGE, AND HANDLING

- A. Packaged Materials: Deliver packaged materials in original, unopened containers showing weight, certified analysis, name and address of manufacturer, and indication of conformance with state and federal laws, as applicable.
- B. Bulk Materials:
 - 1. Do not dump or store bulk materials near structures, utilities, walkways and pavements, or on existing turf areas or plants.
 - 2. Provide erosion-control measures to prevent erosion or displacement of bulk materials, discharge of soil-bearing water runoff, and airborne dust reaching

- adjacent properties, water conveyance systems, or walkways.
3. Accompany each delivery of bulk fertilizers with appropriate certificates.

1.7 PROJECT CONDITIONS

- A. Weather Limitations: Proceed with maintenance only when existing and forecasted weather conditions permit planting to be performed when beneficial and optimum results may be obtained. Apply products during favorable weather conditions according to manufacturer's written instructions.

1.8 MAINTENANCE SERVICE

- A. Initial Prairie Maintenance Service: Provide full maintenance by skilled employees of landscape Maintenance Service Provider. Maintain as required in Part 3. Begin maintenance immediately after each area is planted and continue until acceptable prairie is established, but for not less than 1 year from date of Substantial Completion.
- B. Initial Maintenance Service for Trees and Shrubs: Provide maintenance by skilled employees of landscape Maintenance Service Provider. Maintain as required in Part 3. Begin maintenance immediately after plants are installed and continue until plantings are acceptably healthy and well established but for not less than 1 year from date of Substantial Completion.
- C. Initial Maintenance Service for Ground Cover and Other Plants: Provide maintenance by skilled employees of landscape Maintenance Service Provider. Maintain as required in Part 3. Begin maintenance immediately after plants are installed and continue until plantings are acceptably healthy and well established but for not less than 1 year from date of Substantial Completion.
- D. Continuing Maintenance Proposal: From Maintenance Service Provider to Owner, in the form of a standard yearly (or other period) maintenance agreement, starting on date initial maintenance service is concluded. State services, obligations, conditions, and terms for agreement period and for future renewal options.

PART 2 - PRODUCTS

2.1 FERTILIZERS

- A. Slow-Release Organic Fertilizer: Subject to compliance with requirements, products that may be incorporated into the Work include:
 1. Biosol 6-1-3 Natural All Purpose fertilizer.
 2. Sustane 5-2-4 All Natural Granulated Slow Release Nitrogen fertilizer.

2.2 PESTICIDES/HERBICIDES

- A. Pesticide: Registered and approved by EPA, acceptable to authorities having jurisdiction, and of type recommended by manufacturer for each specific problem and as required for Project conditions and application. Do not use restricted pesticides unless authorized in writing by authorities having jurisdiction.
 1. Selection of Pesticide shall be contingent on, but not limited to, the following:
 - a. Identification of specific pest(s) to be prevented, destroyed, repelled, or mitigated.
- B. Pre-Emergent Herbicide (Selective and/or Non-Selective): Effective for controlling the germination or growth of weeds within planted areas at the soil level directly below the mulch layer.

1. Selection of Pre-Emergent Herbicide(s) shall be contingent on, but not limited to, the following:
 - a. Identification of specific weed(s) to be eradicated.
 - b. Identification of growth rate (at the time of application) required for herbicide to be effective, specific to each type of weed.
 - c. Location of weeds (slope, exposure, etc.).
 - d. Hydrology of the area (i.e., limitations due to possible contamination to wetlands, subsurface water sources, etc.).
 - e. Soil type(s).
 - f. Application type (spot versus broadcast).
- C. Post-Emergent Herbicide (Selective and/or Non-Selective): Effective for controlling weed growth that has already germinated.
 1. Selection of Post-Emergent Herbicide(s) shall be contingent on, but limited to, the following:
 - a. Identification of specific weed(s) to be eradicated.
 - b. Identification of growth rate (at the time of application) required for herbicide to be effective, specific to each type of weed.
 - c. Location of weeds (slope, exposure, etc.).
 - d. Hydrology of the area (i.e., limitations due to possible contamination to wetlands, subsurface water sources, etc.).
 - e. Soil type(s).
 - f. Application type (spot versus broadcast).
 - g. Identification of plants to be saved.

PART 3 - EXECUTION

3.1 PREPARATION

- A. Protect structures, utilities, sidewalks, pavements, and other facilities, trees, shrubs, and turf areas, and existing plantings from damage caused by maintenance operations.

3.2 IRRIGATED PRAIRIE MAINTENANCE

- A. Maintain and establish prairie by watering, weeding, mowing, trimming, replanting, and performing other operations as required to establish a healthy, viable prairie. Roll, regrade, and replant bare or eroded areas and remulch. Provide materials and installation the same as those used in the original installation.
 1. Fill in as necessary soil subsidence that may occur because of settling or other processes. Replace materials and prairie damaged or lost in areas of subsidence.
 2. In areas where mulch has been disturbed by wind or maintenance operations, add new mulch and anchor as required to prevent displacement.
 3. Apply treatments as required to keep prairie and soil free of pests and pathogens or disease. Use integrated pest management practices whenever possible to minimize the use of pesticides and reduce hazards.
 4. Bare areas over 1 square feet in size shall be reseeded and mulched if they fail to establish at least 6 desirable seedlings/sq. ft. (non-irrigated areas) or 12 desirable seedlings/sq. ft. (irrigated areas). The Landscape Architect or Ecologist will direct Contractor on what areas need to be reseeded during establishment inspection approximately 30 days after seeding (June-September).
- B. Watering: Install and maintain piping, hoses, and turf-watering equipment to convey water from sources and to keep seeded areas uniformly moist to a depth of 4 inches (100 mm).

1. Schedule watering to prevent wilting, puddling, erosion, and displacement of seed or mulch.
 2. Water prairie at a minimum rate of 1/2 inch per week for eight weeks after planting unless rainfall precipitation is adequate.
 3. Areas that are irrigated and are not producing a uniform plant growth within 30 days following first seeding, as determined by establishment inspection, shall be reseeded.
- C. Seeded areas shall be mowed for annual weed control, if so directed by the Landscape Architect, at a height of not less than 3 inch and otherwise maintained until there is an acceptable uniform plant growth. A small tractor or mower shall be used to reduce possible crushing of seedling grasses and rutting of soil.

3.3 TREE AND SHRUB PRUNING

- A. Remove only dead, dying, or broken branches. Do not prune for shape.
- B. Prune, thin, and shape trees, shrubs, and vines according to standard professional horticultural and arboricultural practices. Unless otherwise indicated by Architect, do not cut tree leaders; remove only injured, dying, or dead branches from trees and shrubs; and prune to retain natural character.
- C. Do not apply pruning paint to wounds.

3.4 PLANT MAINTENANCE

- A. Maintain plantings by pruning, cultivating, watering, weeding, fertilizing, mulching, restoring planting saucers, adjusting and repairing tree-stabilization devices, resetting to proper grades or vertical position, and performing other operations as required to establish healthy, viable plantings. Spray or treat as required to keep trees and shrubs free of insects and disease.
- B. Fill in as necessary soil subsidence that may occur because of settling or other processes. Replace mulch materials damaged or lost in areas of subsidence.
- C. Apply treatments as required to keep plant materials, planted areas, and soils free of pests and pathogens or disease. Use integrated pest management practices whenever possible to minimize the use of pesticides and reduce hazards. Treatments include physical controls such as hosing off foliage, mechanical controls such as traps, and biological control agents.

3.5 PESTICIDE/HERBICIDE APPLICATION

- A. Apply pesticides, herbicides and other chemical products and biological control agents in accordance with requirements of authorities having jurisdiction and manufacturer's written recommendations. Coordinate applications with Owner's operations and others in proximity to the Work. Notify Owner before each application is performed.
- B. Pre-Emergent Herbicides (Selective and/or Non-Selective): Apply in accordance with manufacturer's written recommendations.
- C. Post-Emergent Herbicides (Selective and/or Non-Selective): Apply only as necessary to treat already-germinated weeds and in accordance with manufacturer's written recommendations.

3.6 CLEANUP AND PROTECTION

- A. During maintenance operations, keep adjacent paving and construction clean and work area in an orderly condition.
- B. Promptly remove soil and debris created by maintenance work from paved areas. Clean wheels of vehicles before leaving site to avoid tracking soil onto roads, walks, or other paved areas.
- C. Protect plants from damage due to maintenance operations. Maintain previously installed protection during maintenance periods. Treat, repair, or replace damaged plantings.
- D. Maintain fencing and barricades throughout initial maintenance period and remove after plantings are established.

3.7 DISPOSAL

- A. Remove surplus soil and waste material including excess subsoil, unsuitable soil, trash, and debris and legally dispose of them off Owner's property.

END OF SECTION

SECTION 32 11 00**AGGREGATE BASE COURSE****PART 1 – GENERAL**

1. This section covers the construction of Aggregate Base as shown on the Plans, described in the Contract Documents, or as directed by the OWNER'S REPRESENTATIVE.
2. All the requirements of the Kansas City Metropolitan Chapter of the American Public Works Association (APWA), *Standard Specifications and Design Criteria* apply as amended and supplemented by the Department of Public Works of the City of Kansas City, Missouri (KCMO). Sections of said Specifications will be hereinafter referred to as "APWA-KCMO."
3. Aggregate construction shall conform to APWA-KCMO 2202.
4. **Aggregate Base** shall conform to Missouri Department of Transportation (MoDOT) Standard Specifications for Highway Construction Section 1007.3 Type 5 Aggregate (or Kansas Department of Transportation (KDOT) AB-3 Aggregate).

PART 2 - MATERIALS AND PLACEMENT

1. **Aggregate Base.** Aggregate for base shall consist of crushed stone or sand and gravel. The aggregate shall not contain more than 15 percent deleterious rock and shale. If crushed stone is used, sand may be added only for the purpose of reducing the plasticity index of the fraction passing the No. 40 sieve in the finished product. The fraction passing the No. 40 sieve shall have a plasticity index not to exceed six. Any sand, silt and clay, and any deleterious rock and shale shall be uniformly distributed throughout the material. When sand and gravel aggregate are used, the fraction passing the No. 200 sieve shall be less than one half of that fraction passing the No. 30 sieve. Type 5 (AB-3) aggregate shall conform to the gradation requirements of MoDOT Standard Specifications for Highway Construction Section 1007.3.2 Type 5 (or KDOT Section 1104.2 AB-3).

PART 3 – EXECUTION

None

PART 4 - MEASUREMENT

1. **Aggregate Base.** Aggregate Base shall be measured per ton.

PART 5 - PAYMENT

1. Aggregate Base shall be paid for at the contract unit price for Aggregate Base. All Such payment and price shall constitute full compensation for all labor, material, and equipment necessary to complete the items including material, securing the source, quarrying, excavating, breaking, and hauling the material to the site.

END OF SECTION

SECTION 32 11 00**UNTREATED COMPACTED AGGREGATE**

PART 1 - GENERAL

1.01 SCOPE OF WORK

- A. Furnish all labor, materials, equipment and incidentals required and obtain materials for construction of aggregate base course as outlined for the uses shown on the Drawings and as specified herein.

1.02 RELATED WORK

- A. Submittals are included in Section 01 33 00.
- B. Site preparation is included in Section 31 22 00.
- C. Subgrade Preparation is included in Section 31 23 13.
- D. Portland cement concrete paving is included in Section 32 13 13.

1.03 SUBMITTALS

- A. Submit, in accordance with Section 01 33 00, complete product data for materials specified in this Section.
 - 1. At least fifteen (15) days prior to the placement of any backfill or fill materials, the Contractor shall provide written documentation of the source of the fill and certification that the fill material is clean and in compliance with applicable standards and regulations for each source of fill material.

1.04 REFERENCE STANDARDS

- A. In addition to complying with all pertinent codes and regulations, comply with the referenced or applicable portions of the American Public Works Association Design Criteria and Standard Specifications as revised, adopted, and provided by the director of Kansas City, Missouri Public Works current at the time of bidding.
- B. American Society for Testing and Materials (ASTM)
 - 1. ASTM C88 – Test Method for Soundness of Aggregates by Use of Sodium Sulfate or Magnesium Sulfate
 - 2. ASTM C88 – Test Method for Soundness of Aggregates by Use of Sodium Sulfate or Magnesium Sulfate

3. ASTM C131 – Test Method for Resistance to Degradation of Small-Size Coarse Aggregate by Abrasion and Impact in the Los Angeles Machine
4. ASTM C136 – Test Method for Sieve Analysis of Fine and Coarse Aggregates
5. ASTM C142 – Test Method for Clay Lumps and Friable Particles in Aggregates

C. American Association of State and Highway Officials (AASHTO)

1. AASHTO T99 – The Moisture-Density Relations of Soils Using a 5.5-lb. (2.5 kg) Rammer and a 12-in. (305 mm) Drop

D. Where reference is made to one of the above standards, the revision in effect at the time of bid opening shall apply.

1.05 QUALITY ASSURANCE

A. Laboratory Testing

2. At least fifteen (15) days prior to the placement of any backfill or fill materials, the Contractor shall provide written documentation of the source of the fill and certification that the fill material is clean and in compliance with applicable standards and regulations for each source of fill material.

2. The soils testing laboratory will perform:

- a. Grain size analyses (ASTM D422) of samples to determine their suitability for use as backfill or fill material in conformance to the materials requirements specified hereinafter.
- b. Proctor analyses (ASTM D698) to determine the maximum dry densities required for compaction testing as specified elsewhere in the Contract Documents.

3. Test results and determinations of suitability shall be delivered to the Engineer no later than five (5) days prior to the placement of backfill or fill materials.

4. Samples of the aggregate to check gradation may be taken by the Inspector at least once daily. Sampling shall be in accordance with ASTM D 75, and testing shall be in accordance with ASTM C 136 and C 117.

1.06 DELIVERY, STORAGE AND HANDLING

A. If granular fill materials are delivered to the site prior to placement approval, materials shall be stockpiled on site in areas as directed by the Engineer. Provision shall be implemented to minimize surface water

impact on the stockpile. Removal and placement of granular fill material shall be done in a manner to minimize intrusion of soils adjacent to and beneath the stockpile.

PART 2 - PRODUCTS

2.01 MATERIALS

- A. The base course material shall consist of crushed stone aggregate with not more than 1.0% clay lumps and friable particles in accordance with ASTM C 142, and free from vegetable or other deleterious substances.
- B. The abrasion loss shall be no more than 35% when tested in accordance with ASTM C 131. That fraction passing the 1 inch (25.0 mm) sieve and retained on the No. 4 (4.75 mm) sieve shall have a loss not greater than 15% by weighted average at 5 cycles of ASTM C 88 (Magnesium Sulfate) Soundness Test.
- C. That fraction of the material passing the 1-inch (25.0 mm) Sieve and retained on the No. 4 (4.75 mm) Sieve shall contain less than 20% by weight of flat and elongated particles (flat being a ratio of 1 to 3 between thickness and least width and a ratio of 1 to 3 between the least width and length).
- D. The material shall consist of angular particles with no less than 90% of particle count having two or more fractured surfaces. The gradation in percentages by weight passing square mesh sieves shall be in accordance with ASTM C 136 and as follows:

U.S. Standard Square Mesh Sieve	Percent Passing
1-1/4 in (31.5 mm)	100
1 in (25.0 mm)	72-100
3/4 in (19 mm)	60-90
3/8 in (9.5 mm)	43-74
No. 4 (4.75 mm)	28-60
No. 10 (2.00 mm)	16-40
No. 40 (425 um)	3-22
No. 200 (75 um)	0-15

- E. In addition to the above limits, the difference between the "Percent Passing Square Mesh Sieve" of successive sieve sizes shall not exceed 25 percent.
- F. That fraction of the material passing the No. 40 (425 um) sieve shall have a plasticity index not to exceed 8 when tested in accordance with ASTM D 4318.

PART 3 - EXECUTION**3.01 PLACEMENT****A. Subgrade**

1. Prior to placement of base course material the previously prepared subgrade surface shall be cleared of all foreign substances and restored in shape, tolerance and density as specified in Section 31 23 13 entitled "Subgrade Preparation."

B. Material Placement

1. The material shall be uniformly spread in successive layers to such depth that when compacted, the base will have the minimum thickness specified. The contractor may construct the base in any number of layers that he chooses except that in no case shall any individual layer have a compacted thickness of more than 4 inches (10.16 cm). Each layer shall be compacted as hereinafter specified before any succeeding layer is placed.
2. After spreading a layer of material, water in an amount sufficient to insure the desired compaction shall be added and uniformly mixed with the aggregate in a manner to prevent segregation. Excess moisture resulting in runoff shall be avoided. If for any reason, the material and subgrade become too wet to permit satisfactory work, they shall be allowed to dry to a moisture content that will permit satisfactory work.

C. Segregation

1. The material shall meet the required specifications immediately before compaction operations are commenced. If, for any reason, segregation occurs in excess of 10% variation from the gradation required under the above paragraph "Materials" or the materials become contaminated, such segregated or contaminated materials shall be removed and replaced with suitable materials at the expense of the Contractor. The limited segregation of 10% variation will be ascertained by a sieve analysis of a minimum 100 pound (45.36 Kg) sample taken from the in-place base course. However, when crushed stone is used, segregated surface areas may be corrected by adding limestone screenings of such gradation and quantity as required to fill the surface voids and firmly bind the loose material in place. Screenings so used in correcting segregated surface areas will be paid for as a part of the aggregate base material.

D. Compacting

1. Shaping and compacting shall be carried on continuously until a true, even and uniform surface of proper grade and cross-section is obtained, and until the density of the complete base is at least 95% of

maximum density as determined by AASHTO T 99. The proper moisture content shall be maintained by wetting the surface as required during shaping and compacting operations. Final rolling shall be accomplished by use of a self-propelled smooth-wheeled roller.

END OF SECTION 32 11 00

SECTION 32 12 13.19**PRIME COATS****PART I - GENERAL****1.1 SUMMARY**

- A. Description
 - 1. Furnish materials and apply liquid or emulsified asphalt to a prepared subgrade or untreated base course (Prime Coat).
 - 2. Apply blotter materials to absorb excess asphalt as required.

1.2 REFERENCED STANDARDS

<u>Sponsor</u>	<u>Number</u>	<u>Subject</u>
AASHTO	T 27	Sieve Analysis of Fine and Coarse Aggregates
AASHTO	T 201	Kinematic Viscosity of Asphalts

1.3 SUBMITTALS AND INFORMATION TO BE RETAINED

- A. Submittals shall be made in accordance with the requirements of the Project Quality Plan, except as modified herein.
- B. Retain the following:
Certificates and Test Reports.

1.4 QUALITY ASSURANCE/QUALITY CONTROL

Quality assurance/quality control shall be in accordance with the requirements of the Project Quality Plan.

1.5 DELIVERY, STORAGE, AND HANDLING

Materials shall be delivered to the site in an undamaged condition and stored off the ground in a well-drained location, protected from damage, and easily accessible for inspection and handling.

PART II - PRODUCTS**2.1 PRIME COAT MATERIAL**

- A. Prime Coat
Liquid asphalt: AASHTO MC-70 or MC-250
- B. Blotter Material (AASHTO T-27)

Granular materials meeting the following criteria:

Sieve Size	Percent Passing
No. 4	90–100
No. 10	25–80
No. 200	0–15

2.2 TACK COAT MATERIAL

- A. Use CSS-1 H Emulsified Asphalt
- B. In the event that paving fabric is applied, use PG 58-22 or PG 64-22 instead.

PART III - EXECUTION

3.1 CONSTRUCTION

- A. Weather Limitations
 - 1. Do not apply prime coat/tack coat on a wet surface.
 - 2. Do not apply prime coat/tack coat when the surface temperature is below 50 Degrees Fahrenheit.
 - 3. Do not apply prime coat/tack coat when the weather conditions prevent it from adhering properly.
- B. Protection Requirements

Protect all structures (including guardrails, guide posts, etc.) from being spattered or marred.
- C. Surface Preparation
 - 1. Prime Coat
 - a. Shape the surface to the required grade and section.
 - b. Keep the surface free from ruts, corrugations, or other irregularities.
 - c. Compact the surface uniformly.
 - 2. Tack Coat
 - a. Clean the surface of all materials that prevent the tack coat from bonding to the existing surface (e.g. mud, dirt, leaves, etc.)
 - b. Maintain the tack coat until the next course is placed. This must be done the same day the tack coat is applied. Cover all tacked surface areas with surfacing materials.
- D. Application
 - 1. Use a pressure distributor to apply the asphalt in a uniform, continuous spread. Keep the viscosity between 50 and 100 centistokes (AASHTO T-201)

2. Spread blotter material if the asphalt fails to penetrate. Use the quantities required to absorb the excess asphalt.
3. Prime Coat
 - a. Apply a prime coat to all concrete surfaced, including vertical which will come in contact with Hot Mix Asphalt.
 - b. Maintain the prime coat until the next course is placed.
 - c. Keep all traffic off the prime coat until it has cured and dried.
4. Tack Coat
Apply a tack coat to all surfaces, including vertical which will come in contact with Hot Mix Asphalt.

PART IV - MEASUREMENT

- 4.1 Measurement** – No Separate measurement will be made for Work described in this Section.

PART V - PAYMENT

- 5.1 Payment** – No separate payment will be made for prime coats. All costs pertaining thereto shall be included in the Contract Unit Prices for other items as listed in the Bid Form-Unit Prices.

END OF SECTION

SECTION 32 12 16.10**ASPHALT CONCRETE PAVEMENT****PART 1 - GENERAL**

1. This section governs all the work and materials necessary for the construction of asphaltic concrete pavements.
2. All the requirements of the Kansas City Metropolitan Chapter of the American Public Works Association (APWA), *Standard Specifications and Design Criteria* apply as amended and supplemented by the Department of Public Works of the City of Kansas City, Missouri (KCMO). Sections of said Specifications will be hereinafter referred to as "APWA-KCMO."

PART 2 - PRODUCTS

1. Asphaltic concrete mixes shall conform to APWA-KCMO 2205. Base course shall be Type 1-01; surface course and wedging shall be Type 5-01.
2. Pavement edge treatment shall be Type 2-01. Pavement edge treatments will consist of the elimination of pavement edge differentials when the distance between a temporary traffic control device and a pavement removal line/pavement drop-off is less than 6-feet. Wedge slopes shall be constructed and compacted as directed by the engineer.
3. Surface course and pavement edge treatment shall be virgin asphalt.
4. Recycled asphalt may be used for the base course.

PART 3 – EXECUTION

1. All work included in this Section shall conform to APWA-KCMO 2200 and the typical sections included in the plan set.

PART 4 - MEASUREMENT

1. The length and width of the work will be measured to the nearest foot and converted to the nearest 0.1 square yard for payment.

PART 5 - PAYMENT

1. "AC Pavement" will be paid for at the Contract Unit Price as listed in the Bid Form-Unit Prices. Such payment and price shall constitute full compensation for all labor, materials, and equipment necessary to complete the item.

END OF SECTION

SECTION 32 12 16.39**PROFILOGRAPH AND PAVEMENT SMOOTHNESS****PART I - GENERAL****1.1 SUMMARY**

- A. Materials and procedures for smoothness testing of (HMA) Hot Mix Asphalt, Open Graded Surface Course (OGSC), Stone Matrix Asphalt (SMA), and Portland Cement Concrete Pavement (PCCP).
- B. Requirements for 25-foot wheel base, California type Profilograph with electronic data recording, storing, data reduction, and printing capabilities.
- C. Related Sections
 - 1. 32 12 13.19 - Prime Coat/Tack Coat
 - 2. 32 13 13 - Portland Cement Concrete Pavement
 - 3. 32 12 16.10 - Asphalt Concrete Pavement

1.2 REFERENCES

MoDOT Materials Manual of Instruction

1.3 GENERAL REQUIREMENTS

- A. Certify Profilograph operators and equipment through the Missouri Department of Transportation. Engineer verifies certifications.
- B. Comply with project Traffic Control Plan and all applicable safety requirements when performing Profilograph testing.
- C. Contractor Quality Control
 - 1. Comply with requirements identified in Section 32 13 13 and Section 32 12 16.10.
 - 2. Address the following minimum items in the QCP:
 - a. Identify person(s) responsible for managing smoothness issues and monitoring compliance with requirements.
 - b. Identify equipment used to measure and monitor smoothness along with calibration and correlation information.
 - c. Identify personnel responsible for operation of equipment and their qualifications.
 - d. Identify construction methods employed to obtain smoothness, including:
 - 1) Method of grade control for rotomilling and paving operations.
 - 2) Actions taken to prevent paver from stopping and starting, including any use of additional equipment.
 - 3) Placement of manholes outside of projected wheel paths and methods of matching surface elevations and slopes

- e. Identify potential problems that could interfere with meeting pavement surface requirements.
- f. Describe grinding process and operation:
 - 1) Equipment and operators
 - 2) Must-grind layout, grade control, sealing process, etc.
 - 3) Schedule

1.4 ACCEPTANCE

- A. Notify the Engineer in writing a minimum of two working days prior to scheduling KCMO inspection of acceptance testing on the final pavement surface, after all corrective work has been performed.
 - 1. Clearly define the areas to be tested for acceptance in the written notification.
 - 2. Do not perform any work on the final surface after acceptance testing, except as directed by the Engineer.
- B. KCMO evaluates the surface by section, defined as:
 - 1. Traffic lane, 0.1 mile in length, including adjacent shoulder with a design width 8.0 ft or less, meeting the Class I description. (See Table 1)
 - a. Testing consists of a single trace measurement of each wheel path, defined as a continuous parallel line 2.5 ft inside the projected lane lines, of the traffic lane.
 - b. Testing of adjacent shoulder consists of a single trace measurement approximately centered in the shoulder when the design width is 6.0 ft or greater. Do not test shoulders having design widths less than 6.0 ft.
 - c. Determine the Profile Index (PI) by taking the average of all profile traces taken on the section.
 - 2. Shoulder, 0.1 mile in length, with a design width greater than 8.0 ft, meeting the Class I description.
 - a. Testing consists of two profile traces, 2.0 ft inside each edge.
 - b. Determine the Profile Index (PI) by taking the average of profile traces taken on the section.
- C. Begin the initial section(s) at the start of the project. Lay out subsequent sections consecutively to the end of the project.
- D. KCMO does not measure the PI for Class II surfaces.
- E. KCMO evaluates longitudinal and transverse deviations for both Class I and Class II surfaces.
- F. If the final lift of pavement cannot be completed due to seasonal limitations, KCMO evaluates all roadway sections paved through the final lift and evaluates the remaining final lift of pavement upon completion.

PART II - PRODUCTS**2.1 FRAME**

- A. Construction:
 - 1. All welded of light-weight square aluminum tubing in three separate units of the same dimensions in width and within 6 inches in length of each other.
 - 2. Design: reinforced truss.
- B. Length:
 - 1. Effective wheel base of the frame assembly: 25 ft.
 - 2. Overall length with multiple wheel assemblies attached: not to exceed 35 ft.
- C. Frame Connections:
 - 1. Indexed with steel location pins or dowels to prevent misalignment of frame assembly.
 - 2. Secured with quick acting clamps rated at a minimum of 800 lbs each.
- D. Parts: Each of the three frame units manufactured to allow interchangeable replacement of individual units.

2.2 WHEEL SUPPORT ASSEMBLIES

- A. Tubing: All welded, light-weight square aluminum.
- B. Connections: All connection points between wheel assemblies and frame sections secured with quick-acting clamps.
- C. Support wheels: Cast aluminum hubs with ball bearing supported steel axles and cushion rubber tires. Caster wheel assemblies: Ball bearing supported.
- D. Front Wheels: Steerable from the center of the machine.
- E. Rear Wheels: Quick setting manual adjustment to allow for short radius turning, moving laterally, and for trimming to avoid crabbing on superelevations.

2.3 RECORDING WHEEL

Light weight, 24 inch to 26 inch nominal diameter, and heavy duty spokes.

- 1. Tire: pneumatic tube type with non-aggressive tread design.
- 2. Frame: all welded of light-weight square aluminum tubing. Frame pivot points and rotating shafts supported by sealed ball bearings.

2.4 GENERAL MECHANICAL

- A. All exposed steel components anodized, nickel plated, or zinc plated for corrosion protection.
- B. Interchangeable parts.

- C. Capable of being broken down in segments that can fit into the back of a standard pickup truck or van for ease of transport.
- D. Constructed to allow complete assembly in less than 15 minutes without tools.

2.5 AC POWER GENERATING UNIT

- A. Self-contained, capable of delivering 120 VAC at 60Hz.
- B. Mount on the frame with appropriate vibration and shock control hardware.

2.6 MICROCOMPUTER

- A. Control the system by a dedicated on-board microcomputer.
- B. The microcomputer components replaceable and interchangeable with like items from the manufacturer's stock to facilitate controller repairs and provide the following minimum operation characteristics:
 - 1. Processor:
 - a. Minimal 16 bit microprocessor capable of running at a nominal 8 MHz processing speed.
 - b. On-board memory sufficient to store Profile Index (PI) and bump Discrimination software.
 - c. RAM memory sufficient to input control parameters and process project documentation variables at the test site.
 - 2. Displacement Transducer Interface:
 - a. Contains an analog to digital converter compatible with the operating characteristics of the microprocessor.
 - b. Include signal conditioning for analog filtering and scaling.
 - c. Overall resolution for displacement transducer less than or equal to 0.004 inches.
 - 3. Odometer Transducer Interface: Provides digital logic to encode positive or negative signals to microprocessor.
 - 4. Clock:
 - a. Provides time and calendar functions to microprocessor unit automatically.
 - b. Independent battery power required to avoid documentation errors and input data losses caused by on-board power shut downs.

2.7 TRANSDUCERS

Rated to withstand shock, vibration, dust, and extremes of humidity. Operational from -30 degrees C to 100 degrees C.

- 1. Vertical Displacement Transducer: Resolution of 0.01 inches.
- 2. Odometer: horizontal resolution of 0.39 inches and operational in either an incrementing or decrementing mode.

3. Temperature transducer: Accurate to 1 degree C.

2.8 PRINTER/PLOTTER

- A. Compatible with and provide suitable interfaces with the microprocessor.
- B. The data acceptance (baud rate) and buffer storage capacity: adequate to fully register, plot, and accept data from a 4 mph operational run without excessive wait states.
- C. Dot matrix mechanism (if applicable): print bar resolution of 100 dots per inch with a row resolution of 200 rows per inch.

2.9 OPERATOR CONTROL PANEL

- A. Located within easy access of the operator and in a location on the profilograph that does not hinder other operational functions or line of sight to testing path.
- B. Control panel with a digital display, data input keyboard, observable indicators, (video or screen) and operator actuated control switches.
- C. Parameters entered, displayed, and printed as follows (all numeric):
 1. Time
 2. Date
 3. Region, route and pavement
 4. Pass number
 5. Beginning Station
 6. Ending Station
 7. Odometer
 8. Blanking band width
 9. Bump height
 10. Bump width
 11. Event marker

2.10 REPORTING REQUIREMENTS

- A. Determine Profile Index, documentation, reports, outputs, or example, as specified. MoDOT Specifications.
- B. Set preprogrammed or operator entered scaling or sensitivity factors at a sensitivity level that to correlate with KCMO profilographs.
- C. Include the following documentation supplied with the Profilograph system:
 1. Operator's Manual.
 2. Wiring Diagrams.
 3. Industry standard part number or name and model numbers for complete subsystems.

PART III - EXECUTION**3.1 HMA, SMA, AND OGSC**

- A. Construction Requirements
 - 1. Construct finished pavement to meet the surface requirements in Table 1.
 - 2. Identify defects exceeding the limits in Table 1 and correct prior to acceptance testing.
 - a. Analyze the profile using 0.2 inch blanking band.
 - b. Correct defects across the entire width of the traffic lane or shoulder either by grinding with a device approved by the Engineer, or by milling and filling as directed by the Engineer.
 - c. Re-profile for correction verification prior to acceptance testing.
 - 3. Correct transverse defects where the pavement surface varies more than 1/8 inch from the lower edge of a 10 foot straightedge placed perpendicular to the centerline of the roadway.
 - 4. Seal ground areas with asphalt tack coat.
 - a. Use a tack coat application rate between 0.07 and 0.14 gal/yd².
 - 5. KCMO inspects acceptance testing prior to the placement of Chip Seal Coat, when applicable.
- B. Incentive/Disincentive – HMA
 - 1. Incentive/Disincentive applies only to Class I surfaces for each pavement section defined in this Section, Article 1.4, Acceptance, paragraph B.
 - a. Incentive/Disincentive is calculated according to Table 2, with partial sections prorated based on length.
 - b. Incentive/Disincentive does not apply to HMA surfaces on projects requiring OGSC or SMA.
 - c. Any section requiring grinding exceeding 20 yd² does not qualify for incentive. Disincentive remains applicable for sections where grinding exceeds 20 yd².
 - 2. Any section still requiring corrective work that is identified at the time of acceptance testing results in loss of incentive for the section. Disincentives remain applicable and are based on PI obtained at the time of acceptance testing.
 - 3. Failure to correct defects, identified at the time of acceptance testing, within 14 calendar days after notification by the Engineer results in liquidated damages assessed at \$100.00 per day after 14 calendar days per each section needing corrective work.
 - a. Liquidated damages may be waived by the Engineer if it is determined to be in the best interests of the Department to defer corrective work.
- C. Incentive/Disincentive - OGSC and SMA Surfaces

1. Incentive/Disincentive applies only to Class I surfaces for each pavement section defined in this Section, article 1.4, Acceptance.
 - a. Incentive/Disincentive is calculated according to Table 3, with partial sections prorated based on length.
2. Any section requiring grinding exceeding 20 yd² or any section still requiring corrective work that is identified at the time of acceptance testing results in a disincentive of \$1000.00 per section
3. Failure to correct defects, identified at the time of acceptance testing, within 14 calendar days after notification by the Engineer results in liquidated damages assessed at \$100.00 per day per each section needing corrective work.
 - a. Liquidated damages may be waived by the Engineer if it is determined to be in the best interests of the Department to defer corrective work.

3.2 PORTLAND CEMENT CONCRETE PAVEMENT (PCCP)

A. Construction Requirements

1. Construct finished pavement to meet surface requirements listed in Table 1.
2. Identify defects exceeding the limits in Table 1 and correct prior to acceptance testing.
 - a. Analyze the profile using 0.2 inch blanking band.
3. Correct defects across the entire width of the traffic lane or shoulder by grinding with a device approved by the Engineer.
 - a. Re-profile for correction verification prior to acceptance testing.
4. Correct transverse defects where the pavement surface varies more than 1/8 inch from the lower edge of a 10 foot straightedge placed perpendicular to the centerline of the roadway.

B. Incentive/Disincentive – PCCP

1. Incentive/Disincentive applies only to Class I surfaces for each pavement section defined in this Section, article 1.4, Acceptance, paragraph B.
 - a. Incentive/Disincentive is calculated according to Table 4, with partial sections prorated based on length.
2. Any section requiring grinding exceeding 20 yd² does not qualify for incentive.
3. Any section still requiring corrective work that is identified at the time of acceptance testing results in loss of incentive for the section. Disincentives remain applicable and are based on PI obtained at the time of acceptance testing.
4. Failure to correct defects, identified at the time of acceptance testing, within 14 calendar days after notification by the Engineer results in liquidated damages assessed at \$100.00 per day per each section needing corrective work
 - a. Liquidated damages may be waived by the Engineer if it is determined to be in the best interests of the Department to defer corrective work.

Table 1 Surface Requirements				
Pavement Category	Class 1 Surface		Class II Surface	
	Section PI	Profile Deviation	Section PI	Profile Deviation
Category	in/mi	in/25ft	in/mi	in/25ft
1	5	0.3	N/A	0.3
2	7	0.3	N/A	0.3
Category 1	National Highway System and Truck Routes (See Section 02741, Table 11) and all other routes with surfaces having three or more opportunities for improving the ride.*			
Category 2	All other routes incorporating single lift overlays with not more than two opportunities for improving the ride.*			
Class I	Surfaces consist of all through traffic and climbing lanes, passing lanes, acceleration and deceleration lanes, shoulders, ramps and turn lanes longer than 1000 ft, including bridges and bridge approach slabs with final riding surfaces placed on the contract. Excluded are horizontal curves having a centerline radius of curvature less than 900 ft and areas within the superelevation transitions to these short radius curves.			
Class II	Surfaces consist of all tapers, road approaches, mainline pavement sections with posted regulatory speeds less than 35 MPH, pavement within 15 ft of bridge decks and approach slabs not paved as part of the project, pavement to a point 50 ft beyond the paving limits of the project and all other surfaces not included in Class 1 and surfaces excluded due to horizontal curves.			

*Each opportunity to improve the ride is one of the following: Placing a gravel or treated base course, OGSC, SMA, rotomilling, cold recycling, and each lift of paving. Leveling is not considered as an opportunity to improve the ride.

PART IV - MEASUREMENT

4.1 Measurement – No Separate measurement will be made for Work described in this Section.

PART V - PAYMENT

5.1 Payment – No separate payment will be made for this Work. All costs pertaining thereto shall be included in the Contract Unit Prices for other items as listed in the Bid Form-Unit Prices.

END OF SECTION

SECTION 32 12 16.50**TEMPORARY SURFACING****PART 1 - GENERAL**

1. This section governs all the work and materials necessary for the construction of temporary surfaces.
2. All the requirements of the Kansas City Metropolitan Chapter of the American Public Works Association (APWA), *Standard Specifications and Design Criteria* apply as amended and supplemented by the Department of Public Works of the City of Kansas City, Missouri (KCMO). Sections of said Specifications will be hereinafter referred to as "APWA-KCMO."
3. All work included in this Section shall conform to APWA-KCMO 2200.
4. Temporary pavement mix shall conform to APWA-KCMO 2205 Type 3-01.
5. Temporary aggregate surfacing shall conform to Missouri Department of Transportation (MoDOT) Standard Specifications for Highway Construction Section 1006 Aggregate for Surfacing.
6. Recycled asphalt may be used for temporary pavement.

PARTS 2 AND 3 - MATERIALS AND PLACEMENT

1. **Temporary Aggregate Surfacing.** Aggregate for surfacing shall be composed of durable particles of durable particles of rock. When tested in accordance with AASHTO T 96, the wear should not exceed 60 percent. Temporary aggregate surfacing shall conform to the gradation requirements of MoDOT Standard Specifications for Highway Construction Sections 1006.2 and 1006.3.

PART 4 - MEASUREMENT

1. The length and width of the work will be measured to the nearest foot and converted to the nearest 0.1 square yard for payment.

PART 5 - PAYMENT

1. "Type 3 Asphalt for Temporary Surfacing" will be paid for at the Contract Unit Price as listed in the Bid Form-Unit Prices. Such payment and price shall constitute full compensation for all labor, materials, and equipment necessary to complete the item. No separate payment will be made for removing or disposing the material from the site.
2. "Aggregate for Temporary Surface". 6-in. MO Type 5 Aggregate Base shall be paid for at the Contract Unit Price as listed in the Bid Form-Unit Prices. All Such payment and price shall constitute full compensation for all labor, material, and equipment necessary to complete the items including material, securing the source, quarrying, excavating, breaking, hauling the material to the site, and removing and disposing the material from the site.

END OF SECTION

SECTION 32 13 13**PORTLAND CEMENT CONCRETE PAVEMENT**

PART 1 - GENERAL

1.01 SCOPE OF WORK

- A. Furnish the necessary equipment, labor and materials required and perform all work in connection with the construction of concrete pavement as shown on the Drawings and as specified at the time of bidding in American Public Works Association Standard Specifications and Design Criteria Section 2200 as revised, adopted, and provided by the Director of Kansas City, Missouri Public Works.

1.02 REFERENCE STANDARDS

- A. In addition to complying with all pertinent codes and regulations, comply with the referenced or applicable portions of the American Public Works Association Standard Specifications and Design Criteria, and the Kansas City, Missouri Standards and Specifications for Water Main Extensions and Relocations available at the time of bidding.
- B. The following standards are referenced directly in this section. The latest version of these standards shall be used.

ASTM:

- A 185 Standard Specification for Steel Welded Wire Fabric, Plain, for Concrete Reinforcement
- A 615 Standard Specification for Deformed and Plain Billet-Steel Bars for Concrete Reinforcement
- C 1116 Standard Specification for Fiber-Reinforced Concrete and Shotcrete
- C 1315 Specification for Liquid Membrane-Forming Compounds Having Special Properties for Curing and Sealing Concrete
- C 1399 Test Method for Obtaining Average Residual-Strength of Fiber-Reinforced Concrete
- D 1751 Standard Specification for Preformed Expansion Joint Filler for Concrete Paving and Structural Construction (Nonextruding and Resilient Bituminous Types)
- D 1752 Standard Specification for Preformed Sponge Rubber and Cork Expansion Joint Fillers for Concrete Paving and Structural Construction

- D 2628 Standard Specification for Preformed Polychloroprene Elastomeric Joint Seals for Concrete Pavements
- D 2835 Standard Specification for Lubricant for Installation of Preformed Compression Seals in Concrete Pavements
- D 3405 Standard Specification for Joint Sealants, Hot-Applied, for Concrete and Asphalt Pavements
- D 3406 Standard Specification for Joint Sealant, Hot-Applied, Elastomeric-Type, for Portland Cement Concrete Pavements
- E 965 Test Method for Measuring Surface Macrotexture Depth Using a Sand Volumetric Technique

AASHTO:

- M 213 Preformed Expansion Joint Fillers for Concrete Paving and Structural Construction (Nonextruding and Resilient Bituminous Types)
- M 220 Preformed Polychloroprene Elastomeric Joint Seals for Concrete Pavements
- M 282 Joint Sealants, Hot-Poured, Elastomeric Type, for Portland Cement Concrete Pavements
- M 301 Joint Sealants, Hot-Poured, for Concrete and Asphalt Pavements

MCIB

Section 1 Concrete Materials

Section 2 Outdoor Concrete Exposed to Freezing and Thawing

Section 3 Concrete Mix Design Tables

PART 2 - PRODUCTS

2.01 MATERIALS

- A. All products shall be as specified in the American Public Works Association Standard Specifications and Design Criteria APWA Section 2200 as revised, adopted, and provided by the Director of Kansas City, Missouri Public Works.

2.02 CONCRETE CONTROL AND QUALITY

- A. The current editions of the "Bulletins" and Approved Sections of the "Standard Concrete Specifications" issued by the Mid-West Concrete Industry Board, Inc. (MCIB) are made a part hereof by reference. However, when the provisions of this Specification differ from the provisions of such "Bulletins" and "Sections" the provisions of this Specification shall govern.

2.03 CONCRETE

- A. Concrete shall conform to MCIB Section 1 shall be MCIB Mix No. A658-1-2-.365 or No. WA561-1-2- 0.410 or approved equal. All coarse aggregate shall meet the requirements of MCIB section 1 except that it shall meet the following gradation:

Coarse Aggregate Gradation Limits, % Passing

Nominal Maximum Size	1"	¾"	½"
Sieve Size			
1½"	100		
1"	90-97	100	
¾"	62-82	90-97	100
½"	25-60	45-70	80-97
3/8"	16-44	20-55	40-70
No. 4	0-10	0-10	0-15
No. 8	0-5	0-5	0-5

- B. If Fly Ash is to be substituted for cement in the production of concrete, it shall be in accordance with APWA Subsection 2212 – Fly Ash Concrete.
- C. A mix design, for all concrete mixes to be used, shall be submitted to the Engineer for review a minimum of 14 days before use and be approved prior to placement. The mix design shall contain the following information as a minimum:
1. Mix design designation required by project
 2. Project name, location, project number and date
 3. Name and location of ready mix plant or plants
 4. List the source and type of all materials from each plant supplying mix
 5. CA and FA Sieve Analysis and quality checks from each plant supplying mix. CA-Ledge, quarry or mine name and location. FA-Sand plant name, location and source (MO or Kaw River)
 6. Cement chemical analysis
 7. Certifications on admixtures
 8. Specific gravity of all materials
 9. All materials tests and certifications shall be performed no more than six months prior to the placement of any concrete mix
 10. The mix design shall be based on one cubic yard of concrete or one

cubic meter if required

11. The mix design shall contain the weight and volume of each mix component (S.S.D.)
12. The results of 7-day and 28-day compressive strengths shall be submitted when required
13. Special requirements for fly ash concrete mixes
14. Certification of cement and aggregate scales calibration date calibrated and company (performed yearly)
15. On bridge deck pours the concrete shall be supplied from only one plant

2.04 REINFORCEMENT

A. Bars

1. Bars shall conform to ASTM A 615.

B. Welded Steel Wire

1. Welded steel wire fabric shall conform to ASTM A 185.

C. Supporting Elements

1. Representative samples of supporting elements shall be submitted and approved by the Engineer prior to their use in the project.

D. Fibers

1. Where required, fibers shall be applied at the rate of 3 pounds per cubic yard (1.8 kg per cubic meter) of concrete. Fibers for concrete reinforcement shall be composed of only 100% virgin homopolymer polypropylene, fibrillated and graded. Fibers shall contain no reprocessed olefin materials, and shall be specifically manufactured to an optimum gradation for use as secondary concrete reinforcement, meeting the requirements of ASTM C 1116, Type III, 4.1.3, and ASTM C 1116 Performance Level 1, and a minimum residual strength of 30 psi per ASTM C 1399, average of 4 beams sampled at the point of discharge (or when appropriate, the point of placement.)

2.05 ISOLATION JOINT FILLERS

- A. Isolation joint fillers shall conform to ASTM D 1752 or D7174.

2.06 JOINT SEALING COMPOUNDS

- A. Joint sealing compounds shall conform to the standards for the type of sealant specified as listed in the following table:

Joint Seals and Sealants	AASHTO	ASTM
Hot-poured, Polymeric Asphalt Based	M 301	D3405
Hot-poured, Elastomeric-Type	M 282	D3406
Preformed Polychloroprene Elastomeric	M 220	D2628
Lubricant for Installation of Preformed Seal	-	D2835
Preformed Expansion Joint Filler	M 213	D1751

2.07 CURING MEMBRANE

- A. All material to be used or employed in curing Portland Cement Concrete must be approved by the Engineer prior to its use. It shall be of the liquid membrane type and shall conform to ASTM C 1315, Type II, Class A.

PART 3 - EXECUTION

3.01 CONSTRUCTION DETAILS

- A. Portland Cement Concrete pavement shall be constructed to the configuration, and to the lines and grades shown on the plans.

B. Grading and Subgrade Preparation

1. All excavation or embankment required shall be as defined in Sections 31 22 00 and 31 23 13 entitled "Site Preparation and Grading" and "Subgrade Preparation." If areas of the subgrade are below the lines and grades shown on the plans, they shall be brought to the proper line and grade by one of the following:
 - a. Additional fill material placed in accordance with Sections 31 22 00 and 31 23 13.
 - b. Areas may be filled with Granular Fill conforming to Sections 32 11 00.
 - c. Areas may be filled with additional thickness of Portland Cement Concrete Pavement.

C. Forms

1. All forms shall be in good condition, clean, and free from imperfections. Each form shall not vary more than 1/4 inch in horizontal and vertical alignment for each 10 feet of length.
2. Material & Size
 - a. Forms shall be made of metal and shall have a height equal to or greater than the prescribed edge thickness of the pavement slab.

3. Strength

- a. Forms shall be of such cross-section and strength, and so secured as to resist the pressure of the concrete when struck off, vibrated, and finished, and the impact and vibration of any equipment which they may support.

4. Installation

- a. Forms shall be set true to line and grade, supported through their length and, joined neatly in such a manner that the joints are free from movement in any direction.

5. Preparation

- a. Forms shall be cleaned and lubricated prior to each use and shall be so designed to permit their removal without damage to the new concrete.

3.02 JOINTS

- A. Generally joints shall be formed at right angles to the true alignment of the pavement and to the depths and configuration specified by the appropriate standard or as modified by the plans and specifications.

1. Isolation Joints

- a. Isolation joints shall be placed at all locations where shown on the plans and standards or as directed by the Engineer.
- b. Isolation joints shall extend the entire width of the pavement and from the subgrade to one inch below the surface of the pavement or the material will have a suitable tear strip provided to allow for the application of the joint sealer.
- c. Under no circumstances shall any concrete be left across the isolation joint at any point.
- d. Material: Isolation joints shall be formed by a one piece, one inch thick preformed joint filler cut to the configuration of the correct pavement section.
- e. Stability: Isolation joints shall be secured in such a manner that they will not be disturbed during the placement, consolidation and finishing of the concrete.

- f. Dowels: If isolation joints are to be equipped with dowels they shall be of the size and type specified, and shall be firmly supported in place, by means of a dowel basket which shall remain in place. One half of each dowel shall be lightly painted or greased with a product approved by the engineer.

B. Contraction Joints

1. Contraction joints shall be placed where indicated and to the depth indicated by the plans, specifications and standards.
2. Contraction joints shall be sawed.
3. When sawing joints, the contractor shall begin as soon as the concrete hardens sufficiently to prevent excessive raveling along the saw cut and shall finish before conditions induce uncontrolled cracks, regardless of the time or weather. The longitudinal contraction joints shall be sawed immediately after sawing transverse joints. When joint sealing backup material is specified with sawed joints, the first stage, which provides a relief cut shall be approximately 1/8 inch wide, and shall be to plan depth. The second stage which widens the joints to allow the insertion of joint sealing backup material to plan depth shall not be performed until the concrete is at least 48 hours old, and shall be delayed longer when the sawing causes raveling of the concrete. If second stage sawing is performed prior to the completion of the curing period, the contractor shall maintain the cure by use of curing tapes, plastic devices, or other materials approved by the engineer.
4. For Portland Cement concrete pavements, sawed contraction joints shall be one-third the thickness of the slab (minimum).
5. Dowels. If contraction joints are to be equipped with dowels they shall be of the size and type specified and shall be firmly supported in place and accurately aligned parallel to the pavement line and grade with an allowable tolerance of 1/8 inch.

C. Longitudinal and Construction Joints

1. Longitudinal joints or construction joints shall be placed as shown on the plans or where the Contractor's construction procedure may require them to be placed. Longitudinal construction joints (joints between construction lanes) shall be keyed or tied joints of the dimensions shown on the plans or standards.

D. Transverse Construction joints

1. Transverse construction joints of the type shown on the plans or standards shall be placed wherever concrete placement is suspended for more than 30 minutes.

E. Tiebars

1. Tiebars shall be of deformed steel of the dimensions specified by the plans or standards. Tiebars shall be installed at the specified spacing and firmly secured so as not to be disturbed by the construction procedure.

3.03 PLACING, FINISHING, CURING, AND PROTECTION

- A. Concrete shall be furnished in quantities required for immediate use and shall be placed in accordance with the requirements of MCIB Concrete Pavement. Prior to commencing construction, the contractor shall furnish a concrete delivery plan which includes at a minimum the number of trucks which will be dedicated to the project, the location of the concrete plant, the route and distance from the plant to the job site, and the anticipated rate of concrete usage. It is essential that concrete be delivered in sufficient quantities to prevent stoppage of the paving operation.

B. Concrete Placement

1. The concrete shall be deposited on the subgrade to the required depth and width of the construction lane in successive batches and in a continuous operation without the use of intermediate forms or bulkheads. The subgrade shall be moistened prior to the placement of concrete. The concrete shall be placed as uniformly as possible in order to minimize the amount of additional spreading necessary. While being placed, the concrete shall be vibrated and compacted with suitable tools so that the formation of voids or honeycomb pockets is prevented.
2. The concrete shall be well vibrated and tamped against the forms and along all joints. Care shall be taken in the distribution of the concrete to deposit a sufficient volume along the outside form lines so that the curb section can be consolidated and finished simultaneously with the slab.
3. No concrete shall be placed around manholes or other structures until they have been brought to the required grade, alignment, and cross slope.
4. Concrete shall not be allowed to extrude below the forms.

C. Concrete Finishing Methods

1. The pavement shall be struck off and consolidated with a mechanical finishing machine. Hand-finishing methods may be used for small or irregular areas. Furnish paving and finishing equipment applicable to the type of construction as follows:

2. Slip-form Machines
 - a. Furnish slip-form machines capable of spreading, consolidating, screening, and float finishing the freshly placed concrete in one pass to provide a dense and homogeneous pavement with minimal hand finishing.
3. Self-Propelled Form-Riding Machines
 - a. Furnish mechanical, self-propelled spreading and finishing machines capable of consolidation and finishing the concrete with minimal hand finishing. Do not use machines that displace the fixed side forms.
4. Manual Fixed-Form Paving Machines
 - a. Furnish spreading and finishing machines capable of consolidating and finishing the concrete with minimal hand finishing.
5. Hand Methods
 - a. When finishing by hand methods, concrete shall be consolidated by use of vibrating units operating in the concrete. Unless the vibrating apparatus is such that the full width of concrete is consolidated in a single passage, a definite system or pattern shall be used in the operation of the vibrator so the full width of concrete in each linear foot of lane will receive adequate and uniform consolidation. The system and methods of vibrating shall be subject to approval of the Engineer. Vibrating equipment shall, under no circumstances, be used as a tool for moving concrete laterally on the grade.

D. Concrete Finishing

1. Floating
 - a. All surfaces shall be consolidated and floated after strike-off prior to final surface finish.
2. Surface Tolerance
 - a. After the longitudinal floating has been completed and the excess water has been removed, and while the concrete is still plastic, the slab shall be tested for trueness with a highway straightedge. The highway straightedge shall be held in successive positions parallel to the road center-line in contact with the surface and the whole area worked from one side of the slab to the other as necessary. Advancement along the pavement shall be in successive stages of not more than one half the length of the highway straightedge. Any depressions found shall be immediately filled with freshly

mixed concrete, struck off, consolidated, and refinished. Check surface longitudinally while concrete is still plastic; correct any surface deviations greater than 1/8 inch in 10 feet. Round edges of pavement to 1/8 inch radius.

3. Edging

- a. Before final finishing is completed and before the concrete has taken its initial set, the edges of the slab and curb shall be finished to the radius shown on the plans or standards by the paving equipment, or with hand edging tools.

4. Final Surface Finish

a. Dragged Surface Treatment

- i. Astroturf or burlap shall be dragged longitudinally over the finished surface to produce a tight, uniform, textured surface, and the edges shall be rounded in a workmanlike manner for roadways with a design speed of 45 MPH or to be posted 45 MPH or less. The texture achieved by the astroturf or burlap drag shall be tested by the Contractor in accordance with ASTM E 965, "Test Method for Measuring Surface Macrotexture Depth Using a Sand Volumetric Technique", to ensure the texture is adequate for skid resistance when this surface treatment is used for roadways to be posted 50 MPH or more. Test locations will be determined by the engineer. The results of ASTM E 965 shall show an average texture depth of any lot, as defined below, shall have a minimum value of 0.032 inch. Any lot showing an average of less than 0.032 inch but equal to or greater than 0.024 inch will be accepted as substantial compliance but the contractor shall amend their operation to achieve the required 0.032 inch minimum depth. (It is not the intention of this tolerance to allow the contractor to continuously pave with an average texture depth of less than 0.032 inch. Any lot showing an average texture depth of less than 0.024 inch shall require diamond grinding of the pavement represented by this lot to attain the necessary texture. Any individual test showing a texture depth of less than 0.020 inch shall require diamond grinding of the pavement represented by this lot to attain the necessary texture. Limits of any failing individual test shall be determined by running additional tests at 100 foot intervals before and after the failing test location. All testing of the surface texture shall be completed no later than the day following pavement placement.

b. Groove Treatment

- i. Unless otherwise specified the texture surface of travel lanes of pavement shall be given a suitable transverse or

longitudinal grooving, or a dragged surface treatment as described in paragraph a for roadways to be posted at 50 MPH or more. If grooving is required, surface grooving shall be done with a mechanical device such as a wire broom or comb or by hand. The broom or comb shall have a single row of spring steel tines, rectangular in cross section, 1/8 inch to 3/16 inch wide; spaced on 3/4 inch centers of sufficient length, thickness, and resilience to form grooves to a depth of a minimum of 1/8 inch to a maximum of approximately 3/16 inch in the plastic concrete. This operation shall be done at such time and in such manner that the desired surface texture will be achieved while minimizing displacement of the larger aggregate particles and before the surface permanently sets. Where abutting pavement is to be placed, the grooving should extend as close to the edge as possible without damaging the edge. If abutting pavement is not to be placed, the 6 inch area nearest the edge or 1 foot from the face of the curb is not required to be grooved. For small or irregular areas or during equipment breakdown, grooving may be done by hand methods.

5. Curing

- a. As soon as practical after the concrete is finished it shall be cured with one of the acceptable methods. Curing shall conform to the requirements of MCIB Standard Concrete Specifications except water proof paper or polyethylene sheeting shall not be acceptable as curing methods for concrete pavement. If a liquid curing membrane is used, it shall be applied in accordance to the manufacturer's directions.
- b. Method of Applying Curing Membrane
 - i. A nozzle producing a uniform fan pattern will be used on all spray equipment when applying the liquid curing membrane. The curing compound should be applied immediately after final finishing, and before the loss of all free water on the surface of the concrete. Normally one smooth, even coat shall be applied at a rate of 150 to 200 square feet per gallon, but two coats may be necessary to ensure complete coverage and effective protection. Second coats should be applied at right angles to the first.
- c. Curing Formed Surfaces
 - i. If the forms are removed from finished concrete pavement within a period of 72 hours or if a slip form paving machine has been used, these surfaces shall also be cured. Curing membrane damaged by joint sawing operations shall be repaired by the Contractor as directed by the Engineer.

6. Protection

- a. The Contractor shall, at his own expense, protect the concrete work against damage or defacement of any kind until it has been accepted by the Engineer.
- b. All vehicular traffic shall be prohibited from using the new concrete pavement until it has attained strength in accordance with the following table:

Slab Thickness	Strength for Opening to Traffic psi	
	Compressive	3rd-Point Flexural
All UTW	2000	300
6.0"	3600	540
7.0"	2700	410
8.0"	2150	340
9.0"	2000	300
10"+	2000	300

- c. Concrete pavement that is not acceptable to the Engineer because of damage or defacement, shall be removed and replaced, or repaired to the satisfaction of the Engineer, at the expense of the Contractor.

7. Diamond Grinding

- a. Grind the riding surface to reduce or eliminate the irregularities.
- b. Use a self-propelled grinding machine with diamond blades mounted on a multi-blade arbor. Avoid using equipment that causes excessive ravels, aggregate fractures, or spalls. Provide uniform texture the full width of the lane.
- c. Transverse grooving will not be required.
- d. Use vacuum equipment or other continuous methods to remove grinding slurry and residue. Prevent the grinding slurry from flowing across lanes being used by traffic.
- e. After corrections have been made to the riding surface, test the pavement for smoothness using the same technique used to determine smoothness originally.
- f. Where smoothness is determined through the use of a profilograph, run two traces in each lane that has been corrected. Run one trace three feet from the longitudinal joint between the lanes and another trace three feet from the shoulder or curb edge of the lane. Assure that the profilograph testing and evaluation is performed by a trained and certified operator. Within two days

3.04 BACKFILL

- A. A minimum of 24 hours shall elapse before forms are removed and 5 days shall elapse or the concrete must have attained 75% of its 28 day compressive strength before pavement is backfilled unless otherwise approved by the Engineer.
- B. Backfill shall be accomplished in accordance with Sections 31 22 00 and 31 23 13 entitled "Site Preparation and Grading" and "Subgrade Preparation."
- C. The Contractor shall be responsible for the repair of any existing street pavement damaged by the construction to the satisfaction of the Engineer.

3.05 JOINT SEALING AND CLEAN-UP

- A. All joints shall be sealed with an approved joint sealer meeting the requirements of the products section applied in accordance with the manufacturer's directions within 7 days of the placement of the concrete and prior to the opening of the pavement to traffic.
- B. The Contractor shall be responsible for the removal of excess dirt, rock, broken concrete, concrete splatters and overspray from the area of the construction.

3.06 INTEGRAL CURB

- A. Integral curbs shall be required along the edges of all street pavements as indicated on the plans, or standards, except at such locations as the Engineer may direct. The integral curb shall be constructed during or immediately following the finishing operation unless otherwise shown on the plans. Special care shall be taken so that the curb construction does not lag behind the pavement construction and form a "Cold joint."
- B. Steel curb forms or integral slipforming shall be required to form the backs of all curbs except where impractical because of small radii street returns or other special sections. Curbs shall be formed to the cross section as shown on the drawings with a mule; or templates supported on the side forms and with a float not less than four feet in length.
- C. The finished surface of the curb and gutter shall be checked for no more than ¼ inch deviation by the use of a 10 foot straightedge and corrected if necessary. Where grades are flat and while the concrete is still plastic, the drainage of the gutter should be checked with a 4 ft. carpenter's level.

3.07 REPAIRING DEFECTS

- A. Repair defects in conformance with the following. Do not begin corrective work until after submitting a plan and receiving the Engineer's approval for repair methods.

Defect Type	Defect Direction	Defect Location	Description	Repair Procedure	Alternate Procedure
Plastic Shrinkage Crack	Any	Anywhere	Only partially Penetrates depth	Do nothing	Fill with HMWM2
Uncontrolled Crack	Transverse	Mid-slab	Full-depth	Saw and seal Crack	LTR3
Uncontrolled Crack	Transverse	Crosses or ends at transverse joint	Full-depth	Saw and seal the crack; Epoxy uncracked joint	
Uncontrolled Crack	Transverse	Relatively parallel and within 1.5 m of joint	Full-depth	Saw and seal the crack; Seal joint	FDR4 to replace crack and joint
Saw cut or Uncontrolled Crack	Transverse	Anywhere	Spalled	Repair spall by PDRS if crack not Removed	
Uncontrolled Crack	Longitudinal	Relatively parallel & within 1 ft. of joint; May cross or end at longitudinal joint	Full-depth	Saw and seal the crack; Epoxy uncracked joint	Cross-stitch' Crack

Defect Type	Defect Direction	Defect Location	Description	Repair Procedure	Alternate Procedure
Uncontrolled Crack	Longitudinal	Relatively parallel & in wheel path 1-4.5 ft -1.35 m from joint)	Full-depth, Hairline or Spalled	Remove and replace slab	Cross-stitch' Crack
Uncontrolled Crack	Longitudinal	Relatively parallel and further than 4.5 ft. from a long. joint or edge	Full-depth	Cross-stitch' crack; Seal longitudinal joint	
Saw cut or Uncontrolled Crack	Longitudinal	Anywhere	Spalled	Repair spall by PDRS if crack not Removed	
Uncontrolled Crack	Diagonal	Anywhere	Full-depth	FDR4	
Uncontrolled Crack	Multiple per Slab	Anywhere	Two cracks Dividing slab into 3 or more pieces	Remove and replace slab	

1 m=3.28 ft

HMWM = High molecular weight methacrylate poured over surface and sprinkled with sand for skid resistance.

LTR = load-transfer restoration; 3 dowel bars per wheel path grouted into slots sawed across the crack; Slots must be parallel to each other and the longitudinal joint.

FDR = full-depth repair; 10 ft long by one lane wide. Extend to nearest transverse contraction joint if 10 ft repair would leave a segment of pavement less than 10 ft long.

PDR = partial-depth repair; Saw around spall leaving 2 in. between spall and 2 in. deep perimeter saw. Chip concrete free, then clean and apply bonding agent to patch area. Place a separating medium along any abutting joint or crack. Fill area with patching mixture.

Cross-stitching; for longitudinal cracks only, drill $\frac{3}{4}$ " holes at 35° angle, alternating from each side of joint on 30-36 in. spacing. Epoxy #5 epoxy coated deformed steel tiebars into hole.

END OF SECTION 32 13 13

SECTION 32 13 13.10**PORTLAND CEMENT CONCRETE PAVEMENT - ML****PART 1 - GENERAL**

1. This section governs all the work and materials necessary for the construction of the Main Line Portland Cement Concrete Pavements.
2. All the requirements of the Kansas City Metropolitan Chapter of the American Public Works Association (APWA), *Standard Specifications and Design Criteria* apply as amended and supplemented by the Department of Public Works of the City of Kansas City, Missouri (KCMO). Sections of said Specifications will be hereinafter referred to as "APWA-KCMO."

PART 2 – PRODUCTS

1. Refer to Section 32 13 13 for the products and materials for this Work.

PART 3 – EXECUTION

1. Refer to Section 32 13 13 for the execution of this Work.

PART 4 - MEASUREMENT

4.1 Measurement

- A. The quantities of accepted work will be measured in the following units. All measurements will be plan measure except for authorized changes.
 1. PCC Pavement CY (Cubic Yard)

PART 5 - PAYMENT

5.1 Payment

Payment will be made at the respective unit or lump-sum price listed in the proposal and shall be full compensation for all labor, materials, and equipment necessary to complete the respective unit in place. There will be no separate measurement or payment for any item of work not specifically identified and listed in the proposal, and all such work shall be considered a subsidiary item with all costs pertaining thereto included in the prices for other items listed in the proposal. At the Engineer's option, partial payment may be made for any lump sum item listed in the proposal, providing that the Contractor is diligently and satisfactorily pursuing full completion of such partially complete item in accordance with the approved job progress schedule.

END OF SECTION

SECTION 32 14 13**PRECAST UNIT PAVING****PART 1 - GENERAL****1.1. RELATED DOCUMENTS**

- A. Drawings and general provisions of the Contract, including General and Supplementary Conditions and Division 01 Specification Sections, apply to this Section.

1.2. SUMMARY

- A. Section Includes:
 - 1. Concrete pavers set in aggregate setting beds.
 - 2. Cast-in-place concrete edge restraints.
- B. Related Sections:
 - 1. Section 32 13 13 "Concrete Paving" for cast-in-place concrete curbs and gutters serving as edge restraints for unit pavers.

1.3. ACTION SUBMITTALS

- A. Product Data: For the following:
 - 1. Pavers.
- B. LEED Submittals:
 - 1. Product Data for Credit MR 4.1 and Credit MR 4.2: For products having recycled content, documentation indicating percentages by weight of postconsumer and preconsumer recycled content.
 - a. Include statement indicating costs for each product having recycled content.
 - 2. Product Data for Credits MR 5.1 and 5.2 - Local/Regional Materials:
 - a. Indicate location of manufacturing facility, including name, address, and distance between manufacturing facility and the project site. Provide manufacturer's documentation indicating location where the base materials were extracted, mined, quarried, harvested, etc. and the distance between this location and the project site. Also include material costs, excluding cost of installation.
- C. Sieve Analyses: For aggregate setting-bed materials, according to ASTM C 136.
- D. Samples for Verification:
 - 1. Full-size units of each type of unit paver indicated.

1.4. QUALITY ASSURANCE

- A. Source Limitations: Obtain each type of unit paver, joint material, and setting material from single source with resources to provide materials and products of consistent quality in appearance and physical properties.

- B. Mockups: Build mockups to verify selections made under Sample submittals and to demonstrate aesthetic effects and set quality standards for materials and execution.
 - 1. Approved mockups may become part of the completed Work if undisturbed at time of Substantial Completion.
- C. Preinstallation Conference: Conduct conference at Project site.

1.5. DELIVERY, STORAGE, AND HANDLING

- A. Store pavers on elevated platforms in a dry location. If units are not stored in an enclosed location, cover tops and sides of stacks with waterproof sheeting, securely tied.
- B. Store cementitious materials on elevated platforms, under cover, and in a dry location. Do not use cementitious materials that have become damp.
- C. Store aggregates where grading and other required characteristics can be maintained and contamination avoided.

1.6. PROJECT CONDITIONS

- A. Cold-Weather Protection: Do not use frozen materials or materials mixed or coated with ice or frost. Do not build on frozen subgrade or setting beds. Remove and replace unit paver work damaged by frost or freezing.

PART 2 - PRODUCTS

2.1. CONCRETE PAVERS

- A. Regional Materials: Provide concrete pavers that have been manufactured within 500 miles (800 km) of Project site from aggregates that have been extracted, harvested, or recovered, as well as manufactured, within 500 miles (800 km) of Project site.
- B. Concrete Pavers: Solid interlocking paving units complying with ASTM C 936 and resistant to freezing and thawing when tested according to ASTM C 67, made from normal-weight aggregates.
 - 1. Product: Subject to compliance with requirements, provide Pavestone Company "Verona" paver.
 - a. Field Paver
 - i. Thickness: 3-1/8 inches (80 mm) minimum.
 - ii. Face Size and Shape: 3" x 18" nominal, rectangular.
 - iii. Color: Pewter Blend (70% Pewter, 20% Limestone, 10% Charcoal).
 - b. Accent Paver 1
 - i. Thickness: 3-1/8 inches (80 mm) minimum.
 - ii. Face Size and Shape: 3" x 18" nominal, rectangular.
 - iii. Color: Limestone.
 - c. Accent Paver 2
 - i. Thickness: 3-1/8 inches (80 mm) minimum.
 - ii. Face Size and Shape: 3" x 18" nominal, rectangular.

iii Color: Charcoal.

2.2. CURBS AND EDGE RESTRAINTS

- A. Job-Built Concrete Edge Restraints: Comply with requirements in Section 03 30 00 "Cast-in-Place Concrete" for normal-weight, air-entrained, ready-mixed concrete with minimum 28-day compressive strength of 3000 psi (20 MPa).

2.3. AGGREGATE SETTING-BED MATERIALS

- A. Graded Aggregate for Subbase: Sound, crushed stone or gravel complying with ASTM D 448 for Size No. 57.
- B. Sand for Leveling Course: Sound, sharp, washed, natural sand or crushed stone complying with gradation requirements in ASTM C 33 for fine aggregate.
- C. Sand for Joints: Fine, sharp, washed, natural sand or crushed stone with 100 percent passing No. 16 sieve and no more than 10 percent passing No. 200 sieve.
1. Provide sand of color needed to produce required joint color.
- D. Separation Geotextile: Woven geotextile fabric, manufactured for separation, filtration, separation, and confinement applications; made from polyolefins or polyesters, with elongation less than 50 percent; complying with the following, measured per test methods referenced:
1. Apparent Opening Size: No. 30 sieve, maximum; ASTM D 4751.
 2. Permittivity: 0.50 per second, minimum; ASTM D 4491.
 3. UV Stability: 50 percent after 500 hours' exposure, ASTM D 4355.
 4. Product: Subject to compliance with the requirements provide TenCate Geosynthetics; Mirafi HP370 or comparable product by another manufacturer.
- E. Herbicide: Commercial chemical for weed control, registered with the EPA. Provide in granular, liquid, or wettable powder form.

PART 3 - EXECUTION

3.1. INSTALLATION, GENERAL

- A. Do not use unit pavers with chips, cracks, voids, discolorations, or other defects that might be visible or cause staining in finished work.
- B. Mix pavers from several pallets or cubes, as they are placed, to produce uniform blend of colors and textures.
- C. Cut unit pavers with motor-driven masonry saw equipment to provide clean, sharp, unchipped edges. Cut units to provide pattern indicated and to fit adjoining work neatly. Use full units without cutting where possible. Hammer cutting is not acceptable.
1. For concrete pavers, a block splitter may be used.
- D. Joint Pattern: Running bond, as indicated on Drawings.
- E. Tolerances: Do not exceed 1/16-inch (1.6-mm) unit-to-unit offset from flush (lippage) nor 1/8 inch in 24 inches (3 mm in 600 mm) and 1/4 inch in 10 feet (6 mm in 3 m) from level, or indicated slope, for finished surface of paving.
- F. Provide edge restraints as indicated. Install edge restraints before placing unit pavers.

1. Install job-built concrete edge restraints to comply with requirements in Section 03 30 00 "Cast-in-Place Concrete."

3.2. AGGREGATE SETTING-BED APPLICATIONS

- A. Compact soil subgrade uniformly to at least 95 percent of ASTM D 698/ASTM D 1557 laboratory density.
- B. Place separation geotextile over prepared subgrade, overlapping ends and edges at least 12 inches (300 mm).
- C. Place aggregate subbase and base, compact by tamping with plate vibrator, and screed to depth indicated.
- D. Place drainage geotextile over compacted base course, overlapping ends and edges at least 12 inches (300 mm).
- E. Place leveling course and screed to a thickness of 1 to 1-1/2 inches (25 to 38 mm), taking care that moisture content remains constant and density is loose and uniform until pavers are set and compacted.
- F. Treat leveling course with herbicide to inhibit growth of grass and weeds.
- G. Set pavers with a minimum joint width of 1/16 inch (1.5 mm) and a maximum of 1/8 inch (3 mm), being careful not to disturb leveling base. If pavers have spacer bars, place pavers hand tight against spacer bars. Use string lines to keep straight lines. Fill gaps between units that exceed 3/8 inch (10 mm) with pieces cut to fit from full-size unit pavers.
 1. When installation is performed with mechanical equipment, use only unit pavers with spacer bars on sides of each unit.
- H. Vibrate pavers into leveling course with a low-amplitude plate vibrator capable of a 3500- to 5000-lbf (16- to 22-kN) compaction force at 80 to 90 Hz. Use vibrator with neoprene mat on face of plate or other means as needed to prevent cracking and chipping of pavers. Perform at least three passes across paving with vibrator.
 1. Compact pavers when there is sufficient surface to accommodate operation of vibrator, leaving at least 36 inches (900 mm) of uncompacted pavers adjacent to temporary edges.
 2. Before ending each day's work, compact installed concrete pavers except for 36-inch (900 mm) width of uncompacted pavers adjacent to temporary edges (laying faces).
 3. As work progresses to perimeter of installation, compact installed pavers that are adjacent to permanent edges unless they are within 36 inches (90 mm) of laying face.
 4. Before ending each day's work and when rain interrupts work, cover pavers that have not been compacted and cover leveling course on which pavers have not been placed with nonstaining plastic sheets to protect them from rain.
- I. Spread dry sand and fill joints immediately after vibrating pavers into leveling course. Vibrate pavers and add sand until joints are completely filled, then remove excess sand. Leave a slight surplus of sand on the surface for joint filling.
- J. Do not allow traffic on installed pavers until sand has been vibrated into joints.
- K. Repeat joint-filling process 30 days later.

3.3. REPAIRING, POINTING, AND CLEANING

- A. Remove and replace unit pavers that are loose, chipped, broken, stained, or otherwise damaged or that do not match adjoining units. Provide new units to match adjoining units and install in same manner as original units, with same joint treatment and with no evidence of replacement.
- B. Pointing: During tooling of joints, enlarge voids or holes and completely fill with grout. Point joints at sealant joints to provide a neat, uniform appearance, properly prepared for sealant application.
- C. Cleaning: Remove excess grout from exposed paver surfaces; wash and scrub clean.

END OF SECTION

SECTION 32 14 43**POROUS PRECAST CONCRETE UNIT PAVING AGGREGATE BED SET****PART 1 - GENERAL****1.1 RELATED DOCUMENTS**

- A. Drawings and general provisions of the Contract, including General and Supplementary Conditions and Division 01 Specification Sections, apply to this Section.

1.2 SUMMARY

- A. Section Includes:
 - 1. Solid concrete pavers with openings between pavers filled with aggregate.
 - 2. Recycled aggregate setting bed for pavers.
- B. Related Requirements:
 - 1. Division 31 Section "Earth Moving" for excavation and compacted subgrade.
 - 2. Division 32 Section "Concrete Paving" for cast-in-place concrete curbs that serve as edge restraints for porous paving.

1.3 PREINSTALLATION MEETINGS

- A. Preinstallation Conference: Conduct conference at Project site.

1.4 ACTION SUBMITTALS

- A. Product Data: For the following:
 - 1. Pavers.
 - 2. Geotextiles.
- B. LEED Submittals:
 - 1. Product Data for Credit MR 4.1 and Credit MR 4.2: For products having recycled content, documentation indicating percentages by weight of postconsumer and preconsumer recycled content.
 - a. Include statement indicating costs for each product in the paver road section having recycled content.
 - 2. Product Certificates for Credit MR 5.1 and Credit MR 5.2: For products and materials required to comply with requirements for regional materials indicating location and distance from Project of material manufacturer and point of extraction or recovery for each raw material.
 - a. Include statement indicating cost for each regional material and the fraction by weight that is considered regional.
- C. Sieve Analyses: For aggregate materials, according to ASTM C 136.
- D. Samples:
 - 1. Full-size units of each type of unit paver indicated.

2. Aggregate fill.
3. Aggregate setting bed materials.

1.5 INFORMATIONAL SUBMITTALS

- A. Product Test Reports: Based on evaluation of comprehensive tests performed by a qualified testing agency, for unit pavers, indicating compliance with requirements.
 1. For solid interlocking paving units, include test data for freezing and thawing according to ASTM C 67.

1.6 QUALITY ASSURANCE

- A. Mockups: Build mockups to verify selections made under Sample submittals and to demonstrate aesthetic effects and set quality standards for materials and execution.
 1. Approval of mockups does not constitute approval of deviations from the Contract Documents contained in mockups unless Architect specifically approves such deviations in writing.
 2. Subject to compliance with requirements, approved mockups may become part of the completed Work if undisturbed at time of Substantial Completion.

1.7 DELIVERY, STORAGE, AND HANDLING

- A. Store pavers on elevated platforms in a dry location. If units are not stored in an enclosed location, cover tops and sides of stacks with waterproof sheeting, securely tied.
- B. Store aggregates where grading and other required characteristics can be maintained and contamination can be avoided.

PART 2 - PRODUCTS

2.1 CONCRETE UNIT PAVERS

- A. Regional Materials: Pavers shall be manufactured within 500 miles of Project site from aggregates and cement that have been extracted, harvested, or recovered, as well as manufactured, within 500 miles of Project site.
- B. Source Limitations: Obtain each type of paver from single source that has resources to provide materials and products of consistent quality in appearance and physical properties.
- C. Solid Concrete Pavers for Porous Paving: Solid interlocking paving units of shapes that provide openings between units, complying with ASTM C 936, resistant to freezing and thawing when tested according to ASTM C 67, and made from normal-weight aggregates.
 1. Product: Subject to compliance with requirements, provide Pavestone "Eco-Priora" paver.
 - a. Field Paver
 - i Thickness: 3-1/8 inches (80 mm).
 - ii Face Size and Shape: 4-3/4" x 9-1/2", rectangular.
 - iii Color: Limestone.
 - iv Finish: Platinum.
 - b. Accent Paver

- i Thickness: 3-1/8 inches (80 mm).
- ii Face Size and Shape: 4-3/4" x 9-1/2", rectangular.
- iii Color: Charcoal.
- iv Finish: Platinum.

2.2 AGGREGATE MATERIALS

- A. Regional Materials: Provide aggregate material that has been extracted or recovered, as well as manufactured, within 500 miles of Project site.
- B. Recycled, Graded Aggregate for Bedding Course and Void Filler: The bedding course and void filler aggregate shall be free of organics and soluble salts, or other contaminants likely to cause efflorescence. The grading requirement shall be in compliance with the following gradation chart. This material will be crusher run and washed.

ASTM Sieve Size	Percent Passing (by weight)
1/2 inch	100%
3/8 inch	94%-100%
1/4 inch	39%-94%
No. 4	23%-39%
No. 8	8%-23%
No. 16	0%-8%

- C. Recycled, Graded Aggregate for Base Course: The base course aggregate shall consist of open-graded stone and meet the following gradation chart. This material will be crusher run and washed.

ASTM Sieve Size	Percent Passing (by weight)
1-1/2 inch	100%
1 inch	90%-100%
3/4 inch	48%-90%
1/2 inch	27%-48%
1/4 inch	12%-27%
No. 4	0%-12%

- D. Recycled, Graded Aggregate for Sub-Base Course: The sub-base course aggregate shall consist of open-graded stone and meet the following gradation chart. This material will be crusher run.

ASTM Sieve Size	Percent Passing (by weight)
4 inch	100%
3 inch	80%-100%
2-1/2 inch	50%-80%
2 inch	20%-50%
1-1/2 inch	5%-20%
1 inch	0%-5%

2.3 CURBS AND EDGE RESTRAINTS

- A. Job-Built Concrete Edge Restraints: Comply with requirements in Section 03 30 00 "Cast-in-Place Concrete" for normal-weight, air-entrained, ready-mixed concrete with minimum 28-day compressive strength of 3000 psi (20 MPa).

PART 3 - EXECUTION

3.1 PREPARATION

- A. Proof-roll prepared subgrade according to requirements in Division 31 Section "Earth Moving" to identify soft pockets and areas of excess yielding. Proceed with porous paver installation only after deficient subgrades have been corrected and are ready to receive subbase and base course for porous paving.
- B. Site grades can be raised to the design subgrade elevation using clean native earth fill (free of deleterious material). This fill should be placed in lifts not exceeding six inches (6") and compacted to a minimum of ninety-five percent (95%) Standard Proctor density. The final subgrade profile should be uniformly compacted to a minimum of ninety-eight percent (98%) Standard Proctor density and proof-rolled to delineate soft areas. Removing the unstable soil and replacing with clean, dry compacted earth fill shall be performed to repair these areas.

3.2 INSTALLATION, GENERAL

- A. Do not use unit pavers with chips, cracks, voids, discolorations, and other defects that might be structurally unsound or visible in finished work.
- B. Mix pavers from several pallets or cubes, as they are placed, to produce uniform blend of colors and textures.
- C. Cut unit pavers with motor-driven masonry saw equipment to provide clean, sharp, unchipped edges. Cut units to provide pattern indicated and to fit adjoining work neatly. Use full units without cutting where possible. Hammer cutting is not acceptable.
- D. Tolerances:
 - 1. Variation in Plane between Adjacent Units (Lipping): Do not exceed 1/16-inch unit-to-unit offset from flush.
 - 2. Variation from Level or Indicated Slope: Do not exceed 1/8 inch in 24 inches and 1/4 inch in 10 feet or a maximum of 1/2 inch.

3.3 SUB-BASE, BASE, AND BEDDING COURSE INSTALLATION

- A. Compact soil subgrade uniformly to at least 95 percent of ASTM D 698 laboratory density.
- B. Proof-roll prepared subgrade to identify soft pockets and areas of excess yielding. Excavate soft spots, unsatisfactory soils, and areas of excessive pumping or rutting, as determined by Architect, and replace with compacted backfill or fill as directed.
- C. The thickness of the sub-base course layer will depend upon the subgrade soil conditions and the anticipated traffic loadings. Final determination of sub-base course depth by Geotechnical Engineer, and as follows:
 - 1. The sub-base course shall consist of a minimum thickness of twelve inches (12") and be compacted using a vibratory 10-15 ton smooth-drum roller. It shall be installed in lifts not to exceed twelve inches (12"). Upon completion of the subbase course installation, the area shall be proof-rolled using a heavy rubber-

tired vehicle (such as a loaded tandem truck) to identify any areas requiring additional compaction. The sub-base course shall be installed to the elevation and cross-section per the plan documents.

- D. The base course shall consist of a thickness of 2"-3", (not to exceed 4"), placed in one lift, and be compacted using a vibratory 10-15 ton smooth-drum roller. The base course shall be installed to the elevation and cross-section per the plan documents (+/- 1/2").
- E. The bedding course shall be spread loose in a uniform layer to provide a depth after compaction of the paving units of 1"-2". The contractor shall screed the bedding course using either an approved mechanical screed apparatus or by the use of screed guides and boards.
 - 1. The screeded bedding aggregate shall not be subjected to any traffic by either mechanical equipment or pedestrian use prior to the installation of the paver units. The voids left after the removal of the screed rails shall be filled with loose aggregate as the paver bedding course proceeds.

3.4 PAVER INSTALLATION

- A. All edge restraints shall be constructed as shown on the plans and in place prior to the installation of the pavers and base course.
- B. The pavers shall be installed in approximately the order in which they were manufactured. No cluster shall be installed next to a cluster that was manufactured more than 1,000 cycles before or after.
- C. Lay pavers in the pattern as shown on the drawings. Lay pavers away from the existing laying face or edge restraint in such a manner as to ensure that the pattern remains square. Chalk lines shall be used upon the bedding course to maintain straight joint lines. Joint spacing between pavers shall be between 1/8" and 1/4"; however, the joint width may need to be increased to 3/8" (if necessary) to maintain straight joint lines. Lines and grades shown on the plans shall be established and maintained during the installation of the ecological permeable pavers.
- D. Pavers shall be cut using a masonry saw. Block splitting shall not be permitted. All cut faces shall be vertical. Dry cutting of the pavers shall be performed utilizing a dust collection system. If wet cutting method used, paver surface must be washed while still wet to remove cement dust and slurry.
- E. Once the pavers have been placed upon the bedding course and all cut pavers have been inserted to provide a full and complete surface, inspect the pavers for damaged units and remove and replace those units. Once all pattern lines have been straightened, initially compact the pavers and then place void filler into the paver openings to the top of the chamfer on the pavers and the surface swept broom clean.
- F. The pavement surface shall be compacted to achieve consolidation of the bedding course and paving stones and brought to design levels and profiles by two passes of a suitable plate compactor. Compaction of the pavers shall be accomplished by the use of a vibratory plate compactor capable of a minimum of 5,000 pounds of compaction force. No compaction shall be permitted within five feet (5') of unrestrained edges of the pavement.
- G. On completion of vibration after void filling, after compaction, inspect the pavers for damaged units and remove and replace those units. The surface tolerances shall be plus or minus 1/2" from finish levels and the pavers shall be flush to 1/4" above edge restraints.

- H. Additional void filler material shall be swept in the paver voids to within 1/2" from the bottom of the chamfer on the paving stones. Upon completion, the wearing course surface shall be swept clean of all excess materials. Remove from the site all surplus materials, equipment and debris resulting from these operations.

3.5 CONSTRUCTION WASTE MANAGEMENT AND DISPOSAL

- A. Comply with Waste Management Plan required under Division 01 Section "Construction Waste Management And Disposal."

END OF SECTION

SECTION 32 15 43
STONE SURFACING

PART 1 - GENERAL

1.1 RELATED DOCUMENTS

- A. Drawings and general provisions of the Contract, including General and Supplementary Conditions and Division 01 Specification Sections, apply to this Section.

1.2 SUMMARY

- A. Section Includes stone surfacing materials including the following:
1. Stone boulders.
 2. Stone mulch.
- B. Related Sections:
1. Division 31 Sections for site clearing and earth moving.

1.3 SUBMITTALS

- A. LEED Submittals:
1. Product Certificates for Credit MR 5.1 and Credit MR 5.2: For products and materials required to comply with requirements for regional materials indicating location and distance from Project of material manufacturer and point of extraction or recovery for each raw material.
 - a. Include statement indicating cost for each regional material and the fraction by weight that is considered regional.
- B. Samples:
1. Submit 4 by 6 inch color photographs of specified stone material with ruler or yardstick adjacent to stone for scale.

1.4 QUALITY ASSURANCE

- A. Off-site material should comply with LEED 5.1 and 5.2 credit for regional material. Consult with project landscape architect prior to obtaining off-site fill material.
- B. Landscape Architect or representative will field select and tag stone for stone boulders.
- C. Landscape Architect or representative will field locate position of stone boulders on site and approve installation.
- D. Preinstallation Conference: Conduct conference at Project site to comply with requirements of Division 01 Section "Project Management And Coordination."

1.5 DELIVERY, STORAGE AND HANDLING

- A. Store stone materials where grading and other required characteristics can be maintained and contamination avoided.

PART 2 - PRODUCTS**2.1 NATIVE STONE AND BOULDER**

- A. Regional Materials: Provide stone aggregates and boulders that have been extracted or recovered, as well as manufactured, within 500 miles of Project site.
- B. Stone Boulders:
1. Type: Local angular stone.
 2. Color Range: Tan/Buff/Limestone.
 3. Size: Landscape boulders type and quantity shall be determined by size and shape as follows:

Percent Of Total Quantity	Approximate Size Range		
	Length	Width	Height
30 - Large	6 feet	4 feet	3 to 4 feet
50 - Medium	4 feet	2 feet	1 to 3 feet
20 - Small	2 feet	1 foot	6 inches to 1.5 feet

- C. Stone Mulch:
1. Type: Local angular stone.
 2. Color Range: Tan/Buff/Limestone.
 3. Size: 3/4" to 1-1/2".

2.2 WEED-CONTROL BARRIERS

- A. Nonwoven Geotextile Filter Fabric: Polypropylene or polyester fabric, 3 oz./sq. yd. (101g/sq. m) minimum, composed of fibers formed into a stable network so that fibers retain their relative position. Fabric shall be inert to biological degradation and resist naturally encountered chemicals, alkalis, and acids.

PART 3 - EXECUTION**3.1 EXCAVATION**

- A. Excavate for placement of stone surfacing in planting areas to the limits indicated on the Drawings. Remove all soft, yielding material. Replace with suitable on-site material to subgrade. Compact to smooth, firm surface. Notify Landscape Architect for placement direction. Backfill and compact after placement.

3.2 STONE PLACEMENT

- A. Protect exposed faces of stone surfacing from scraping, gouging and similar damage during handling and placement.
- B. Protect stone faces from damage by pry-bars or mechanical placement equipment.
- C. Stone Boulders: Place in planting beds and swales where indicated on Drawings. Set stone with bottom 1/3 of depth in ground. See Drawing details.
- D. Stone Mulch: Install weed-control barriers before mulching according to manufacturer's written instructions. Completely cover area to be mulched, overlapping edges a minimum of 6 inches (150 mm) and secure seams with galvanized pins. Apply 3-inch (75-mm) average thickness of stone mulch and finish level with adjacent finish grades, where indicated on Drawings.

3.3 CLEANING

- A. Wash and clean stone boulder material prior to installation. Dry brush and clean boulders after installation.

3.4 CONSTRUCTION WASTE MANAGEMENT AND DISPOSAL

- A. Comply with Waste Management Plan required under Division 01 Section "Construction Waste Management And Disposal."

END OF SECTION

SECTION 32 16 13**CURBING****PART 1 - GENERAL****1.01 SCOPE OF WORK**

- A. Furnish the necessary equipment, labor and materials required and perform all work in connection with the construction of curbs and gutters as shown on the Drawings and as specified in American Public Works Association Standard Specifications and Design Criteria Section 2200 as revised, adopted, and provided by the director of Kansas City, Missouri Public Works current at the time of bidding and American Public Works Association Standard Specifications and Design Criteria Standard Drawing Number C-1 as revised, adopted, and provided by the Director of Kansas City, Missouri Public Works current at the time of bidding.

1.02 REFERENCE STANDARDS

- A. In addition to complying with all pertinent codes and regulations, comply with the referenced or applicable portions of the American Public Works Association Standard Specifications and Design Criteria as revised, adopted, and provided by the Director of Kansas City, Missouri Public Works current at the time of bidding.
 1. The following standards are referenced directly in this section. The latest version of these standards shall be used.
 - a. MCIB: Standard Concrete Specifications

PART 2 - PRODUCTS**2.01 MATERIALS**

- A. All Materials shall conform to Section 32 13 13 entitled "Portland Cement Concrete Pavement".

PART 3 - EXECUTION**3.01 CONSTRUCTION**

- A. The curbing shall be constructed or reconstructed to the configuration and to the lines and grades shown on the plans. Generally the curbing shall be placed prior to the placement of pavement or sidewalk sections, except when curb and gutter is integral with the pavement.
- B. Removal of Existing Curbing for Reconstruction

1. Existing curbing shall be totally removed to the nearest contraction or expansion joint or with the approval of the Engineer it may be sawed provided no free section is left that is less than 5 lineal feet in length, and provided the entire curbing section is sawed a minimum of 2 inches below any exposed surface, or sufficiently to prevent disturbance or damage to all adjacent structures or slabs, whichever is greater.

C. Grading and Subgrade Preparation

1. All excavation or embankment shall conform to Sections 31 22 00 and 31 23 13 entitled "Site Preparation and Grading" and "Subgrade Preparation" and as follows:
2. Compaction shall conform to Section 31 23 13.
3. The top 6 inches of the subgrade shall be compacted to obtain a density of 95% of the maximum standard proctor density within -2 to +2% of the optimum moisture content.
4. If during reconstruction operations, additional fill material is needed beneath the curb, it shall be base course material conforming to Section 32 11 00.

D. Forms

1. All forms shall be in good condition, clean, and free from imperfections. Each form shall not vary more than 1/4 inch in horizontal and vertical alignment for each 10 feet in length.
 - a. General
 - i. Face forms will be used with all curb standards except CG-2 (rollback) as applicable.
 - b. Forms shall have a height equal to or greater than the height of the curb face being formed.
 - c. The forms shall be set true to line and grade and shall be supported to stay in position while depositing and consolidating the concrete. The forms shall be designed to permit their removal without damage to the concrete. The forms shall be lubricated.

D. Curb Machine

1. A slip-form curb machine may be used in lieu of forms. The machine must be equipped with mechanical internal vibrators and be capable of placing curb to the correct cross section, line and grade within the allowable tolerances.

3.02 JOINTS

A. The joints shall be formed at right angles to the alignment of the curbing and to the depths specified by the appropriate standard drawing or as shown on the plans.

B. Isolation Joints

1. Isolation joints shall be placed at all radius points, driveways, curb inlets, or where directed by the plans or Engineer.

a. Material

i. Isolation joints shall be formed by a one piece, 3/4 inch thick preformed joint filler cut to the configuration of the correct curb section, and conforming to Section 32 13 13.

b. Stability

i. Isolation joints shall be secured in a manner so they will not be disturbed by depositing and consolidating of concrete.

c. Edging

i. The edges of the joints shall be rounded with an edging tool of 1/4 inch radius.

C. Contraction Joints

1. Curbing shall have contraction joints installed at intervals of not less than 10 feet or more than 15 feet. They shall extend through the entire curb section from the top of the curb to a depth 2 inches below pavement surface.

2. Method

a. Contraction joints shall be sawed.

i. When sawing joints, the contractor shall begin as soon as the concrete hardens sufficiently to prevent excessive raveling along the saw cut and shall finish before conditions induce uncontrolled cracks, regardless of the time or weather. When joint sealing backup material is specified with sawed joints, the first stage, which provides a relief cut shall be approximately 1/8 inch wide, and shall be to plan depth. The second stage which widens the joints to allow the insertion of joint sealing backup material to plan depth shall not be performed until the concrete is at least 48 hours old, and shall be delayed longer when the sawing causes raveling of the concrete. If second stage sawing is performed prior to the completion of the curing period, the contractor

shall maintain the cure by use of curing tapes, plastic devices, or other materials approved by the engineer.

- ii. Saw joints shall be a minimum of 2 inches deep.

D. Joint Sealer

1. When specified, joint sealants shall conform to Section 32 13 13.

3.03 CONCRETE WORK

A. Concrete for curbing shall be placed in accordance with the requirements of Section 32 13 13. Isolation and contraction joints shall be constructed as shown on the plans, standard drawings, or where directed by the Engineer.

B. Concrete Placement

1. Concrete Placement: Concrete shall be mechanically vibrated except for mixes No. WA-610-1-4-0.410 and WA-634-3/4-4-0.410 and shall not be allowed to extrude below the forms to cause an irregular alignment of the abutting street pavement.

C. Finishing

1. After placing and initial strike-off the curb shall be tooled to the required radii. If the surface of the concrete is sufficiently wet that a ridge is formed at the inside of the radius tool, finishing will cease until the excessive moisture has evaporated.
2. After initial set, the face forms shall be removed and the surface finished to the required dimensions. No water, dryer, or additional mortar shall be applied to the free surface of the concrete.
3. The finished surface of the concrete shall be broomed perpendicular to the curb with a clean broom to provide an antiskid surface.
4. In all cases the finished curb shall have a true surface, free from sags, twists, or warps, and shall have a uniform color and appearance.

D. Curing

1. As soon as practical after the concrete is finished it shall be cured with a liquid curing membrane meeting the requirements of Section 32 13 13, applied according to the manufacturer's directions.
2. If front and/or back forms are removed from finished curbing within a period of 72 hours of placement these surfaces shall also be cured.
3. Wet burlap, cotton mat, waterproof paper, polyethylene sheeting or earth backfill is not an acceptable curing method for curbing.

E. Protection

1. The Contractor shall protect the concrete work against damage or defacement of any kind until it has been accepted by the Engineer. Concrete which is damaged or defaced, shall be removed and replaced, or repaired to the satisfaction of the Engineer, at the expense of the Contractor.

F. Temperature Limitations

1. Concrete work shall be placed in accordance with requirements of MCIB.

G. Repairing Defects

1. Defects in the concrete shall be repaired in accordance with Section 32 13 13.

3.04 BACKFILL

- A. Backfill shall conform to embankment or backfill as specified in Section 31 22 00.
- B. The Contractor shall be responsible for the repair of any street pavement disturbed by the construction to the satisfaction of the Engineer.

3.5 JOINT SEALING AND CLEAN-UP

- A. Joint sealer shall be applied in accordance with the manufacturer's directions within 7 days of the placement of the concrete. The Contractor shall be responsible for the removal of excess dirt, rock, broken concrete, concrete splatters and overspray from the area of the construction.

3.6 SURFACE TOLERANCES

- A. Curbing shall have a surface tolerance of 1/4 inch in 10 feet when checked with a ten foot straightedge.

END OF SECTION 32 16 13

SECTION 32 16 23**STANDARD SIDEWALKS, SIDEWALK RAMPS, DRIVEWAYS, AND
BICYCLE/PEDESTRIAN PATHS**

PART 1 - GENERAL

1.01 SCOPE OF WORK

- A. Furnish the necessary equipment, labor and materials required and perform all work in connection with the construction or reconstruction of sidewalks, sidewalk ramps, driveways, and bicycle/pedestrian paths as shown on the Drawings and as specified at the time of bidding in American Public Works Association Standard Specifications and Design Criteria Section 2301 titled "Standard Sidewalks, Sidewalk Ramps, Driveways, and Bicycle & Pedestrian Paths" as revised, adopted, and provided by the Director of Kansas City, Missouri Public Works.

1.02 REFERENCE STANDARDS

- A. In addition to complying with all pertinent codes and regulations, comply with the referenced or applicable portions of the American Public Works Association Standard Specifications and Design Criteria available at the time of bidding.
- B. The following standards are referenced directly in this section. The latest version of these standards shall be used.

ADAAG:

Section 4.7 – Curb Ramps

ASTM:

D 1751 Standard Specification for Preformed Expansion Joint Filler for Concrete Paving and Structural Construction (Nonextruding and Resilient Bituminous Types)

D 1752 Standard Specification for Preformed Sponge Rubber and Cork Expansion Joint Fillers for Concrete Paving and Structural Construction

D 2805 Standard Test Method for Hiding Power or Paints by Reflectometry

MCIB

Section 1 Concrete Materials

Section 2 Outdoor Concrete Exposed to Freezing and Thawing

Section 3 Concrete Mix Design Tables

PART 2 - PRODUCTS

2.01 MATERIALS

- A. All materials in this section shall conform to the requirements of Section 32 13 13 entitled "Portland Cement Concrete Pavement," under subsection 2.01 Materials unless otherwise noted.
- B. Concrete Mix: Concrete shall conform to APWA Section 2209.2 titled "Curbing Materials" and be MCIB WA610-1-4-0.410 or WA561-1-2-0.410.
- C. Contractor shall recognize the effects of temperature, wind, and humidity when placing and curing concrete. When the ambient air temperature is 90 degrees F (32 degrees C) or higher, a retarder shall be used in the concrete mix. When the ambient air temperature is 90 degrees F (32 degrees C) or higher and the wind velocity is above 20 mph, evaporation shall also be controlled.

PART 3 - EXECUTION

3.01 CONSTRUCTION DETAIL

- A. Construction Details
 - 1. The sidewalks, sidewalk ramps, driveways or bicycle/pedestrian paths shall be constructed or reconstructed to the configuration, and to the lines and grades shown by the plans. Generally sidewalks, sidewalk ramps, driveways, and bicycle/pedestrian paths should be constructed after the curbing. Sidewalk ramp construction shall comply fully with all requirements for sidewalks in this section and shall comply with the requirements of ADAAG Section 4.7.
 - 2. Ramp construction and layout shall conform to APWA Standard Drawing "Sidewalk Ramp Details" which is an interpretation of ADAAG Section 4.7.
 - 3. Removal: Existing sidewalks, sidewalk ramps, driveways, or bicycle/pedestrian paths shall be totally removed to the nearest contraction or isolation joint, unless otherwise specified by the Engineer. The section shall be sawed full depth.
 - 4. Grading and Subgrade Preparation: All excavation or embankment required in the grading or subgrade preparation shall be as defined in the Sections 31 22 00 and 31 23 13 entitled "Site Preparation and Grading" and "Subgrade Preparation," except as follows:
 - a. The top 6 inches (150 mm) of the subgrade shall be compacted to obtain a density of 95 percent of maximum in conformance with Section 31 23 13 entitled, "Subgrade Preparation," subsection 3.03 Construction.
 - b. On reconstruction projects or after roadway grading is completed on new construction, additional fill material needed beneath sidewalks or driveways shall be crushed stone

conforming to Section 32 11 00 entitled "Untreated Compacted Aggregate," placed and compacted in conformance with Section 32 11 00 subsection 3.01.

5. Forms: All forms shall be in good condition, clean, and free from imperfections. Each form shall not vary more than 1/4 inch (0.64 cm) in horizontal or vertical alignment for each 10 feet (3.05 m) in length.
 - a. Material and Size: Forms shall be made of metal unless otherwise approved by the Engineer and shall have a height equal to or greater than the depth of the sidewalk, driveway, or bicycle/pedestrian path section.
 - b. Strength: Forms shall be of such cross-section and strength, and so secured as to resist the pressure of the concrete when struck off, vibrated, and finished, and the impact and vibration of any equipment which they may support.
 - c. Installation: The forms shall be set true to line and grade, supported through their length and joined neatly in such a manner that the joints are free from movement in any direction.
 - d. Preparation: Forms shall be cleaned and lubricated prior to each use and shall be so designed to permit their removal without damage to the new concrete.
6. Slip-form Machine: A slip-form machine may be used in lieu of forms. The machine must be equipped with mechanical internal vibrators and be capable of placing concrete to the correct cross section, line and grade within the allowable tolerances.
7. Location. All public sidewalks within Kansas City shall be constructed of PC concrete and shall be located in the public right-of-way or within a public sidewalk easement. The standard location shall be one foot from the right-of-way or easement line. Sidewalks shall be constructed to allow access to all pedestrian signal actuation devices and bus stop shelters.
8. Required Dimensions. The minimum width of public sidewalks on residential streets shall be four feet. The minimum width of public sidewalks along higher class streets shall be five feet. The minimum width of public sidewalks abutting curb shall be five feet. Uninterrupted four foot wide walks shall have a five foot square passing space every 200 feet. All public sidewalks shall be a minimum of four inches thick.
9. Grades and Slopes. The grade or slope along the length of the walk shall be as near parallel to the street gradient as practical. The maximum longitudinal slope shall be 5%, except where a

variance from street grade has been approved by the City Engineer. The standard cross slope shall be 2% maximum toward the street and this 2% slope shall be carried thru driveways. The finish grade of the sidewalk shall allow the grass area between the curb and the sidewalk (sometimes called parkway) to slope toward the street at a maximum grade of 4%, except as shown on the plans.

10. Wheelchair accessible curb ramps shall be constructed at all street crossings and shall conform to the most current adopted KCMO Sidewalk Ramp Standard drawings. The minimum allowable thickness for wheelchair accessible curb ramps shall be eight inches. Curb ramps shall be poured monolithically with the curb.
 11. Maximum slope of ramps shall be one inch per foot. Minimum width shall be four feet, except along thoroughfare corridors where the width shall be five feet. Transitions from ramps to walks, gutters, or streets shall be flush and free of abrupt changes. Side (flare) slopes of ramps shall not exceed 1:10 where such side slopes are in the normal path of pedestrians on adjacent portions of sidewalk. Ramps with curbs may be used when pedestrians would not normally cross through the ramp. Surface texture shall be a coarse broom finish transverse to the slope of the ramp. If the street curb has not been constructed to receive the sidewalk ramp, the curb shall be removed and reconstructed as required.
- B. Joints: Unless directed by the Engineer the joints shall be formed at right angles to the alignment of the sidewalk, driveway, or bicycle/pedestrian path and to the configuration specified by the plans or standards.
1. Joint Patterns: All joints shall be constructed on straight and true lines.
 - a. Sidewalks: Sidewalk surfaces shall be marked with a transverse joint spaced at a distance equal to the width of the sidewalk. Sidewalks greater than 6 feet (21.8 m) in width shall be divided by longitudinal joints spaced not less than 30 inches (760 mm) nor more than 60 inches (1.5 m) with transverse joints spaced to form a square pattern. Edger tool marks shall remain showing unless the sidewalk is slip-formed and subsequently sawed. Curb joints should align with sidewalk joints where they abut.
 - b. Driveways and bicycle/pedestrian paths: In general, no driveway slab dimension shall exceed 10 feet (3.05 m), although widths no more than 24 times the slab thickness will be permitted to match existing joint patterns.
 2. Isolation joints. Isolation joints shall be placed as shown on the standard drawings, where new concrete abuts existing, against structures, and as directed by the Engineer or as indicated on the plans. In no case shall isolation joints exceed 250' center to center.

Isolation joints are often referred to as “expansion joints” in some documents and drawings.

- a. General: The preformed isolation joint material shall be left 1/2 inch (13 mm) below the surface, or a suitable tear strip will be provided to allow for the application of the joint sealer.
 - b. Material: Isolation joints shall be formed by a 1 piece; 1/2 inch (13 mm) thick non-extruding preformed joint filler cut to the configuration of the abutting section. The filler material shall be full depth, and shall conform to ASTM D1751, D1752 or D7174. D1752 or D7174 material shall be used against curved surfaces, around utility boxes or poles, or against other irregular surfaces, and may be used for all applications.
 - c. Stability: Isolation joints shall be secured in a manner so they will not be disturbed by depositing and consolidating the concrete.
 - d. Edging: The newly poured edges of these joints shall be rounded with an edging tool of 1/4inch (6 mm) radius.
3. Contraction joints: Contraction joints shall be 1 inch (25 mm) deep by 1/8 inch (3 mm) wide with 1/4 inch (6 mm) radii rounded edges.
- a. Edging: Edger marks shall remain showing unless the sidewalk, driveway or bicycle/pedestrian path is slip formed and subsequently sawed.
 - b. Slip forming: Contraction joints may be sawed 1/8 inch (3 mm) wide by 1/3rd the thickness of the slab.
 - c. Joint Sealer: joint sealer is not required.
- C. Concrete Work: Concrete work shall be placed in accordance with the requirements of MCIB.
1. Concrete Placement: Deposit and consolidate concrete as close to the final position as possible, beginning at one corner of the forms. Perform necessary hand spreading with shovels or come-alongs, not with rakes or vibrators. Do not walk in the fresh concrete with boots or shoes coated with earth or foreign substances. When concrete is placed on a sloped surface, begin concrete placement at the lowest area.
 2. Finishing:
 - a. Strike off the concrete with a vibratory screed or a hand strike-off method when adequate consolidation is attained. Immediately after strike-off, the concrete may be bullfloated to remove any high or low spots. Minimize the use of the bullfloat.

- b. Do not finish concrete with water standing on the surface or when edging tool makes a ridge on its inside edge. Resume finishing when excess moisture evaporates. All edges of the slab shall be finished with a ¼ inch (6mm) radius edger.
 - c. After finishing, the surface of the concrete shall be broomed with a fine clean broom to provide an antiskid surface, and the edges and joints retooled unless slipformed.
 - d. In all cases the finished sidewalk, driveway, or bicycle/pedestrian path shall have a true surface, free from sags, twists, or warps, and shall have a uniform color and appearance.
3. Curing: As soon as practical after the concrete is finished it shall be cured with an acceptable white pigmented liquid curing membrane applied according to manufacturers directions.
- a. If forms are removed within a period of 72 hours of placement those formed surfaces shall also be cured.
 - b. Wet burlap, cotton mats, waterproof paper, polyethylene sheeting or earth backfill shall not be acceptable as curing methods.
4. Protection: The Contractor shall protect the concrete work against damage or defacement of any kind until it has been accepted by the City. Concrete which is damaged or defaced shall be removed and replaced or repaired to the satisfaction of the Engineer, at the expense of the Contractor.
5. Temperature Limitations: Concrete shall be placed in accordance with the requirement of MCIB, as modified. Concrete with temperature above 90 degrees F may be placed provided sufficient labor and equipment is furnished to pour, finish and cure the concrete to meet city standards before it sets.
6. Repairing Defects: Defects in the concrete shall be repaired in accordance with Section 32 13 13 entitled "Portland Cement Concrete Pavement," subsection 3.07 Repairing Defects.
- D. Backfill: A minimum of 24 hours shall elapse before forms are removed and 5 days shall elapse or the concrete must have attained 75% of its 28 day compressive strength before pavement is backfilled unless otherwise approved by the Engineer. Backfill shall be accomplished in accordance with Sections 31 22 00 and 31 23 13 entitled "Site Preparation and Grading" and "Subgrade Preparation."
1. The Contractor shall be responsible for the repair of any street pavement disturbed by the construction.

- E. Joint Sealing and Clean-Up: All isolation joints shall be sealed with an approved one-component, moisture-curing, non-priming, gun-grade, elastomeric polyurethane joint sealant that meets the requirements of ASTM C920, Type S, Grade NS, Class 25, Use NT and M. It shall be applied in accordance with the manufacturer's instructions within 7 days of the placement of the concrete.
1. The Contractor shall be responsible for the removal of excess dirt, rock, broken concrete, splatters and overspray from the construction area within 10 days unless otherwise directed by the Engineer.
- F. Surface Tolerances: Sidewalks, driveways, or bicycle/pedestrian paths shall have a surface tolerance of 1/4 inch (6 mm) in 10 feet (3.05 m) when checked with a 10 foot (3.05m) straightedge. Vertical deflections at sidewalk joints shall not exceed ¼ inch (6 mm).
- G. Detectable Warnings: Detectable warnings are required standardized surface features built in or applied to walking surfaces on sidewalks or ramps to warn visually impaired people of hazards on a circulation path. Those hazards include, but are not limited to interfaces between sidewalks and areas where moving vehicles may be present.
1. Detectable warnings shall be installed whenever sidewalk curb ramps are constructed or altered.
 2. Dimensions: Detectable warnings shall consist of raised truncated domes with a 0.9 in (23 mm) nominal diameter, a nominal 0.2 in (5mm) height, and a nominal center to center spacing of 2.35 in (60 mm). They shall extend across the full walking surface of the walk or ramp, and shall be 2 feet (0.6 m) long in the direction of pedestrian travel.
 3. Contrast: Detectable warnings shall contrast visually with adjoining surfaces, either light-on-dark or dark-on-light. The material used to provide contrast should contrast by at least 40%. Contrast in percent is determined by:

$$\text{Contrast} = [(B1 - B2) / B1] \times 100$$

Where: B1=light reflectance value (LRV) of the lighter area
B2=light reflectance value (LRV) of the darker area

Light Reflectance Value shall be determined by ASTM D2805 for painted surfaces or by visual comparison to paint chips with LRVs determined by ASTM D2805 for non-painted surfaces. Note that in any application both white and black are never absolute: thus B1 is always less than 100, and B2 is always greater than 0.
 4. Material: The material used to provide contrast shall be an integral part of the walking surface.

5. Submittals shall include:
 - a. Manufacturer product data and application instructions
 - b. Samples to visually demonstrate color contrast
 - c. Details of product composition, tests performed, product service experience, limitations to coating, application procedures, and Material Safety Data Sheets (MSDS)
 - d. Manufacturers certification that the product(s) meets or exceeds these specifications

END OF SECTION 32 16 23

SECTION 32 16 23.10**SIDEWALKS, DRIVEWAYS, AND CURBS - ML****PART I - GENERAL****1.1 SUMMARY****A. Description**

The work in this Section consists of constructing concrete curbs, curb transitions, curb and gutter, pedestrian access ramps, sidewalks, driveways, concrete strips, detectable warning surface, as shown on the Contract Drawings and as specified herein.

1.2 REFERENCES

American Public Works Association Standard Specifications and Design Criteria Section 2301 titled "Standard Sidewalks, Sidewalk Ramps, Driveways, and Bicycle & Pedestrian Paths" as revised, adopted, and provided by the Director of Kansas City, Missouri Public Works.

1.3 REFERENCE STANDARDS**A. Refer to Sections 32 16 13 and 32 16 23 for the applicable reference standards****PART II - PRODUCTS****A. Refer to Sections 32 16 13 and 32 16 23 for the products and materials for the Work.****PART III - EXECUTION****A. Refer to Sections 32 16 13 and 32 16 23 for the execution of the Work.****PART IV - MEASUREMENT****4.1 Item Basis – Measurement of the following concrete installations will be per the unit of measurement of each item as listed below.**

Pay Item	Unit of Measurement
Type CS Curb	LF, Linear Feet
Type C-1 Curb	LF, Linear Feet
Type CG-1 Curb	LF, Linear Feet
Concrete Sidewalk	SY, Square Yard
Concrete Sidewalk Ramp	SY, Square Yard
Detectable Warning Strip	LF, Linear Feet
Type II Concrete Driveway	SY, Square Yard

PART V - PAYMENT**5.1 General – The accepted measured quantity of each pay item will be paid for at the Contract unit price per unit of measurement. The Contract unit price will be payment in full for furnishing all labor, materials, tools, equipment and incidentals, and doing all Work necessary to complete the Work specified.****END OF SECTION**

SECTION 32 17 23**PAVEMENT MARKINGS****PART I - GENERAL****1.1 SUMMARY****A. Description**

Methods and materials for installing pavement marking materials, including Preformed Polymer Pavement Marking Tape, Preformed Thermoplastic, Epoxy, Preformed Removable Lane Tape, and other pavement marking materials.

1.3 SUBMITTALS AND INFORMATION TO BE RETAINED

- A. Submittals shall be made in accordance with the requirements of the KCMO's CM/GC General Conditions, except as modified herein.
- B. Submit a separate Tape Manufacturer's Material Certification for each production lot that is shipped.
- C. Provide a Manufacturer Warranty Bond for the installed price of the material, or the following amount, whichever is greater:

-
1. Pavement Marking Tape: \$140,000.
 2. Preformed Thermoplastic: \$100,000.
- D. Provide a full Manufacturer Warranty covering 100 percent of the installed price of all materials, equipment, and labor.
1. Manufacturer is responsible for quality control of the materials, proper placement by the Contractor or Subcontractor, and all other factors that affect the service life of the materials.
 2. In the event of a performance failure, remove and/or replace 100 percent of the markings for all failed sections at no cost to KCMO.
 3. Failed sections for Pavement Marking Tape and Preformed Thermoplastic are defined in KCMO's General Conditions.
- 1.4 QUALITY ASSURANCE/QUALITY CONTROL
- Quality assurance/quality control shall be made in accordance with the requirements of the Project Quality Plan.
- 1.5 DELIVERY, STORAGE, AND HANDLING
- A. In accordance with manufacturer's recommendations.
 - B. Provide Material Safety Data Sheets (MSDS) upon delivery of material.
- 1.6 MANUFACTURER SERVICE REQUIREMENT
- Manufacturer shall provide technical support to the Contractor during the placement of the marking materials, including information about handling, storage, placement and other training that may preserve the quality of the installed markings.
- 1.7 SERVICE LIFE TESTING
- A. Contractor will perform service life testing.
 - B. Performance Measures:
 1. Retro-reflectivity
 2. Color contrast and stability
 3. Durability under all traffic volumes and wear conditions
 - C. Retro-reflectivity is measured using a Federally approved instrument (30 m geometry).

- D. When performing Service Life Testing, take readings on clean surface areas free of debris.

PART II – PRODUCTS

2.1 MATERIALS

- A. Preformed Polymer Pavement Marking Tape, Thermoplastic Pavement Marking Tape, Epoxy, Drop-on Glass Beads, Preformed Removable Pavement Marking Tape, and ancillary materials shall be as outlined in MoDOT Specification Section 1048.

2.2 PAVEMENT GRINDING EQUIPMENT

- A. Use machinery capable of grinding to required depth and cross-section, and with sufficient power and stability to maintain an accurate depth of cut for pavement marking material.
- B. Use appropriate cleaning equipment capable of picking up all millings during and after grinding operations.

2.3 PAVEMENT MARKING USE

- A. Preformed Polymer Tape shall be used for permanent applications of crosswalks, stop bars, pavement arrows and messages, regardless of pavement material. All Preformed Polymer Tape shall be ground in to the pavement in accordance with the specifications herein.
- B. Thermoplastic pavement marking material shall be used for permanent applications of longitudinal lane lines to be installed in bituminous material.
- C. Epoxy pavement marking material shall be used for permanent applications of lane lines to be installed in concrete material. All epoxy pavement markings shall be ground into the pavement in accordance with the manufacturer's specifications.
- D. All temporary pavement marking shall be consist of one of the following options, under conditions as described below.
 - 1. Preformed Removable Pavement Marking Tape, for temporary conditions to exist longer than three days.
 - 2. Acrylic Copolymer Fast Dry Pavement Marking Paint, for temporary conditions to exist three days or less.

PART III – EXECUTION

3.1 REMOVAL OF EXISTING PAVEMENT MARKINGS

- A. Pavement marking removal operations shall be as outlined in MoDOT Specification Section 620.70.
- B. Do not eliminate or obscure existing striping, in lieu of removal, by covering with black paint or any other covering.
 - 1. The Engineer may grant prior written approval for use of black paint or other obscuring material for work durations shorter than “long term stationary” as defined in the Temporary Traffic Control section of the MUTCD.
- C. Use equipment specifically designed for removal of pavement marking material.

3.2 REMOVAL OF TEMPORARY PAVEMENT MARKINGS

- A. All temporary pavement marking removal work shall be coordinated with the construction activities. Temporary pavement markings shall be removed in advance of the traffic shift unless otherwise approved by the Engineer. Temporary pavement markings shall be removed during the same day or days that the traffic shift is accomplished, just prior to the traffic shift.

3.3 GROOVING BITUMINOUS and/or CONCRETE PAVEMENT SURFACES FOR EPOXY and POLYMER PREFORMED PAVEMENT MARKINGS

- B. The pavement markings are to be grooved into the pavement surfaces. GRINDER-TYPE CUTTING HEADS CANNOT BE USED. The goal of the grooving process is to protect the pavement marking from snowplow damage and ultimately extend the service life of the pavement markings. Grooving operations are incidental to permanent pavement marking operations.

The Contractor has the option to dry or wet groove the pavement while the roadway is open or closed to traffic. The groove must be cleaned completely prior to pavement marking application, using an air compressor with at least 185 CFM air flow and 120 PSI air pressure. The compressor must be equipped with a moisture and oil trap, and cannot have more than 50 feet of 3/4 inch ID hose between the compressor and the air nozzle. The air nozzle must have an inside diameter of 1/2 inch or greater.

- C. The grooving shall be performed by a self-propelled machine equipped with gang stacked diamond cutting blades mounted on a floating head with controls capable of providing uniform depth and alignment.

The cutting heads shall consist of stacked 1/8 inch to 3/8 inch wide diamond tipped cutting blades. The spacers between each blade must be such that the raise in the bottom of the finished groove between the blades is less than 25% of the groove depth. The resulting bottom of the groove shall have a fine corduroy finish. If a coarse tooth pattern is present, the Contractor shall increase the number of blades and/or decrease the thickness of the spacers on the cutting head.

The equipment shall be capable of grooving the total width of the groove in one pass or be capable of grooving uniform depths with multiple passes. The maximum number of passes is detailed below. If multiple passes are used, the ridge between passes shall be mechanically removed prior to groove cleaning and pavement marking application.

The equipment shall be capable of grooving double lines simultaneously or parallel lines to a uniform depth with two passes.

The equipment shall be self-vacuuming and leave the cut groove ready for pavement marking installation. Dry cut grooving without a vacuum will only be allowed if markings run perpendicular to the roadway, such as Stop Bars. The pavement marking manufacturer shall approve the equipment and method used.

- D. The grooving shall be performed within the following tolerances. Failure to meet these tolerances will result in the suspension of work until the Contractor can demonstrate that these tolerances can be met to the satisfaction of the Engineer. The pavement marking system shall be applied so that it is centered within the groove.

GROOVE WIDTH AND MAXIMUM NUMBER OF PASSES		
MARKING WIDTH	GROOVE WIDTH	MAX NUMBER OF PASSES
4 inches	5" ± 1/8"	1
6 inches	7" ± 1/8"	1
8 inches	9" ± 1/8"	1
12 inches	13" ± 1/8"	2
24 inches	25" ± 1/8"	3

- E. Groove Depth
1. The groove depth for Epoxy pavement markings shall be 30 mil ± 10 mil.
 2. The groove depth for Preformed Polymer Tape pavement markings shall be 110 mil ± 10 mil.
 3. Thermoplastic pavement markings shall NOT be grooved.
- F. Since pavements are irregular, the depth of groove across the width may vary. To compensate for this, the depth of the groove shall be measured from the bottom of the groove to a straight edge extended over the groove from the pavement surface opposite the pavement joint.

FULL DEPTH GROOVE LENGTHS	
Full Depth Groove Length (Broken Line)	10 feet ± 3 inches
Tapers At End of Each Line	6 inches to 9 inches
Space Between Double lines	4 inches ± 1/4 inch

- G. The groove shall be placed 2 inches \pm 1 inch from the edge of joints or seams along edge or centerline, unless otherwise indicated in the Plan.

Grooving alignment deviations from the control guide or existing lines specified by the Engineer shall not exceed 2 inches.

All pavement markings to be grooved in shall be placed in accordance with pavement marking or element manufacturer's instructions. New bituminous pavement shall not be grooved within a minimum 10 days of the placement of the final course of pavement, unless otherwise directed by the Engineer.

If the ground-in Epoxy markings are to be installed in the same location where there are existing pavement markings, including interim or temporary, the removal of the existing pavement markings shall be incidental to and included within the Epoxy (GR IN) pay item. The Contractor may cut the groove and remove the existing marking in a simultaneous operation.

3.4 Application

- A. Conduct surface preparations in accordance with manufacturer's recommendations.
- B. Operate equipment in the direction of the normal flow of traffic.
- C. Apply Pavement Marking Materials according to manufacturer's specifications.

END OF SECTION

SECTION 32 17 23.10**TEMPORARY PAVEMENT MARKINGS****PART I - GENERAL****1.1 SUMMARY****A. Description**

1. This work includes the installation of temporary pavement markings and the removal of existing pavement markings as shown on the Contract Drawings and as specified herein. Generally, the work involves striping for detours, lane closures and arrows for restricted lane movements.
2. Temporary pavement markings shall conform to the requirements of Missouri Department of Transportation (MoDOT) Specifications, except as modified herein.

1.3 SUBMITTALS

Submittals shall be made in accordance with the requirements of the Project Quality Plan, except as modified herein.

PART II - PRODUCTS**2.1 MATERIALS**

- A. Provide traffic paint conforming to the requirements of Missouri Department of Transportation (MODOT) Specifications Section 01558.
- B. Provide glass beads conforming to the requirements of Missouri Department of Transportation (MODOT) Specifications.
- C. Provide pavement marking tape conforming to the requirements of Missouri Department of Transportation (MODOT) Specifications.
- D. Provide temporary raised pavement markers conforming to the requirements of Missouri Department of Transportation (MODOT) Specifications.

PART III - EXECUTION**3.1 GENERAL**

- A. Stop bars shall be placed parallel to crosswalks, unless otherwise noted on plans.

- B. Stop bars shall be located a minimum of four feet behind the crosswalk.
- C. Place pavement markings for lane and center lines on all streets intersection the streetcar corridor 120' back from the stop bar or crosswalk.
- D. The broken line pavement marking pattern shall be a ten-foot stripe followed by a thirty-foot gap.
- E. The dotted line pavement marking patterns shall be as indicated on the plans.

3.2 TEMPORARY PAVEMENT MARKINGS

- A. Temporary pavement markings shall conform to the requirements of the Traffic Control Plan.
- B. All temporary pavement marking shall be by one of the following options:
 - 1. Highway traffic paint and glass beads.
 - 2. Reflectorized pavement marking tape.
 - 3. Raised temporary pavement markers.
- C. All temporary pavement marking work shall be coordinated with the construction activities. Temporary pavement markings shall be installed in advance of traffic use unless otherwise approved by the Engineer. Temporary pavement markings shall be installed during the same day or days that the traffic shift is accomplished, just prior to the traffic shift.

3.3 REMOVAL OF EXISTING PAVEMENT MARKINGS

- A. Use one of these removal methods:
 - 1. Grinding
 - 2. High pressure water spray
 - 3. Sand blasting
 - 4. Shot blasting.
- B. Use equipment specifically designed for removal of pavement marking material.

3.4 REMOVAL OF TEMPORARY PAVEMENT MARKINGS

All temporary pavement marking removal work shall be coordinated with the construction activities. Temporary pavement markings shall be removed in advance of the traffic shift unless otherwise approved by the Engineer. Temporary pavement markings shall be removed during the same day or days that the traffic shift is accomplished, just prior to the traffic shift.

END OF SECTION

SECTION 32 31 00**FENCES AND GATES****PART I - GENERAL****1.1 SUMMARY**

A. Description

The work in this Section includes furnishing and installing permanent chain link fencing and gates, including grounding, and furnishing and installing temporary security fencing.

ASTM	A 702	Specification for Steel Fence Posts and Assemblies, Hot Wrought
ASTM	A 824	Specification for Metallic-Coated Steel Marverled Tension Wire for Use with Chain Link Fence
ASTM	F 567	Practice for Installation of Chain Link Fence
ASTM	F 626	Specification for Fence Fittings
ASTM	F 668	Specification for Poly (Vinyl Chloride) (PVC) - Coated Steel Chain Link Fence Fabric
ASTM	F 669	Specification for Strength Requirements of Metal Posts and Rails for Industrial Chain Link Fence
ASTM	F 900	Specification for Industrial and Commercial Swing Gates
ASTM	F 1083	Specification for Pipe, Steel, Hot-Dipped Zinc Coated (Galvanized) Welded, for Fence Structures

FS	RR-F-191/1	Fencing, Wire and Post, Metal (Chain Link Fence Fabric) (Detail Specification) - Type IV.
FS	FF-P-101	Padlocks
CLFMI	Standards	Chain Link Fence Manufacturers Institute Standards

1.3 SUBMITTALS

- A. Submittals shall be made in accordance with the requirements of the Project Quality Plan, except as modified herein.
- B. Submit product data including manufacturer's data, specifications and installation instructions.
- C. Submit Shop Drawings which show details of fabrication and installation.
- D. Submit complete materials list and detailed fabrication drawings for gates and frames including structural calculations as required.

1.4 QUALITY CONTROL

Comply with CLFMI Standards and manufacture a complete system produced by a single manufacturer including necessary fittings and fastenings.

PART II - PRODUCTS

2.1 CHAIN LINK FENCE MATERIALS (2 INCH Galvanized)

- A. Fabric
 - 1. Galvanized Steel Wire: ASTM A 392, 2.0 oz/ft² of zinc after weaving.
 - 2. Helically wound and woven to height indicated on drawings, 2 inch diamond mesh of 9 gauge wire.
 - 3. Selvage of fabric shall be knuckled top and bottom.
 - 4. Provide one-piece fabric widths.
- B. Framing
 - 1. Steel Pipe: ASTM F 669 standard weight schedule 40.
 - 2. Hot dipped galvanized with minimum average 1.8 oz ft² zinc.
- C. Gates
 - 1. Horizontal and vertical members of gates shall be fabricated for gate operation and attachment of fabric, hardware and accessories.
 - 2. Fabricate gate perimeter frames of steel pipe, in size required above, galvanized.

3. Assemble gage frames by welding or with special fittings and rivets, for rigid connections.
4. Install fabric with stretcher bars at vertical edges and top and bottom edges.
5. Attach hardware to provide security against removal or breakage.
6. Hinges shall be size and material to suite gage size, non-lift-off type, offset to permit maximum degree of gate opening. Provide sufficient hinges for each leaf to support gage without excessive sagging, minimum of 1-½ pair of hinges per leaf, unless otherwise noted. Attach chain link fence fabric to the gate frame with stretcher bars and tie wires as specified for the fence construction, and provide suitable tension connections spaced at approximately one foot intervals.
7. Latch shall be forked type or plunger-bar type to permit operation from either side of gate, with padlock eye as integral part of latch. Provide padlocks conforming to FS FF-P-101, Type EPC, two inch size, solid brass case, with chain. Provide one padlock with chain for each gate. Key padlocks alike and master-key to KCMO system locks as required by the KCMO or its designee.
8. Provide adequate bracing. Provide gates capable of being opened and closed easily by one person. Provide with locking latches and a plunger-bar arranged to engage the center stop. Use center stops consisting of a device arranged to be set in concrete and to engage a plunger bar of the latch. Use keeper consisting of a mechanical device for securing the free end of the gate when in the full open position.

D. Accessories

1. Chain link fence accessories shall conform to ASTM F 626. Provide all items necessary to complete fence system. Galvanize and coat each ferrous metal item in accordance with ASTM A 153 and finish to match framing and fabric.
2. Tension wire shall be galvanized and coated seven gage coiled spring wire. Finish shall match fabric.
3. Post Caps shall be pressed steel, wrought iron, or malleable iron, finished to match fabric and posts designed as a watertight closure cap, with openings to permit through passage of top rail. Provide one cap for each post.
4. Tension (stretcher) bars shall be one piece lengths equal to full height of fabric, with a minimum cross-section of $\frac{3}{16}$ " by $\frac{3}{4}$ " with the same galvanizing as the fabric. Provide tension (stretcher) bars where chain link fabric meets terminal posts.
5. Tension (stretcher bar) bands shall be pressed steel spaced not over 15" on center to secure tension (stretcher) bars to end, corner, pull, and gate posts.
6. Provide one stretcher bar for each end post, and two for each corner and pull post, except where fabric is integrally woven into the post.
7. Wire ties and clips shall be 9 gauge galvanized steel for attachment of fabric to line posts. Double wrap 13 gauge for rails and braces. Hog ring ties of 11 gauge for attachment of fabric to tension wires.

E. Concrete shall be as specified in Section 03 30 00.

- F. Provide all other materials not specifically described, but required for a complete installation of the work described in this Section.
- G. Materials shall be new, first quality of their respective kinds, as selected by the Contractor subject to review by the Engineer.

2.2 CHAIN LINK FENCE MATERIALS (1 INCH Black Vinyl)

- A. Fabric
 - 1. Galvanized Steel Wire: ASTM A 392, 2.0 oz/ft² of zinc after weaving.
 - 2. Helically wound and woven to height indicated on drawings, 1 inch diamond mesh of 9 gauge wire.
 - 3. Selvage of fabric shall be knuckled top and bottom.
 - 4. Provide one-piece fabric widths.
 - 5. Provide black vinyl clad fabric of polyvinyl chloride thermally bonded to galvanized wire, conforming to FS RR-F-191/1, Type IV. Provide vinyl of a uniform 0.02 inch thick.
- B. Framing
 - 1. Steel Pipe: ASTM F 669 standard weight schedule 40.
 - 2. Hot dipped galvanized with minimum average 1.8 oz ft² zinc, coated and bonded with black PVC, with finish to match fabric.
- C. Gates
 - 1. Horizontal and vertical members of gates shall be fabricated for gate operation and attachment of fabric, hardware and accessories.
 - 2. Fabricate gate perimeter frames of steel pipe, in size required above, galvanized and coated in the same manner as the fabric.
 - 3. Assemble gate frames by welding or with special fittings and rivets, for rigid connections.
 - 4. Install fabric with stretcher bars at vertical edges and top and bottom edges.
 - 5. Attach hardware to provide security against removal or breakage.
 - 6. Hinges shall be size and material to suite gate size, non-lift-off type, offset to permit maximum degree of gate opening. Provide sufficient hinges for each leaf to support gate without excessive sagging, minimum of 1-½ pair of hinges per leaf, unless otherwise noted. Attach chain link fence fabric to the gate frame with stretcher bars and tie wires as specified for the fence construction, and provide suitable tension connections spaced at approximately one foot intervals.
 - 7. Latch shall be forked type or plunger-bar type to permit operation from either side of gate, with padlock eye as integral part of latch. Provide padlocks conforming to FS FF-P-101, Type EPC, two inch size, solid brass case, with chain. Provide one

padlock with chain for each gate. Key padlocks alike and master-key to KCMO system locks as required by KCMO or its designee.

8. Provide adequate bracing. Provide gates capable of being opened and closed easily by one person. Provide with locking latches and a plunger-bar arranged to engage the center stop. Use center stops consisting of a device arranged to be set in concrete and to engage a plunger bar of the latch. Use keeper consisting of a mechanical device for securing the free end of the gate when in the full open position.

D. Accessories

1. Chain link fence accessories shall conform to ASTM F 626. Provide all items necessary to complete fence system. Galvanize and coat each ferrous metal item in accordance with ASTM A 153 and finish to match framing and fabric.
2. Tension wire shall be galvanized and coated seven gage coiled spring wire. Finish shall match fabric.
3. Post Caps shall be pressed steel, wrought iron, or malleable iron, finished to match fabric and posts designed as a watertight closure cap, with openings to permit through passage of top rail. Provide one cap for each post.
4. Tension (stretcher) bars shall be one piece lengths equal to full height of fabric, with a minimum cross-section of $\frac{3}{16}$ " by $\frac{3}{4}$ " with the same galvanizing as the fabric. Provide tension (stretcher) bars where chain link fabric meets terminal posts.
5. Tension (stretcher bar) bands shall be pressed steel spaced not over 15" on center to secure tension (stretcher) bars to end, corner, pull, and gate posts.
6. Provide one stretcher bar for each end post, and two for each corner and pull post, except where fabric is integrally woven into the post.
7. Wire ties and clips shall be 9 gauge galvanized steel for attachment of fabric to line posts. Double wrap 13 gauge for rails and braces. Hog ring ties of 11 gauge for attachment of fabric to tension wires.
8. Roll type gate shall include wheel carriers, rear wheels, pipe track brackets, and latch.

E. Concrete shall be as specified in Section 03 30 00.

F. Provide all other materials not specifically described, but required for a complete installation of the work described in this Section.

G. Materials shall be new, first quality of their respective kinds, as selected by the Contractor subject to review by the Engineer.

2.3 TEMPORARY SECURITY FENCE

A. Fence Material

1. Fabric shall be galvanized steel wire chain link, as specified in Section 2.1 above
2. Framework shall be steel pipe as specified above in Section 2.1.

3. Accessories shall be as specified above in Section 2.1.
 4. Used Material for Temporary Security Fence is acceptable.
- B. Fence Panels
1. Provide 72" fence panels 10' - 12' long framed on both ends of top and bottom with 1- $\frac{3}{8}$ " diameter galvanized sheet tubing welded to form a single piece panel frame.
 2. End takes shall extend beyond the bottom of the frame 6" minimum to fit into concrete bases.
- C. Fence Fabric
1. Fabric shall be as specified herein, but need not be vinyl clad, may be a 2" diamond mesh, and shall be a single piece for each panel.
 2. Fabric shall be stretched tight between frame work and secured with metal wire, as specified, at 12" intervals and at corners all around the frame work.
- D. Concrete Bases: Provide concrete bases approximately 70 lbs., 5" high x 5" wide, and 12" long, with two holes in each for setting panel legs.
- E. Panel Clamp: Provide at least two galvanized steel saddle clamps with carriage bolts at connections between panels. Provide one at top and one at bottom of panel.

2.4 STEEL PICKET FENCES

- A. Pickets, Rails and Posts - Fabricate from cold-rolled steel, square tubing conforming to ASTM A500 or hot-rolled steel bars conforming to ASTM A6. Post caps: 3/16 inch thick flat steel plate conforming to ASTM A6 continuously welded in place; weld watertight, and grind flush and smooth. Provide round picket fence posts to interface with chain link fence where indicated on the Contract Drawings.
- B. Fabrication - Weld pickets to rails. Bolt picket panels to post. Shop-assemble fence components. Miter, cope and weld intersections. Remove spatter, grind exposed welds, and blend and contour surfaces to match adjacent surfaces.
- C. Gates and Removable Panels - Assemble in shop and ship with hardware. Gate - Welded construction with neat full weld. Locking devices - Substantially constructed, practical, and complete with hardware as required.
- D. Galvanizing - Hot-dip galvanize after fabrication in accordance with ASTM A123. Apply galvanized coating, minimum 2.0 oz./sq. ft. for posts and 1.5 oz./sq. ft. for steel pickets. Provide test coupon verifying minimum coating thickness for each panel.
- E. Finish - Black Zinc galvanized coating.
- F. Concrete, post holes and grounding system as specified for Chain Link Fence in Paragraph 2.1.
- G. Optional Finish - At Contractor's option, supply black polyvinyl chloride (PVC) coating over lightly galvanized finish.
1. Galvanize components in accordance with ASTM A123, G40, minimum.

2. Fabricated, galvanized panels - PVC coated with 10 mils black PVC thermally fused and bonded by fluidized bed method. PVC coating - In accordance with ASTM F668, Paragraphs 16.2.3 and 16.3.2 through 16.3.3 (performance criteria), and Paragraph 16.5.1 (color)
3. After installation, use PVC coating manufacturer's touch-up paint and repair PVC coating where welded, scratched, abraded, removed or otherwise damaged.
4. Weld galvanized post caps and steel plate panel connectors onto posts before applying PVC coating.

2.5 BOLLARDS

- A. Pipe: 4" diameter galvanized structural steel pipe per ASTM A53.
- B. Concrete: Class AA(AE) as specified in Section 03 15 16.
- C. Components: Galvanized structural steel per ASTM A53.

2.6 SWING TYPE GATE (VEHICULAR)

- A. Framing
 1. 2" O.D. Steel Pipe uprights for hinge and latch sides.
 2. Hot dipped galvanized with minimum average 1.80 oz ft² zinc.
 3. 1-5/8" O.D. vertical bracing, and 2" diagonal members.
 4. Vertical bracing spaced at 5' minimum increments from gate post.
- B. Gate Post
 1. 4" O.D. x 7' Steel Pipe
 2. Hot dipped galvanized with minimum average 1.80 oz ft² zinc.
- C. Accessories
 1. Aluminum Post Caps for pipe ends.
 2. Malleable butt hinges (galvanized)
 3. Gate latches (galvanized)

PART III - EXECUTION

3.1 GENERAL

- A. Verify areas to receive fencing are completed to final grades and elevations.
- B. Ensure property lines and legal boundaries of work are clearly established.

3.2 CHAIN LINK FENCING

- A. Install chain link fencing in accordance with ASTM F 567 and manufacturer's instructions.

- B. Locate terminal posts at each fence termination, change in horizontal alignment and vertical direction of 30 degrees or more.
- C. Space line posts uniformly at 10 feet on center.
- D. Concrete set terminal, line and gate posts:
 - 1. Drill holes for concrete footings for fence posts in firm, undisturbed or compacted soil. Holes shall have the minimum diameters shown on the Contract Drawings. Excavate hole depths approximately 6" lower than the post bottom, with bottom of posts set not less than 36" below the surface.
 - 2. Place concrete around posts and vibrate or tamp for consolidation.
- E. Check each post for vertical and top alignment, and hold in position during placement and finishing operations.
- F. For fencing mounted on concrete wall place fence posts in wall sleeves, check each post for vertical and top alignment. Hold in position and use Poroc grout or approved equal for setting the posts in the sleeves.
- G. Top rails shall be installed continuously through post caps. Expansion couplings as recommended by fencing manufacturer.
- H. Brace assemblies shall be installed so posts are plumb when diagonal rod is under proper tension.
- I. Tension wire shall be installed by weaving through fabric and tying to each post with not less than six gage galvanized wire, or by securing the wire to fabric. Take care not to damage wire coating.
- J. Fabric shall be installed with approximately 2" between finish grade and bottom selvage and 2" between top selvage and overhead structure. Pull fabric taut and tie to posts, rails, and tension wires. Install fabric on security side of fence, and anchor to framework so that fabric remains in tension after pulling force is released.
- K. Stretcher bars shall be threaded through or clamped to fabric at 4" on center and secure to posts with metal bands spaced 15" on center.
- L. Gates shall be installed plumb, level, and secured for full opening without interference. Adjust hardware for smooth operation.
- M. U-shaped tie wires, conforming to diameter of pipe to which attached, shall be installed with clasping pipe and fabric firmly attached with ends twisted at least two full turns. Ends of wire shall be bent to minimize hazard to persons and clothing.
- N. Fasteners shall be installed with nuts for tension bands and hardware bolts on side of fence opposite fabric side. Ends of bolts shall be peened or threads shall be scored to prevent removal of nuts.
- O. Install "no trespassing" signs on fence as indicated. Do not place manufacturer's or other signs on fence.
- P. Clean up debris and unused material, and remove from the site.

3.3 TEMPORARY SECURITY FENCE

- A. Temporary security fence shall be installed to provide a temporary barrier which will isolate the construction area from the adjacent property, whenever the Contractor's operations create a condition hazardous to traffic or to the public, in accordance with KCMO's CM/GC General Conditions.
- B. When fence panels are not used, install fence as specified above.
- C. Terminal and line posts shall be driven in ground.
- D. Upon completion of the work, the fence shall be removed and become the property of the Contractor.

3.4 STEEL PICKET FENCE

- A. Footings and Posts: Excavate holes on maximum 10 foot centers, measured parallel to slope of natural ground; do not impose on KCMO's right-of-way monuments. Install posts and pickets in vertical position. Except as otherwise indicated, grout posts in sleeves where fencing will be installed on top of concrete walls or in sidewalks. Place concrete and grout as specified in Section 03 30 00, Cast-in-Place Concrete; allow concrete and grout to cure not less than 72 hours before proceeding with work on posts. Do not place signs on fence.
- B. Rails: Install horizontally and step, as required, to adjust to variations in grade.
- C. Ground Rods: Install along fence line on nominal 500 foot centers; install rods and bond at gates. Where a power line passes over fence, install ground rod and ground well on each side of power line crossing, at fence line post nearest crossing, and install additional grounds 165 feet each side of that point. Ground end posts and posts on each side of removable access panels. Exothermically weld connecting wire to posts and ground rods; coat welds with one coat of hot coal-tar enamel.
- D. Touch-Up: After installation, repair fence where galvanizing or vinyl coating has been welded, scratched, abraded, removed, or otherwise damaged.
- E. Field Quality Control: Perform megger test between fence and absolute ground, midway between every ground rod. Measure resistance between fence and absolute ground with megger not less than 48 hours after rainfall or artificial waterings. Do not exceed two ohms resistance.
- F. Clean Up: Remove excess and waste materials from Worksite.

3.5 BOLLARDS

- A. Install per Contract Drawings.

3.6 SWING TYPE GATE (VEHICULAR)

- A. Install per manufacturers instructions with hole depth approximately 6" lower than post bottom with bottom of posts set not less than 36" below the surface. Hole shall be bell shaped (wider at the bottom). Fill hole with concrete to approximately 4"-5" below grade or ground level. Next, back fill with dirt and replumb post.
- B. Gates shall be installed, plumbed, level, and secured for full opening without interference.
- C. Clean up debris and unused material, remove from site.

PART IV - MEASUREMENT

4.1 Measurement

- A. The quantities of accepted work will be measured in the following units. All measurements will be plan measure except for authorized changes.
1. Chain Link Fence LF (Linear Foot)
 2. Chain Link Swing Gate EA (Each)

PART V - PAYMENT

5.1 Payment

Payment will be made at the respective unit or lump-sum price listed in the proposal and shall be full compensation for all labor, materials, and equipment necessary to complete the respective unit in place. There will be no separate measurement or payment for any item of work not specifically identified and listed in the proposal, and all such work shall be considered a subsidiary item with all costs pertaining thereto included in the prices for other items listed in the proposal. At the Engineer's option, partial payment may be made for any lump sum item listed in the proposal, providing that the Contractor is diligently and satisfactorily pursuing full completion of such partially complete item in accordance with the approved job progress schedule.

END OF SECTION

SECTION 32 31 16**WELDED WIRE FENCES AND GATES****PART 1 - GENERAL****1.1 RELATED DOCUMENTS**

- A. Drawings and general provisions of the Contract, including General and Supplementary Conditions and Division 01 Specification Sections, apply to this Section.

1.2 SUMMARY

- A. Section Includes:
1. Metallic-coated-steel, welded-wire fences.
 2. Swing gates.
- B. Related Requirements:
1. Section 03 30 00 "Cast-in-Place Concrete" for concrete fill.
 2. Section 31 20 00 "Earth Moving" for site excavation, fill, and backfill where welded-wire fences and gates are located.

1.3 PREINSTALLATION MEETINGS

- A. Preinstallation Conference: Conduct conference at Project site.

1.4 ACTION SUBMITTALS

- A. Product Data: For each type of product.
- B. Shop Drawings: For gates. Include plans, elevations, sections, details, and attachments to other work.
- C. LEED Submittals:
1. Product Data for Credit MR 4.1 and Credit MR 4.2: For products having recycled content, documentation indicating percentages by weight of postconsumer and preconsumer recycled content.
 - a. Include statement indicating costs for each product having recycled content.
 2. Product Data for Credits MR 5.1 and 5.2 - Local/Regional Materials:
 - a. Indicate location of manufacturing facility, including name, address, and distance between manufacturing facility and the project site. Provide manufacturer's documentation indicating location where the base materials were extracted, mined, quarried, harvested, etc. and the distance between this location and the project site. Also include material costs, excluding cost of installation.
- D. Samples: For each fence material and for each color specified.
1. Provide Samples 12 inches (300 mm) in length for linear materials.
 2. Provide Samples 12 inches (300 mm) square for wire mesh.

1.5 CLOSEOUT SUBMITTALS

- A. Maintenance Data: For gate operators to include in maintenance manuals.

1.6 QUALITY ASSURANCE

- A. Installer Qualifications: Fabricator of products.
- B. Mockups: Build mockups to verify selections made under Sample submittals, to demonstrate aesthetic effects, and to set quality standards for fabrication and installation.
 - 1. Include 10-foot (3-m) length of fence complying with requirements.
 - 2. Subject to compliance with requirements, approved mockups may become part of the completed Work if undisturbed at time of Substantial Completion.

1.7 PROJECT CONDITIONS

- A. Existing Utilities: do not interrupt utilities serving facilities occupied by Owner or others unless permitted under the following conditions and then only after arranging to provide temporary utility services according to requirements indicated:
 - 1. Notify Architect not less than two days in advance of proposed utility interruptions.
 - 2. Do not proceed with utility interruptions without Architect's written permission.
- B. Field Measurements: verify layout information for fences and gates shown on drawings in relation to property survey and existing structures. Verify dimensions by field measurements.

PART 2 - PRODUCTS

2.1 METALLIC-COATED-STEEL, WELDED-WIRE FENCES

- A. Metallic-Coated-Steel, Welded-Wire Fences:
 - 1. Manufacturers: Subject to compliance with requirements, available manufacturers offering products that may be incorporated into the Work include, but are not limited to, the following:
 - a. Omega Fence Systems (www.omegafence.com)
 - b. Other manufacturer, provided they have five years or more experience manufacturing metallic coated steel welded wire fences and swing gates meeting all specifications for design, size, gauge of metal and fabrication.
- B. Model: Omega Architectural
 - 1. Height: 4 ft. (1245 mm) or 8 ft. (2464 mm), where indicated on drawings.
 - 2. Color: Black (RAL 9004).
- C. Fence Fabric: Metallic-coated-steel wire.
 - 1. Spacing of Vertical Wires: 6 inches (150 mm).
 - 2. Vertical Wire Size: 6 gauge - 0.192 inch (4.88 mm).
 - 3. Spacing of Horizontal Wires: 2 inches (50 mm).
 - 4. Horizontal Wire Size: 6 gauge - 0.192 inch (4.88 mm).
 - 5. The cold rolled wire shall have a tensile strength of at least 75,000 psi (515 Mpa)

- and a 2,172 lbs (985 Kg) break strength as per ASTM A185 & A853.
6. Panels shall have a number of folds (to add strength) according to the table below depending on the respective height of the panel. Panel camber may not exceed 0.094" (2.5 mm).

Panel		
Width [in. (mm)]	Height [in. (mm)]	Number of folds
92-3/4 (2356)	49 (1245)	2
92-3/4 (2356)	61 (1549)	2
92-3/4 (2356)	70 (1778)	3
92-3/4 (2356)	97 (2464)	4

D. Posts:

1. Square tubes, to be installed in-ground and/or a flanged application. The size and the gauge of the posts shall be as shown in the table below for the various height dimensions. Posts are cold rolled from 1008 grade steel and meet ASTM 500 and ASTM A787-01.

Typical available posts	4' Height (1245 mm)	5' Height (1549 mm)	6' Height (1778 mm)	8' Height (2464 mm)
2 x 2 (50x50) 16 Ga (1,6mm)	329	263	--	--
2 x 2 (50x50) 11 Ga (3,0mm)	578	463	385	289
3 x 3 (50x50) 11 Ga (3,0mm)	1383	1106	922	691

- a. Minimum requirement for posts per table below (length of posts are a minimum 24 in. to 36 in. [610 mm to 915 mm] longer than actual height of the fence for installation in the ground):

Square Post				Installation
Height [in. (mm)]	Type [in.]	Gauge	Weight [lbs./ft.]	Depth [in. (mm)]
72 (1829)	2 x 2	16	1.71	36 (914)
84 (2134)	2 x 2	16	1.71	36 (914)
96 (2440)	2 x 2	11	2.8	36 (914)
	3 x 3	11	4.7	36 (914)
120 (3048)	2 x 2	11	2.8	36 (914)
	3 x 3	11	4.7	36 (914)

- E. Post Caps: Aluminum castings.
- F. Fasteners: Manufacturer's standard tamperproof, corrosion-resistant, color-coated fasteners matching fence components.
- G. Finish: Powder coating.

2.2 SWING GATES

- A. Gate Configuration: As indicated on drawings.

- B. Gate Frame Height: 8 ft. (2464 mm).
- C. Gate Opening Width: As indicated on drawings.
- D. Galvanized-Steel Frames and Bracing: In accordance with ASTM F900 (1984) using galvanized square steel tube 16 ga (1.6 mm). Frame shall be fabricated from two vertical tubes of 1 1/2 in. X 1 1/2 in. (38 mm X 38 mm) (and from two horizontal tubes of 2 in. x 2 in. (50 mm X 50 mm) welded at intersections to create a rigid frame. If gate is over 8 ft. (2440 mm) high or 8 ft. (2440 mm) wide, a supplementary vertical support of 1 1/2 in. X 1 1/2 in. (38 mm X 38 mm) is needed. If gate height or width exceeds 7 ft. (2134 mm), both vertical tubes must be 11 ga (3.0 mm).
- E. Gate Posts: Cold rolled from 1008 grade steel. Posts are to include cap and attachment kit for adjacent panel mounting. Post selection per table below:

Single Frame Gate Opening	Square Post Size
6 ft. (1830 mm) or less	3 in. x 3 in. (75 mm x 75 mm)
6.1 ft. (1860 mm) to 13.5 ft. (4115 mm)	4 in. x 4 in. (100 mm x 100 mm)
13.6 ft. (4145 mm) to 16 ft. (4875 mm)	6 in. x 6 in. (150 mm x 150 mm)
16 ft. (4876 mm) and over	Custom by manufacturer

- F. Infill: Welded-wire fence fabric matching adjacent fence, see section 2.01.C.
- G. Hardware: In conformity with ASTM F900 (1984) for hinges, latch, drop rods, shall be hot-dip galvanized steel, and sized to assure proper gate operation. Non moving parts shall be powder coated.
- H. Spring Hinges: BHMA A156.17, Grade 1, suitable for exterior use.
1. Function: 320 - Gate spring pivot hinge. Adjustable tension / 321 - Gate spring pivot hinge. Fixed tension.
 2. Material: Malleable iron; galvanized.
- I. Hinges: BHMA A156.1, Grade 1, suitable for exterior use.
1. Function: 39 - Full surface, triple weight, antifriction bearing.
 2. Material: Wrought steel, forged steel, cast steel, or malleable iron; galvanized.
- J. Rim Locks: BHMA A156.5, Grade 1, suitable for exterior use.
1. Function: 621 - Latchbolt by key from outside and by turn from inside. Latchbolt is held retracted by device from inside / 622 - Deadbolt by key from outside and by turn from inside / 629 - Deadlocking latchbolt by key from outside and by turn from inside / 626 - Interlocking deadbolt operated by key from either side / 627 - Interlocking deadbolt operated by key from outside and by turn from inside.
 2. Material: Cast, forged, or extruded brass or bronze.
 3. Mounting Plate: Configuration necessary for mounting locks. Fabricate from 1/8-inch- (3.2-mm-) thick, steel plate; hot-dip galvanize after fabrication.
- K. Mortise Locks: BHMA A156.13, Grade 1, suitable for exterior use.
1. Function: F06 - Holdback lock / F07 - Storeroom or closet lock / F09 - Apartment, exit, or public toilet lock / F16 - Double-cylinder deadlock / F17 - Deadlock.
 2. Material: Brass or bronze.
 3. Levers: Cast, forged, or extruded brass or bronze.

4. Mounting Box: Configuration necessary to enclose locks. Fabricate from 1/8-inch- (3.2-mm-) thick, steel plate; hot-dip galvanize after fabrication.
- L. Electric Strikes: BHMA A156.31, Grade 1, of configuration required for use with lock specified, fail-safe/-secure, and suitable for exterior use.
 1. Mounting Plate: Configuration necessary for mounting electric strikes. Fabricate from 1/8-inch- (3.2-mm-) thick, steel plate; hot-dip galvanize after fabrication.
 2. Mounting: Mortise into post.
- M. Cane Bolts: Provide for inactive leaf of pairs of gates. Fabricated from 1/2-inch- (12.7-mm-) / 3/4-inch- (19-mm-) diameter, round steel bars, hot-dip galvanized after fabrication. Finish to match gates. Provide galvanized-steel pipe strikes to receive cane bolts in closed position / both open and closed positions.
- N. Finish exposed welds to comply with NOMMA Guideline 1, Finish #2 - completely sanded joint, some undercutting and pinholes okay / Finish #3 - partially dressed weld with splatter removed / Finish #4 - good-quality, uniform undressed weld with minimal splatter.
- O. Metallic-Coated-Steel Finish: High-performance coating / Galvanized finish.

2.3 FENCE AND GATE MATERIALS

- A. Metallic-Coated-Steel Wire: Welded-wire fence fabric, hot-dip galvanized after fabrication. Weight of zinc coating shall be not less than 1.0 oz./sq. ft. (305 g/sq. m).
- B. Plates, Shapes, and Bars: ASTM A 36/A 36M.
- C. Tubing: ASTM A 500/A 500M, cold-formed steel tubing.
- D. Uncoated Steel Sheet: Hot-rolled steel sheet, ASTM A 1011/A 1011M, Structural Steel, Grade 45 (Grade 310) or cold-rolled steel sheet, ASTM A 1008/A 1008M, Structural Steel, Grade 50 (Grade 340).
 1. Interior surface of tubes formed from uncoated steel sheet shall be hot-dip zinc coated same as exterior or coated with zinc-rich thermosetting coating to comply with ASTM F 2408.
- E. Metallic-Coated Steel Sheet: Galvanized-steel sheet or aluminum-zinc, alloy-coated steel sheet.
- F. Galvanized-Steel Sheet: ASTM A 653/A 653M, structural quality, Grade 50 (Grade 340), with G90 (Z275) coating.
- G. Aluminum-Zinc, Alloy-Coated Steel Sheet: ASTM A 792/A 792M, structural quality, Grade 50 (Grade 340), with AZ60 (AZM180) coating.
- H. Iron Castings: Either gray or malleable iron unless otherwise indicated.
 1. Gray Iron: ASTM A 48/A 48M, Class 30.
 2. Malleable Iron: ASTM A 47/A 47M.
- I. Aluminum Castings: ASTM B 26/B 26M, Alloy A356.0-T6.
- J. Galvanizing: For components indicated to be galvanized and for which galvanized coating is unspecified, hot-dip galvanize to comply with ASTM A 123/A 123M. For hardware items, hot-dip galvanize to comply with ASTM A 153/A 153M.

2.4 COATING MATERIALS

- A. Epoxy Primer for Galvanized Steel: Epoxy primer recommended in writing by topcoat manufacturer.
- B. Polyurethane Intermediate Coat and Topcoat: Complying with MPI #72 and compatible with undercoat.
- C. Zinc Coating:
 - 1. Wire mesh to be coated with 0.5 oz./sq.ft. (150 g/m²) zinc in conformity with ASTM A 641 (1989) Class 1.
 - 2. Fence posts, swing gate frame and posts are zinc coated (galvalum process) with a minimum of 0.9 oz/sq.ft. (275 g/m²) as per ASTM A653 G90.
- D. Polyester Powder Coating: Minimum 4 mils applied by an electrostatic method. Coating shall cover all surfaces of the wire and post sections. Coating shall be capable of withstanding the following tests:
 - 1. Mechanical adhesion test as per ASTM D 3359 (1990) - Method B.
 - 2. Shock resistance tests as per ASTM D 2794 (1990).
 - 3. Salt spray testing with a min. of 1,000 hrs without red rust appearance, as per ASTM B 117 (1990).
 - 4. Humidity resistance in a weather meter chamber as per ASTM D 2247 (1988).
 - 5. Exposure to ultraviolet light with exposure of 1000 hours using apparatus Type E and 63°C as per ASTM D1499.

2.5 MISCELLANEOUS MATERIALS

- A. Welding Rods and Bare Electrodes: Select according to AWS specifications for metal alloy welded.
- B. Concrete: Normal-weight, air-entrained, ready-mix concrete complying with requirements in Section 03 30 00 "Cast-in-Place Concrete" with a minimum 28-day compressive strength of 3000 psi (20 MPa), 3-inch (75-mm) slump, and 1-inch (25-mm) maximum aggregate size or dry, packaged, normal-weight concrete mix complying with ASTM C 387/C 387M mixed with potable water according to manufacturer's written instructions.
- C. Nonshrink Grout: Factory-packaged, nonstaining, noncorrosive, nongaseous grout complying with ASTM C 1107/C 1107M and specifically recommended by manufacturer for exterior applications.

2.6 METALLIC-COATED-STEEL FINISHES

- A. Galvanized Finish: Clean welds, mechanical connections, and abraded areas, and repair galvanizing to comply with ASTM A 780/A 780M.
- B. Surface Preparation: Clean surfaces with nonpetroleum solvent so surfaces are free of oil and other contaminants. After cleaning, apply a conversion coating suited to the organic coating to be applied over it. Clean welds, mechanical connections, and abraded areas, and repair galvanizing to comply with ASTM A 780/A 780M.
- C. Powder Coating: Immediately after cleaning and pretreating, apply two-coat finish consisting of epoxy prime coat and TGIC polyester topcoat, with a minimum dry film thickness of 2 mils (0.05 mm) for topcoat. Comply with coating manufacturer's written instructions to achieve a minimum total dry film thickness of 4 mils (0.10 mm).

- D. High-Performance Coating: Apply epoxy primer, polyurethane intermediate coat, and polyurethane topcoat to prepared surfaces. Comply with coating manufacturer's written instructions and with requirements in SSPC-PA 1, "Paint Application Specification No. 1: Shop, Field, and Maintenance Painting of Steel," for shop painting. Apply at spreading rates recommended by coating manufacturer.
1. Match approved Samples for color, texture, and coverage. Remove and refinish, or recoat work that does not comply with specified requirements.

PART 3 - EXECUTION

3.1 EXAMINATION

- A. Examine areas and conditions, with Installer present, for compliance with requirements for site clearing, earthwork, pavement work, construction layout, and other conditions affecting performance of the Work.
- B. Do not begin installation before final grading is completed unless otherwise permitted by Architect.
- C. Proceed with installation only after unsatisfactory conditions have been corrected.

3.2 PREPARATION

- A. Stake locations of fence lines, gates, and terminal posts. Do not exceed intervals of 500 feet (152.5 m) or line of sight between stakes. Indicate locations of utilities, lawn sprinkler system, underground structures, benchmarks, and property monuments.
1. Construction layout and field engineering are specified in Section 01 73 00 "Execution."

3.3 FENCE INSTALLATION

- A. Install fences according to manufacturer's written instructions.
- B. Post Excavation: Drill or hand-excavate holes for posts in firm, undisturbed soil. Excavate holes to a diameter of not less than 4 times post size and a depth of not less than 24 inches (600 mm) plus 3 inches (75 mm) for each foot (300 mm) or fraction of a foot (300 mm) that fence height exceeds 4 feet (1.2 m).
- C. Post Setting: Set posts in concrete footings at indicated spacing into firm, undisturbed soil.
1. Verify that posts are set plumb, aligned, and at correct height and spacing, and hold in position during setting with concrete or mechanical devices.
 2. Concrete Fill: Place concrete around posts / sleeves and vibrate or tamp for consolidation. Protect aboveground portion of posts from concrete splatter.
 - a. Exposed Concrete: Extend 2 inches (50 mm) above grade. Finish and slope top surface to drain water away from post.
 - b. Concealed Concrete: Stop 2 inches (50 mm) below grade as indicated on Drawings to allow covering with surface material. Slope top surface of concrete to drain water away from post.
 3. Posts Set in Concrete: Extend post to within 6 inches (150 mm) of specified excavation depth, but not closer than 3 inches (75 mm) to bottom of concrete.
 4. Posts Set into Concrete in Sleeves: Use galvanized-steel pipe sleeves with inside diameter at least 3/4 inch (20 mm) larger than outside diagonal dimension

of post, preset and anchored into concrete for installing posts.

- a. Extend posts at least 5 inches (125 mm) into sleeve.
 - b. After posts have been inserted into sleeves, fill annular space between post and sleeve with nonshrink grout, mixed and placed to comply with grout manufacturer's written instructions; shape and smooth to shed water. Finish and slope top surface of grout to drain water away from post.
5. Posts Set into Voids in Concrete: Form or core drill holes not less than 3/4 inch (20 mm) larger than outside diagonal dimension of post.
- a. Extend posts at least 5 inches (125 mm) into concrete.
 - b. Clean holes of loose material, insert posts, and fill annular space between post and concrete with nonshrink grout, mixed and placed to comply with grout manufacturer's written instructions. Finish and slope top surface of grout to drain water away from post.
6. Space posts uniformly per manufacturer instructions.

3.4 GATE INSTALLATION

- A. Install gates according to manufacturer's written instructions, level, plumb, and secure for full opening without interference. Attach hardware using tamper-resistant or concealed means. Install ground-set items in concrete for anchorage. Adjust hardware for smooth operation and lubricate where necessary.

3.5 ADJUSTING

- A. Gates: Adjust gates to operate smoothly, easily, and quietly, free of binding, warp, excessive deflection, distortion, nonalignment, misplacement, disruption, or malfunction, throughout entire operational range. Confirm that latches and locks engage accurately and securely without forcing or binding.
- B. Lubricate hardware and other moving parts.

3.6 DEMONSTRATION

- A. Engage a factory-authorized service representative to train Owner's personnel to adjust, operate, and maintain gates.

END OF SECTION

SECTION 32 84 00**PLANTING IRRIGATION****PART 1 - GENERAL****1.1 RELATED DOCUMENTS**

- A. Drawings and general provisions of the Contract, including General and Supplementary Conditions and Division 01 Specification Sections, apply to this Section.

1.2 SUMMARY

- A. Section Includes:
1. Piping.
 2. Encasement for piping.
 3. Manual valves.
 4. Pressure-reducing valves.
 5. Automatic control valves.
 6. Automatic drain valves.
 7. Transition fittings.
 8. Dielectric fittings.
 9. Miscellaneous piping specialties.
 10. Sprinklers.
 11. Quick couplers.
 12. Drip irrigation specialties.
 13. Controllers.
 14. Boxes for automatic control valves.

1.3 DEFINITIONS

- A. Circuit Piping: Downstream from control valves to sprinklers, specialties, and drain valves. Piping is under pressure during flow.
- B. Drain Piping: Downstream from circuit-piping drain valves. Piping is not under pressure.
- C. Main Piping: Downstream from point of connection to water distribution piping to, and including, control valves. Piping is under water-distribution-system pressure.
- D. Low Voltage: As defined in NFPA 70 for circuits and equipment operating at less than 50 V or for remote-control, signaling power-limited circuits.

1.4 PERFORMANCE REQUIREMENTS

- A. Delegated Design: Design 100 percent coverage irrigation system, including comprehensive engineering analysis by a qualified professional engineer, using performance requirements and design criteria indicated.
- B. Irrigation zone control shall be automatic operation with controller and automatic control valves.
- C. Each zone shall irrigate a landscape with similar site, soil conditions and plant material with similar water needs. To the extent reasonably feasible, areas with significantly different solar exposures shall be zoned separately.
- D. Turf and non-turf areas shall be irrigated on separate zones.

- E. On steep grades, an irrigation method with a lower precipitation rate shall be used in order to minimize runoff and, to the extent feasible, these areas shall be zoned separately.
- F. Drip, micro-sprays, sprayheads and rotors shall not be combined on the same zone.
- G. The irrigation method shall be selected to correlate with the plant density. Drip irrigation or bubblers shall be used for sparsely-planted trees and shrubs, and rotors, sprayheads and multi-jet rotary nozzles shall be used for turfgrass.

1.5 ACTION SUBMITTALS

- A. Product Data: For each type of product indicated. Include rated capacities, operating characteristics, electrical characteristics, and furnished specialties and accessories.
- B. Wiring Diagrams: For power, signal, and control wiring.
- C. Delegated-Design Submittal: For irrigation systems indicated to comply with performance requirements and design criteria, including analysis data signed and sealed by the qualified professional engineer responsible for their preparation.

1.6 INFORMATIONAL SUBMITTALS

- A. Coordination Drawings: Irrigation systems, drawn to scale, on which components are shown and coordinated with each other, using input from Installers of the items involved. Also include adjustments necessary to avoid plantings and obstructions such as signs and light standards.
- B. Qualification Data: For qualified Installer.
- C. Zoning Chart: Show each irrigation zone and its control valve.
- D. Controller Timing Schedule: Indicate timing settings for each automatic controller zone.
- E. Field quality-control reports.

1.7 CLOSEOUT SUBMITTALS

- A. Operation and Maintenance Data: For sprinklers controllers and automatic control valves to include in operation and maintenance manuals.

1.8 MAINTENANCE MATERIAL SUBMITTALS

- A. Furnish extra materials that match products installed and that are packaged with protective covering for storage and identified with labels describing contents.

1.9 QUALITY ASSURANCE

- A. Installer Qualifications: An employer of workers that include a certified irrigation designer qualified by The Irrigation Association, Professional Class member of the American Society of Irrigation Consultants, or Professional Technical Class member of the American Society of Irrigation Consultants.
- B. Electrical Components, Devices, and Accessories: Listed and labeled as defined in NFPA 70, by a qualified testing agency, and marked for intended location and application.

1.10 DELIVERY, STORAGE, AND HANDLING

- A. Deliver piping with factory-applied end caps. Maintain end caps through shipping, storage, and handling to prevent pipe-end damage and to prevent entrance of dirt, debris, and moisture.
- B. Store plastic piping protected from direct sunlight. Support to prevent sagging and bending.

1.11 PROJECT CONDITIONS

- A. Interruption of Existing Water Service: Do not interrupt water service to facilities occupied by Owner or others unless permitted under the following conditions and then only after arranging to provide temporary water service according to requirements indicated:
 - 1. Notify Architect, Construction Manager, and/or Owner no fewer than two days in advance of proposed interruption of water service.
 - 2. Do not proceed with interruption of water service without Architect's, Construction Manager's, and/or Owner's written permission.

PART 2 - PRODUCTS

2.1 GENERAL EQUIPMENT SELECTION

- A. In order to reduce leakage of water from the irrigation system, a master shut-off valve shall be installed downstream of the backflow device to shut off water to the system when not operating.
- B. New irrigation controller(s) shall be "smart" controllers, using climate-based or soil moisture-based technology, selected from the Irrigation Association's current Smart Water Application Technologies (SWAT) tested products list or other similarly tested product list. Controllers must be installed and programmed according to manufacturer's specifications.
 - 1. A data input chart for the Smart Controller, including the precipitation rate from the audit, shall be posted at each irrigation controller.
 - 2. Within 6 weeks of the installation of new landscaping, the irrigation system "smart" Controllers shall be reset to the normal seasonal watering schedule.
- C. A rain sensor shall be installed on each new irrigation controller and installed according to the manufacturer's specifications.
- D. Sprinklers and nozzles shall meet the following requirements:
 - 1. The type of sprinkler and associated nozzles shall be selected to correlate with the size and geometry of the zone being irrigated.
 - 2. Sprinklers shall be spaced no closer than seventy-five (75) percent of the maximum radius of throw for the given sprinkler and nozzle. Maximum spacing shall be head-to-head coverage.
 - 3. Coverage arcs and radius of throw for turf areas shall be selected and adjusted to water only turf areas and minimize overspray onto vegetated areas, hard surfaces, buildings, fences, or other non-landscaped surfaces.
 - 4. Sprinklers, bubblers or emitters on a zone shall be of the same manufacturer.
 - 5. Sprayheads in turf areas shall have a minimum three and one-half (3½) inch pop-up riser height.
 - 6. Sprayheads on a zone shall have matched precipitation nozzles.
 - 7. Nozzles for rotors shall be selected to achieve an approximate uniform precipitation rate throughout the zone.

8. All sprayheads and rotors shall be equipped with check valves and pressure regulating stems.
- E. Pressure-compensating emitters shall be used for drip irrigation. For sloped areas, a check valve shall be installed and the drip line shall be parallel to the slope.
- F. Remote control valves shall have flow control.
- G. A backflow prevention assembly shall be installed in accordance with local codes. All backflow assemblies shall be equipped with adequately sized winterization ports downstream of the backflow assembly.

2.2 SLEEVING

- A. Separate sleeves shall be installed beneath paved areas to route each run of irrigation pipe or wiring bundle. The diameter of sleeving shall be twice that of the pipe or wiring bundle.
- B. The sleeving material beneath sidewalks, drives and streets shall be PVC Class 200 pipe with solvent welded joints.

2.3 WATER PRESSURE

- A. The irrigation system designer shall verify the existing available water pressure.
- B. The irrigation system shall be designed such that the point-of-connection design pressure, minus the possible system pressure losses, is greater than or equal to the design sprinkler operating pressure.
- C. All pop-up spray sprinkler bodies equipped with spray nozzles shall operate at no less than twenty (20) psi and no more than thirty (30) psi.
- D. All rotary sprinklers and multi-stream rotary nozzles on pop-up spray bodies shall operate at the manufacturer's specific optimum performance pressure.
- E. If the operating pressure exceeds the manufacturer's specified maximum operating pressure for any sprinkler body, pressure shall be regulated at the zone valve or sprinkler heads.
- F. Booster pumps shall be installed on systems where supply pressure does not meet the manufacturer's minimum recommended operating pressure for efficient water distribution.

PART 3 - EXECUTION

3.1 EARTHWORK

- A. Excavating, trenching, and backfilling are specified on the Civil Drawings.

3.2 PREPARATION

- A. Set stakes to identify locations of proposed irrigation system. Obtain Architect's approval before excavation.

3.3 SYSTEM INSTALLATION

- A. Install irrigation system per industry standards, and as required in Section 1.09.

3.4 FIELD QUALITY CONTROL

- A. Perform tests and inspections.
- B. Tests and Inspections:
 - 1. Leak Test: After installation, charge system and test for leaks. Repair leaks and retest until no leaks exist.
 - 2. Operational Test: After electrical circuitry has been energized, operate controllers and automatic control valves to confirm proper system operation.
 - 3. Test and adjust controls and safeties. Replace damaged and malfunctioning controls and equipment.
- C. Any irrigation product will be considered defective if it does not pass tests and inspections.
- D. Prepare test and inspection reports.

3.5 STARTUP SERVICE

- A. Perform startup service.
 - 1. Complete installation and startup checks according to manufacturer's written instructions.
 - 2. Verify that controllers are installed and connected according to the Contract Documents.
 - 3. Verify that electrical wiring installation complies with manufacturer's submittal.

3.6 ADJUSTING

- A. Adjust settings of controllers.
- B. Adjust automatic control valves to provide flow rate at rated operating pressure required for each sprinkler circuit.
- C. Adjust sprinklers and devices, except those intended to be mounted aboveground, so they will be flush with, or not more than 1/2 inch (13 mm) above, finish grade.

3.7 CLEANING

- A. Flush dirt and debris from piping before installing sprinklers and other devices.

3.8 DEMONSTRATION

- A. Train Owner's maintenance personnel to adjust, operate, and maintain automatic control valves and controllers.

END OF SECTION

SECTION 32 91 00**PLANTING PREPARATION****PART 1 - GENERAL****1.1 RELATED DOCUMENTS**

- A. Drawings and general provisions of the Contract, including General and Supplementary Conditions and Division 01 Specification Sections, apply to this Section.

1.2 SUMMARY

- A. Section Includes soil preparation, planting soil stabilization, and landscape grading including the following:
1. Inorganic soil amendments.
 2. Organic soil amendments.
 3. Fertilizers.
 4. Planting soils.
 5. Erosion-control material(s).
 6. Pesticides and Herbicides.
 7. Miscellaneous products including:
 - a. Mycorrhizal fungi.
- B. Related Sections:
1. Division 31 Section "Site Clearing" for protection of existing trees and plantings, topsoil stripping and stockpiling, and site clearing.
 2. Division 31 Section "Earth Moving" for excavation, filling and backfilling, and rough grading and for subsurface aggregate drainage and drainage backfill materials.
 3. Section 32 92 00 "Prairie Grasses and Wildflowers" for prairie planting, hydromulching, and erosion-control materials.
 4. Section 32 80 00 "Irrigation " for irrigation.
 5. Section 32 93 00 "Plants" for trees.
 6. Division 33 Section "Subdrainage" for below-grade subsurface drainage of landscaped areas, paved areas, and wall perimeters.

1.3 DEFINITIONS

- A. Duff Layer: The surface layer of native topsoil that is composed of mostly decayed leaves, twigs, and detritus.
- B. Finish Grade: Elevation of finished surface of planting soil.
- C. Manufactured Topsoil: Soil produced off-site by homogeneously blending mineral soils or sand with stabilized organic soil amendments to produce topsoil or planting soil.
- D. Planting Area: Areas to be planted.
- E. Pests: Living organisms that occur where they are not desired or that cause damage to plants, animals, or people. These include insects, mites, grubs, mollusks (snails and slugs), rodents (gophers, moles, and mice), unwanted plants (weeds), fungi, bacteria, and viruses.
- F. Planting Soil: Standardized topsoil; existing, native surface topsoil; existing, in-place

surface soil; imported topsoil; or manufactured topsoil that is modified with soil amendments and perhaps fertilizers to produce a soil mixture best for plant growth.

- G. Subgrade: Surface or elevation of subsoil remaining after excavation is complete, or the top surface of a fill or backfill before planting soil is placed.
- H. Subsoil: All soil beneath the topsoil layer of the soil profile, and typified by the lack of organic matter and soil organisms.
- I. Surface Soil: Soil that is present at the top layer of the existing soil profile at the Project site. In undisturbed areas, the surface soil is typically topsoil, but in disturbed areas such as urban environments, the surface soil can be subsoil.

1.4 SUBMITTALS

- A. Product Data: For each type of product indicated, including soils.
- B. LEED Submittals:
 - 1. Product Data for Credits MR 5.1 and 5.2 - Local/Regional Materials:
 - a. Indicate location of manufacturing facility, including name, address, and distance between manufacturing facility and the project site. Provide manufacturer's documentation indicating location where the base materials were extracted, mined, quarried, harvested, etc. and the distance between this location and the project site. Also include material costs, excluding cost of installation.
- C. Samples for Verification: For each of the following:
 - 1. Erosion Control Blankets, Fiber Mesh, and Mats: 12 by 12 inches.
- D. Qualification Data: For qualified landscape Installer.
- E. Product Certificates: For each type of manufactured product soil amendments and fertilizers, from manufacturer, and complying with the following:
 - 1. Manufacturer's certified analysis of standard products.
 - 2. Analysis of other materials by a recognized laboratory made according to methods established by the Association of Official Analytical Chemists, where applicable.
- F. Material Test Reports: For manufactured ASTM D 5268 topsoil.

1.5 QUALITY ASSURANCE

- A. Installer Qualifications: A qualified landscape Installer whose work has resulted in successful establishment of plants.
 - 1. Professional Membership: Installer shall be a member in good standing of either the Professional Landcare Network or the American Nursery and Landscape Association.
 - 2. Installer's Field Supervision: Require Installer to maintain an experienced full-time supervisor on Project site when work is in progress.
 - 3. Pesticide Applicator: State licensed, commercial.
- B. Soil-Testing Laboratory Qualifications: An independent laboratory or university laboratory, recognized by the State Department of Agriculture, with the experience and

capability to conduct the testing indicated and that specializes in types of tests to be performed.

- C. Soil Analysis: For each unamended soil type/source, furnish soil analysis and a written report by a qualified soil-testing laboratory stating percentages of organic matter; gradation of sand, silt, and clay content; cation exchange capacity; sodium absorption ratio; deleterious material; pH; and mineral and plant-nutrient content of the soil.
1. Testing methods and written recommendations shall comply with USDA's Handbook No. 60.
 2. The soil-testing laboratory shall oversee soil sampling, with depth, location, and number of samples to be taken per instructions from the Landscape Architect. A minimum of three representative samples shall be taken from varied locations for each soil to be used or amended for planting purposes.
 3. Report suitability of tested soil for plant growth.
 - a. Based upon the test results, state recommendations for soil treatments and soil amendments to be incorporated. State recommendations in weight per 1000 sq. ft. or volume per cu. yd. for nitrogen, phosphorus, and potash nutrients and soil amendments to be added to produce satisfactory planting soil suitable for healthy, viable plants.
 - b. Report presence of problem salts, minerals, or heavy metals, including aluminum, arsenic, barium, cadmium, chromium, cobalt, lead, lithium, and vanadium. If such problem materials are present, provide additional recommendations for corrective action.
- D. Preinstallation Conference: Conduct conference at Project site.

1.6 DELIVERY, STORAGE, AND HANDLING

- A. Packaged Materials: Deliver packaged materials in original, unopened containers showing weight, certified analysis, name and address of manufacturer, and indication of conformance with state and federal laws, as applicable.
- B. Bulk Materials:
1. Do not dump or store bulk materials near structures, utilities, walkways and pavements, or on existing turf areas or plants.
 2. Provide erosion-control measures to prevent erosion or displacement of bulk materials, discharge of soil-bearing water runoff, and airborne dust reaching adjacent properties, water conveyance systems, or walkways.
 3. Accompany each delivery of bulk fertilizers, lime, and soil amendments with appropriate certificates.

1.7 PROJECT CONDITIONS

- A. Field Measurements: Verify actual grade elevations, service and utility locations, irrigation system components, and dimensions of plantings and construction contiguous with new plantings by field measurements before proceeding with planting work.
- B. Weather Limitations: Proceed with planting only when existing and forecasted weather conditions permit planting to be performed when beneficial and optimum results may be obtained. Apply products during favorable weather conditions according to manufacturer's written instructions.

PART 2 - PRODUCTS

2.1 INORGANIC SOIL AMENDMENTS

- A. Lime: ASTM C 602, agricultural liming material containing a minimum of 80 percent calcium carbonate equivalent and as follows:
 - 1. Class: T, with a minimum of 99 percent passing through No. 8 sieve and a minimum of 75 percent passing through No. 60 sieve.
 - 2. Class: O, with a minimum of 95 percent passing through No. 8 sieve and a minimum of 55 percent passing through No. 60 sieve.
 - 3. Provide lime in form of ground dolomitic limestone.
- B. Sulfur: Granular, biodegradable, containing a minimum of 90 percent sulfur, and with a minimum of 99 percent passing through No. 6 sieve and a maximum of 10 percent passing through No. 40 sieve.
- C. Iron Sulfate: Granulated ferrous sulfate containing a minimum of 20 percent iron and 10 percent sulfur.
- D. Aluminum Sulfate: Commercial grade, unadulterated.
- E. Perlite: Horticultural perlite, soil amendment grade.
- F. Agricultural Gypsum: Minimum 90 percent calcium sulfate, finely ground with 90 percent passing through No. 50 sieve.
- G. Sand: Clean, washed, natural or manufactured, and free of toxic materials.
- H. Diatomaceous Earth: Calcined, 90 percent silica, with approximately 140 percent water absorption capacity by weight.
- I. Zeolites: Mineral clinoptilolite with at least 60 percent water absorption by weight.

2.2 ORGANIC SOIL AMENDMENTS

- A. Compost: Either Class I or Class II compost as produced by a composting facility registered with the Missouri Department of Public Health and Environment, and as follows:
 - 1. Available Products: Subject to compliance with requirements, products that may be incorporated into the Work include, but are not limited to the following:
 - a. A-1 Organics: Biocomp (Class I).
 - b. A-1 Organics: Premium 3 Horticultural Grade (Class II).
 - c. B.O.S.S. Compost, Inc.: Boston Tea Compost (Class I).
 - d. B.O.S.S. Compost, Inc.: Black Tea Compost (Class II).

2.3 FERTILIZERS

- A. Slow-Release Organic Fertilizer: Subject to compliance with requirements, products that may be incorporated into the Work include:
 - 1. Biosol 6-1-3 Natural All Purpose fertilizer.
 - 2. Sustane 5-2-4 All Natural Granulated Slow Release Nitrogen fertilizer.

2.4 PLANTING SOILS

- A. Topsoil: ASTM D 5268 topsoil, with pH range of 5.5 to 7, a minimum of 6 percent organic material content; free of stones 1 inch or larger in any dimension and other extraneous materials harmful to plant growth.

1. Topsoil Source: Existing, native surface topsoil formed under natural conditions with the duff layer retained during excavation process and stockpiled on-site. Verify suitability of native surface topsoil to produce viable planting soil. Clean soil of roots, plants, sod, stones, clay lumps, and other extraneous materials harmful to plant growth.
 - a. Supplement with imported or manufactured topsoil from offsite sources when quantities are insufficient. Obtain topsoil displaced from naturally well-drained construction or mining sites where topsoil occurs at least 4 inches (100 mm) deep; do not obtain from agricultural land, bogs or marshes. Screened and free of stones 1 inch or larger in any dimension; free of roots, plants, sod, clods, clay lumps, pockets of coarse sand, paint, paint washout, concrete slurry, concrete layers or chunks, cement, plaster, building debris, oils, gasoline, diesel fuel, paint thinner, turpentine, tar, roofing compound, acid, and other extraneous materials harmful to plant growth; free of obnoxious weeds and invasive plants including quackgrass, Johnsongrass, poison ivy, nutsedge, nimblewill, Canada thistle, bindweed, bentgrass, wild garlic, ground ivy, perennial sorrel, and brome grass; not infested with nematodes; grubs; or, other pests, pest eggs, or other undesirable organisms and disease-causing plant pathogens; friable and with sufficient structure to give good tilth and aeration. Continuous, air-filled, pore-space content on a volume/volume basis shall be at least 15 percent when moisture is present at field capacity. Soil shall have a field capacity of at least 15 percent on a dry weight basis.
- B. Planting Soil: Mix topsoil with the following soil amendments and fertilizers in the following quantities to produce planting soil:
 1. Ratio of Loose Compost to Topsoil by Volume: 4 yds. / 1000 sq.ft.
 2. Based upon the Soil Analysis results and recommendations: Nitrogen, phosphorus, and potash nutrients and soil amendments to be added to produce satisfactory planting soil suitable for healthy, viable plants.

2.5 MISCELLANEOUS PRODUCTS

- A. Mycorrhizal Inoculum shall be AM 120 Standard, or approved equal:
 1. 100% Glomus intraradices (UT isolate)(120 propagules per c.c. or 100 propagules per gr.)

2.6 PESTICIDES/HERBICIDES

- A. Pesticide: Registered and approved by EPA, acceptable to authorities having jurisdiction, and of type recommended by manufacturer for each specific problem and as required for Project conditions and application. Do not use restricted pesticides unless authorized in writing by authorities having jurisdiction.
 1. Selection of Pesticide shall be contingent on, but not limited to, the following:
 - a. Identification of specific pest(s) to be prevented, destroyed, repelled, or mitigated.
- B. Pre-Emergent Herbicide (Selective and/or Non-Selective): Effective for controlling the germination or growth of weeds within planted areas at the soil level directly below the mulch layer.
 1. Selection of Pre-Emergent Herbicide(s) shall be contingent on, but not limited to,

the following:

- a. Identification of specific weed(s) to be eradicated.
 - b. Identification of growth rate (at the time of application) required for herbicide to be effective, specific to each type of weed.
 - c. Location of weeds (slope, exposure, etc.).
 - d. Hydrology of the area (i.e., limitations due to possible contamination to wetlands, subsurface water sources, etc.).
 - e. Soil type(s).
 - f. Application type (spot versus broadcast).
- C. Post-Emergent Herbicide (Selective and/or Non-Selective): Effective for controlling weed growth that has already germinated.
1. Selection of Post-Emergent Herbicide(s) shall be contingent on, but limited to, the following:
 - a. Identification of specific weed(s) to be eradicated.
 - b. Identification of growth rate (at the time of application) required for herbicide to be effective, specific to each type of weed.
 - c. Location of weeds (slope, exposure, etc.).
 - d. Hydrology of the area (i.e., limitations due to possible contamination to wetlands, subsurface water sources, etc.).
 - e. Soil type(s).
 - f. Application type (spot versus broadcast).
 - g. Identification of plants to be saved.

PART 3 - EXECUTION

3.1 EXAMINATION

- A. Examine areas to be planted for compliance with requirements and other conditions affecting installation and performance.
1. Verify that no foreign or deleterious material or liquid such as paint, paint washout, concrete slurry, concrete layers or chunks, cement, plaster, oils, gasoline, diesel fuel, paint thinner, turpentine, tar, roofing compound, or acid has been deposited in soil within a planting area.
 2. Do not mix or place soils and soil amendments in frozen, wet, or muddy conditions.
 3. Suspend soil spreading, grading, and tilling operations during periods of excessive soil moisture until the moisture content reaches acceptable levels to attain the required results.
 4. Uniformly moisten excessively dry soil that is not workable and which is too dusty.
- B. Proceed with installation only after unsatisfactory conditions have been corrected.
- C. If contamination by foreign or deleterious material or liquid is present in soil within a planting area, remove the soil and contamination as directed by Architect and replace with new planting soil.

3.2 PREPARATION

- A. Protect structures, utilities, sidewalks, pavements, and other facilities, trees, shrubs, turf areas, and existing plantings from damage caused by planting operations.
1. Protect grade stakes set by others until directed to remove them.
- B. Install erosion-control measures to prevent erosion or displacement of soils and

discharge of soil-bearing water runoff or airborne dust to adjacent properties and walkways.

3.3 PESTICIDE/HERBICIDE APPLICATION

- A. Apply pesticides, herbicides and other chemical products and biological control agents in accordance with requirements of authorities having jurisdiction and manufacturer's written recommendations. Coordinate applications with Owner's operations and others in proximity to the Work. Notify Owner before each application is performed.
- B. Pre-Emergent Herbicides (Selective and/or Non-Selective): Apply in accordance with manufacturer's written recommendations.
- C. Post-Emergent Herbicides (Selective and/or Non-Selective): Apply only as necessary to treat already-germinated weeds and in accordance with manufacturer's written recommendations.

3.4 PLANTING AREA PREPARATION AND ESTABLISHMENT

- A. Limit subgrade preparation to areas to be planted.
- B. Newly Graded Subgrades: Loosen subgrade to a minimum depth of 12 inches. Remove stones larger than 1 inch in any dimension and sticks, roots, rubbish, and other extraneous matter and legally dispose of them off Owner's property.
 - 1. Spread topsoil, apply soil amendments and fertilizer on surface, and thoroughly blend planting soil.
 - a. Delay mixing fertilizer with planting soil if planting will not proceed within a few days.
 - b. If lime application is required, mix with dry soil before mixing fertilizer.
 - 2. Spread planting soil to a depth of 6 inches but not less than required to meet finish grades after light rolling and natural settlement. Do not spread if planting soil or subgrade is frozen, muddy, or excessively wet.
 - a. Where planting soil depth is less than 8 inches, spread approximately 1/2 the thickness of planting soil over loosened subgrade. Mix thoroughly into top 4 inches of subgrade. Spread remainder of planting soil.
- C. Unchanged Subgrades: If planted areas are in areas unaltered or undisturbed by excavating, grading, or surface-soil stripping operations, prepare surface soil as follows:
 - 1. Remove existing grass, vegetation, and turf. Do not mix into surface soil.
 - 2. Loosen surface soil to a depth of at least 8 inches. Apply soil amendments and fertilizers according to planting soil mix proportions and mix thoroughly into top 6 inches of soil. Till soil to a homogeneous mixture of fine texture.
 - 3. Remove stones larger than 1 inch in any dimension and sticks, roots, trash, and other extraneous matter.
 - 4. Legally dispose of waste material, including grass, vegetation, and turf, off Owner's property.
- D. Finish Grading: Grade planting areas to a smooth, uniform surface plane with loose, uniformly fine texture. Grade to within plus or minus 1/2 inch of finish elevation. Roll and rake, remove ridges, and fill depressions to meet finish grades. Limit finish grading to areas that can be planted in the immediate future.
- E. Before planting, obtain Landscape Architect's acceptance of finish grading; restore

planting areas if eroded or otherwise disturbed after finish grading.

- F. Apply Mycorrhizal Inoculum, per manufacturer's recommendations, at a rate of 60lbs. per acre (67.5 kg/ha)/1.4 lbs. per 1,000 ft²(0.7 kg / 100 m²), by the following methods (as applicable):
1. Seed Drilling: Incorporate into the soil at a depth ranger at or below the seed.
 2. Broadcast and Till: Evenly distribute across seedbed after seeding. Cover the exposed seed and inoculum by harrowing, chain dragging or applying an organic topdressing. Do not leave inoculum exposed to sunlight for more than four hours.
 3. Nursery Medium: Evenly blend at 5 lbs per yd³ (3 kg. Per m³). 1 lb. (454 grams) contains approximately 60,000 living propagules. Rate provides 300,000 living propagules per yd³ (396,000 living propagules per m³) or 6.5 living propagules per in³.

3.5 CLEANUP AND PROTECTION

- A. During planting, keep adjacent paving and construction clean and work area in an orderly condition.

3.6 DISPOSAL

- A. Remove surplus soil and waste material including excess subsoil, unsuitable soil, trash, and debris and legally dispose of them off Owner's property.

END OF SECTION

SECTION 32 92 00**PRAIRIE GRASSES AND WILDFLOWERS****PART 1 - GENERAL****1.1 RELATED DOCUMENTS**

- A. Drawings and general provisions of the Contract, including General and Supplementary Conditions and Division 01 Specification Sections, apply to this Section.

1.2 SUMMARY

- A. Section Includes prairie grasses and wildflowers.
- B. Related Sections:
 - 1. Division 31 Section "Site Clearing" for topsoil stripping and stockpiling.
 - 2. Division 31 Section "Earth Moving" for excavation, filling and backfilling, and rough grading.
 - 3. Section 32 01 90 "Operation And Maintenance Of Planting" for maintenance instructions and pesticide application.
 - 4. Section 32 91 00 "Planting Preparation" for soil preparation, planting soil stabilization, and landscape grading.
 - 5. Section 32 93 00 "Plants" for trees.

1.3 DEFINITIONS

- A. Duff Layer: The surface layer of native topsoil that is composed of mostly decayed leaves, twigs, and detritus.
- B. Finish Grade: Elevation of finished surface of planting soil.
- C. Subgrade: Surface or elevation of subsoil remaining after excavation is complete, or top surface of a fill or backfill before planting soil is placed.
- D. Subsoil: All soil beneath the topsoil layer of the soil profile, and typified by the lack of organic matter and soil organisms.
- E. Surface Soil: Soil that is present at the top layer of the existing soil profile at the Project site. In undisturbed areas, the surface soil is typically topsoil, but in disturbed areas such as urban environments, the surface soil can be subsoil.

1.4 SUBMITTALS

- A. Product Data: For each type of product indicated.
 - 1. Pesticides and Herbicides: Include product label and manufacturer's application instructions specific to this Project.
 - 2. Imported topsoil, organic matter, and fertilizers: Include product label and manufacturer's application instructions specific to this Project.
 - 3. Fiber mulch: Include product label and manufacturer's application instructions specific to this Project.
 - 4. Mycorrhizal Inoculum: Include product label and manufacturer's application instructions specific to this Project.

- B. Certification of Grass Seed: From seed vendor for each grass-seed monostand or mixture stating the botanical and common name, percentage by weight of each species and variety, and percentage of purity, germination, and weed seed. Include the year of production and date of packaging.
- C. Qualification Data: For qualified landscape Installer.

1.5 QUALITY ASSURANCE

- A. Quality of Materials: Seed materials shall be subject to inspection and approval.
 - 1. Architect reserves the right to reject, at any time or place prior to acceptance, work and seed which in the Architect's opinion fails to meet these Specification requirements.
 - 2. Owner's Representative may make inspection periodically during seeding, at completion and at the end of warranty periods.
- B. Installer Qualifications: A qualified landscape Installer whose work has resulted in successful prairie establishment.
 - 1. Professional Membership: Installer shall be a member in good standing of either the Professional Landcare Network or the American Nursery and Landscape Association.
 - 2. Installer's Field Supervision: Require Installer to maintain an experienced full-time supervisor on Project site when work is in progress.
- C. Preinstallation Conference: Conduct conference at Project site.

1.6 DELIVERY, STORAGE, AND HANDLING

- A. Seed:
 - 1. Deliver seed in sealed standard containers, with seed tags stating scientific and variety name of all species, % germination, year of preparation for seeding, name of project and acreage to be seeded by this shipment and mixture of seed.
 - 2. Seed damaged in transit or storage will not be accepted.
 - 3. Notify Architect of delivery schedule in advance so that material may be inspected upon arrival at the project site as required. Seed tags are to be given to the Landscape Architect, Ecologist or Project supervisor.
 - 4. Unacceptable material shall be removed immediately from project site.
- B. Chemical Fertilizer:
 - 1. Deliver chemical fertilizer to site in original unopened container bearing manufacturer's guaranteed chemical analysis, name, trade name, trademark and conformance to State law, bearing name and warranty of producer.
- C. Bulk Materials:
 - 1. Do not dump or store bulk materials near structures, utilities, walkways and pavements, or on existing grassed areas or plants.
 - 2. Provide erosion-control measures to prevent erosion or displacement of bulk materials, discharge of soil-bearing water runoff, and airborne dust reaching adjacent properties, water conveyance systems, or walkways.

1.7 PROJECT CONDITIONS

- A. Planting Restrictions: Plant during one of the following periods. Coordinate planting periods with initial maintenance periods to provide required maintenance from date of Substantial Completion.
 - 1. Spring Planting: April 1 – June 30. Adjust for weather limitations and freezing conditions.
 - 2. Fall Planting: September 1 – November 30. Adjust for weather limitations and freezing conditions.
- B. Weather Limitations: Proceed with planting only when existing and forecasted weather conditions permit planting to be performed when beneficial and optimum results may be obtained. Apply products during favorable weather conditions according to manufacturer's written instructions.
- C. Pesticide/Herbicide Coordination: If applicable, delay planting until each pesticide/herbicide is inactive, as recommended by the manufacturer.

1.8 WARRANTY

- A. Seeded areas shall be warranted for one growing season to be in a healthy vigorous growing condition.
- B. During original warranty period, seeded areas that die due to natural causes, failure of germination, erosion, etc., or in opinion of Architect are unhealthy, shall be replaced.
- C. Such replacements shall be installed as specified, equal to original planting.
- D. Should settling occur, fill and compact settled areas and reseed affected areas per grading and landscape plan.

PART 2 - PRODUCTS

2.1 FERTILIZER

- A. Slow-Release Organic Fertilizer: Subject to compliance with requirements, products that may be incorporated into the Work include:
 - 1. Biosol 6-1-3 Natural All Purpose fertilizer.
 - 2. Sustane 5-2-4 All Natural Granulated Slow Release Nitrogen fertilizer.

2.2 MULCH

- A. Bedding Straw:
 - 1. Bedding straw shall be provided in 40-50 lb. bales, free of any materials considered sources of weed seed. No hay shall be used for any purpose on the project site. All straw shall be certified noxious weed free.
- B. High Performance Flexible Growth Medium:
 - 1. High Performance Flexible Growth Medium (HP-FGM) shall be hydraulically-applied, 100% biodegradable, manufactured in the United States and is composed of 100% recycled thermally refined (within a pressure vessel) wood fibers, crimped interlocking man-made biodegradable fibers, micro-pore granules, naturally derived crosslinked biopolymers and water absorbents. HP-FGM shall be phytosanitized, free from plastic netting, requires no curing period and upon application forms an intimate bond with the soil surface to create a

continuous, porous, absorbent and flexible erosion resistant blanket that allows rapid germination and accelerated plant growth.

- a. Preferred Manufacturer/Product:
Flexterra HP-FGM, by Profile Products, or approved equal.

2.3 MYCORRHIZAL INOCULUM

- A. Mycorrhizal Inoculum shall be AM 120 Standard, or approved equal:
 1. 100% Glomus intraradices (UT isolate)(120 propagules per c.c. or 100 propagules per gr.)

2.4 SCHEDULE OF PRAIRIE GRASSES AND WILDFLOWER SEED MIXTURES:

- A. Per Drawings.

PART 3 - EXECUTION

3.1 EXAMINATION

- A. Examine areas to be planted for compliance with requirements and other conditions affecting performance.
- B. Proceed with installation only after unsatisfactory conditions have been corrected.
- C. If contamination by foreign or deleterious material or liquid is present in soil within a planting area, remove the soil and contamination as directed by Architect and replace with new planting soil.

3.2 PREPARATION

- A. Decompact any construction traffic, or staging areas prior to topsoiling by tilling to 12 inches.
- B. Layout of seeding areas is indicated on the Drawings. Verify locations with Landscape Architect, Ecologist or Project Supervisor prior to starting seeding operations.
- C. Base Preparation/Grading:
 1. Protect existing surface and underground features and improvements from damage.
 2. Restore seed areas to specified condition if damaged after finish grading. No seeding shall occur until the Architect has accepted the base preparation.
 3. Protect grade stakes set by others until directed to remove them.
- D. See Division 32 Section "Planting Preparation" for soil preparation, planting soil stabilization, and landscape grading.
- E. Moisten prepared area before planting if soil is dry. Water thoroughly and allow surface to dry before planting. Do not create muddy soil.

3.3 FERTILIZING

- A. Apply fertilizer as specified in Section 32 91 00 Planting Preparation. Biosol is the preferred fertilizer for native seeded areas and it should be applied prior to hydromulching. All seeding types, except Type 2 Upland Prairie Seed Mixture, shall have Biosol applied at a rate of 1200 pounds/acre. Type 2 Upland Prairie Seed Mixture shall have Biosol applied at a rate of 800 pounds/acre.

3.4 SEEDING

- A. Drill seeded areas shall use a Truax or other native grass drill with separate seed boxes for different seed sizes, agitators in the boxes, Coulter wheels, depth bands, seed rows no wider than 7 inches. Seed shall be drilled in two applications at 90 degrees to each other, 50 percent plus or minus of seed applied in each pass using a Brillion seed application or approved equal.
1. Seed shall be drilled parallel to the slope in the final pass.
 2. Set depth bands to 1/4 to 1/3 inch depth. Seed shall be drilled in such a manner that after surface is raked and rolled, seed shall have about 1/4 of cover.
 3. Seed shall not be drilled during windy weather or when ground is frozen or snow covered or untillable.
 4. Seeding schedule to be coordinated with Owner, Contractor and Architect to ensure optimal success.
 5. Rake seeded areas to ensure good soil contact, raking always in direction perpendicular to slope of the land.
 6. Application Rate: shall be as indicated on the seed mix tables.
- B. Areas inaccessible to drilling equipment may be seeded by broadcasting using a mechanical spreader or by hand.
1. Rake to cover seed with 1/4 to 1/3 inch soil.
 2. Application Rate: shall be two times the drill seed rate.

3.5 MULCHING

- A. Slopes < 5:1:
1. Protect seeded areas by spreading straw mulch. Spread uniformly at a minimum rate of 2 tons/acre (42 kg/92.9 sq. m) to form a continuous blanket 1-1/2 inches (38 mm) in loose thickness over seeded areas. Spread by hand, blower, or other suitable equipment.
 - a. Anchor straw mulch by crimping into soil with suitable mechanical equipment.
- B. Slopes \geq 5:1 :
1. High Performance Flexible Growth Medium (HP-FGM) to be applied to seeded areas where slopes are greater than or equal to (\geq) 5:1. Apply HP-FGM at the following application rates:
 - a. \leq 5:1 slope: 2,500 pounds per acre.
 - b. > 5:1 slope and \leq 3:1 slope: 3,000 pounds per acre.
 - c. \geq 3:1 slope and \leq 2:1 slope: 3,500 pounds per acre.
- C. Hydromulching shall not be done during or after rainstorms, when water is standing or when runoff is occurring or when below freezing, or in the presence of snow.

3.6 MYCORRHIZAL INOCULUM

- A. Apply Mycorrhizal Inoculum, per manufacturer's recommendations, at a rate of 60lbs. per acre (67.5 kg/ha)/1.4 lbs. per 1,000 ft²(0.7 kg / 100 m²), by the following methods (as applicable):
1. Seed Drilling: Incorporate into the soil at a depth ranger at or below the seed.

2. Broadcast and Till: Evenly distribute across seedbed after seeding. Cover the exposed seed and inoculum by harrowing, chain dragging or applying an organic topdressing. Do not leave inoculum exposed to sunlight for more than four hours.
3. Nursery Medium: Evenly blend at 5 lbs per yd³ (3 kg. Per m³). 1 lb. (454 grams) contains approximately 60,000 living propagules. Rate provides 300,000 living propagules per yd³ (396,000 living propagules per m³) or 6.5 living propagules per in³.

3.7 MAINTENANCE AND ACCEPTANCE

- A. Maintenance period shall begin immediately after each area is seeded, and continue until final acceptance of landscaping work. Upon acceptance of landscaping work, the maintenance period shall extend to 30 days from the delivery date of the project.
- B. During this time water, mow, spot spray with approved herbicides (after seedlings are no longer sensitive to them), hand weed, as necessary to insure that seeded areas are in a vigorous growing condition until final acceptance.
- C. Bare areas over 1 square feet in size shall be reseeded and mulched if they fail to establish at least 6 desirable seedlings/sq. ft. (non-irrigated areas) or 12 desirable seedlings/sq. ft. (irrigated areas). The Landscape Architect or Ecologist will direct Contractor on what areas need to be reseeded during establishment inspection approximately 30 days after seeding (June-September).
- D. Seeded areas shall be mowed for annual weed control, if so directed by the Landscape Architect, at a height of not less than 3 inch and otherwise maintained until there is an acceptable uniform plant growth. A small tractor or mower shall be used to reduce possible crushing of seedling grasses and rutting of soil.
- E. Areas that are irrigated and are not producing a uniform plant growth within 30 days following first seeding, as determined by establishment inspection, shall be reseeded.
- F. Acceptable uniform plant growth shall be defined as the following, whichever is the more strict:
 1. 70% of predisturbance vegetative cover.
 2. At least 6 desirable seedlings/sq. ft. (non-irrigated areas) or 12 desirable seedlings/sq. ft. (in irrigated areas). Scattered bare spots, no greater than 1 sq. ft. and not exceeding 5 percent of seeded area may be acceptable, if approved by Landscape Architect or Ecologist.

3.8 CLEANING

- A. After completion, objects or debris which may interfere with maintenance operation shall be removed.
- B. Paved areas over which operations have been conducted shall be cleaned.
- C. Remove excess mulch from trees, shrubs and sod to prevent damage.

END OF SECTION

SECTION 32 93 00**PLANTS****PART 1 - GENERAL****1.1 RELATED DOCUMENTS**

- A. Drawings and general provisions of the Contract, including General and Supplementary Conditions and Division 01 Specification Sections, apply to this Section.

1.2 SUMMARY

- A. Section Includes:
1. Plants.
 2. Mulching.
 3. Tree stabilization.
- B. Related Sections:
1. Division 31 Section "Site Clearing" for protection of existing trees and plantings, topsoil stripping and stockpiling, and site clearing.
 2. Division 31 Section "Earth Moving" for excavation, filling, and rough grading and for subsurface aggregate drainage and drainage backfill materials.
 3. Section 32 01 90 "Operation And Maintenance Of Planting" for maintenance instructions and pesticide application.
 4. Section 32 91 00 "Planting Preparation" for soil preparation, planting soil stabilization, and landscape grading.
 5. Section 32 92 00 "Prairie Grasses and Wildflowers" for prairie planting and erosion-control materials.
 6. Division 33 Section "Subdrainage" for below-grade drainage of landscaped areas, paved areas, and wall perimeters.

1.3 DEFINITIONS

- A. Backfill: The earth used to replace or the act of replacing earth in an excavation.
- B. Balled and Burlapped Stock: Plants dug with firm, natural balls of earth in which they were grown, with ball size not less than diameter and depth recommended by ANSI Z60.1 for type and size of plant required; wrapped with burlap, tied, rigidly supported, and drum laced with twine with the root flare visible at the surface of the ball as recommended by ANSI Z60.1.
- C. Bare-Root Stock: Plants with a well-branched, fibrous-root system developed by transplanting or root pruning, with soil or growing medium removed, and with not less than minimum root spread according to ANSI Z60.1 for type and size of plant required.
- D. Container-Grown Stock: Healthy, vigorous, well-rooted plants grown in a container, with a well-established root system reaching sides of container and maintaining a firm ball when removed from container. Container shall be rigid enough to hold ball shape and protect root mass during shipping and be sized according to ANSI Z60.1 for type and size of plant required.
- E. Duff Layer: The surface layer of native topsoil that is composed of mostly decayed leaves, twigs, and detritus.

- F. Finish Grade: Elevation of finished surface of planting soil.
- G. Planting Area: Areas to be planted.
- H. Plant; Plants; Plant Material: These terms refer to vegetation in general, including trees, shrubs, vines, ground covers, ornamental grasses, bulbs, corms, tubers, or herbaceous vegetation.
- I. Root Flare: Also called "trunk flare." The area at the base of the plant's stem or trunk where the stem or trunk broadens to form roots; the area of transition between the root system and the stem or trunk.
- J. Stem Girdling Roots: Roots that encircle the stems (trunks) of trees below the soil surface.
- K. Subgrade: Surface or elevation of subsoil remaining after excavation is complete, or the top surface of a fill or backfill before planting soil is placed.
- L. Subsoil: All soil beneath the topsoil layer of the soil profile, and typified by the lack of organic matter and soil organisms.
- M. Surface Soil: Soil that is present at the top layer of the existing soil profile at the Project site. In undisturbed areas, the surface soil is typically topsoil; but in disturbed areas such as urban environments, the surface soil can be subsoil.

1.4 SUBMITTALS

- A. Product Data: For each type of product indicated, including soils.
 - 1. Plant Materials: Include quantities, sizes, quality, and sources for plant materials.
 - 2. Plant Photographs: Include color photographs in digital format of each required species and size of plant material as it will be furnished to the Project. Take photographs from an angle depicting true size and condition of the typical plant to be furnished. Include a scale rod or other measuring device in each photograph. For species where more than 20 plants are required, include a minimum of three photographs showing the average plant, the best quality plant, and the worst quality plant to be furnished. Identify each photograph with the full scientific name of the plant, plant size, and name of the growing nursery.
- B. LEED Submittals:
 - 1. Product Data for Credits MR 5.1 and 5.2 - Local/Regional Materials:
 - a. Indicate location of manufacturing facility, including name, address, and distance between manufacturing facility and the project site. Provide manufacturer's documentation indicating location where the base materials were extracted, mined, quarried, harvested, etc. and the distance between this location and the project site. Also include material costs, excluding cost of installation.
- C. Samples for Verification: For each of the following:
 - 1. Organic Compost Mulch: 1-quart volume sample of each organic mulch required; in sealed plastic bags labeled with composition of materials by percentage of weight and source of mulch. Each Sample shall be typical of the lot of material to be furnished; provide an accurate representation of color, texture, and organic makeup.

- D. Qualification Data: For qualified landscape Installer.
- E. Product Certificates: For each type of manufactured product, from manufacturer, and complying with the following:
 - 1. Manufacturer's certified analysis of standard products.
 - 2. Analysis of other materials by a recognized laboratory made according to methods established by the Association of Official Analytical Chemists, where applicable.
- F. Warranty: Sample of special warranty.

1.5 QUALITY ASSURANCE

- A. Installer Qualifications: A qualified landscape Installer whose work has resulted in successful establishment of plants.
 - 1. Professional Membership: Installer shall be a member in good standing of either the Professional Landcare Network or the American Nursery and Landscape Association.
 - 2. Installer's Field Supervision: Require Installer to maintain an experienced full-time supervisor on Project site when work is in progress.
- B. Provide quality, size, genus, species, and variety of plants indicated, complying with applicable requirements in ANSI Z60.1.
- C. Measurements: Measure according to ANSI Z60.1. Do not prune to obtain required sizes.
 - 1. Trees and Shrubs: Measure with branches and trunks or canes in their normal position. Take height measurements from or near the top of the root flare for field-grown stock and container grown stock. Measure main body of tree or shrub for height and spread; do not measure branches or roots tip to tip. Take caliper measurements 6 inches above the root flare for trees up to 4-inch caliper size, and 12 inches above the root flare for larger sizes.
 - 2. Other Plants: Measure with stems, petioles, and foliage in their normal position.
 - 3. Plant Material Observation: Architect may observe trees and shrubs either at place of growth or at site before planting for compliance with requirements for genus, species, variety, size, and quality. Landscape Architect retains right to observe trees and shrubs further for size and condition of balls and root systems, insects, injuries, and latent defects and to reject unsatisfactory or defective material at any time during progress of work. Remove rejected trees or shrubs immediately from Project site.
 - a. Notify Landscape Architect of sources of planting materials seven days in advance of delivery to site. Arrange visit with Landscape Architect to nursery or source of plant material to inspect plant material for approval prior to delivery to site.
 - b. Arrange visit with Landscape Architect to site to inspect plant material for approval prior to planting. Advise Landscape Architect five to seven days advance notice for site visit
- D. Preinstallation Conference: Conduct conference at Project site.

1.6 DELIVERY, STORAGE, AND HANDLING

- A. Packaged Materials: Deliver packaged materials in original, unopened containers

showing weight, certified analysis, name and address of manufacturer, and indication of conformance with state and federal laws if applicable.

- B. Bulk Materials:
1. Do not dump or store bulk materials near structures, utilities, walkways and pavements, or on existing turf areas or plants.
 2. Provide erosion-control measures to prevent erosion or displacement of bulk materials, discharge of soil-bearing water runoff, and airborne dust reaching adjacent properties, water conveyance systems, or walkways.
 3. Accompany each delivery of bulk fertilizers and soil amendments with appropriate certificates.
- C. Deliver bare-root stock plants freshly dug. Immediately after digging up bare-root stock, pack root system in wet straw, hay, or other suitable material to keep root system moist until planting.
- D. Do not prune trees and shrubs before delivery. Protect bark, branches, and root systems from sun scald, drying, wind burn, sweating, whipping, and other handling and tying damage. Do not bend or bind-tie trees or shrubs in such a manner as to destroy their natural shape. Provide protective covering of plants during shipping and delivery. Do not drop plants during delivery and handling.
- E. Handle planting stock by root ball. Protect stems and trunks from damage due to transport and lifting.
1. Do not drop plants. Do not lift plants by the trunk, stems, or foliage. Handle plants by the ball or the container.
 2. Reject balled plants if the ball is broken or the trunk is loose in the ball.
 3. Protect plants at all times from drying out or injury.
 4. Minor broken and damaged roots shall be pruned before planting. Major damage shall be cause for rejection as determined by the Project Manager.
- F. Store bulbs, corms, and tubers in a dry place at 60 to 65 deg F until planting.
- G. Deliver plants after preparations for planting have been completed, and install immediately. If planting is delayed more than six hours after delivery, set plants and trees in their appropriate aspect (sun, filtered sun, or shade), protect from weather and mechanical damage, and keep roots moist.
1. Heel-in bare-root stock. Soak roots that are in dry condition in water for two hours. Reject dried-out plants.
 2. Set balled stock on ground and cover ball with soil, peat moss, sawdust, or other acceptable material.
 3. Do not remove container-grown stock from containers before time of planting.
 4. Water root systems of plants stored on-site deeply and thoroughly with a fine-mist spray. Water as often as necessary to maintain root systems in a moist, but not overly-wet condition.

1.7 PROJECT CONDITIONS

- A. Field Measurements: Verify actual grade elevations, service and utility locations, irrigation system components, and dimensions of plantings and construction contiguous with new plantings by field measurements before proceeding with planting work.

- B. Planting Restrictions: Plant during one of the following periods. Coordinate planting periods with maintenance periods to provide required maintenance from date of Substantial Completion.
 - 1. Spring Planting: April 1 – June 30. Adjust for weather limitations and freezing conditions.
 - 2. Fall Planting: September 1 – November 30. Adjust for weather limitations and freezing conditions.
- C. Weather Limitations: Proceed with planting only when existing and forecasted weather conditions permit planting to be performed when beneficial and optimum results may be obtained. Apply products during favorable weather conditions according to manufacturer's written instructions and warranty requirements.
- D. Coordination with Prairie Areas (Meadows): Plant trees, shrubs, and other plants after finish grades are established and before planting prairie areas unless otherwise indicated.
 - 1. When planting trees, shrubs, and other plants after planting turf areas, protect prairie areas, and promptly repair damage caused by planting operations.

1.8 WARRANTY

- A. Special Warranty: Installer agrees to repair or replace plantings and accessories that fail in materials, workmanship, or growth within specified warranty period.
 - 1. Failures include, but are not limited to, the following:
 - a. Death and unsatisfactory growth, except for defects resulting from abuse, lack of adequate maintenance, or neglect by Owner, or incidents that are beyond Contractor's control.
 - b. Structural failures including plantings falling or blowing over.
 - c. Faulty performance of tree stabilization.
 - 2. Warranty Periods from Date of Substantial Completion:
 - a. Trees, Shrubs, Vines, and Ornamental Grasses: 12 months.
 - b. Prairie Areas, Ground Covers, Perennials, and Other Plants: 12 months.
 - 3. Include the following remedial actions as a minimum:
 - a. Immediately remove dead plants and replace unless required to plant in the succeeding planting season.
 - b. Replace plants that are more than 25 percent dead or in an unhealthy condition at end of warranty period.
 - c. A limit of one replacement of each plant will be required except for losses or replacements due to failure to comply with requirements.
 - d. Provide extended warranty for period equal to original warranty period, for replaced plant material.

PART 2 - PRODUCTS

2.1 LOCAL / REGIONAL MATERIALS

- A. Preference shall be given to suppliers whose facilities are within a 500 mile radius of the project site.
- B. Preference shall be given to plant suppliers who provide:
 - 1. Native plant species that are locally grown

2. Naturalized plant species that are regionally grown
 3. Non-native adapted plant species that are acclimated at the nursery for an appropriate period of time prior to planting.
- C. Preference shall be given to materials that are harvested, extracted, mined, quarried, etc. within a 500 mile radius of the project site.

2.2 PLANT MATERIAL

- A. General: Furnish nursery-grown plants true to genus, species, variety, cultivar, stem form, shearing, and other features indicated in Plant Schedule or Plant Legend shown on Drawings and complying with ANSI Z60.1; and with healthy root systems developed by transplanting or root pruning. Provide well-shaped, fully branched, healthy, vigorous stock, densely foliated when in leaf and free of disease, pests, eggs, larvae, and defects such as knots, sun scald, injuries, abrasions, and disfigurement.
1. Trees with damaged, crooked, or multiple leaders; tight vertical branches where bark is squeezed between two branches or between branch and trunk ("included bark"); crossing trunks; cut-off limbs more than 3/4 inch in diameter; or with stem girdling roots will be rejected.
 2. Collected Stock: Do not use plants harvested from the wild, from native stands, from an established landscape planting, or not grown in a nursery unless otherwise indicated.
- B. Grade: Provide trees and shrubs of sizes and grades complying with ANSI Z60.1 for type of trees and shrubs required. Trees and shrubs of a larger size may be used if acceptable to Landscape Architect, with a proportionate increase in size of roots or balls.
1. Contractor is to install all plants shown on the Drawings as specified and in quantities listed on the "Plant Schedule". If any discrepancies arise between the plant schedule and the Drawings, the Drawings shall take precedence.
 2. Plants larger than specified in the plant list may be used if approved by the Project Manager but use of such plants shall not increase the contract price.
 3. Minimum ball size for trees: (These sizes are typical, check with American Standard Nursery Stock for exact specifications or each species).

Tree Size	Ball Depth Minimum	Ball Diameter Minimum
1-1/2" caliper	16"	20"
2" caliper	18"	22"
2-1/2" caliper	20"	24"
3" caliper	22"	28"

- C. Labeling: Label each plant of each variety, size, and caliper with a securely attached, waterproof tag bearing legible designation of common name and full scientific name, including genus and species. Include nomenclature for hybrid, variety, or cultivar, if applicable for the plant as shown on Drawings.
- D. If formal arrangements or consecutive order of plants is shown on Drawings, select stock for uniform height and spread, and number the labels to assure symmetry in planting.
- E. Balled & burlapped plant material shall be dug with firm natural balls or earth of sufficient diameter and depth to include most of the fibrous roots. Tree ball shapes shall be truncated cones. Balled & burlapped plants may be rejected for failure to meet good digging practices. No balled plant shall be placed if the ball is cracked or broken either before or during the planting process. Any plant that is loose in the ball shall be removed from the site & replaced.

- F. Container Grown Stock Requirements:
1. Container grown stock shall have a root system sufficiently developed to hold the container soil together firm & whole. No plants shall be loose in the containers. No plant shall be container-bound.
 2. Use rigid containers that will hold ball shape and protect root mass during shipping of not less than the minimum sizes recommended by ANSI Z60.1.
 3. Where formal arrangements or consecutive order of trees are shown, select stock for uniform height and spread, and label with number to assure symmetry in planting.
- G. Substitutions will not be permitted unless upon evidence that a plant is not obtainable and upon authorization from the Project Manager. The nearest obtainable size and variety of plant material having the same essential characteristics shall be used as a substitute. No adjustments of contract price shall be made by the Contractor.

2.3 SHADE AND FLOWERING TREES

- A. Shade Trees: Single-stem trees with straight trunk, well-balanced crown, and intact leader, of height and caliper indicated, complying with ANSI Z60.1 for type of trees required.
1. Provide balled and burlapped trees.
 2. Branching Height: One-third to one-half of tree height.
 3. Size: Refer to drawings.
 4. Quantity: Refer to drawings.
- B. Small Trees: Branched or pruned naturally according to species and type, with relationship of caliper, height, and branching according to ANSI Z60.1; stem form as follows:
1. Stem Form: Single stem.
 2. Provide balled and burlapped trees.
 3. Size: Refer to drawings.
 4. Quantity: Refer to drawings.
- C. Multistem Trees: Branched or pruned naturally according to species and type, with relationship of caliper, height, and branching according to ANSI Z60.1; stem form as follows:
1. Stem Form: Clump.
 2. Provide balled and burlapped trees.
 3. Size: Refer to drawings.
 4. Quantity: Refer to drawings.

2.4 DECIDUOUS SHRUBS

- A. Form and Size: Deciduous shrubs with not less than the minimum number of canes required by and measured according to ANSI Z60.1 for type, shape, and height of shrub.
1. Provide container-grown shrubs.
 2. Size: Refer to drawings.
 3. Quantity: Refer to drawings.

2.5 BROADLEAF EVERGREENS

- A. Form and Size: Normal-quality, well-balanced, broadleaf evergreens, of type, height, spread, and shape required, complying with ANSI Z60.1.

1. Provide container-grown trees.
2. Size: Refer to drawings.
3. Quantity: Refer to drawings.

2.6 TREE STABILIZATION MATERIALS

A. Root-Ball Stabilization Materials:

1. Proprietary Root-Ball Stabilization Devices: Proprietary at- or below-grade stabilization systems to secure each new planting by root ball; sized per manufacturer's written recommendations unless otherwise indicated.
 - a. Product: Subject to compliance with requirements, provide Platypus Anchors Inc. (USA Office 2008 Garner Station Boulevard, Raleigh, NC 27603, USA; 866-752-8478); Platypus Rootball Fixing System with Plati-mat.

B. Stakes and Guys

1. Upright and Guy Stakes: Rough-sawn, sound, new hardwood, redwood, or current acceptable pressure-preservative-treated softwood, free of knots, holes, cross grain, and other defects, 2 by 2 inches (50 by 50 mm) by length indicated, pointed at one end.
2. Guy and Tie Wire: ASTM A 641/A 641M, Class 1, galvanized-steel wire, 2-strand, twisted, 0.106 inch (2.7 mm) in diameter for large trees, 0.080-inch in diameter for small trees.
3. Guy Cable: 5-strand, 3/16-inch-diameter, galvanized-steel cable, with zinc-coated turnbuckles, a minimum of 3 inches long, with two 3/8-inch galvanized eyebolts.
4. Strap Chafing Guard: 12" – 18" Nylon woven straps with two non corrosive reinforced grommets.
5. Flags: Standard surveyor's plastic flagging tape, white, 6 inches long

2.7 MISCELLANEOUS PRODUCTS

- A. Trunk-Wrap Tape: Two layers of crinkled paper cemented together with bituminous material, 4-inch-wide minimum, with stretch factor of 33 percent applied late November through late April. Re-apply trunk wrap that has loosened or removed due to weather or other circumstances during this period. Remove in late April.
- B. Antidesiccant: Water-insoluble emulsion, permeable moisture retarder, film forming, for trees and shrubs. Deliver in original, sealed, and fully labeled containers and mix according to manufacturer's written instructions.

PART 3 - EXECUTION

3.1 EXAMINATION

- A. Examine areas to receive plants for compliance with requirements and conditions affecting installation and performance.
 1. Verify that no foreign or deleterious material or liquid such as paint, paint washout, concrete slurry, concrete layers or chunks, cement, plaster, oils, gasoline, diesel fuel, paint thinner, turpentine, tar, roofing compound, or acid has been deposited in soil within a planting area.
 2. Do not mix or place soils and soil amendments in frozen, wet, or muddy conditions.

3. Suspend soil spreading, grading, and tilling operations during periods of excessive soil moisture until the moisture content reaches acceptable levels to attain the required results.
 4. Uniformly moisten excessively dry soil that is not workable and which is too dusty.
- B. Proceed with installation only after unsatisfactory conditions have been corrected.
- C. If contamination by foreign or deleterious material or liquid is present in soil within a planting area, remove the soil and contamination as directed by Architect and replace with new planting soil.

3.2 PREPARATION

- A. Protect structures, utilities, sidewalks, pavements, and other facilities and turf areas and existing plants from damage caused by planting operations.
1. Protect grade stakes set by others until directed to remove them.
- B. See Division 32 Section "Planting Preparation" for soil preparation, planting soil stabilization, and landscape grading.
- C. Lay out individual tree and shrub locations and areas for multiple plantings as indicated on Drawings. Stake locations, outline areas, adjust locations when requested, and obtain Architect's acceptance of layout before excavating or planting. Make minor adjustments as required.
- D. Apply antidesiccant to trees and shrubs using power spray to provide an adequate film over trunks (before wrapping), branches, stems, twigs, and foliage to protect during digging, handling, and transportation.
1. If deciduous trees or shrubs are moved in full leaf, spray with antidesiccant at nursery before moving and again two weeks after planting.
- E. Wrap trees and shrubs with burlap fabric over trunks, branches, stems, twigs, and foliage to protect from wind and other damage during digging, handling, and transportation.

3.3 EXCAVATION FOR TREES AND SHRUBS

- A. Planting Pits and Trenches: Excavate circular planting pits with sides sloping inward at a 45-degree angle. Excavations with vertical sides are not acceptable. Trim perimeter of bottom leaving center area of bottom raised slightly to support root ball and assist in drainage away from center. Do not further disturb base. Ensure that root ball will sit on undisturbed base soil to prevent settling. Scarify sides of planting pit smeared or smoothed during excavation.
1. Excavate approximately three times as wide as ball diameter for balled and burlapped, balled and potted, or container-grown stock.
 2. Excavate at least 12 inches wider than root spread and deep enough to accommodate vertical roots for bare-root stock.
 3. Do not excavate deeper than depth of the root ball, measured from the root flare to the bottom of the root ball.
 4. If area under the plant was initially dug too deep, add soil to raise it to the correct level and thoroughly tamp the added soil to prevent settling.
 5. Maintain required angles of repose of adjacent materials as shown on the Drawings. Do not excavate subgrades of adjacent paving, structures, hardscapes, or other new or existing improvements.
 6. If drain tile is shown on Drawings or required under planting areas, excavate to

top of porous backfill over tile.

- B. Subsoil removed from excavations should be amended and used as planting soil mix for backfill. A minimum of 1/3 of the excavated subsoil should be discarded and replaced with amended topsoil. Excavated soil and amended topsoil should be thoroughly mixed prior to use as planting soil mix for backfill. Till mixture if clods larger than 2" are present.
- C. Obstructions: Notify Architect if unexpected rock or obstructions detrimental to trees or shrubs are encountered in excavations.
 - 1. Hardpan Layer: Drill 6-inch- diameter holes, 24 inches apart, into free-draining strata or to a depth of 10 feet, whichever is less, and backfill with free-draining material.
- D. Drainage: Notify Architect if subsoil conditions evidence unexpected water seepage or retention in tree or shrub planting pits.
- E. Fill excavations with water and allow to percolate away before positioning trees and shrubs.

3.4 TREE AND SHRUB PLANTING

- A. Before planting, verify that root flare is visible at top of root ball according to ANSI Z60.1. If root flare is not visible, remove soil in a level manner from the root ball to where the top-most root emerges from the trunk. After soil removal to expose the root flare, verify that root ball still meets size requirements.
- B. Remove stem girdling roots and kinked roots. Remove injured roots by cutting cleanly; do not break.
- C. Set balled and burlapped stock plumb and in center of pit or trench with top of root ball 1 inch above adjacent finish grades.
 - 1. Remove burlap and wire baskets from tops of root balls and partially from sides, but do not remove from under root balls. Remove pallets, if any, before setting. Do not use planting stock if root ball is cracked or broken before or during planting operation.
 - 2. Place planting soil mix around root ball in layers, tamping to settle mix and eliminate voids and air pockets. When pit is approximately one-half backfilled, water thoroughly before placing remainder of backfill. Repeat watering until no more water is absorbed. Water again after placing and tamping final layer of planting soil mixes.
- D. Set container-grown stock plumb and in center of pit or trench with top of root ball 1 inch above adjacent finish grades.
 - 1. Carefully remove root ball from container without damaging root ball or plant.
 - 2. Place planting soil mix around root ball in layers, tamping to settle mix and eliminate voids and air pockets. When pit is approximately one-half backfilled, water thoroughly before placing remainder of backfill. Repeat watering until no more water is absorbed. Water again after placing and tamping final layer of planting soil mixes.
- E. When planting on slopes, set the plant so the root flare on the uphill side is flush with the surrounding soil on the slope; the edge of the root ball on the downhill side will be above the surrounding soil. Apply enough soil to cover the downhill side of the root ball.
- F. Organic Mulching: Apply 3-inch, average thickness of organic mulch extending 12 inches

beyond edge of planting pit or trench. Do not place mulch within 3 inches of trunks or stems.

- G. Wrap trees of 2-inch caliper and larger with trunk-wrap tape. Start at base of trunk and spiral cover trunk to height of first branches. Overlap wrap, exposing half the width, and securely attach without causing girdling. Inspect tree trunks for injury, improper pruning, and insect infestation; take corrective measures required before wrapping. Remove tree wrap when seasonal conditions permit.

3.5 MECHANIZED TREE SPADE PLANTING

- A. Coniferous Trees shall be planted with an approved mechanized tree spade at the designated locations. Do not use tree spade to move trees larger than the maximum size allowed for a similar field-grown, balled-and-burlapped root-ball diameter according to ANSI Z60.1, or larger than the manufacturer's maximum size recommendation for the tree spade being used, whichever is smaller.
- B. When extracting the tree, center the trunk within the tree spade and move tree with a solid ball of earth.
- C. Cut exposed roots cleanly during transplanting operations.
- D. Use the same tree spade to excavate the planting hole as was used to extract and transport the tree.
- E. Plant trees as shown on Drawings, following procedures in "Tree, Shrub, and Vine Planting" Article.
- F. Where possible, orient the tree in the same direction as in its original location.

3.6 TREE AND SHRUB PRUNING

- A. Remove only dead, dying, or broken branches. Do not prune for shape.
- B. Prune, thin, and shape trees and shrubs as directed by Architect.
- C. Prune, thin, and shape trees and shrubs according to standard professional horticultural and arboricultural practices. Unless otherwise indicated by Architect, do not cut tree leaders; remove only injured, dying, or dead branches from trees and shrubs; and prune to retain natural character.
- D. Do not apply pruning paint to wounds.

3.7 TREE STABILIZATION

- A. Root-Ball Stabilization: Install at- or below-grade stabilization system to secure each new planting by the root ball unless otherwise indicated.
 - 1. Proprietary Root-Ball Stabilization Device: Install root-ball stabilization system sized and positioned as recommended by manufacturer unless otherwise indicated and according to manufacturer's written instructions.
- B. Upright Staking and Tying: Stake trees of 2- through 5-inch caliper. Stake trees of less than 2-inch caliper only as required to prevent wind tip-out. Use a minimum of 2 stakes of length required to penetrate at least 18 inches below bottom of backfilled excavation and to extend at least 72 inches above grade. Set vertical stakes and space to avoid penetrating root balls or root masses. Support trees with two strands of tie wire encased in hose sections at contact points with tree trunk. Allow enough slack to avoid rigid

restraint of tree. Use the number of stakes as follows:

1. Use 2 stakes for trees up to 12 feet high and 2-1/2 inches or less in caliper; 3 stakes for trees less than 14 feet high and up to 4 inches in caliper. Space stakes equally around trees.
2. Remove all tree stakes and guy wire at the end of the warranty period.

3.8 TREE PROTECTION DEVICES

- A. Install deer protection cages to the height of the lowest branches. Cage should be constructed so that it can be temporarily removed and reinstalled when necessary.

3.9 CLEANUP AND PROTECTION

- A. During planting, keep adjacent paving and construction clean and work area in an orderly condition.
- B. Protect plants from damage due to landscape operations and operations of other contractors and trades. Maintain protection during installation and maintenance periods. Treat, repair, or replace damaged plantings.
- C. After installation and before Substantial Completion, remove nursery tags, nursery stakes, tie tape, labels, wire, burlap, and other debris from plant material, planting areas, and Project site.

3.10 DISPOSAL

- A. Remove surplus soil and waste material including excess subsoil, unsuitable soil, trash, and debris and legally dispose of them off Owner's property.

END OF SECTION

SECTION 32 94 13**ALUMINUM LANDSCAPE EDGING****PART 1 - GENERAL****1.1 RELATED DOCUMENTS**

- A. Drawings and general provisions of the Contract, including General and Supplementary Conditions and Division 01 Specification Sections, apply to this Section.

1.2 SUMMARY

- A. Section Includes aluminum landscape edgings as mulch edge restraints.
- B. Related Sections:
 - 1. Division 31 Section "Earth Moving" for excavation, filling, and rough grading and for subsurface aggregate drainage and drainage backfill materials.
 - 2. Division 32 Section "Prairie Grasses and Wildflowers" for meadow planting, hydromulching, and erosion-control materials.

1.3 DEFINITIONS

- A. Finish Grade: Elevation of finished surface of planting soil.
- B. Planting Area: Areas to be planted.

1.4 SUBMITTALS

- A. Product Data: For each type of product indicated.
- B. LEED Submittals:
 - 1. Product Data for Credit MR 4.1 and Credit MR 4.2 – Recycled Content: For products having recycled content, documentation indicating percentages by weight of postconsumer and preconsumer recycled content.
 - a. Include statement indicating costs for each product having recycled content.
- C. Samples for Verification: For each of the following:
 - 1. Edging Materials and Accessories: Manufacturer's standard size, to verify color selected.
- D. Qualification Data: For qualified landscape Installer. Include list of similar projects completed by Installer demonstrating Installer's capabilities and experience. Include project names, addresses, and year completed, and include names and addresses of owners' contact persons.
- E. Warranty: Sample of special warranty.

1.5 QUALITY ASSURANCE

- A. Installer Qualifications: A qualified landscape Installer whose work has resulted in successful installation of edgings similar to those indicated for the Project.

- B. Preinstallation Conference: Conduct conference at Project site.

1.6 DELIVERY, STORAGE, AND HANDLING

- A. Packaged Materials: Deliver packaged materials in original, unopened packages, name and address of manufacturer.

1.7 PROJECT CONDITIONS

- A. Field Measurements: Verify actual grade elevations, service and utility locations, irrigation system components, and dimensions of plantings and construction contiguous with new plantings by field measurements before proceeding with edging work.
- B. Coordination with Turf Areas (Lawns): Install edgings after finish grades are established and before planting turf areas unless otherwise indicated.
 - 1. When planting trees, shrubs, other plants, and mulch after installing edgings, protect edgings, and promptly repair damage caused by planting operations.

1.8 WARRANTY

- A. Special Warranty: Installer agrees to repair or replace edgings that fail in materials or workmanship within specified warranty period.
 - 1. Failures include, but are not limited to, the following:
 - a. Faulty performance of edgings.
 - b. Deterioration of metals and metal finishes beyond normal weathering.
 - 2. Warranty Periods from Date of Substantial Completion: 12 months:

PART 2 - PRODUCTS

2.1 LANDSCAPE EDGINGS

- A. Recycled Content of Aluminum Products: Provide products with an average recycled content of aluminum so postconsumer recycled content plus one-half of preconsumer recycled content is not less than 100 percent.
- B. Aluminum Edging: Standard-profile extruded-aluminum edging, ASTM B 221, Alloy 6063-T6, fabricated in standard lengths with interlocking sections with loops stamped from face of sections to receive stakes. Edging to have roll-top or rounded-mill top to provide "non-sharp" exposed edge.
 - 1. Basis-of-Design Product: Subject to compliance with requirements, provide Permaloc Corporation; CleanLine XL or comparable product by one of the following:
 - a. Curv-Rite, Inc.
 - b. Russell, J. D. Company (The).
 - c. Sure-Loc Edging Corporation.
 - 2. Edging Size: 3/16 inch wide by nominal 6 inches deep.
 - 3. Stakes: Aluminum, ASTM B 221, Alloy 6061-T6, approximately 1-1/2 inches wide by minimum 12 inches long.
 - 4. Finish: Mill Finish (Silver).

PART 3 - EXECUTION**3.1 EXAMINATION**

- A. Examine areas to receive edging for compliance with requirements and conditions affecting installation and performance.
- B. Proceed with installation only after unsatisfactory conditions have been corrected.

3.2 PREPARATION

- A. Protect structures, utilities, sidewalks, pavements, and other facilities and turf areas and existing plants from damage caused by edging operations.

3.3 EDGING INSTALLATION

- A. Aluminum Edging: Install aluminum edging where indicated according to manufacturer's written instructions. Anchor with aluminum stakes spaced as recommended by manufacturer but not more than 36 inches apart, driven below top elevation of edging.

3.4 CLEANUP AND PROTECTION

- A. During edging operations, keep adjacent paving and construction clean and work area in an orderly condition.
- B. Protect edging from damage due to landscape operations and operations of other contractors and trades. Maintain protection during installation and maintenance periods. Repair or replace damaged edgings.
- C. Construction Waste Management And Disposal: Comply with Waste Management Plan required under Division 01 Section "Construction Waste Management And Disposal."

END OF SECTION

SECTION 33 01 00**OPERATION AND MAINTENANCE OF UTILITIES****PART I - GENERAL****1.1 SUMMARY**

- A. Description
 - 1. This work consists of maintenance and support of existing utilities during construction.
 - 2. All existing utilities shall be maintained and adequately supported until the proposed utility relocations are completed.

PART II – PRODUCTS - NOT USED**PART III - EXECUTION****3.1 GENERAL**

- A. The Contract Drawings show the utilities as they existed at the drawing date based on the best available information. All utility work for the Project that is performed in this Contract and by the utility owners is shown on these Contract Drawings.
- B. Existing facilities to be abandoned will be in service until the Contractor or utility owner has completed all connections to the new, relocated facility. Any utility that is in service, whether temporarily or permanently must be protected from damage. If a facility that is planned to be abandoned is damaged before it can be permanently removed from service, the Contractor shall make, or pay the utility owner to make, any repairs necessary to maintain the facility, just as if the facility is indicated to permanently remain in service.
- C. Contractor shall contact the utility owner to determine the current service status of any proposed facility or any existing facility to be abandoned.
- D. The Contractor shall arrange with the owners and operators of the respective utility systems to mark the location and, if necessary or prudent, to expose the existing utilities prior to construction of the facilities included in this Contract.
- E. Except for facilities to be relocated by the utility owners as part of this Project, and abandoned facilities indicated to be removed under this contract, the existing utilities within the work area, including but not limited to, power transmission and distribution systems, street lighting, fiber optic, telephone, and traffic signals, whether shown on the Plans or not, shall not be disturbed.
- F. If major utilities, such as sewer, water, gas, electric power and telephone, not shown on the Plans are encountered while excavating, the Contractor shall stop excavation, and immediately advise KCMO and the affected utility.
- G. Minor underground utility service lines, such as, sanitary sewer, gas and water services, side sewers, house or yard drains, electric lighting, or telephone services, shall be

maintained, relocated, rerouted, removed, and restored by the Contractor, during the execution of the work and for Contractor's convenience, with the least possible interference with such services.

3.2 NOTIFICATION OF UTILITIES AND AGENCIES

- A. The Contractor shall obtain prior approval from the cities for closing or partial closing of any street. Give at least two (2) working days advance notice of such closure to all agencies providing emergency services, including without limitation police, fire and ambulance services. Notification shall include but not be limited to, local jurisdiction, owner of the road, street, lane, etc. Notification shall include, but not be limited to the time of commencement and completion of work, names of streets or location of alleys to be closed, or partially closed, schedule of operations and routes of detours where applicable.
- B. It shall be prima facie notification if a valve box or utility meter is visible under ordinary conditions, marked by a stake or a reference stake or is pointed out to the Contractor or his representative. The staking and pointing out by an employee of the utility will have the same force as if it were done by the Engineer. Under these conditions, the Contractor will be fully responsible for damage to these items.
- C. When performing work in streets and easements, whether inside or outside the Project limits, notify all of the affected utilities and local agencies about the operations so as to properly coordinate and expedite the work in such a manner as to cause the least amount of conflict and interference between the work and operations of other agencies. Where service to customers of the utility may occur, notify affected customers at least 24 hours in advance. For interruptions which are not restored on the same day a plan shall be approved with the affected utilities and customers to either provide temporary service or interrupt the service.
- D. Existing utilities as shown on the utility drawings are compiled based on the utility as-built drawings and field locate survey available to the Utility Consultant. As such the existing utilities may not be located as indicated on the Plans. Existing utility locations shall be field verified by the Contractor. Request on-site utility locations from One-Call Location Service and utility owners by phone and confirm by letter 48 hours prior to working in areas requiring on-site location of utilities during progress of the work. Notify the utility owners and the locator service agencies by phone at least 48 hours prior to excavation.
- E. There will be other utilities and/or companies with private facilities located in the working area. Notify them, if possible.
- F. For construction work, KCMO shall relocate or cause to be relocated all privately or publicly owned utility conduits, lines, poles, mains, pipes and such other facilities within their jurisdiction and control where such relocation is necessary in order to conform said utility and other facilities to the Plans and ultimate requirements of the Project. Contractor shall call the above listed locator service and the utilities for location of their facilities prior to excavation.
- G. The right is reserved by the KCMO and the owners of utilities, or their authorized agents, to enter upon the right-of-way for the purpose of making changes as are necessary for the rearrangement of their facilities or for making necessary connections or repairs. The Contractor shall cooperate with forces engaged in this work and shall conduct his operations in such a manner to avoid any unnecessary delay or hindrance to the work being performed by other forces.

3.3 UTILITIES AND EXISTING IMPROVEMENTS

- A. Operation of water valves and hydrants by unauthorized personnel is strictly prohibited. Obtain hydrant permits and/or written permission from the governing agency and pay any required fees, prior to using water hydrant.
- B. Provide for the flow of sewers, drains, or water courses interrupted during the progress of the work, and restore such drains or water courses.
- C. Repair any and all damage to any utility as may be caused by the work. Maintain in place utilities, not shown on the drawings, to be relocated or altered by others. Maintain utilities which are relocated by others in their relocated positions in order to avoid interference with structures which cross the Contract work.
- D. Make exploratory excavations and borings ahead of work, as necessary, to determine the exact location of interfering utilities or underground structures. When this potholing is not feasible or practical or the need for such work was not foreseen, such utility owners or the owner shall have the right to enter upon the right-of-way and upon any structure therein for the purpose of making new installations, changes or repairs.

3.4 LIGHTING AND ELECTRICAL

- A. Contractor shall make all arrangements and pay all costs associated with the connection for any temporary lighting systems to KCPL (Kansas City Power & Light). Contractor shall obtain certification of the electrical lighting system from KCPL.

PART 4 – MEASUREMENT

Not Used

PART 5 - PAYMENT**PAYMENT**

No separate payment will be made for this item, unless specifically listed in the Bid Form-Unit Prices. All costs pertaining thereto shall be included in the Contract Unit Price(s) for other items.

END OF SECTION

SECTION 33 05 13.13**ADJUSTMENT OF INCIDENTAL STRUCTURES****PART I – GENERAL****1.1 SUMMARY**

A. Description:

1. The work in this Section covers the adjustment to required grade of the tops of existing structures, including but not limited to manholes, catch basins, sumps, inlets, valve boxes, meter boxes, and monument boxes, which may be disturbed during construction, and similar structures as shown on the Contract Drawings, as specified herein.

1.2 REFERENCES

<u>Sponsor</u>	<u>Number</u>	<u>Subject</u>
APWA	33 05 14	Utility Grade Adjustment
AASHTO	M 105	Grey Iron Casting

1.3 DEFINITIONS

- A. Manholes refer to structures designed to permit human entry and working space inside and to confine and control the flow of pipe-conveyed liquids. These structures are collectively referred to as manholes regardless of composition, design, type or depth.
- B. Box refers to valve boxes, meter boxes, monument boxes, fire hydrants, electrical pull box or other like structures not intended for human entry, which need to be adjusted due to a slope or grade change.
- C. Vault refers to structures intended for human entry containing electrical/ telephone facilities or other like structures, which need to be adjusted due to a grade change.

PART II – PRODUCTS**2.1 GENERAL**

Materials to be used in the adjustment of incidental structures shall be either materials salvaged from the existing installation and brought to a condition suitable for reuse, or new materials conforming to the requirements of other applicable Sections of these specifications.

PART III – EXECUTION**3.1 CONSTRUCTION**

- A. Adjustment of incidental structures shall include, but is not limited to, the adjustment to grade, relocation or removal and reinstallation of the following items as required:

1. Manhole Frames and Covers
 2. Inlet Frames and Grates
 3. Valve Box Frames, Covers and Traffic Rated Lids
 4. Meter Box Frames, Steel Covers
 5. Monument Box Frames and Covers
 6. Clean-Out Frames and Covers
 7. Vault Frames and Covers
 8. Water Line and Valves
 9. Fire Hydrants
 10. Private Utility Structures -such as gas, telephone, electrical, cable television, will be relocated by the owners of those facilities.
- B. Metal frames, covers, grates and fittings may be salvaged from structures to be adjusted, and if of suitable size and condition may be reused in the work. Any parts that are damaged or are unfit for reuse, shall be replaced with similar items comparable in all respects with those they are to replace and which are adequate for the intended purpose. Construction shall be in accordance with the provisions of the appropriate Sections of these Specifications.
- C. Base drains at inlets, gravel backfill at sumps and all stone bases disturbed by or fouled because of the adjusting work shall be repaired, replaced or restored to the condition at the time work commenced.
- D. Any aggregate bases, treated bases, or pavements disturbed by adjustment shall be repaired.
- E. The adjusted structures shall be adequate in all respects for the service rendered by them prior to being adjusted.
- F. Metal inlets, valve boxes, meter boxes, monument boxes and other like structures shall be raised or lowered to grade normally by resetting the entire structure on firm foundation or, in the case of raising the structure, to a point where it would enclose or protect its contents, by adding concrete extensions of like design below the original structure or by complete replacement of the structure with a new structure of adequate design. Construction shall be in accordance with the provisions of the appropriate Sections of these Specifications.
- G. Salvaged structures not reused or provided to the utility company or KCMO as required, shall become the property of the Contractor.
- H. Fire hydrant relocation shall be performed by the Contractor as required by the local jurisdiction. Where these requirements differ, those of the local jurisdiction shall govern.
- I. Raising Tops of Masonry Structures
1. After existing frames, covers and grates have been removed, the exposed top surface on which new mortar or concrete is to be placed shall be chipped away to a depth of at least 1/4 inch to expose firm concrete and the new surface shall be cleaned by brushing and shall be moistened with water at the time of placing new concrete thereon. New concrete shall then be placed to required grade and cured at least three days, after which the frame shall be seated in fresh mortar and brought to proper grade. Masonry of bricks or concrete blocks shall be raised with new bricks, blocks, mortar or combinations thereof or with Portland cement concrete, as conditions may require or permit. Concrete boxes may be lifted and placed on

precast concrete box extensions, or new brick or on cast-in-place concrete as may be suitable.

2. Mortar for building up existing masonry shall be placed to a depth of not more than two inches. Concrete shall be placed to a depth of not less than 3 ½ inches. To conform to these requirements, existing shells or walls of structures to be raised shall be cut down as necessary to provide space for the new construction. Rebar used in adjusting to grade shall conform to Section 03 20 00 and as shown on the contract drawings.

J. Lowering Tops of Masonry Structures:

1. Where the top of an existing masonry structure is to be lowered, the masonry portion of the structure shall be exposed to required depth, cut off or removed to an elevation below that established for the bottom of metal frame or cover which is to be reset on masonry and shall then be built up with mortar, concrete, brick or concrete blocks, to the required elevation and top design. When joining new material to old, minimum thicknesses of new mortar and concrete, limitations, curing and other details shall be as set forth above.

K. Adjust Structures to Grade:

1. Manholes, inlets, catch basins and similar structures shall be brought to the specified finished grade by methods of construction as required in the APWA Standard Specifications, Section 33 05 14.
2. Excavation necessary for bringing structures to grade shall center about the structure and be held to the minimum area as approved. At the completion of the structure adjustment, the void around the structure shall be backfilled with crushed aggregate and thoroughly compacted before paving. A concrete collar shall be placed around each lid and frame.
3. When adjustment of the top of existing manholes to a lower grade is approved by the Engineer, the following requirements will prevail:
 - a. The manhole cone shall not be reduced to a point such that the inside diameter will be less than 25-3/4 inches.
 - b. The manhole frame casting shall not rest on the manhole step.
 - c. A 12-inch wide, 3000 psi or greater concrete collar will be constructed around the frame casting from below the top of cone and flush with the top of manhole frame casting. Collar shall be a minimum of 8 inches thick and be circular in shape. For manholes located within concrete pavement areas, provide blockouts a minimum of 1 foot outside of edge of ring. Set lids below adjacent pavement section as follows: ¼ inch in concrete pavement; ½ inch in asphalt pavement and 1 inch in landscaped areas.
 - d. If the cone is cracked during construction, the manhole will be restacked with shorter manhole sections and a new cone shall be installed.

PART IV – MEASUREMENT

Not Used

PART V - PAYMENT

PAYMENT

No separate payment will be made for this item, unless specifically listed in the Bid Form-Unit Prices.
All costs pertaining thereto shall be included in the Contract Unit Price(s) for other items.

END OF SECTION

SECTION 33 05 16**UTILITY ADJUSTMENTS****PART 1 – GENERAL****A. ADJUSTMENTS**

1. Items under this heading include utility adjustments in conjunction with the scope of work for this project as follows: water mains, water service lines, sewer service lines, gas service lines and buried and or overhead cables, utility poles, traffic signals, signal poles and signal cables belonging to public utility companies or the private consumers, such as the KCMO Water Services Department, KCMO Streets & Traffic Division, Gas Service, electric, cable TV, telephone, and other non-franchise utility companies, damaged during the construction of this project shall be repaired as necessary in conformance with the regulations of the involved utilities.
2. The CONTRACTOR is responsible for the maintenance of service of all sewer mains and building sewers encountered during construction. The CONTRACTOR shall not be entitled to additional compensation for the repair of any such lines damaged during his operations.
3. Gas Valve Box Adjustments. Missouri Gas Energy (MGE) shall be notified of broken boxes or missing lids; MGE will repair and adjust the box or provide new lids to the CONTRACTOR. The CONTRACTOR shall notify the appropriate MGE District Supervisor at least two (2) days in advance, of any tear-out location which involves a gas valve cover within a concrete area. This notification shall include the specific location and the date of the scheduled tear-out. The CONTRACTOR shall not place new concrete or asphalt over a gas valve cover.

B. RELOCATIONS

1. Relocations or adjustments to facilities owned by Utility Companies will be accomplished by the utility company at no cost to the CONTRACTOR except Water, City owned Street Lights, and sanitary sewer lines which will be covered by a separate Contract.
2. The OWNER will endeavor to have all necessary adjustments or relocations of public or private utility facilities in direct conflict with the roadway work made as soon as practicable. Such adjustments or relocations will be made at no cost to the CONTRACTOR. The adjustments or relocations may be completed before the CONTRACTOR progresses to the points affected. Under some circumstances, however, such adjustments or relocations may have to be performed during the CONTRACTOR'S construction. The CONTRACTOR shall be responsible for coordinating his work with that of the utility owners or their CONTRACTORS so as to cause the least possible delay in the work.

3. Locations or grades of items shown on the Plans are considered approximate only. No guarantee is made as to the accuracy or completeness thereof.
4. It is anticipated that unknown items not shown on the plans will also be uncovered during excavations and shall require adjustment as specified herein. The CONTRACTOR shall carefully note the location of all such items exposed and report the information to the Utility. The CONTRACTOR'S employees shall not knowingly cover over permanently any such items unless specifically instructed to do so.

C. STREET RIGHT-OF-WAYS/EASEMENTS

Utilities located in street right-of-way; except water, sanitary sewer, and street lighting; requiring adjustment or relocation for this construction shall be adjusted or relocated by the respective owner at no cost to the CONTRACTOR. The CONTRACTOR shall be responsible for coordinating this activity with the responsible utility.

D. PROTECTION

Utilities located in utility easements or private easements shall be protected. The CONTRACTOR may incur some expense when enlisting the assistance of the utility owner for such protection.

PART 2 – PRODUCTS

None

PART 3 – EXECUTION

None

PART 4 – MEASUREMENT

PART 5 - PAYMENT

PAYMENT

No separate payment will be made for this item, unless specifically listed in the Bid Form-Unit Prices. All costs pertaining thereto shall be included in the Contract Unit Price(s) for other items.

END OF SECTION

SECTION 33 11 13.13**DUCTILE IRON PIPE FOR WATER MAINS**

PART 1 - GENERAL

1.01 SECTION DESCRIPTION

- A. This section provides for pipe, fittings, and appurtenances associated with the installation of ductile iron pipe water main. This section applies to all water main 16" diameter and smaller and to other sizes when ductile iron pipe is selected. Installation of all other ductile iron pipe shall be in accordance with Kansas City, Missouri Water Services Department, Rules and Regulations for Water Main Extensions and Relocations.

Pipe shall be tested in accordance with Section 33 13 00 – Watermain Testing, Disinfection and Dechlorination.

1.02 SECTION INCLUDES

- a. Pipe
- b. Fittings
- d. Appurtenances
- d. Shop Coating and Lining
- e. Bolts and Nuts
- f. Protective Coatings

1.03 REFERENCES

- A. The following standards are referenced directly in this section. The latest version of these standards shall be used.

ANSI/NSF61 – Drinking Water Treatment Chemicals

ASTM A53 – Standard Specification for Pipe, Steel, Black and Hot-Dipped, Zinc Coated, Welded and Seamless

ASTM A307 – Standard Specification for Carbon Steel Bolts and Studs, 60,000 psi Tensile

ASTM D4976 – Standard Specification for Polyethylene Tubing

AWWA C104/ANSI A21.4 – Cement-Mortar Lining for Cast-Iron Pipe and Fittings

AWWA C105/ANSI A21.5 – Polyethylene Encasement For Ductile Iron Piping.

AWWA C110/ANSI A21.10 – Gray-Iron and Ductile Iron Fittings

AWWA C111/ANSI A21.11 – Rubber-Gasket Joints for Cast Iron and Ductile Iron Pressure Pipe and Fittings

AWWA C115/ANSI A21.15 – Flanged Ductile-Iron Pipe with Ductile Iron or Gray Iron Thread

AWWA C150/ANSI A21.50 – Standard for the Thickness Design of Ductile Iron Pipe

AWWA C151/ANSI A21.51 – Ductile Iron Pipe Centrifugally Cast for Water

AWWA C153/ANSI A21.53 – Ductile-Iron Compact Fittings, 3 in. through 24 in

AWWA C203 – Standards for Steel Pipe

AWWA C550 – Protective Epoxy Interior Coatings for Valves and Hydrants

AWWA C600 – Installation of Ductile Iron Water Mains and their Appurtenances

PART 2 - PRODUCTS

2.01 WATER MAIN PIPE MATERIALS.

A. Pipe

1. Unless indicated otherwise, all 4" diameter through 12" diameter shall be thickness class 52. Pipe 16-inch diameter and larger shall be thickness Class 54 minimum. The pipe shall be designed in accordance with AWWA C150-ANSI A21.50 and manufactured per AWWA C151-ANSI A21.51 complete with all accessories.
2. All ductile iron pipe, and all fittings, valves, and other buried appurtenances, shall be encased in polyethylene.
3. Joints: The joints shall be of the push-on type unless otherwise specified conforming to ANSI/AWWA C111/A21.11, except gaskets shall be neoprene or synthetic rubber. Gaskets shall be certified as suitable for chlorinated potable water in accordance with ANSI/NSF61. Natural rubber will not be acceptable.
4. Restrained Joints: See Section 02669 of the Standards and Specifications for Water Main Extensions and Relocations.

B. Fittings

1. All fittings shall be made of Ductile Iron and manufactured according to AWWA C110/ANSI A21.10 or AWWA C153/ANSI A21.53.
2. Fitting joints shall be Mechanical Joint (MJ), Flange Joint (FLG), or Push-On Joint, per AWWA C111/ANSI A21.11. All MJ glands shall be ductile iron. Fittings shall have distinctly cast upon them, the pressure rating and the letters "DI" or "Ductile." FLG Fittings shall be used only for aboveground installations.
3. Flanged Joints: Shall be provided with full-face gaskets and shall meet the requirements of AWWA C115/ANSI A21.15.

C. Appurtenances

1. Welded - On Outlets: May not be used in lieu of tees.
2. Tapping Sleeves:
 - a. Material: All material in the body, lugs, outlet, flange, bridge plate, bolts, nuts and washers shall be ASTM A-276 Type 304 or Type 316 or ASTM A-564 Type 630 stainless steel.
 - b. Body: Shall be a minimum of 14 gauge stainless steel and shall fit cast iron pipe classes A, B, C, and D.
 - c. Outlet: Shall be a minimum of 14-gauge stainless steel. The branch outlet shall be supplied with a tap and plug to permit pressure testing the sleeve prior to tapping the main.
 - d. Flange: Shall conform to AWWA C207 Class D with drilling in accordance with ANSI B 16.1 class 125, and shall be indexed per MSS-SP 60 to accept tapping valve.
 - e. Welding: All welding on the coupling shall be done with stainless steel rods.
 - f. Gaskets: Sleeve gaskets shall be full circumferential a minimum of ¼" thick gridded with tapered lap joint ends and stainless steel bridge plates molded flush into the gasket.
 - g. The Outlet: The outlet flange face shall be supplied with a bonded, full-face gasket. All gaskets shall be grade 30 specially compounded rubber, synthetic rubber, or 100 percent neoprene that shall have the necessary qualities to allow outside storage, permanence, and resistance to set after installation.
 - h. Bolts and Nuts: All bolts, nuts and washers shall be loose; lifter bar style bolt attachments shall not be permitted. All bolts and/or nuts shall be impregnated or coated to prevent seizure. Minimum diameter shall be 5/8."

- i. Working Pressure: Sleeve shall be designed for a minimum working pressure of 175 psi.
 - j. General: Power Seal Model 3490-AS; JMC 432; Cascade CST-Ex stainless steel extra heavy duty; Ford Model FTSS; Romac STD Band SST-III; Smith Blair Type 665.
 - k. Power Seal Model 3490MJ or approved equal may also be used.
3. Tie Rods: ASTM A276, Type 304 or Type 316 Stainless Steel.
 4. Couplings: Dresser "Style 38" or Smith-Blair "441 or 411 Flexible Coupling"; without pipe stop. Bolted compression type couplings shall be manufactured of steel or ductile iron specifically for use with ductile iron pipe.

D. Shop Coating and Lining

1. All pipe and fittings shall be cement mortar lined in accordance with AWWA C104/ANSI A21.4. All buried pipe and fittings shall be coated with a black asphaltic coating minimum 1 mil in thickness per AWWA C151/ANSI A21.51. Any pipe or fittings above ground shall be prime coated with 6 mils DFT of Tnemec 140-1211 Epoxy Primer.
2. As an alternative to cement mortar lining on fittings, the manufacturer may use a Fusion Bonded Epoxy on both the interior and exterior that complies with AWWA C550 and is NSF 61 approved for potable water.
3. Ductile Iron Pipe used for sewers shall have an interior protective coating of calcium aluminate mortar (Sewper Coat, as manufactured by Griffin, or approved equal) or an approved PVC lining.

E. Bolts and Nuts

1. Bolts: ASTM A307, chamfered or rounded ends projecting 1/4 to 1/2 inch from surface.
2. Nuts: ASTM A307, hexagonal, ANSI B18.2.2.

F. Marking

1. Markings shall be legibly indented in the pipe or painted thereon with waterproof paint.

2.02 PROTECTIVE COATINGS.

A. Polyethylene Encasement

1. Polyethylene encasement materials shall be in accordance with ASTM D4976 and AWWA C105/ A21.5; LLD-8 mil or HDCL-4 mil.

Item	LLD-8 mil	HDCL-4 mil
Tensile Strength, psi	3,600	6,300
Elongation, percent	800	100
Dielectric Strength, v/mil	800	800
Tear Resistance, gf	2,550	250
Impact Resistance, g	600	800

2. The minimum tube size for each pipe diameter shall be in accordance with AWWA C105 as follows:

Polyethylene Flat Tube Width (inches)

Nominal Pipe Diameter (inches)	Push-on Bell & Spigot Joints	Mechanical Joints
4	14	16
6	17	20
8	21	24
10	25	27
12	29	30
14	33	34
16	37	37
18	41	41
20	45	45
24	53	53

3. Adhesive tape shall be a general purpose adhesive tape 1-inch wide and approximately 8 mils thick, such as Scotch Tape No. 50, Polyken No. 900, Tapecoat CT or approved equal (Duct Tape will not be allowed).
- B. Exterior Surfaces Underground (Excluding Pipe & Fittings): All metal surfaces, including each mechanical coupling, shall be thoroughly cleaned and then coated with Tnemec coal-tar epoxy "High-Build Tnemec-Tar." All material and the application thereof shall conform to AWWA C203.
- C. Above ground pipe and fittings shall be field coated with Tnemec Coal Tar Epoxy "High- Build Tnemec-Tar."

PART 3 - EXECUTION

3.01 HANDLING

- A. Pipe, fittings, and accessories shall be handled in a manner that will ensure installation in a sound, undamaged condition. Equipment, tools, and methods used in unloading, reloading, hauling, and laying pipe and fittings shall be such that the pipe, pipe coating, and fittings are not damaged. Hooks shall not be used. Under no circumstances shall pipe or accessories be dropped or dumped. Pipe and fittings shall not be moved by inserting anything into pipe ends.

Pipe and fittings on which the cement lining has been broken or loosened shall be replaced. Where the damaged areas are small and readily accessible, the lining may be permitted to be repaired in accordance with AWWA C104.

3.02 INSPECTION

- A. Pipe and fittings shall be carefully examined for cracks and other defects immediately before installation. Spigot ends shall be examined with particular care since they are vulnerable to damage from handling. All defective, damaged, or unsound pipe and fittings shall be rejected and marked as such and removed from the site of the work.

3.03 PREPARATION

A. Cutting Pipe

1. Ductile iron pipe shall be cut with a saw or an abrasive wheel. Existing cast iron pipe shall be cut with a saw or abrasive wheel.
2. The cutting of pipe with a torch will not be permitted.
3. Cutting shall be done in a neat manner without damage to the pipe or the cement lining. Cuts shall be smooth, straight, and at right angles to the pipe axis. After cutting, the end of the pipe shall be dressed with a file to remove all roughness and sharp corners.

B. Cleaning

1. The interior of all pipe and fittings shall be thoroughly cleaned of foreign matter before being installed and shall be kept clean until the work has been accepted.
2. Surfaces shall be wire brushed, if necessary, wiped clean, and kept clean until jointing is completed.

3.04 INSTALLATION

A. General

1. Alignment: Runs intended to be straight shall be laid straight. Deflections from a straight line or grade shall not exceed the quantities stipulated in Table 4 or Table 5 of AWWA C600. Shorter pipe sections or special bends shall be installed where the alignment or grade requires them.
2. Laying Pipe: Pipe shall be protected from lateral displacement by pipe embedment material installed as specified in Section 32 11 00. Under no circumstances shall the pipe be laid in water; and no pipe shall be laid in unsuitable trench conditions.
3. Pipe shall be laid with the bell ends facing the direction of laying except when reverse laying is specifically authorized by the WSD.

4. Whenever pipe laying is stopped, the open end of the line shall be sealed with a watertight plug that will prevent water and objects from entering the pipe.
5. No pipe length less than 18" shall be used.

B. Mechanical Joints:

1. The gasket and gland shall, after proper joint cleaning, be in position on the spigot before shoving the pipe to its final position. Center the entering spigot so that the gland or follower ring is parallel to the face of the connecting bell. Joint shall be shoved "home" and the gland properly positioned with respect to the connecting bell with the connecting pipes in as nearly perfect alignment as practicable. The bolts shall be slightly and uniformly tightened. Deflection may be made after the bolts are tightened.
2. Coat the gasket with a lubricant (suitable for potable water) supplied by the pipe manufacturer and all surfaces of the bell, spigot, and gland that will come in contact with the gasket at any time during assembly.
3. Gasket shall be carefully pushed into position and evenly seated in the bell. The gland shall be shoved into place against the gasket, the bolts inserted, and the nuts tightened with the fingers until snug. Final tightening of the bolts shall be done with a ratchet torque wrench.
4. Partially tighten the bottom bolt, then the top bolts, alternately either side, and finally the remaining bolts, alternately tightening bolts 180 degrees apart. This cycle is then to be repeated until all bolts are tightened to the torque specified by the manufacturer:
 - a. 5/8" bolts --- 40 to 60 foot pounds
 - b. 3/4" bolts --- 60 to 90 foot pounds
5. If sealing is not maintained at the torque specified, the joint shall be disassembled, thoroughly cleaned, and reassembled. Overstressing of bolts to compensate for poor installation practice will not be permitted.

C. Push-On Joints:

1. Wipe the gasket seat clean with a cloth and position in place. Coat the gasket with a lubricant supplied by the pipe manufacturer. Apply to all of the inner surface of the gasket that will come into contact with the entering pipe.
2. Clean the plain end of the pipe and apply a thin film of lubricant (suitable for potable water) to the outside of the plain end of the pipe and its beveled edge. Align the plain end of the pipe with the bell of the pipe to which it is to be joined. The joint deflection angle should not exceed the recommended maximum of the manufacturer.

3. Bring the plain end of the pipe in contact with the gasket and exert sufficient force on the entering pipe so that its plain end compresses the gasket and makes contact with the base of the socket of the bell. This force can be applied by means of a jack type tool, backhoe, or other methods approved by the WSD.

D. Flanged Joints:

1. When bolting, care shall be taken to provide uniform gasket compression and prevent unnecessary stress on the flanges. Flange shall be free to move in any direction while the flange bolts are being tightened. Bolts shall be tightened gradually and at a uniform rate to provide uniform gasket compression.
2. Use full-face gaskets only.

E. Restrained Joints:

1. Restrained joints shall be installed in accordance with the pipe manufacturer's recommendations.
2. All joints within utility casings shall be restrained joints.

F. Encasement:

1. Polyethylene encasement shall be installed on all ductile iron pipe and fittings. The polyethylene shall prevent contact between the pipe, fittings, and the surrounding embedment.
2. The polyethylene encasement shall be installed as specified in "Method A" or "Method C" below and as shown on the Construction Detail Drawing No. 02618-1.
 - a. Method A: Polyethylene tubing shall be approximately two (2) feet longer than the length of the pipe section to provide a one (1) foot overlap on each adjacent pipe section. Tube ends need not be taped in place unless directed by the WSD. Repair rips, punctures, or other damages to the polyethylene with adhesive tape or with a short length of polyethylene tube cut open, wrapped around the pipe, and secured with adhesive tape as directed by the WSD (duct tape is not allowed).
 - b. Method C: Each section is completely wrapped with a flat polyethylene sheet. The sheets shall be approximately 2 feet longer than the length of the pipe section to provide a one-foot overlap on each adjacent pipe section. Apply adhesive tape as directed by the WSD (duct tape is not allowed).
3. Pipe-Shaped Appurtenances: Bends, reducers, offsets, and other pipe-shaped appurtenances shall be covered with polyethylene in the same manner as the pipe.
4. Odd-Shaped Appurtenances: Valves, tees, crosses, and other odd-shaped pieces that cannot practically be wrapped in a tube shall be wrapped with a flat sheet or split length of polyethylene tube. The sheet shall be passed under the

appurtenance and brought up around the body. Seams shall be made by bringing the edges together, folding over twice, and taping down. Tape polyethylene securely in place at overlaps, valve tops and all other penetrations.

5. Lifting devices shall not be placed over polyethylene.
6. Polyethylene shall be protected from exposure to weather or damage at all times.
7. Openings in Encasement: Openings for branches, service taps, blow-offs, air valves, and similar appurtenances shall be made by making an x-shaped cut in the polyethylene and temporarily folding the film back. After the appurtenance is installed, tape the slack securely to the appurtenance and repair the cut as well as any other damaged areas in the polyethylene with tape. The new appurtenance shall be wrapped.
8. Junctions Between Wrapped and Unwrapped Pipe: Where polyethylene wrapped pipe joins an existing pipe which is not wrapped, extend the polyethylene tube to cover the unwrapped pipe a distance of at least three feet. Secure the end with circumferential turns of tape.
9. Taps: Wrap 3 layers of adhesive tape over the polyethylene, covering the area where the tapping machine will be mounted. Mount the machine over the tape. Make the tap and install the corporation stop through the tape and polyethylene. After making the service connection, inspect the polyethylene, and repair damaged areas with tape.

END OF SECTION 33 11 13.13

SECTION 33 13 00**WATER MAIN TESTING, DISINFECTION, AND DECHLORINATION**

PART 1 - GENERAL

1.01 SECTION DESCRIPTION

- A. This section provides for the required procedure for the water main testing, disinfection, and dechlorination prior to placing in service.

1.02 SECTION INCLUDES

- A. Corporation Cocks
- B. Hydrostatic Testing
- C. Disinfection of Water Mains

1.03 REFERENCES

- A. Current version at time of bidding of AWWA C651 - Standards for Disinfecting Water Mains.

PART 2 - PRODUCTS

2.01 CORPORATION COCKS

- A. The Contractor will furnish and install a three-fourth inch (3/4") Corporation cock to be used in the testing and disinfection of each new main. The location of these corporation cocks shall be as directed by the WSD.
- B. After the line has been tested and prior to placing the main in service, the Contractor shall remove the corporation cock and replace it with a tapered brass plug.

PART 3 - EXECUTION

3.01 HYDROSTATIC TESTING

- A. General
 1. The entire main shall be tested (pressure test and allowable leakage test) immediately after construction as directed and witnessed by the WSD.
 2. With approval of the WSD, the pressure test and leakage test may be conducted simultaneously. However, should the Contractor be granted permission to make both tests simultaneously, the required test pressure shall be equal to or greater than that for pressure tests as specified below.

B. Pressure Test

1. After the trench has been backfilled, the test connections made and the main filled with water, a minimum pressure of not less than the normal operating pressure (for the lowest point on the line) plus 50% for surge but in no case less than 150 psi, unless otherwise stated, shall be maintained on the new water main for at least two (2) hours.
2. The Contractor shall furnish all pumps, piping, gauges, labor and other materials and services necessary to bring the main up to the specified test pressure.
3. All exposed pipe, fittings, valves, hydrants and joints shall be inspected by the WSD and all evidence of moisture appearing on the surface of the ground during the test shall be investigated by the Contractor by excavation where the pipe has been covered with backfill.
4. All defective pipe, fittings, valves or hydrants discovered during the pressure test shall be removed and replaced by the Contractor and the pressure test shall be repeated until satisfactory to the WSD.
5. The Contractor shall furnish and install all temporary blow-off assemblies, fittings, thrust blocks, and restraining devices required for temporary connections for flushing, pressure testing, chlorination, and de-chlorination of water mains.

C. Leakage Test

1. An allowable leakage test shall be conducted after the pressure test has been satisfactorily completed. The Contractor shall maintain a minimum pressure in the new water main of 150 psi (or a minimum of 10 psi greater than the normal operating pressure of the system, if the normal operating pressure is lower than 140psi) for the lowest point on the line for at least two (2) hours.
2. Leakage shall be defined as the quantity of water that must be supplied into the newly laid pipe to maintain the specified leakage test pressure after the air has been expelled and the pipe has been filled with water.
3. No water main, or section thereof will be accepted if and while it has a leakage rate in excess of that determined by the following formula:

$$L = .0000075 SD (P)^{1/2} / 2$$

Where:

L = Maximum permissible leakage in gallons for two hours.

S = Length of pipe tested, in feet.

D = Nominal internal diameter of the water main being tested in inches.

P = Average test pressure in psi in the water main being tested.

4. Should the actual leakage exceed the allowable leakage, the test pressure shall be maintained for an additional period of time as directed by the WSD so that the leakage location may be detected.

3.02 DISINFECTION OF WATER MAINS

A. General

1. After completion of hydrostatic testing the Contractor shall flush and disinfect the entire main under the direction of WSD.
2. The Contractor shall prepare the main for disinfection by exposing the pipe at all entry points where the chlorine will be introduced into the pipe and installing temporary blow-offs at all discharge ends.
3. Continuous feed method of chlorination is required. The slug method of chlorination may be used only when directed by WSD.

B. Continuous Feed-Method

1. Water supplied from an approved source of supply shall be made to flow at a constant, measured rate into the new water main.
2. At a point not more than 10 ft downstream from the beginning of the new main, water entering the new main shall receive a dose of chlorine fed at a constant rate such that the water will have not less than 60 mg/L free chlorine. To ensure that this concentration is achieved, the chlorine concentration should be measured at regular intervals.
3. As an optional procedure, water used to fill the new water main during the application of chlorine shall be supplied through a temporary connection. This temporary connection shall be installed with an appropriate cross-connection control device for backflow protection of the active distribution system. Chlorine application shall not cease until the entire main is filled with heavily chlorinated water. The chlorinated water shall be retained in the main for at least 24 hours, during which time all valves and hydrants shall be operated to ensure disinfection of the appurtenances. At the end of this 24-hour period, the treated water in all portions of the main shall have a residual of at least 45 mg/L free chlorine.
4. The preferred equipment for applying liquid chlorine is a solution-feed, vacuum- operated chlorinator and a booster pump. The vacuum-operated chlorinator mixes the chlorine gas in solution water; the booster pump injects the chlorine-gas solution into the main to be disinfected. All connections shall be checked for tightness before the solution is applied to the main.
5. After the required retention period (24 hours), the heavily chlorinated water shall be flushed from the pipeline until chlorine measurements show that the water leaving the pipeline is no higher than that generally prevailing in the

system or is acceptable for domestic use. A reducing agent shall be applied to the water before discharging, to neutralize thoroughly the chlorine residual remaining in the water.

6. Contractor shall co-ordinate disinfectant testing and bacteriological testing to demonstrate that the above requirements have been met.

C. Slug Method

1. Water supplied from an approved source of supply shall be made to flow at a constant, measured rate into the new water main.
2. At a point not more than 10 ft downstream from the beginning of the new main, water entering the new main shall receive a dose of chlorine fed at a constant rate such that the water will have not less than 100 mg/L free chlorine. To ensure that this concentration is achieved, the chlorine concentration should be measured at regular intervals.
3. The chlorine shall be applied continuously and for a sufficient period to develop a solid column, or "slug" of chlorinated water that will, as it moves through the main, expose all interior surfaces to a concentration of approximately 100 mg/L for at least 3 hours
4. If at any time chlorine residual drops below 50 mg/L, the flow shall be stopped. Then the chlorination equipment shall be relocated at the head of the slug, and, as flow is resumed, chlorine shall be applied to restore the free chlorine in the slug to not less than 100 mg/L.
5. After the required retention period (at least 3 hours), the heavily chlorinated water shall be flushed from the pipeline until chlorine measurements show that the water leaving the pipeline is no higher than that generally prevailing in the system or is acceptable for domestic use. A reducing agent shall be applied to the water before discharging, to neutralize thoroughly the chlorine residual remaining in the water.
6. Contractor shall co-ordinate disinfectant testing and bacteriological testing to demonstrate that the above requirements have been met.

END OF SECTION 33 13 00

SECTION 33 31 13**POLYVINYL CHLORIDE (PVC) GRAVITY SEWER PIPE****PART 1 - GENERAL****1.01 SCOPE**

- A. This section covers all work, materials, and testing for installation of PVC gravity sewer pipe by the open-cut method as shown on the Drawings and in conformity with these specifications. All pipelines shall be constructed to proper line and grade as shown on the Drawings and shall result in an unobstructed, smooth and uniform conduit.

1.02 DESCRIPTION

- A. Sanitary sewer construction shall consist of furnishing all labor, materials and equipment for the complete installation of PVC gravity sewer pipe and appurtenances in accordance with Contract Drawings and these specifications.

1.03 SPECIFICATION MODIFICATIONS

- A. It is understood that throughout this section these Specifications may be modified by appropriate items in the Specific Project Requirements section of these specifications or on the Contract Drawings.

1.04 REVISIONS OF STANDARDS

- A. When reference is made to a Standard Specification, i.e., ASTM, ANSI, AWWA, the Specification referred to shall be understood to mean the latest revision of said specifications as amended at the time of the Notice to Bidders, except as noted on the Drawings or in the Specific Project Requirements section of these specifications.

PART 2 - PRODUCTS**2.01 MATERIALS****A. General:**

- 1. This section governs materials that may be required to complete pipeline construction, exclusive of structures, as shown on the drawings and/or as provided for in the Modifications to Detailed Specifications.

B. Requirements:

- 1. Furnish pipe materials, joint types, sizes, and strength classes indicated and specified. Higher strengths may be furnished at the Contractor's option at no additional cost to the Owner.

C. Manufacturer:

1. The manufacturer shall be experienced in the design, manufacture and commercial supplying of the specific material.

D. Inspection and Testing:

1. Inspection and testing shall be performed by the Manufacturer's quality control personnel in conformance with applicable standards. Testing may be witnessed by Owner, Engineer, or approved independent testing laboratory. The contractor shall provide certified test reports indicating that materials conform to these specifications.

2.02 PIPE, FITTINGS, JOINTS, COATINGS

- A. Type PSM Polyvinyl Chloride (PVC) Sewer Pipe and Fittings: Pipe and fittings 6 inch through 15 inch diameter pipe shall conform to ASTM D3034, except as otherwise specified herein.

1. GENERAL DESCRIPTION

- a. Furnish maximum pipe length normally produced by the manufacturer except for fittings, closures and specials.

2. MATERIALS

- a. The pipe shall be made of PVC plastic having a minimum cell classification of 12454C or 12454B, or 13364B, or 13364C as defined in ASTM D1784

3. DESIGN

- a. Pipe shall have an integral wall bell and spigot joint. Pipe shall have a minimum wall thickness conforming to SDR 21. If for any reason the depth of cover on SDR 21 pipe becomes greater than 29 feet, the contractor shall immediately notify the design engineer.

4. JOINTS

- a. Joints shall conform to ASTM D3212. Joints shall be push-on type only with the bell-end grooved to receive a gasket. Elastomeric seal (gasket) shall have a basic polymer of synthetic rubber conforming to ASTM F477. Natural rubber gaskets will not be accepted.

5. FITTINGS

- a. Fittings defined as tee or wye connections suitable for assembly to four (4) inch or six (6) inch building service lines shall be bell-end with a minimum wall thickness conforming to SDR 26 and shall be furnished by the pipe manufacturer.

- B. Polyvinyl Chloride (PVC) Large Diameter Plastic Gravity Sewer Pipe and Fittings, 18-inch through 36-inch diameters. Pipe and fittings shall conform to ASTM F679 except as otherwise specified herein.
1. GENERAL DESCRIPTION
 - a. Furnish maximum pipe length normally produced by the manufacturer except for fittings, closures and specials.
 2. MATERIALS
 - a. The pipe shall be made of PVC plastic having a minimum cell classification of 12454C or,13364C as defined in ASTM D1784
 3. DESIGN
 - a. Pipe shall have an integral bell gasketed joint to form a water tight seal. Pipe shall have a minimum wall thickness T-1 conforming to Table No. 1 of ASTM F679.
 4. JOINTS
 - a. Joints made with pipes and fittings shall show no sign of leakage, when tested in accordance with ASTM D3212. Joints shall be push-on type only with the bell-end grooved to receive a gasket. Elastomeric seal (gasket) shall have a basic polymer of synthetic rubber conforming to ASTM F477. Natural rubber gaskets will not be accepted.
 5. FITTINGS
 - a. The minimum wall thickness of the fittings shall be the same as the minimum wall thickness of the equivalent size of the pipe as specify in Table 1, ASTM F679.
 6. PIPE STIFFNESS
 - a. The pipe stiffness shall equal or exceed the minimum value listed in Table 1, ASTM F679 when tested at 5% deflection datum in accordance with Test method D2412.

PART 3 - EXECUTION

3.01 HANDLING

- A. Pipe and accessories shall be handled in a manner that will ensure their installation in the work in a sound, undamaged condition. Equipment, tools and methods used in unloading, reloading, hauling and laying pipe and fittings shall be such that the pipe is not damaged. Pipe having premolded joints shall be handled in such a manner that no weight, including the weight of the pipe itself, will bear on or be supported by the spigot end or bell end at any time. Pipe and pipe fittings which have

been damaged in any way will not be accepted and shall be removed from the project site.

3.02 LAYING PIPE

- A. Pipe shall be protected from lateral displacement by means of pipe embedment material installed as provided in the Earthwork section. Under no circumstances shall pipe be laid in water and no pipe shall be laid under unsuitable weather or trench conditions.
- B. When jointed in the trench, the pipe shall form a true and smooth line. Pipe shall not be trimmed except for closures, and pipe not making a good fit shall be removed.
- C. Pipe which is part of a gravity sewer line shall be aligned and constructed to grades as shown on the Drawings.

2. Alignment and Grade

- A. All pipe shall be laid straight between changes in alignment and at a uniform grade between changes in grade. All lines shall be laid so that each section between manholes will lamp.

3.02 JOINTING

A. Push-on gasketed joints

1. All instructions and recommendations of the pipe manufacturer, relative to gasket installation and other jointing operations, shall be observed and followed by the Contractor. All joint surfaces shall be heavily lubricated with vegetable soap solution immediately before the joint is completed.

3.04 CUTTING PIPE

- #### A. Cutting of pipe shall be done in a neat manner, without damage to the pipe. Pipe cuts shall be smooth, straight and at right angles to the pipe axis. All cutting of pipe shall be done with mechanical pipe cutters of an approved type except that in locations where the use of mechanical cutters would be impracticable, existing pipe may be cut with diamond point chisels, saws, or other tools which will cut the pipe without a damaging impact or shock.

3.05 CLEANING

- #### A. The interior of all pipe shall be cleaned of all foreign matter before being installed and shall be kept clean until the work has been accepted. All lumps, blisters and excess coating shall be removed from exterior spigot and interior bell surfaces. Such surfaces shall be wired brushed and wiped clean, dry, and free from oil and grease before placing the spigot in the bell. All joint contact surfaces shall be kept clean until the jointing is completed.
- #### B. Every precaution shall be taken to prevent foreign material from entering the pipe while it is being installed. No debris, tools, clothing, or other materials shall be placed in the pipe.
- #### C. Whenever pipe laying is stopped at the end of the work day, the open end of the line shall be sealed with a watertight plug. Whenever a tie-in to the existing collection system is made, a plug shall be installed in the new line to prevent water and/or debris from entering the existing collection system.

3.06 Pipe Embedment and Trench Backfill

- #### A. All pipe embedment and trench backfill shall conform to the Section 31 22 00 Site Preparation and Grading and Section 31 23 13 Subgrade Preparation of these specifications and the Contract Drawings, and Section 2507 Backfill, of Kansas City Metro American Public Works Association.

3.07 TESTING

- #### A. All pipelines shall be tested in accordance with Kansas City Metro American Public Works Association Section 2509 - Testing.

END OF SECTION 33 31 13

SECTION 33 39 13**SEWER MANHOLE CONSTRUCTION****PART 1 – GENERAL****1.01 SCOPE**

- A. This section covers standard sewer manholes. Standard manholes shall be constructed complete with covers, fittings, and other appurtenances, in accordance with the Kansas City, MO standard details.

1.02 GENERAL

- A. At the option of the Contractor, standard manholes may be constructed with cast-in-place bases or pre-cast concrete (developed) bases.

PART 2 - PRODUCTS**2.01 MATERIALS****A. Manhole Frames and Covers****1. Castings:**

- a. Tough, close-grained gray iron, sound, smooth, clean, free from blister, blowholes, shrinkage, cold shuts, and defects.
- b. Cast Iron: ASTM A48 Class 35B.
- c. Ductile Iron: ASTM A536, Grade 60-40-12.
- d. Plane or grind bearing surfaces to ensure flat, true surfaces.

2. Cover:

- a. True and seat within ring at all points.
- b. All manhole rings and cover shall be Kansas City, Missouri Standard, MH-RC, Type R3, latest revision.

- B. Non-shrinking Grout. Non-shrink grout shall be in the plastic state and show no expansion after set as tested in accordance with ASTM C827 and shall develop compressive strength not less than three thousand (3,000) psi with a trowelable mix within twenty-four (24) hours per ASTM C109. The placement time shall be not less than forty-five (45) minutes based on initial set per ASTM C191. Cormix "Supreme", L&M "Crystex", Master Builders "Masterflow 713 Grout" or "Set Grout", Sauereisen Cements "F-100 Level Fill Grout", UPCO "Upcon Super Flow", or U.S. Grout "Five Star Grout".

- C. Cast-in-Place Concrete. Materials, handling, forms, finishing, curing, and other work as specified in the concrete sections.

1. Class A concrete used for aerial crossing piers, wetwell walls, manhole walls, bases, inverts, and flat slabs shall have a 28-day strength of 4000 psi, unless otherwise specified.

2. Class B concrete used for concrete encasements and embedments, thrust blocks, pipe anchors, and pipe collars shall have a 28-day strength of 3000 psi, unless otherwise specified.
 - D. Pre-cast Concrete. Pre-cast concrete manholes shall conform to ASTM C478. Minimum wall thickness not less than one-twelve (1/12) of inside diameter, plus one inch or five (5) inches, whichever is greater.
 - E. Pre-cast Concrete Riser and Base Sections. Circular, uniform outside diameter; ASTM C478, except modified herein. Developed bases shall be used unless prior approval is obtained from the Engineer. The diameter of the base pad shall be eight (8) inches greater than outside diameter of the manhole.
 - F. Cone Sections. Eccentric, ASTM C478; wall thickness and reinforcement as specified for riser sections.
 - G. Manhole Adjusting Rings. Concrete or HDPE manhole adjustment rings shall be used. If HDPE manhole adjustment rings are used they shall be as supplied by Ladtech, Inc.
 - H. Reinforcement Steel. Welded Wire Fabric-ASTM A185. Reinforcing Bars- ASTM A615, Grade 40, or Grade 60. Fabricated Steel Bar and Rod Mats - ASTM A184, Grade 40, or Grade 60
 - I. Resilient Manhole/Pipe Connectors. Pipe openings shall contain flexible gaskets conforming to the requirements of ASTM C923. Mortar connections will be allowed only if prior approval has been given by the Engineer. Flexible gaskets shall be manufactured by the Press-Seal Gasket Corporation, A-Lok Products Inc., or approved equal. When RCP is used with A-Lok gasket, the barrel of the RCP shall be lubricated to prevent damage to the gasket during insertion. When PSX gaskets are used, the take-up screws for the gasket clamps shall be positioned a minimum of 90° apart. The specific type of gasket approved for each diameter is referenced in the table below.

Diameter (in.)	PSX	A-LOK	A-LOK: X-CEL	A-LOK PREMIUM
8	Yes	Yes	Yes	No
10	Yes	Yes	Yes	No
12	Yes	Yes	Yes	No
15	Yes	Yes	No	Yes
18	Yes	Yes	No	Yes
21	Yes	Yes	No	Yes
24	Yes	Yes	No	Yes
27	Yes	Yes	No	Yes
30	Yes	Yes	No	Yes
36	Yes	Yes	No	Yes
42	Yes	Yes	No	Yes
48	Yes	Yes	No	Yes

- J. Joint Sealant. Joints shall be sealed with two beads of preformed bitumastic sealants meeting the requirements of Federal Specification SS-S-210A. The minimum bead dimension shall be an inch square. The sealants shall be placed at the elbow of the section's joint. The sealant shall be butt-joined and not lapped.
- K. External Manhole Seal - Heat Shrinkable Wraparound Sleeves. In accordance with ANSI/AWWA C216-89. The wrap system shall consist of a two-piece sleeve (backing + adhesive) with a closure system and a G-type primer. It shall consist of an irradiated cross-linked polyolefin sheeting, pre-coated with a layer of anti-corrosion adhesive. The backing shall have a minimum recovery of 22%.
1. The wrap shall have a mastic-type adhesive, specially formulated to become fluid at temperatures achieved during installation and maintain flexibility in cold climates with installation temperatures down to -40°F. Upon cooling the adhesive shall form a tough, elastomeric protective layer. The wrap shall employ a closure seal to allow sealing of the overlap area. The overall thickness of an applied sleeve shall nominally measure 0.100" (2.5mm). The heat shrinkable wraparound sleeves shall be "Wrapid Seal" as manufactured by Canusa or approved equal.
 2. The sleeves shall be installed according to the following procedure:
 - a. Ensure surface to be covered is free of dirt, sharp points, and preheated to remove moisture. Apply the primer over all areas to be covered and let dry. (5-15 min.)
 - b. Cut a length of sleeve twelve inches longer than the exterior circumferential distance around the manhole measured at each joint or manufacturers recommendation. The wrap shall extend six (6) inches above each joint and six (6) inches below each joint on the exterior

- surface of the manhole. The wrap applied to the cone section and casting shall be eighteen (18) inches wide.
- c. Wrap the sleeve around the manhole. Position the self-adhering closure seal at the overlap. Heat the overlap area and pat down with a gloved hand to ensure bonding. Heat the sleeve until the entire sleeve has recovered. Smooth out the wrinkles. Quench with water or allow to cool prior to backfilling for the adhesive to set.
- (i) For castings installed above ground contractor shall grout between the gussets to create a bevel with a 3000 psi mix of (small aggregate 3/8" max) concrete to insure the heat shrinkable wraparound sleeve in making contact to entire surface area of chimney section. The wraparound sleeve should be fitted to overlap the grouted area at least 2-inches above grouted slope. Contractor shall then install a stainless steel band around top and bottom of wraparound sleeve to insure security of sleeve. Contractor shall then paint heat shrinkable wraparound sleeve with white latex paint after installation of sleeves and bands.
- (ii) For castings below ground level the contractor will cut the heat shrinkable wraparound sleeves around casting gussets and secure to frame.
- L. Internal Sealing System. All flattops manholes shall only have a Cretex Internal Seal installed in them for the entire chimney section. Manholes frame-chimney joint area can be sealed with an internal flexible rubber seal, as manufactured by Cretex Specialty Products, or approved equal. The flexible rubber sleeve, extensions and wedge strips shall be extruded or molded from a high grade rubber compound conforming to the applicable requirements of ASTM C-923, with a minimum 1500 psi tensile strength, maximum 18% compression set and a hardness (durometer) of 48 +or- 5.
1. The sleeve shall be either double or triple pleated with a minimum unexpanded vertical height of 8" and 10" respectively, a minimum thickness of 3/16" and shall be capable of a vertical expansion when installed of not less than 2." The top and bottom section of the sleeve shall contain an integrally formed expansion band recess and multiple sealing fins.
 2. The extension shall have a minimum thickness of 3/16." The top section of the extension shall be shaped to fit into the bottom band recess of the sleeve under the bottom chimney seal band. The bottom section of the extension shall contain an integrally formed expansion band recess and multiple sealing fins matching that of the rubber sleeve.
 3. Any splice used to fabricate the sleeve and extension shall be hot vulcanized and have a strength such that the sleeve shall withstand a 180 degree bend with no visible separation.
 4. The continuous wedge strip used to adapt the rubber sleeve to sloping surfaces shall have the slope differential needed to provide a vertical band

recess surface, be shaped to fit into the band recess and have an integral band restraint. The length of the wedge strips shall be such that, when its ends are butted together, it will cover the entire inside circumference of that band recess needing slope adjustment.

5. The expansion bands used to compress the sleeve against the manhole shall be 16-gauge stainless steel conforming to ASTM A-240, Type 304, with a minimum width of 1-3/4." The expansion mechanism shall have the capacity to develop the pressures necessary to make a watertight seal and shall have a minimum adjustment range of 2 diameter inches. Studs and nuts used for this mechanism shall be stainless steel conforming to ASTM F-593 and 594, Type 304.
 6. Elastomeric polyurethane resin-saturated oakum can be substituted for the butyl rubber elastic material. The material shall be able to withstand hydrogen sulfide and other corrosive gases. The material shall be installed in a double row circumferentially at each joint. For the resin-saturated oakum system, the outer ring shall be saturated with a urethane base foam chemical sealing material. The inner ring shall be saturated with water and shall be placed to prevent urethane foam from entering the manhole.
- M. Mastic Fill Gaskets. Mastic filler shall be butyl rubber compatible with resilient connector material, or Rapid Seal.
- N. Rubber. ASTM C361, Section 6.9.1, except gasket shall be synthetic, with hardness of 40 ± 5 when measured by ASTM D2240, Type A Durometer.
- O. Waterproofing. Exterior surfaces shall be coated with one of the following approved coatings:
1. A total dry film thickness of not less than 14.0 mils of Anchor-Tite Uni-Seal Asphalt Dampproofing Liquid Grade.
 2. A total dry thickness of not less than 4.0 mils of Tnemec Series 66 Hi-Build Epoxiline.
- P. Castings. ASTM A48, Class 35B or better. Kansas City, Missouri Standard, MH-RC, Type R3, latest Revision.
- Q. Manhole Steps. Manhole Steps shall be plastic coated.

PART 3 – EXECUTION

3.01 MANUFACTURE

- A. Pre-cast base sections shall be provided with circular openings, with continuous, circular, resilient connectors cast into the wall.

- B. Resilient connectors shall be installed in accordance with the manufacturer's recommendations, except that connectors shall be positioned so that sealing or resealing operations may be accomplished from inside the manhole.
- C. Pre-cast sections may be provided with lifting notches on the inside faces of the walls to facilitate handling. Lifting notches shall be not more than 3 inches deep; holes extending through the wall will not be acceptable.
- D. If pre-cast concrete base sections are used, part of the concrete invert fill may be furnished with the pre-cast unit; however, a rough surface shall be provided to improve bond with the final invert fill. At least the top 2 inches of the concrete invert fill shall be installed in the field.

3.02 DELIVERY

- A. Pre-cast concrete sections shall not be delivered to the job until the concrete control cylinders have attained a strength of at least 80 percent of the specified minimum.

3.03 HANDLING

- A. Pre-cast concrete sections shall be handled carefully and shall not be bumped or dropped. Hooks shall not be permitted to come in contact with joint sections.

3.04 INSPECTION

- A. Pre-cast concrete sections shall be inspected when delivered and all cracked or otherwise visibly defective units rejected. Owner reserves the right to inspect the production of the units at the manufacturing plant.

3.05 MANHOLE EXCAVATION

A. Excavation

- 1. This Section and Section 31 22 00 shall govern excavation for manholes and special structures. It shall be achieved in a suitable and orderly manner providing a minimum disturbance to the general public.

B. Depth of Excavation

- 1. Depth of excavation shall be to that required for proper installation of the manhole or structure. Over-depth excavation may be required by the Engineer if the subgrade is unstable. Over-depth excavation due to unstable subgrade shall be backfilled as required by the Engineer. Over-depth excavation occurring through an oversight by the Contractor shall be backfilled as required by the Engineer at no additional cost to the Owner.

C. Side Clearances

- 1. Side clearance outside the manhole and/or structures shall be no greater than to allow for forming connection of piping, proper application of special coatings,

if required, and to permit inspection. When concrete is to be placed directly against excavated faces, excavation shall be sufficiently outside of the manhole or structure to provide not less than three (3) inches of concrete cover over the steel reinforcement.

3.06 MANHOLE INSTALLATION

A. Bases

1. If developed bases cannot be used, poured concrete bases shall be used. Cast-in-place concrete bases shall have a minimum thickness of eight (8) inches. Concrete shall be placed on undisturbed earth in accordance with requirements of the concrete section. The bottom wall section shall be embedded in the base section a minimum of four (4) inches. The bottom pre-cast wall section shall not be used for supporting or leveling the other wall sections prior to pouring the base. Concrete blocks shall be used for supporting or leveling the bottom wall section prior to pouring the base. Use of Wood blocks will not be accepted.
 2. If pre-cast concrete (developed) bases are used, the subgrade materials shall be excavated to undisturbed earth and a uniform elevation which will permit at least 4 inches of crushed rock, as specified in the earthwork section, to be installed and compacted. The surface of the granular material shall be carefully graded and the base section accurately set so that connecting pipes will be on proper line and grade. The elevation of the granular material shall be adjusted as required until proper grade and alignment of the base section has been attained.
 3. No wedging or blocking under pre-cast concrete bases will be permitted.
 4. When resilient connectors are used with cast-in-place bases, the concrete fill under the connecting pipe outside the manhole shall be deleted and shall be replaced with granular embedment material to undisturbed earth.
 5. In no case shall the invert section through a manhole be greater than that of the outgoing pipe. The shape of the invert shall conform exactly to the lower half of the pipe it connects. Side branches shall be connected with as large radius of curve as practicable. All inverts shall be troweled to a smooth, clean surface.
- B. Riser and Cone Sections. Circular pre-cast sections shall be provided with a rubber or mastic gasket to seal joint between sections. Lifting notches in manhole walls shall be filled with non-shrinking grout. The minimum horizontal clear distance in the barrel of the manholes shall not be less than four (4) feet unless otherwise specified on the Drawings.
- C. Connecting Piping. The space between connecting piping and the wall of the pre-cast sections shall be completely filled with non-shrinking grout, except where resilient connectors are provided.

1. When resilient connectors are used, the connecting pipe shall be carefully adjusted to proper line and grade, and bedding material shall be compacted under the haunches and to the springline of the pipe for a distance of at least 6 feet from the manhole wall and to at least the minimum trench width. The pipe shall be installed in the resilient connector prior to backfilling outside the manhole and shall be resealed as required after completion of the manhole and backfill. All visible leakage shall be eliminated.
 2. The connecting pipe for installation with resilient connectors shall be plain end, square cut spigots and shall not protrude more than one inch inside the manhole wall. A clear distance of at least one-inch from the end of each connecting pipe and around the pipe shall be provided when the concrete invert fill is installed or as recommended by the manufacturer of the resilient connector. After completion of the manhole, the boxout shall be filled with mastic filler material, completely filling the space beneath the pipe and extending to at least the springline. The filler material shall provide a smooth, uniform surface between the inside diameter of the pipe and manhole invert.
- D. Inverts. Inverts shall structural concrete and steel-troweled (or formed if inverts are pre-cast) to produce a dense, smooth finish. The invert channel shall be "U-shaped" in cross section and extend upward three-fourth of the inside pipe diameter. Smooth transitions shall be formed for pipes of different sizes, elevation, and bends. The invert bench shall be constructed with a 4:1 slope to drain and built to accommodate CCTV equipment.
- E. Steps. Steps shall be aligned vertically below the casting and spaced at sixteen (16) inch centers. The top step shall be not more than one (1) foot below the top of the cone. The lowest step shall be not more than two (2) feet above the invert bench. Field drilled step holes are not permitted in pre-cast concrete manhole. Manhole steps shall meet the following requirements:
1. Minimum 1/2 inch diameter steel reinforcing bar: ASTM A615
 2. Grade 60 or deformed wire: ASTM A496
 3. Encase in polypropylene: ASTM D4101
- F. Top Elevation. The finished top elevation of manhole castings shall conform to the following unless otherwise shown on the Drawings or directed by the Engineer.
1. In paved or future paved areas, the top of the casting shall conform to the slope of the pavement and be 1/8 inch below the finished pavement elevation.
 2. In non-pavement areas, the top of the casting shall be not more than six (6) inches above the surrounding ground or less than the sod's upper root limit. The final elevation shall be at a point where water will not pond over the manhole cover.
- G. Manhole Adjustment. All new manholes will be provided with adjustment ring(s) underneath the casting as shown on drawings. A maximum of one (1) 6-inch or two (2) 4-inch riser rings shall be installed on top of the cone section. The joints shall be

sealed with a double bead preformed bitumastic sealant. If the top of an existing manhole is required to be raised to an elevation which will exceed twelve (12) inches, or lowered more than the adjustment rings will allow, all vertical adjustments shall be made to the barrel of the manhole.

- H. Castings. Casting shall be installed with the mud ring inserted inside the manhole opening and resting on a minimum of two rows of preformed bitumastic joint sealant.

3.07 DAMPPROOFING

- A. Dampproofing may be applied to pre-cast units in the shop. If the shop coating is damaged during construction, a touch up coat of paint as required shall be applied and allowed to dry prior to backfilling. Surfaces to receive paint shall be dry.

3.08 DRAWINGS AND DATA

- A. Drawings and data covering pre-cast concrete sections shall be submitted in accordance with the submittals section.

3.09 MANHOLE TESTING

- A. The Contractor shall shall test all pipes and manholes in accordance with APWA Section 2509 – Testing and APWA Section 2510.9 Manhole Testing, respectively.

END OF SECTION 33 39 13

SECTION 33 40 00**STORM DRAINAGE UTILITIES****PART I - GENERAL****1.1 SUMMARY****A. Description**

1. This Work consists of furnishing and installing storm drainage pipes and structures as shown and as specified herein. This Work also includes joints and connections on the Contract Drawings to other drainage structures or systems, and temporary storm drainage measures during construction.
2. The Contractor has the option of using pipe of different materials. The Contractor may substitute stronger, and higher quality material at any installation site, provided the substitution is approved by the local government agency (where applicable), and the Engineer.
3. The nominal sizes of pipe are shown on the Contract Drawings. The actual diameters and thickness will be determined according to AASHTO and ASTM tolerances for different pipe diameters for the appropriate kind and class of pipe.

1.3 SUBMITTALS

- A. Submittals shall be made in accordance with the requirements of the Project Quality Plan, except as modified herein.
1. Details of concrete pipe joints and special sections.
 2. Details of precast concrete components.
 3. Details of metal components for manholes.
 4. Details of catch basins.
 5. Details of HDPE Pipe to manhole connection.
- B. Product data shall be submitted for the following:
1. Reinforced Concrete Pipe and Joint Material
 2. Rubber gaskets.
 3. Galvanized Corrugated Metal Pipe
 4. PVC and High Density Polyethylene pipe and fittings.
 5. Single wall, fully corrugated polyethylene drainage pipe.
 6. Fully corrugated polyethylene with smooth internal diameter wall pipe.
 7. Precast Reinforced Concrete Box Sections.

1.4 QUALITY ASSURANCE/QUALITY CONTROL

Precast components shall be manufactured by firms with at least 5 years experience in manufacturing component of this type required by the contract.

PART II - PRODUCTS

2.1 MATERIALS

Cast-in-place concrete shall be in accordance with the requirement of Sections 03 20 10 and 03 30 00.

2.2 PVC PIPE

Use PVC pipe conforming with: ASTM D3034 SDR 35, 4-15" Diameter where shown on the Plans.

2.3 CONCRETE PIPE

- A. Nonreinforced or plain circular concrete pipe and special sections shall conform to the requirements of AASHTO M 86 (ASTM C 14) or ASTM C 985 except as follows:
1. Where rubber gasket joints are used, the design of the ends of the pipe sections shall be modified according to AASHTO M 198 to accommodate rubber gaskets.
 2. Indent the markings required by AASHTO M 86 (ASTM C 14) in the outside surface of each section of pipe.
- B. Reinforced concrete pipe and special sections shall conform to the requirements of AASHTO M 170 (ASTM C 76) except as follows:
1. Where rubber gasket joints are used, modify the design of the ends of pipe sections according to AASHTO M 198 to accommodate rubber gaskets.
 2. Special sections such as elbows, wyes, tees, crosses, bend, and reducers shall be as shown, specified, or directed. In the absence of any design or specifications, the special sections shall be of the design recommended by the manufacturer for the intended use. Generally the special sections shall conform to the requirements specified for the pipe with which it is to be used. Special sections with components shall be from tested and approved lots. Production dates shall be available for such sections.
 3. Indent the markers required by AASHTO M 170 (ASTM C 76) in the outside surface of each section of pipe.
 4. Reinforced concrete pipe having the same D-load strengths as those specified to be furnished under AASHTO M 170 (ASTM C 76) may be furnished according to AASHTO M 242 (ASTM C 655).
 5. The basis of acceptance for pipe, manufactured according to AASHTO M 170 (ASTM C 76), and AASHTO M 242 (ASTM C 655), shall be load bearing tests, material tests, and inspection of manufactured pipe for visual defects and imperfections, unless other basis are approved.

2.4 METAL PIPE

- A. Corrugated steel pipe, helical rib pipe and special sections shall conform to the requirements of AASHTO M 36, (ASTM A 760) Type I, IA, and II, except as follows:
1. Shape shall be full-circle, unless otherwise stated. The shapes of pipe fabricated and furnished may include any of the following:
 - a. Full circle fabricated helical rib pipe in full-circle cross section only.
 - b. Half circle pipe fabricated as half sections of full-circle pipe of the same diameter.
 2. Connecting bands shall be used to make field joints for pipes not requiring water tight joints. Coating damage on edges of bands need not be repaired.
 3. Joints shall be welded according to recognized standard practice and any damaged zinc or aluminum coating repaired as specified herein.
 4. For repair of damaged coating in addition to the methods given in AASHTO M 36 (ASTM A 760) the Contractor may, at his option, repair damaged zinc or

aluminum coating by removing all loose or cracked coating, removing all welding flux, wire brushing the damaged area, and applying 2 coats (min. 2 mils total thickness each) of a high zinc dust content paint conforming to the general requirements of ASTM A 780. Damaged zinc or aluminum coating, within 3/8-inch of the ends of pipe sections, caused by production cut-off of pipe will be permitted without repair.

5. Sloped and skewed ends shall be fabricated to provide a smooth surface, and coating shall be restored as specified herein.

2.5 HIGH DENSITY POLYETHYLENE PIPE

- A. High density polyethylene (HDPE) pipe shall be submitted and approved by Engineer. Pipe size shall be as shown on plans. All pipe sizes as shown on the drawings and as specified herein are in reference to "nominal" diameter, unless otherwise indicated. Pipe sizing is to be according to ASTM F714 and ASTM D 3035. The pipe shall be made from Premium High Density Polyethylene resin qualified as Type III, Category 5, Class C, Grade P34 in ASTM D1248. This material shall have a long term hydrostatic strength of 1600 psi when tested and analyzed by ASTM D2837, and listed by the Plastic Pipe Institute as a PE 3408 Resin.
- B. The following minimum engineering design specifications are required:
 1. ASTM D-638 Tensile Strength Yield (2 in/min), >3200 P.S.I.
 2. ASTM D-638 Elongation at break, 750%
 3. ASTM D-638 Modulus of Elasticity, 105,000 P.S.I.
 4. ASTM D-3350 Flexural Modulus, 125,000 P.S.I.
 5. ASTM D-1693 Environmental stress crack resistance Condition C, >5000 F 20 hrs.
 6. ASTM D-2837 Long Term High Strength (L.T.H.S.) @ 73.4⁰ F, 1600 P.S. I.
- C. The pipe shall contain no recycled compound except that generated in the manufacturer's own plant from resin of the same specification from the same raw material supplier.
- D. The polyethylene pipe shall be homogeneous throughout and free of visible cracks, holes, foreign inclusions, or other injurious defects. The pipe shall be uniform in color, opacity, density, and other physical properties.
- E. The following information shall be continuously marked on the pipe or spaced at intervals not exceeding five (5) feet:
 1. Name and/or trademark of the pipe manufacturer.
 2. Nominal pipe size.
 3. Standard Dimensional Ratio (SDR).
 4. PE 3408.
 5. Manufacturer's Standard reference.

6. A production code from which the date and place of manufacture can be determined.
- F. Compliance with the requirements of these specifications shall be certified in writing by the pipe supplier.

2.6 HDPE PIPE JOINTS

- A. All HDPE pipe and fittings shall be jointed by the butt fusion process per ASTM D 2657 and the manufacturer's specific recommendations. The tensile strength at yield of the butt-fusion joints shall be not less than the pipe.
- B. HDPE bead removal: The bead on the inside of the pipe resulting from the fusion process shall be removed flush with the inside surface of the pipe with a cutting tool specifically designed for this purpose.
- C. HDPE Couplings: Mechanical connections of polyethylene pipe to fittings or other materials shall be by means of flanged connections (flanged coupling adapters and ANSI backup rings rated for the same pressure service as the system piping) or flexible couplings designed for joining polyethylene pipe to polyethylene pipe or to another piping material as applicable. Flanged joints shall use bolts of compatible material. Gaskets shall be required when joining to non-polyethylene materials. In all cases, the bolts shall be evenly torqued using a cross pattern. Flanged joints are to be retorqued after one hour or more has passed.
- D. Manholes on HDPE Pipe: Approved water stops or flange anchors shall be used where the pipe enters and exits the manhole.

2.7 JOINT PROOF TESTS

- A. General
 1. The intent of this requirement is to prequalify a joint system, components of which meet the joint requirements, as to the water tightness capability of that joint system. This proof test shall be understood to apply to all sanitary sewers and to storm drains which are to be tested for water tightness prior to acceptance. Material and test equipment for proof testing shall be provided by the manufacturer. Joints shall meet the requirements of yard testing specified below. The pipe manufacturer shall submit results of the yard tests made, certified by a testing agency approved by the Engineer. When approved, internal hydrostatic pressure may be applied by a suitable joint tester. In general, each pipe material and joint assembly shall be subject to the following three proof tests at the discretion of the Engineer:
 - a. Pipe in Straight Alignment: No less than three nor more than five pipes selected from stock by the Engineer shall be assembled according to the manufacturer's installation instructions with the ends suitably plugged and restrained against internal pressure. The pipe shall be subjected to 10 psi hydrostatic pressure for 10 minutes. Free movement of water through the pipe joint or pipe wall shall be grounds for rejection of the pipe.
 - b. Pipe in Maximum Deflected Position: A test section shall be deflected as described hereinafter for each pipe material. The pipe shall be subjected to 10 psi hydrostatic pressure for 10 minutes. Free movement of water

through the pipe joint or pipe wall shall be grounds for rejection of the pipe.

- 1) For deflected position, join 12 ½ foot lengths, then deflect along an arc or 720 feet radius (0.11 feet offset at the end of each length from a tangent at the joint).
- c. Joints Under Differential Load: The test section shall be supported on blocks or otherwise as described hereinafter for each pipe material. There shall be no visible leakage when the stressed joint is subjected to 10 psi internal hydrostatic pressure for 10 minutes.
- 1) For differential load, join two lengths and uniformly support for at least 2 feet on both sides of the joint with vertical load applied sufficient to deflect the joint and adjacent pipe to 95% of its initial vertical diameter.
2. An alternative to the internal hydrostatic pressure test would be an external hydrostatic test or a vacuum test effectively meeting the same time and pressure requirements as determined by the Engineer.

2.8 FITTINGS

A. General

1. Provide tee and wye fittings in the storm sewer main for service line sewers and catch basins or inlet connections. Tees and wyes for service line sewers shall be the same diameter as the pipe which they join, unless otherwise specified. All fittings shall be of sufficient strength to withstand all handling and load stresses encountered. All fittings shall be of the same materials as the pipe unless otherwise specified. Material joining the fittings to the pipe shall be free from cracks and shall adhere tightly to each joining surface. Use the same type of joints on all fittings that are used on the main sewer pipe, unless approved by Engineer.

C. HDPE Pipe

1. Standard fittings and special fittings shall be manufactured from the same class of material as the pipe is manufactured and be fully compatible.
2. Fittings shall be manufactured in accordance with ASTM 3197 or ASTM D 3261. Fabricated fittings shall be pressure rated to match the system piping.
3. Tee and wye fittings to connect existing service laterals to HDPE pipe shall be either molded butt fusion fittings, or molded saddle fusion fittings.

2.9 MANHOLES, CATCH BASINS AND HEADWALLS

- A. Earthwork: Excavation and backfill shall be in accordance with the requirements of Sections 31 22 00 as appropriate.
- B. Cast-In-Place Concrete: Cast-in-place concrete shall be in accordance with the requirements of Sections 03 20 10 and 03 30 00.
- C. Precast concrete sections shall conform to the requirements of Section 33 49 13 and the following:

1. The precast risers, cones and cover slabs for precast concrete manholes shall conform to the requirements of AASHTO M 199 (ASTM C 478) and be rated for H-20 loading.
2. The precast rings and lids for precast concrete inlets shall be of portland cement concrete conforming to AASHTO M 199.

D. Metal Items.

1. Metal frames, covers, grates, and ladders shall conform to the following:

AASHTO/ASTM

<u>Item</u>	<u>Designation</u>	<u>Grade</u>
Manhole frames and cover inlet frames and grates	M 105/A 48	Class 30B
	M 277/A 663	65
	M 183/A 36	-
	M 103/A 27	65-35
Manhole ladder rails	M 183/A 36	-
	M 227/A 663	65

2. Steps for manholes and rungs for manhole ladders from structural steel having a minimum yield strength of 28,000 psi and be galvanized according to AASHTO M 111 (ASTM A 123).
3. Welding shall conform to AWS D1.1.
4. Frames, covers and grates shall have even and uniform bearings where they come in contact with each other.
5. Miscellaneous metal items and hardware shall conform to the appropriate requirements of Section 05 50 00.

E. Manhole Steps

1. Manhole steps shall conform with AASHTO designation M-190 unless noted otherwise. Steps shall not be installed in storm sewer manholes or boxes that are 6 feet deep or less to pipe flowline.
2. Steel reinforcing of manhole steps shall conform to AASHTO designation M-270, grade 36. Plastic coating of manhole steps shall conform to AASHTO designation M-31, grade 60.

2.10 JOINT MATERIALS

- A. Rubber Gaskets: Rubber gaskets for concrete pipe and precast section joints shall conform to the requirements of AASHTO M 198.
- B. Joint Mortar: Joint mortar for concrete pipe joints and precast manhole section joints shall consist of one part portland cement and two parts approved sand with water, as necessary, to obtain the required consistency. Mortar shall be used within 30 minutes after preparation unless conditions during use necessitate a shorter time.

- C. Plastic Compound: Plastic compound for precast manhole section joints shall be a compound that:
1. Has a putty-like, preformed homogeneous blend of hydrocarbon resins and rubber or plasticizing materials with not more than 50% by weight of inert mineral filler.
 2. Is specifically manufactured for the intended use and pliable and temperatures between 32°F and 135°F and ½ inches square in cross section shall stretch at least 1-1/2 inches before rupture when tested with the apparatus described in ASTM D 113.
 3. Adheres firmly and cohesively to the precast manhole sections when the compound-sealed joint is flexed to its maximum extent.
 4. Includes for use, a primer solution recommended by the compound manufacturer.
 5. Conforms with Federal Specification SS-S-00210 (GSA-FSS).

PART III - EXECUTION

3.1 PIPE

- A. Earthwork: Excavation, bedding, backfilling and compacting shall conform to the requirements of Section 31 22 00.
- B. Installation in Paved Areas
1. General: Pipes shall be installed within paved areas that are to be preserved by open excavation, tunneling, jacking, or boring methods as the Contractor elects. Regardless of the method used, the adjoining pavement shall not be damaged.
 2. Open Cut:
 - a. Pavement Cuts
 - 1) Pavement shall be vertically saw cut along each edge of the area to be removed when no pavement overlay will occur or when the surface is carrying traffic. All other pavements may be either saw or wheel cut.
 - 2) The area being cut shall be limited to the least width and extent practical for installation. Cuts shall be clean, vertical and made true to lines designated within a tolerance of 1 inch. Depths of the cuts shall be sufficient to permit the removal of pavement between or alongside them without damage to pavement or structures to be left in-place.
 - 3) Pavement lying within the limits of the cuts and from any adjoining areas damaged by the cutting and removal operation shall be removed and disposed of according to Section 02 40 00.
 3. Replacement Surfacing

- 1) Aggregate base shall be placed and compacted after trench backfill is completed in accordance with Section 32 11 00. Aggregate base shall be 18 inches thick or the thickness of the removed base whichever is greater.
- 2) Pavement shall correspond with the kind and thickness removed. Shoulders, driveways, curbs, gutters, walks, dikes, walls and other similar asphalt or portland cement concrete structures shall be replaced with construction at least equal in all respects to that of the structures or parts of structures removed, similar and matching that of adjoining, undisturbed structures.
- 3) Replacement work shall be performed as follows:
 - a) Trim all loose fragments from abutting edges of old pavement.
 - b) Apply asphalt tack coat to edges of existing asphalt concrete.
 - c) Thoroughly moisten edges of old portland cement concrete with water.
 - d) Place, shape, compact, and finish the asphalt or portland cement concrete to established grade and cross section.
 - e) Respective thicknesses of new pavement shall equal removed pavement thickness or the following, whichever is greater:

**Minimum Compacted
Thickness, Inches**

<u>Kind</u>	<u>Traveled-Way Area</u>	<u>Other Areas</u>
Asphalt Concrete	5	4
Portland Cement Concrete	8	8

- 4) Pavement shall be opened, pipe installed, area repaved, and traffic resorted in the same day or trench covered with a steel plate or temporary surfacing as approved. Temporary surfacing shall be graded to proper cross section.

C. Laying

1. Pipe shall be laid beginning at the downstream end of the line with the bottom in contact with shape bedding throughout its full length except where bell holes are required. Pipe shall be placed with bell or female grooved ends facing upstream.
2. Round elliptically reinforced concrete pipe shall be placed so that manufacturer's marks designating top and bottom of pipe are within 5 degrees of a vertical plane through the longitudinal axis of the pipe.

D. Joining

1. Field joints made in joining pipe sections and connecting pipe to structures shall:
 - a. Provide equal or greater strength than the adjoining pipe.
 - b. Fit close and tight.
 - c. Provide a smooth and uniform interior surface.
 - d. Secure and hold adjoining sections to each other.
 - e. Fasten securely to adjoining structures and special sections.
 2. Field mortar joints shall be made in accordance with the following:
 - a. Clean and wet the surfaces to be joined with water.
 - b. Apply mortar to the lower portion of the bell or groove of the section already laid and to the upper portion of the spigot or tongue of the section being laid.
 - c. Clean the joint recesses, fill with mortar and wipe to a smooth finish both inside and out.
 - d. Do not allow free water to come in contact with mortar joints within 24 hours after the mortared joints are finished.
 - e. Protect the completed joints against rapid drying.
 3. Watertight field joints with rubber gaskets shall be used for all storm and sanitary sewers. Gaskets shall be installed in accordance with the manufacturer's installation instructions.
- E. Inspection: All pipe shall be inspected after laying and joining but before backfilling. Pipe which is out of alignment, unduly settled, or damaged shall be taken up and relayed, or replaced.
- F. Backfilling
1. Backfilling shall be as specified in Section 31 22 00.
 2. Where the top of pipe is exposed above the top of the trench, embankment layers shall be placed and compacted to above the top of Pipe Compaction Zone shown on the Contract Drawings.
 3. Heavy construction equipment shall not cross over pipes until at least 4 feet of compacted cover has been placed.
 4. Material for side fill around and to the top of box culverts shall be select crushed rock and shall not contain stones larger than 3" in greatest dimension or moisture in excess of that permitted through the compaction requirements of Section 31 22 00.

3.2 MANHOLES, CATCH BASINS AND HEADWALLS

- A. Earthwork: Excavation and backfill shall be in accordance with the requirements of Section 31 22 00 as appropriate.
- B. Cast-In-Place Concrete: Cast-in-place concrete shall be in accordance with the requirements of Sections 03 20 10 and 03 30 00.
- C. Precast Concrete: Joints shall be made in accordance with the applicable requirements specified herein for watertight pipe joints or in accordance with the manufacturer's instructions.
- D. Pipe Connections: Connecting pipes shall be placed at required alignment and grade. Pipes shall be set through the full thickness of the wall flush with inner face of the wall. Joints between pipe and wall shall be watertight.
- E. Frames, Covers, Grates, and Fittings: Metal frames shall be set on full mortar beds. If concrete is to be poured around the frames, the portion of the frame that will contact the concrete shall be painted with hot asphalt before placing the concrete. Frames, covers and grates shall be set true to the locations and grades established. Bearing surfaces shall be cleaned to provide uniform contact. All fastenings shall be secure.
- F. Manhole Steps: Manhole steps shall be installed in accordance with details referenced by plans.

3.3 TESTING

- A. Testing Storm Drain Pipe: Storm Drain Pipe shall be visually inspected for cleanliness. Water shall be discharged into all inlets to assure that lines are free of obstructions and leakage.

PART IV - MEASUREMENT

4.1 Measurement

- A. The quantities of accepted work will be measured in the following units. All measurements will be plan measure except for authorized changes.
 - 1. Curb Inlets EA (Each)
 - 2. Curb Inlets – Type 2 EA
 - 3. Rehab Manholes EA
 - 4. Remove Brick MH, New 48" MH EA
 - 5. Remove Curb Inlets EA
 - 6. Core & Grout 8" PVC into Existing/Rehab CI/MH EA
 - 7. Core & Grout 15" RCP into Existing/Rehab CI/MH EA
 - 8. Track & Bridge Drain EA

9. Raise Existing Bridge Barrier Scuppers EA
10. 8" PVC LF (Linear Foot)
11. 15" RCP LF
12. 15" HDPE LF
13. Fill Abandoned Pipe (Unknown Dia.) LF
14. Protect-in-Place Ex. 12" RCP LF

PART V - PAYMENT

5.1 Payment

Payment will be made at the respective unit or lump-sum price listed in the proposal and shall be full compensation for all labor, materials, and equipment necessary to complete the respective unit in place. There will be no separate measurement or payment for any item of work not specifically identified and listed in the proposal, and all such work shall be considered a subsidiary item with all costs pertaining thereto included in the prices for other items listed in the proposal. At the Engineer's option, partial payment may be made for any lump sum item listed in the proposal, providing that the Contractor is diligently and satisfactorily pursuing full completion of such partially complete item in accordance with the approved job progress schedule.

END OF SECTION

SECTION 33 41 13**REINFORCED CONCRETE PIPE****PART 1 - GENERAL****1.01 SCOPE OF WORK**

- A. This section covers all work, materials, and testing for installation of reinforced concrete storm sewer pipe by the open-cut method as shown on the Drawings and in conformity with these specifications. All pipelines shall be constructed to proper line and grade as shown on the Drawings and shall result in an unobstructed, smooth and uniform conduit.

1.02 DESCRIPTION

- A. Reinforced concrete pipe construction shall consist of furnishing all labor, materials and equipment for the complete installation of reinforced concrete pipe and appurtenances in accordance with Contract Drawings and these specifications and as specified in American Public Works Association Standard Specifications and Design Criteria Section 2600 as revised, adopted, and provided by the Director of Kansas City, Missouri Public Works current at the time of bidding and American Public Works Association Standard Specifications.

1.03 SPECIFICATION MODIFICATIONS

- A. It is understood that throughout this section these Specifications may be modified by appropriate items in the Specific Project Requirements section of these specifications or on the Contract Drawings.

1.04 REVISIONS OF STANDARDS

- A. In addition to complying with all pertinent codes and regulations, comply with the referenced or applicable portions of the American Public Works Association Standard Specifications and Design Criteria as revised, adopted, and provided by the director of Kansas City, Missouri Public Works current at the time of bidding.
- B. When reference is made to a Standard Specification, i.e., ASTM, ANSI, AWWA, the Specification referred to shall be understood to mean the latest revision of said specifications as amended at the time of the Notice to Bidders, except as noted on the Drawings or in the Specific Project Requirements section of these specifications.

PART 2 - PRODUCTS**2.01 MATERIALS**

- A. General - This section governs materials that may be required to complete pipeline construction, exclusive of structures, as shown on the drawings and/or as provided for in the Modifications to Detailed Specifications.
- B. Requirements - Furnish pipe materials, joint types, sizes, and strength classes indicated and specified. Higher strengths may be furnished at the Contractor's option at no additional cost to the Owner.
- C. Manufacturer - The manufacturer shall be experienced in the design, manufacture and commercial supplying of the specific material.

2.02 PIPE, FITTINGS, JOINTS, COATINGS

- A. Reinforced Concrete Pipe: Reinforced concrete pipe shall conform to the following ASTM Standards and be of the minimum strength designated herein or such higher strength as may be required by the Contract Drawings or Special Provisions:
 - 1. Round Pipe: ASTM C 76, Class III, Wall B
 - 2. Elliptical Pipe: ASTM C 507, Class HE-III
 - 3. Arch Culvert Pipe: ASTM C 506, Class A-III
- B. Joints: Flexible gaskets may be either flat gaskets cemented to the pipe tongue or spigot, O-ring gaskets, or roll-on gaskets.
 - 1. All gaskets shall conform to ASTM C 443.

2.03 GRANULAR BEDDING MATERIAL

- A. Granular bedding material shall be crushed clean limestone aggregate meeting one of the following gradations:

Bedding Material Gradation Limits, % Passing

Sieve Size	3/4"	1/2"	3/8"
1"	100		
3/4"	90-100	100	
1/2"		80-100	
3/8"	20-55	40-70	100
No. 4	0-10	0-15	30-40
No. 8	0-5	0-5	0-4

In areas where the pipe trench is below the potential high point of the water table, only three-eighths (3/8") inch bedding may be used.

2.04 FLOWABLE BACKFILL: CONTROLLED LOW STRENGTH MATERIAL (CLSM):

- A. The CLSM materials proposed for use in construction shall conform to the following requirements:
- a. Cement shall conform to ASTM C 150, Type I or Type II.
 - b. Fly Ash shall conform to ASTM C 618, Class C
 - c. Fine Aggregate shall conform to ASTM C 33.
 - d. Mixing water shall conform to ASTM C 94.
 - e. Admixtures shall only be used when specified by the Engineer.
- B. Mixture Design
- a. The CLSM Flowable Backfill shall be transit mix, or from a mobile mixer. The elapsed time from when the water is added for batching until the CLSM is placed shall not exceed two hours.
 - b. The slurry mixture shall be mixed between 70 to 100 revolutions of the ready-mixed truck. To minimize segregation, all flowable fill material shall be re-mixed at the project site at mixing speed in the ready-mix truck for approximately two (2) minutes immediately prior to discharge of the slurry mixture.
 - c. The CLSM shall be composed of the proportions as hereinafter provided, or an acceptable mix as approved by the Engineer.

Design Mix	Type A	Type B	Type C
Type 1 Cement	150 lbs.	50 lbs.	0 lbs.
Water	460 (55 gal.)	500 (60 gal.)	542 (65 gal.)
Sand	3085 lbs.	2817 lbs.	2649 lbs.
Class C Fly Ash	0 lb.	250 lbs.	350 lbs.

PART 3 - EXECUTION

3.01 HANDLING AND PROTECTION

- A. Pipe and accessories shall be handled in a manner that will ensure their installation in the work in a sound, undamaged condition. Equipment, tools and methods used in unloading, reloading, hauling and laying pipe and fittings shall be such that the pipe is not damaged. Pipe having premolded joints shall be handled in such a manner that no weight, including the weight of the pipe itself, will bear on or be supported by the spigot end or bell end at any time. Pipe and pipe fittings which have been

damaged in any way will not be accepted and shall be removed from the project site.

- B. All pipe shall be protected during installation against shock and free fall, and be installed without cracking, chipping, breaking, bending, or damage to coating materials. Damaged pipe materials shall be replaced with new materials except as may be permitted by the Engineer.

3.02 CUTTING PIPE

- A. Cutting of pipe shall be done in a neat manner, without damage to the pipe. Pipe cuts shall be smooth, straight and at right angles to the pipe axis. All cutting of pipe shall be done with mechanical pipe cutters of an approved type except that in locations where the use of mechanical cutters would be impracticable, existing pipe may be cut with diamond point chisels, saws, or other tools which will cut the pipe without a damaging impact or shock.

3.03 CLEANING

- A. The interior of all pipe shall be cleaned of all foreign matter before being installed and shall be kept clean until the work has been accepted. All lumps, blisters and excess coating shall be removed from exterior spigot and interior bell surfaces. Such surfaces shall be wired brushed and wiped clean, dry, and free from oil and grease before placing the spigot in the bell. All joint contact surfaces shall be kept clean until the jointing is completed.
- B. Every precaution shall be taken to prevent foreign material from entering the pipe while it is being installed. No debris, tools, clothing, or other materials shall be placed in the pipe.
- C. Whenever pipe laying is stopped at the end of the work day, the open end of the line shall be sealed with a watertight plug. Whenever a tie-in to the existing collection system is made, a plug shall be installed in the new line to prevent water and/or debris from entering the existing collection system.

3.04 INSPECTION

- A. Pipe and fittings shall be carefully examined for cracks and other defects immediately before installation; spigot ends shall be examined with particular care. All defective pipe and fittings shall be marked as such and removed from the site of the work.

3.05 TRENCH EXCAVATION

- A. Prior to excavation of the sewer trench in any fill areas, fill shall be compacted to a minimum 90% of maximum density (as determined by ASTM D 698) up to a minimum height of 18 inches above the top of the
